Preparation—1 Powdered arsenic is shaken into a retort filled with Br vapour, and the bromide is distilled from the excess of As —2 Powdered arsenic is added to a mixture of 1 part Br with 2 parts CS_2 , until the liquid is colourless, more Br is then added, followed by more As , until the colour is no longer removed on the addition of As , the liquid is then filtered and evaporated, on standing, the bromide is deposited in crystals (Nicklès, *C R* 68, 837; *J Ph* [3] 41, 142).

Properties—Colourless deliquescent prisms with strong arsenical odour, melting to a pale yellow liquid which fumes but slightly in the air. Volatilises unchanged and yields a crystalline sublimate.

Reactions—1 *Water*, added in small quantity, produces $AsOBr$ and HBr (? with a little arsenious oxide) (Serullas, *S* 55, 345), added in large quantity, decomposes it into HBr and

As₂O₃ (Serullas, *lc*) An aqueous solution containing HBr deposits the oxy salts **2AsOBr 3As₂O₃ 12H₂O** and **2AsOBr 3H₂O** (Wallace, *P M* [4] 17, 261) — **2 Ammonium bromide** added to a cold concentrated aqueous solution pps six sided tables consisting chiefly of **AsBr₃** (Wallace, *P M* [4] 17, 261) — **3 Sodium thiosulphate** at first produces **AsOBr**, and then **As₂S₃** (Nicklès, *J Ph* [3] 41, 142) — **4 Arsenious oxide** dissolves in molten **AsBr₃**, on cooling to 150° the liquid separates into two layers, the upper of which is **AsOBr**, and the lower probably **3AsOBr As₂O₃** (Wallace, *P M* [4] 17, 261)

Combinations — With the **alkaline bromides** to form rather unstable crystallisable compounds (Nicklès, *lc*)

Arsenic, chloride of AsCl₃ (*Arsenious chloride, Trichloride of arsenic, Butler of arsenic, Caustic oil of arsenic*) Mol w 181.11 [below 29°] (180° 2) (Thorpe, *C J* 37, 352) SG $\frac{2}{4}$ 2.205 (Thorpe, *lc*) VD 90.75 Volume at t° = vol at 0° + 0.00991338t + 0.00000849t² + 0.000000027551t³ (Thorpe, *lc*) SHp 1122, SHv 7034, HV 69.74 (Regnault, *J* 1863 77) HF 71,460 [solid As and gaseous Cl] (*Th* 2, 326) R_x 49.69 (Haagen, *P* 131, 122) SV 94.37 (Thorpe, *lc*)

Formation — 1 By distilling **As₂O₃** with conc **H₂SO₄** and **NaCl** (Glauber in 1648, Dumas, *P* 9, 308) — 2 By distilling **As₂O₃** with conc **HCl** — 3 By leading dry **HCl** gas over powdered **As₂O₃** — 4 By passing dry **HCl** gas over gently heated powdered **As₂O₃**, **As₂O₃ + 10HCl = 2AsCl₃ + 2Cl₂ + 5H₂O** (Mayrhofer, *A* 158, 326) — 5 By adding **H₂SO₄** to a solution of **As₂O₃** in conc **HCl** — 6 By heating **As₂S₃** with **3HgCl₂** in a retort (Ludwig, *Ar Ph* 97, 23) — 7 By the action of **S₂Cl₂** on **As** (Wöhler, *A* 73, 374) — 8 By the action of **PCl₃** on **As₂O₃** or on **As₂O₅** (**POCl₃**, and in the case of **As₂O₅** free **Cl₂** is also formed) (Hintzig and Geuther, *A* 111, 171)

Preparation — Coarsely powdered arsenic is heated in a retort, dry chlorine is then led in, and the contents of the retort are heated, the distillate is collected in a dry receiver, and freed from excess of chlorine by redistillation from arsenic, or by shaking with mercury, pouring off from the black solid which is formed, and redistilling. Or the product may be distilled upwards for some time in a current of dry **CO₂** (Thorpe, *lc*)

Properties — A colourless, oily, fuming, very poisonous, liquid, mixes with alcohol, ether, and liquid oils, it is decomposed by water (*v infra*) Distilled with aqueous **HCl**, **AsCl₃** is partly volatilised, **HCl** prepared from arsenic containing **H₂SO₄** always therefore contains **AsCl₃**, arsenious chloride when hot dissolves phosphorus and sulphur, but they crystallise out again on cooling

Reactions — 1 With a little water the solid oxychloride **AsOCl H₂O (= As(OH)₂Cl)** is produced (Wallace, *P M* [4] 16, 358) With more water, especially if hot, **AsCl₃** is decomposed into **HCl** and **As₂O₃**, a great portion of the latter separating in the solid form — 2 With *arsenic hydride* it reacts to form **HCl** and **As** — 3 By the action of **NO₂** it is converted into **As₂O₃**, **NOCl** being

simultaneously produced (Geuther, *J pr* [2] 8, 354)

Combinations — 1 *Arsenious oxide* dissolves in boiling **AsCl₃**, and on distillation the oxy chloride **AsOCl (q v)** is obtained (Wallace, *P M* [4] 16, 358) — 2 *Ammonia* gas is absorbed by **AsCl₃** with production of a white solid, **2AsCl₃ 7NH₃**, according to H Rose (*P* 52, 62), **2AsCl₃ 4NH₃ Cl NH₃**, according to Pasteur (*A Ch* 68, 307), Michaelis suggests the formula **2As(NH₂Cl)₂ NH₃** (*Lehrbuch der anorg Chem* 11 459, [1881]), this compound is decomposed by heat, giving off **NH₃**, and then a white sublimate containing **NH₄Cl**, it is soluble in alcohol, but is decomposed by cold water with production of heat and ammonia, from the solution six sided plates crystallise out, having the composition **AsCl₃ N₂ H₁₀ O₃**, these are decomposed by conc ammonia with production of **(NH₄)₂AsO₄**, which soon decomposes (Pasteur, *lc*) — 3 *Sulphur dichloride*, **SCl₂**, is said to form a compound **2AsCl₃ 3SCl₂**, but according to Nilson, the product of the action is merely a mixture (*J pr* [2] 12, 295) — 4 With *alcohol* forms easily decomposed crystals of **AsCl₃ C₂H₅O** (De Luynes, *C R* 50, 831)

Arsenic, fluoride of AsF₃ (*Arsenious fluoride*) Mol w 131.9 (60° 4) (Thorpe, *C J* 37, 352) SG $\frac{2}{4}$, 2.666 (Thorpe, *lc*) VD 66.1 SVS 49.5

Formation — By heating sodium or ammonium fluoride with arsenious bromide or chloride (Macivor, *C N* 30, 169)

Preparation — Equal parts of dry powdered fluorspar and arsenious oxide are heated in a leaden vessel with 5 parts conc **H₂SO₄**, the distillate is collected in a dry glass receiver

Properties — A transparent, very volatile, fuming, liquid, it acts slowly on glass in a closed vessel, but exposed to the air it absorbs moisture with production of **As₂O₃**, and **HF** which acts on the glass. Dropped on the skin it evaporates at once but leaves a painful wound (Dumas, *A Ch* [2] 31, 434) It absorbs dry **NH₃**, in large quantities, miscible with alcohol and ether (Macivor, *lc*)

Reaction — With *water* it forms a clear liquid (heat is produced) which soon decomposes to **As₂O₃** and **HF**

Arsenic, haloid compounds of AsF₃, AsCl₃, AsBr₃, AsI₃ and AsI₂ (? AsI₄) All gashed, except the di and pent iodide, and molecular weights known, *v the arts* **ARSENIC, FLUORIDE OF, CHLORIDE OF, BROMIDE OF, IODIDES OF, v also art HALOID COMPOUNDS**

Arsenic, hydrides of (In connection with these compounds *v art HYDRIDES*) Two hydrides are known, gaseous **AsH₃**, and solid **nAsH**

I ARSENIC TRIHYDRIDE AsH₃ (*Arsenuretted hydrogen, Arsine*) Mol w 77.9 [−113° 5] (−54° 8) (Olszewski, *Sitz W* 5, 127) (about −40°) VD 39.1 (Dumas, *A Ch* 33, 355) H.F. −361, 700 (solid As) (Ogier, *A Ch* [5] 20, 5) Discovered by Scheele in 1775

Formation — 1 By dissolving zinc or iron in dilute **HClAq** or **H₂SO₄Aq** containing **As₂O₃** or **As₂O₅** — 2 By electrolysis of solution of **As₂O₃Aq** or **As₂O₅Aq** — 3 By the action of organic matter on many arsenic compounds, *eg the action of paper on Scheele's green* (the air of

rooms the paper on the walls of which is coloured with Scheele's green usually contains a little AsH_3 .)

Preparation—1 By the action of water, or better very dilute HCl or H_2SO_4 , on the solid alloy of As and Na which is obtained by heating Na in AsH_3 obtained by the action of acids on Zn containing As (Janowsky, *B* 6, 216)—2 By the action of H_2SO_4 diluted with 3 times its weight of water on the alloy of As and Zn obtained by heating equal parts of finely granulated Zn and powdered As in a covered crucible (Soubeiran, *A Ch* [2] 23, 307, 43, 207) The gas is collected over boiled water

Properties—A colourless gas with repulsive odour, excessively poisonous (in working with this gas it is impossible to be too careful, more than one chemist has been killed by it, e.g. Gehlen in 1815) Easily decomposed by heat into its elements even when mixed with much hydrogen By the action of the silent electric discharge it yields solid As hydride (Ogier, *A Ch* [5] 20, 5) Slightly soluble in water Dry oxygen has no action at ordinary temperatures

Reactions—1 Heated in air it burns to As_2O_3 and H_2O , in a limited supply of air, to As and H_2O —2 Mixed with oxygen and subjected to electric discharge, complete decomposition to As_2O_3 and H_2O occurs explosively—3 Concentrated acids decompose it into its elements, conc H_2SO_4 forms also As_2S_3 (Humpert, *J pr* 94, 392), conc HClAq acting for some time forms also AsCl_3 (Napoli, *J pr* 64, 93)—4 Decomposed by chlorine, bromine, or iodine, with production of much heat and formation of haloid compounds of As —5 Sulphuretted hydrogen at about 300° forms As_2S_3 and H_2 —6 The haloid acids HCl , HBr , HI , are without action on AsH_3 at ordinary temperatures—7 Heated with sulphur, As_2S_3 and H_2S are produced (Jones, *C J* [2] 14, 648)—8 Reacts with PCl_5 to produce AsP and HCl (v ARSENIC, *Combinations*, of No 8)—9 Many metals, e.g. K , Na , Sn , heated in AsH_3 form alloys with As and set free H —10 Many metallic oxides, e.g. CuO , decompose AsH_3 when heated with it, forming arsenides and water (the quantity of AsH_3 in a gaseous mixture may be thus determined)—11 Absorbed and slowly decomposed by alkalis, and by water containing oxygen or air—12 Many metallic salts in aqueous solutions absorb and decompose AsH_3 , salts of metals whose oxides are easily deoxidised produce water and arsenious oxide, salts of metals whose oxides are not so easily deoxidised produce water and arsenic which is precipitated with the metal Thus with (1) AgNO_3 , and (2) CuSO_4 , solution, the reactions are

(1) $24\text{AgNO}_3\text{Aq} + 4\text{AsH}_3 + 6\text{H}_2\text{O} = \text{As}_2\text{O}_3\text{Aq} + 24\text{HNO}_3\text{Aq} + 24\text{Ag}$,
(2) $2\text{AsH}_3 + 3\text{CuSO}_4\text{Aq} = \text{As}_2\text{S}_3 + 3\text{H}_2\text{SO}_4\text{Aq}$
Gold chloride in solution is reduced to gold, while As_2O_3 remains in solution

References—(Besides those in the text) Marsh, *B J* 17, 191, 20, 190, 22, 175, Stromeyer, *Comment Soc Güt* 16, 141, Proust, *Scher J* 8, 285, Fischer, *P* 9, 261, Myers, *A* 159, 127, Parsons, *C N* 35, 235

II SOLID ARSENIC HYDRIDE, nAsH Mol w unknown Janowsky (*B* 6, 220) states that when potassium or sodium arsenide is decom-

posed by water, a solid, brown, velvet like, compound of As and H , in the ratio As H , separates out When dilute acids are used in place of water, AsH_3 is evolved and As deposited According to Ogier (*A Ch* [5] 20, 5), solid nAsH is produced by the action of the silent discharge on AsH_3 Older observations recorded the production of a solid compound of As and H by the action of dilute acids on arsenide of zinc (v especially Wiederhold, *P* 118, 615), but these are contradicted by Janowsky (*lc*) According to Blondlot (*A Ch* [3] 68, 186), a solid hydride of arsenic is produced (1) in a Marsh's apparatus when a little HNO_3 is present, and (2) when AsH_3 is passed into aqueous AgNO_3 , excess of Ag is removed by adding NaCl , a drop of HNO_3Aq is added, and a piece of Zn is placed in the liquid

Arsenic, hydroxides of The compounds of As , O , and H , are acids, v ARSENIC, ACIDS OF (v also arts ACIDS, and HYDROXIDES)

Arsenic, iodides of

I ARSENIUS IODIDE, AsI_3 (*Triiodide of arsenic*) Mol w 454.59 (394° to 414°) (Carnelley & Williams, *C J* 33, 283) SG 4.89 VD 227.3 S 30.12 at 100° HF solid As , gaseous I [As, I^*] = 28,800 (Guntz, *C R* 101, 161) SVS 103.6

Formation—1 By subliming together 1 part As and 3 parts I in a retort arranged so that the sublimate condenses in the neck, the sublimate is treated with hot alcohol from which the AsI_3 crystallises on cooling (Bette, *A* 3, 349)—2 By boiling 3 parts powdered As and 10 parts I with water, filtering, and evaporating (Plisson, *S* 55, 335)—3 By acting on AsCl_3 with conc HI solution (HCl is evolved) (Hautefeuille, *Bl* [2] 7, 198)—4 By adding a concentrated solution of KI to a hot solution of As_2O_3 in HClAq (Bamberger & Philipp, *B* 14, 2643)

Preparation—A saturated solution of iodine in ether is heated to boiling with excess of powdered As in a flask with an upright condenser, the liquid is filtered while hot on cooling, well formed crystals of AsI_3 are obtained (Wiggers, Michaelis's *Lehrbuch der anorgan Chem* [1881] 2, 462)

Properties and Reactions—Lustrous, red, hexagonal, tables, $a, c = 1.2998$ (details of crystal form, v Friedlander, *Z K* 3, 214) Soluble in alcohol, ether, benzene, &c, soluble in much water, soluble without change in alcohol, decomposed by a little water with formation of 4AsOI $3\text{As}_2\text{O}_3 \cdot 24\text{H}_2\text{O}$, action of boiling H_2O produces AsOI As_2O_3 which deposits on cooling (Wallace, *P M* [4] 17, 122)

Combinations—1 With iodides of the alkali metals to form very unstable compounds (Nickles, *C R* 48, 237)—2 When ammonia is passed into a solution of AsI_3 in benzene, a bulky white pp of $2\text{AsI}_3 \cdot 9\text{NH}_3$ is produced (Bamberger & Philipp, *B* 14, 2643)

Reactions—1 Heated with oxygen, iodine is evolved and As_2O_3 is produced—2 Heated with alcohol, ethylic iodide is formed (Bamberger & Philipp, *B* 14, 2643)

II ARSENIC DIIODIDE AsI_2 (Bamberger & Philipp, *B* 14, 2643) Mol w unknown

Preparation—One part As is heated with 2 parts I to 230° in a sealed tube, the product is

dissolved in CS₂ in an atmosphere of CO₂, and the liquid is allowed to deposit crystals

Properties—Thin prisms of a dark cherry red colour

Reactions—Very easily oxidised Decomposed by water to AsI₃ and As, (3AsI₃ = 2AsI₅ + As)

III ARSENIC PENTIOXIDE According to Sloan (C N 46, 194) a brown crystalline solid, containing As and I in the ratio As 5I, is obtained by heating As with a slight excess of I to 100° for some time in an atmosphere of CO₂. The body is easily decomposed to AsI₃ and I, by heat or by solution in ether or CS₂.

Arsenic oxides of (In connection with these compounds, *see* art OXIDES) Arsenic forms two well defined oxides, arsenious oxide As₂O₃, which has been gasified, and arsenic oxide, As₂O₅, which has not been gasified both act as anhydrides, the acid corresponding to the former is not known, but many arsenites, M₃AsO₃, have been prepared. Three arsenic acids are known corresponding in composition to the three phosphoric acids, two of these exist only as solids, they all readily lose water yielding the anhydride As₂O₅. The greyish film which forms on the surface of arsenic exposed to the air has been regarded as a suboxide, but no definite proof of the existence of an oxide with less O than As₂O₅ has been given

I ARSENIOS OXIDE As₂O₃ Mol w 395.36 (*Arsenic trioxide, White arsenic, Arsenious anhydride, Arsenous acid*) Vitreous As₂O₃ melts under pressure, crystalline vaporises without melting (Wöhler, *Gm* 4, 255) SG vitreous 3.698 to 3.733, cryst 3.85 to 4.15 (*v* Claudet, C J [2] 6, 179, and Groth, P 137, 426) VD 198 (*at white heat, v* Meyer, B 12, 1117) CE (cubic at 40°) 00012378 (Fizeau, C R 62, 1133) S (13°) vitreous, 4, cryst 1.2 to 1.3 S (100°) 11 (Bussy, A 64, 286) S (15° standing for some days) cryst 28, vitreous 92, S (saturated at 100° and then cooled to 15°) cryst 218, vitreous, 3.33 (Buchner, J Ph [3] 1, 421) S (alcohol, 15°) cryst 25, vitreous, 1.06 (Girardin, J Ph [3] 46, 269) S (ether) 0 HF 809,340, HF in aqueous solution, 294,240, [As'O₃.Aq] = -15,100 (*Th* 2, 236) SH cryst 1279 S VS vitreous, 106.3, cryst 98.9

Occurrence—Native, as the mineral *Arsenite* (*or Arsenolite*), whenever arsenic volatilises in contact with air, or arsenic containing minerals are heated in air

Preparation—Obtained as a principal product in the roasting of arsenical pyrites, and as a secondary product in the roasting of arsenical ores of Sn, Co, Ni, or Ag. The oxide is condensed in chambers, and purified by resublimation. Extremely poisonous, doses of 0.6 gram are usually fatal (but *v* Roscoe 'On the alleged Practice of Arsenic eating in Styria,' *Mem of Lit and Phil. Soc of Manchester*, 1860)

Properties—Exists in three forms, *amorphous, regular octahedra, and trimetric prisms* (*a b c* = 3758 : 1 : 35), the first passes slowly into the second form on keeping, the third is obtained under special conditions (*v infra*) The change from amorphous to octahedral arsenious oxide is attended with production of 5,300 gram units of heat, and that from amorphous to prismatic with 24,950 units per As₂O₃ grams (Favre;

Troost and Hautefeuille, C R 69, 48) **Amorphous arsenious oxide** is produced by condensing the vapour on a surface slightly cooler than the temperature of volatilisation of the oxide, it is a transparent glass like solid which gradually becomes opaque because of formation of octahedral crystals. The octahedral oxide is produced by cooling the vapour quickly, by crystallising either of the other forms from water, by treating the amorphous form with ammonia solution and washing with water. This form is obtained pure by fusing commercial arsenious oxide with carbonate of sodium and nitre dissolving the arsenate of sodium so formed in water, filtering from sodium antimonate which remains, and reducing with SO solution. According to H Rose (P 35, 481) a solution of 2-3 parts amorphous As₂O₃ in 12 parts boiling conc HClAq deposits crystals of the octahedral oxide when very slowly cooled, the formation of each crystal being accompanied by a flash of light, a similar solution of the crystalline oxide does not behave in this way. The trimetric prismatic variety of As₂O₃ is obtained by saturating with As₂O₃, and then allowing to cool, a boiling solution of potash (Pasteur, C R 24, 474), Wöhler found this oxide in an oven in which arsenical ores had been roasted (P 26, 177), Claudet found it native at San Domingos, in Portugal (C J [2] 6, 179), Kuhn obtained it from a solution of Ag₃AsO₃ in HNO₃ (J 1853 378, *v* also Uhrich, J 1858 173), Scheurer Kestner found it in pipes leading from the pyrites burners to the chambers of a sulphuric acid works (*Bl* [2] 10, 444) The three forms of As₂O₃ may be obtained, according to Debray (C R 58, 1209), by heating the oxide in a closed glass tube half immersed in sand, in an upright position, the lower part being at about 400°, on cooling, the lowest part of the tube contains amorphous, the middle part trimetric crystals, and the uppermost part octahedral crystals, of As₂O₃. Arsenious oxide is isomorphous with antimonious oxide. The vitreous (amorphous) variety may be fused before volatilising, the crystalline sublimes without melting, even under pressure (Wöhler, *Gm* 4, 255) The vapour is colourless and inodorous. The solubilities in water of the three forms are different (*v supra*), long continued contact with hot water decreases the solubility of the vitreous form inasmuch as it is thus changed to the octahedral form. Many acids dissolve As₂O₃, the vitreous more rapidly than the crystalline varieties (Bacaloglo, J pr 83, 111), from these solutions the oxide crystallises on cooling, in the case of HClAq some AsCl₃ remains in solution, tartaric acid is, however, said to form a salt analogous to tartar emetic. An aqueous solution of As₂O₃ slightly reddens litmus, but no acid has been obtained in definite form. The oxide must be regarded as a feebly acid forming oxide possessing at the same time salt forming tendencies (*v ARSENIOS ACID AND ARSENITES, and also, infra, Reactions, especially Nos 2, 10, and 11, and Combinations, No 2*)

Reactions—Arsenious oxide acts both as a reducing and an oxidising agent, it deoxidises nitric, manganic, chromic, hypochlorous, acids, &c, with formation of arsenic acid, it oxidises carbon, sulphur, phosphorus, hydrogen, sodium,

potassium, carbon monoxide, potassium cyanide &c., when heated with these bodies. The oxide in solution is oxidised to arsenic oxide by chlorine, bromine, or iodine, in presence of alkaline bicarbonates, on this fact is based the use of As_2O_3 in volumetric analysis. 1 Chlorine passed over the dry oxide at a moderate temperature forms AsCl_3 (Weber, *P* 112, 619), in solution chlorine produces arsenic acid and HClAq , iodine and bromine act similarly in presence of alkaline bicarbonates. —2 Hydrochloric acid forms some AsCl_3 , but in presence of HNO_3 or KClO_3 only As_2O_3 is produced. —3 Free oxygen does not oxidise As_2O_3 at ordinary temperatures, but if a plate of Pt is partly immersed in solution of As_2O_3 in HClAq the oxygen coming off from the Pt produces As_2O_3 (Berthelot, *C R* 84, 1408). —4 An aqueous solution of As_2O_3 heated to 200° with phosphorus yields phosphide of arsenic (Oppenheim, *Bl* [2] 1, 163). —5 Na amalgam appears to reduce As_2O_3 with production of a solution which acts as an energetic reducer (Fremy, *C R* 70, 61). —6 Phosphorus trichloride reacts at 110° – 130° according to the equation $5\text{As}_2\text{O}_3 + 12\text{PCl}_3 = 2\text{As}_4 + 6\text{P}_2\text{O}_3 + 12\text{AsCl}_3$ (Michaelis, *J Z* 6, 239). —7 Phosphorus pentachloride produces AsCl_3 and POCl_3 (Hurtzig a Geuther, *A* 111, 159). —8 When As_2O_3 is shaken with ammonia solution, an unstable compound is formed (De Luynes, *C R* 44, 1353). —9 Phosphorous and hypophosphorous acids precipitate arsenic and produce phosphoric acid. —10 Sulphydric acid (H_2S) passed into an aqueous solution of As_2O_3 forms As_2S_3 which is pptd on addition of an acid (v ARSENIUM SULPHIDE). —11 Ammonium hydrogen tartrate solution is said to dissolve As_2O_3 , on cooling, crystals of a double salt isomorphous with tartar emetic separate out (Maignac, *Ann M* [5] 15, 288). Pclouze (*A Ch* [3] 6, 63) describes a somewhat similar salt containing K in place of NH_4 . Neither tartrate has, however, been satisfactorily examined. —12 Heated in a tube with a dry acetate, cacodyl oxide, $\text{As}_2(\text{CH}_3)_2\text{O}$, is produced. —13 Heated with dry alkaline earth oxides or with dry carbonates of the fixed alkalis, an arsenate of the metal is produced along with arsenic which sublimes. —14 The oxide dissolves in hot solutions of the alkalis but most of it pps again on cooling in the air (v ARSENIUM ACID AND ARSENIUMS). —15 The higher oxidised compounds of many metals are reduced by As_2O_3 , thus CuO is reduced to Cu_2O , in presence of alkali. —16 Many metals, e.g. zinc, reduce acid solutions of As_2O_3 with ppp of As and formation of AsH_3 . —17 As_2O_3 is reduced by a Cu Zn couple with formation of AsH_3 (Gladstone a Tribe, *C J* 33, 306). —18 Palladium or platinum charged with hydrogen separates As from As_2O_3 Aq without formation of AsH_3 (Gladstone, *lc*). —19 Some metallic salts which act as reducing agents convert the oxide into arsenic, e.g. SnCl_2 Aq produces SnCl_4 , As, and AsH_3 (Kessler, *J* 1861, 265). —20 Freshly pptd ferric hydrate reacts with As_2O_3 Aq or with alkaline arsenites to form an insoluble compound, probably arsenite of iron, on this fact is based the use of ferric hydrate as an antidote in cases of arsenic poisoning (v Bunsen and Berthold, *Das Eisenoxyhydrat, ein Gegengift der arsenigen Saure*, Göttingen, 1834).

Combinations —1 Fused with arsenic oxide the body $\text{As}_2\text{O}_3 \cdot \text{As}_2\text{O}_5$ is probably produced (Bloxam, *C J* 18, 62). Other compounds of As_2O_3 and As_2O_5 are obtained by oxidising As_2O_3 by warm HNO_3 Aq (v Joly, *C R* 100, 1221). —2 Dissolves in fuming sulphuric acid, on evaporation yields needle shaped crystals of $\text{As}_2\text{O}_3 \cdot 4\text{SO}_3$ which are decomposed by water (Schultz Shellac, *B* 4, 109, gives the formula $\text{As}_2(\text{SO}_3)_4 \cdot \text{SO}_3$). A compound of As_2O_3 and SO_3 was obtained by Schafhautl (*B J* 22, 113), in the fumes from copper smelting works in Wales, and by Reich in a canal which carried off the sulphurous acid from a pyrites work near Freiberg (*J pr* 90, 176). —3 By cooling mixed hot aqueous solutions of KI, KBr or KCl and KAsO_4 , the compounds $\text{As}_2\text{O}_3 \cdot \text{KI}$, $\text{As}_2\text{O}_3 \cdot \text{KBr}$, and $\text{As}_2\text{O}_3 \cdot \text{KCl}$ are obtained (Rudorff, *B* 18, 1411, v also Schiff a Sestini, *A* 228, 72). Rudorff (*B* 19, 2678) also describes $\text{NH}_4\text{I} \cdot \text{As}_2\text{O}_3$, $\text{NH}_4\text{Br} \cdot \text{As}_2\text{O}_3$, and $2\text{NH}_4\text{Cl} \cdot \text{As}_2\text{O}_3$. Forms a complex series of compounds with MoO_3 and WO_3 and various bases (v Gibbs, *Am* 7, 209 a 313, *C N* 48, 155).

II ARSENIC OXIDE As_2O_5 . Mol w unknown, not less than that represented by formula (*Arsenic pentoxide, Arsenic anhydride*) SG 3734 (fused oxide) S V S 61 6 H F 219,400, H F in aqueous solution, 225,400 [$\text{As O}^+ \text{Aq O}^-$] = 78,350 (*Th* 2, 236).

Preparation —Not produced by heating arsenic in air or oxygen. If arsenic or arsenious oxide is digested with HNO_3 Aq or with a mixture of 1 part HClAq and 12 parts HNO_3 Aq in a retort, or if chlorine is led into a warm solution of As_2O_3 , arsenic acid, H_2AsO_4 , is produced and may be obtained as crystals by cooling a concentrated solution. When this acid is heated to low redness the anhydride As_2O_5 is produced.

Properties —A white solid which slowly absorbs moisture from the air with formation of H_2AsO_4 Aq. Slowly but completely dissolves in water forming H_2AsO_4 Aq. Heated above low redness it yields As_2O_3 and O.

Reactions —1 Heated with charcoal, many metals, or potassium cyanide, it yields As. —2 Heated with conc hydrochloric acid it yields AsCl_5 , with HCl gas even in the cold the same product is obtained (Souhay, *Fr* 1, 189, Mayrhofer, *A* 158, 326). —3 Reacts with phosphorus pentachloride thus $\text{As}_2\text{O}_5 + 5\text{PCl}_5 = 5\text{POCl}_3 + 2\text{Cl}_2 + 2\text{AsCl}_3$ (Hurtzig a Geuther, *A* 3, 159). —4 According to Michaelis (*J Z* 6, 239), the oxide is not acted on by POCl_3 even at 200° . —5 Reduced in aqueous solution by nascent hydrogen with formation of AsH_3 , but if chlorides are present only a trace of AsH_3 is produced according to Bloxam (*C J* 15, 56). —6 Stannous chloride, in the cold, produces stannous pyroarsenate and arsenite, in warm solutions produces arsenic and AsH_3 (Schiff, *J* 1861 278, Kessler, *ibid* 265). —7 With water it reacts to produce arsenic acid, H_2AsO_4 Aq. Joly (*C R* 106, 1262) describes a hydrate $\text{As}_2\text{O}_5 \cdot 4\text{H}_2\text{O}$. Arsenic oxide reacts as a strongly acid forming oxide and exhibits no tendency to form corresponding salts by reactions with acids (v e.g. reaction with HClAq). —8 Forms a large series of compounds with MoO_3 or WO_3 and bases (v Gibbs, *Am* 7, 209 a 313, *C N* 48, 155).

Arsenic oxybromides of. AsOBr (*Bromarsenous acid*), and $?\text{As}_2\text{O}_3\text{Br}_2$. Mol w unknown, not less than represented by above formulae

Formation— AsOBr is produced by the action of H_2O in limited quantity on AsBr_3 .

Preparation—Arsenious oxide is dissolved in molten AsBr_3 , the dark viscid liquid which results is distilled till it becomes rather thick, and is then cooled to 150° whereat it separates into two layers, the upper of which contains the oxybromide AsOBr , and the lower probably contains the other oxybromide $\text{As}_2\text{O}_3\text{Br}_2$. (Wallace, *P M* [4] 17, 261)

Properties—Brown, waxy, solid Decomposed by heat to AsBr_3 and As_2O_3 .

Combinations—With water, a hydrate of arsenic oxybromide, $2\text{AsOBr} \cdot 3\text{H}_2\text{O}$ is obtained as thin white pearly crystals by placing a cold concentrated aqueous solution of AsBr_3 , containing HBr , over sulphuric acid (Wallace, *lc*) If the solution of AsBr_3 in HBr is boiled, another compound, said to have the composition $4\text{AsBr}_3 \cdot 11\text{As}_2\text{O}_3 \cdot 24\text{H}_2\text{O}$, separates out (Wallace, *lc*)

Arsenic oxychlorides of AsOCl (*Chlorarsenous acid*), and $\text{As}_2\text{O}_3\text{Cl}$ Mol ws unknown, not less than represented by above formulae

Formation—When AsCl_3 is mixed with less than sufficient water to completely decompose it, AsOCl is formed

Preparation of AsOCl —By distilling until frothing begins the liquid obtained (a) by dissolving As_2O_3 in boiling AsCl_3 in the proportion As_2O_3 , 2AsCl_3 , or (b) by leading dry HCl gas over dry warm As_2O_3 until almost the whole of the latter has been changed to AsCl_3 , and allowing to cool

Properties of AsOCl —Obtained as above, it is a hard, translucent, slightly fuming solid which slowly absorbs oxygen from the air (Wallace, *P M* [4] 16, 358, Hurtzig & Geuther, *A* 111, 172)

Combinations—1 A solution of AsCl_3 in conc HClAq mixed with solid ammonium chloride, and allowed to stand, deposits crystals of $\text{AsOCl} \cdot \text{H}_2\text{O}$, but after some days white fibrous needles are formed, which, when dried over H_2SO_4 , have the composition $\text{AsOCl} \cdot 2\text{NH}_4\text{Cl}$.—2 With water, a hydrate of AsOCl , having the composition $\text{AsOCl} \cdot \text{H}_2\text{O}$ ($= \text{As}(\text{OH})\text{Cl}$) is obtained by adding water to AsCl_3 in about the proportion $8\text{H}_2\text{O} \text{ AsCl}_3$, and allowing to stand for some days. The hydrate forms small star-like crystals (Wallace, *lc*)

$\text{As}_2\text{O}_3\text{Cl}$ is said to be obtained, as a hard, glass like solid, when AsOCl is heated until As_2O_3 begins to sublime from it (about 218°) (Wallace, *lc*)

Arsenic oxyiodide of $\text{AsOI As}_2\text{O}_3$. Mol w unknown Produced in thin pearly laminae, according to Wallace (*P M* [4] 17, 122) by slowly cooling a hot conc solution of AsI_3 in H_2O , drying between filter paper, and then over H_2SO_4 .

Arsenic, pentafluoride of, double compounds containing No gaseous compound of arsenic of the type AsX_3 , where X is a monovalent atom or atomic group, has yet been obtained. Solid compounds are, however, known, one of the constituents of which seems to be the group AsF . The following are described by Marignac

(*A* 145, 237) —1 *Potassic arsenic fluoride*, $2(\text{KF AsF}_2) \cdot \text{H}_2\text{O}$, formed in well developed rhombic prisms by dissolving potassium arsenate in much hydrofluoric acid.—2 *Potassic arsenic oxyfluoride*, $\text{KF AsOF} \cdot \text{H}_2\text{O}$, formed in acute rhombic plates by repeated evaporation of the solution from which compound No 1 is obtained, or by dissolving potassium arsenate in a small quantity of HFAq .—3 *Dipotassic-arsenic fluoride*, $2\text{KF AsF}_2 \cdot \text{H}_2\text{O}$, large, lustrous, rhombic prisms, obtained by adding KFAq to a solution in HFAq of either of the preceding salts, and evaporating.—4 *The double salt* $4\text{KF AsF}_2 \cdot \text{AsOF} \cdot 3\text{H}_2\text{O}$ is said to be produced when a solution in HFAq of salt No 3 is repeatedly evaporated

Arsenic phosphide of, v ARSENIC, Combinations No 8

Arsenic selenides and Seleno sulphides of, v ARSENIC, Combinations, No 7

Arsenic, sulphides of (In connection with these compounds v art SULPHIDES) Three sulphides of arsenic are known, As_2S_3 , As_2S_5 , and As_4S_6 . None of these has been gasified, hence the formulae do not necessarily represent molecules of the compounds As_2S_3 and As_2S_5 occur native as *Realgar* and *Orpiment* respectively. The two sulphides As_2S_3 and As_4S_6 are salt forming, they dissolve in alkali sulphides with production of thio arsenites M_2AsS_3 &c, or thio arsenates M_2AsS_5 &c (v *infra*) The disulphide, As_2S_5 , is not salt forming, Berzelius's statement that it combines with various metallic sulphides has been shown to be erroneous (Nilson, *B* 4, 989)

I ARSENIC DISULPHIDE As_2S_3 (*Realgar, Red orpiment, Ruby sulphur*) *SG* 34-36 *H* 15-2 Mol w unknown *VS* 611

Occurrence—Native, as *Realgar*, accompanying ores of silver and lead, &c

Preparation—1 By heating together As and S , or As_2S_3 with As , in the proper proportions.—2 By heating As_2O_3 with S , in the proportion As_2O_3 , 7S , repeatedly subliming the mass from end to end of a glass tube in a stream of CO , (Nilson, *J pr* [2] 8, 89)—3 By heating As_2S_3 with NaHCO_3Aq in a closed tube to 150° , crystals are thus obtained $\frac{1}{4}$ mm long (Sénarmont, *A Ch* [3] 82, 129)—4 On the large scale, impure, containing As_2O_3 (Hausmann, *A* 74, 196), by subliming a mixture of arsenical pyrites and iron pyrites

Properties—Occurs native in monoclinic prisms, $a \cdot b \cdot c = 1.321 : 4866$, $\alpha = 85^\circ 16'$, orange-red, more or less translucent, resinous lustre, conchoidal fracture. Pure As_2S_3 is transparent, ruby colour, easily fusible, and crystalline after fusion, it burns in the air with a blue flame forming SO_2 and As_2O_3 . It is used as a pigment, also in pyrotechny

Reactions—1 *Nitric acid* oxidises As_2S_3 to H_2AsO_4 , $\text{H}_2\text{SO}_4\text{Aq}$, $\text{H}_2\text{SO}_4\text{Aq}$, and S .—2 Heated in a current of *chlorine*, S_2Cl_2 and AsCl_3 are produced (Nilson, *J pr* [2] 12, 295, 13, 1)—3 Heated in *hydrogen*, As and H_2S are formed (*N*)—4 Solution of *potash* partially dissolves As_2S_3 , with formation of As_2S_5 , which then forms KAsS_3Aq , and production of $\text{As}(\text{N})$.—5 It is slightly soluble in solutions of the *alkali metal sulphides*.—6 It is *electrolysed* to As and S by a powerful battery (Lapichin

Tichanowitsch, *O C* [2] 6, 613)—7 Heated with *sodium*, the compound $\text{As}_2\text{S}_3 \cdot \text{AsI}_3 (= \text{AsSI})$ is produced (Schneider, *J pr* [2] 23, 486)

II ARSENIC TRISULPHIDE As_2S_3 (*Arsenious sulphide, Sulpharsenous anhydride, Orpiment, Yellow sulphide of arsenic*) Mol w unknown BG 346-348 SVS 709

Occurrence—Native as *Orpiment*

Formation—1 By heating to $70^\circ\text{--}80^\circ$ a solution of Na_2CO_3 saturated with As_2S_3 (Nilson, *J pr* [2] 12, 295, 13, 1)—2 Impure, commercial, by subliming together 7 parts powdered As_2O_3 with 1 part S

Preparation—1 By subliming together As and S in the proper proportions—2 By saturating $\text{As}_2\text{O}_3\text{Aq}$ with H_2S a little HClAq being added If no mineral acid is added the As_2S_3 produced remains in solution in a colloidal form (Schneider, *J pr* [2] 25, 431)

Properties—Occurs native in trimetric prisms ($a b c = 603.1 \ 674$) translucent, lemon or slightly orange yellow Prepared in the wet way it forms a lemon yellow powder which becomes darker when heated Melts easily and volatilises at a higher temperature When H_2S is passed into $\text{As}_2\text{O}_3\text{Aq}$, As_2S_3 is formed but remains in solution in colloidal form, a saturated solution contains 34.46 p.c. As_2S_3 , it is slowly decomposed on standing, but may be boiled without precipitation of As_2S_3 , bone char removes all the As_2S_3 from solution, most acids and many salts precipitate As_2S_3 (Schneider, *J pr* [2] 25, 431) Used as a pigment, also as a reducing agent in dyeing, also as a depilatory

Reactions—1 Long continued action of *hot water* produces H_2S and $\text{As}_2\text{O}_3\text{Aq}$ according to Field (*C N* 3, 114)—2 Dilute acids do not act on As_2S_3 , conc HClAq produces AsCl_3 , conc HNO_3Aq produces $\text{H}_2\text{SO}_4\text{Aq}$, S, and $\text{H}_2\text{AsO}_4\text{Aq}$ 3 Fused with *potassium hydrogen sulphate*, SO_2 is evolved, and KHAO_3 and K_2SO_4 remain 4 Chlorine acts readily, a brown liquid is formed said to be a chlorosulphide of As (H Rose), heated with chlorine, AsCl_3 is produced (Ludwig, *Ar Ph* 97, 23)—5 Passed over *hot iron, silver*, &c, sulphide of the metal is formed, and arsenic which partially alloys with the metal—6 Passed over *red hot lime*, sulphide and arsenate of calcium, and arsenic are produced—7 Heated with *sodium or potassium carbonate*, a mirror of As is obtained, along with arsenate and thio arsenate of the alkali metal, if the mixture is heated in hydrogen the arsenate is reduced (Rose, *P* 90, 565)—8 Heated with an *alkaline carbonate and charcoal or potassium cyanide*, a mirror of As is obtained, according to Fresenius (*A* 49, 287), the whole of the As in the As_2S_3 is thus obtained, according to Rose (*Ph C* 1853 594), some of the As forms thio arsenate (KCNS being also produced) which is not reduced No mirror of As is obtained (Rose) if As_2S_3 is mixed with excess of S and heated with KCN, the presence of an easily reduced metal is also said to prevent the formation of As, because the As alloys with the metal If the mixture of As_2S_3 with Na_2CO_3 (or K_2CO_3) and KCN is heated in hydrogen, the whole of the arsenic is obtained as metal (comp Rose, *P* 90, 565, with Nilson, *A* 49, 287)—9 As_2S_3 readily dissolves in cold

aqueous potash, soda, or ammonia, forming an arsenite and a thio arsenite, thus

on adding an acid to the solution the whole of the As is precipitated as As_2S_3 , thus

If oxide of Ag or Pb is added to a solution of As_2S_3 in NH_4Aq and the solution is boiled, the whole of the S is precipitated as Ag_2S or PbS , and Ag or Pb arsenite remains in solution 10 When As_2S_3 is boiled with a solution of *sodium or potassium carbonate*, As_2S_3 is precipitated, CO_2 and H_2S are evolved, and the solution contains the following salts, Na_2S , $3\text{As}_2\text{S}_3$, Na_2O , $2\text{As}_2\text{S}_3\text{O}_2$, Na_3AsS_4 , Na_2HASO_4 , NaHCO_3 , (Nilson, *J pr* [2] 14, 1, 145)—11 As_2S_3 is easily soluble in a hot solution of *potassium hydrogen sulphate*, thus, $2\text{As}_2\text{S}_3 + 16\text{KHSO}_4\text{Aq} = 4\text{KAsO}_2\text{Aq} + 6\text{K}_2\text{S}_2\text{O}_7\text{Aq} + 7\text{SO}_2\text{Aq} + 3\text{S} + 8\text{H}_2\text{O}$

Combinations— As_2S_3 acts as a salt forming sulphide, or anhydride of a thio acid, it combines with the sulphides of the alkali and alkaline earth metals, and with some metallic hydrosulphides, to form thio arsenites (*q v* under ARSENIC, THIO ACIDS or) The following are the typical reactions

III—ARSENIC PENTASULPHIDE As_2S_5 (*Per sulphide of Arsenic*) Mol w unknown

Preparation—1 By melting As with considerable excess of S, a thin, transparent, liquid is obtained which solidifies to an elastic mass, and after some time becomes hard, if this hard solid is powdered and treated with NH_4Aq a solution of As_2S_5 is obtained from which the sulphide is thrown down on addition of HClAq (Géhlis, *A Ch* [4] 30, 114)—2 A solution of Na_2S is digested with As_2S_3 and enough S to form As_2S_5 , on evaporating and cooling large crystals of $2\text{NaAsS}_5 \cdot 15\text{H}_2\text{O}$ are obtained (Rammelsberg, *P* 52, 249, 90, 40), when HClAq is added to a solution of this salt, As_2S_5 is precipitated and H_2S is evolved (Fuchs, *Fr* 1, 189, Fluckiger, *Vierteljahrsschr pr Pharm* 12, 330, Eckert, *ibid* 13, 367) The product of the action of H_2S on $\text{H}_2\text{AsO}_4\text{Aq}$ is not As_2S_5 , as was once supposed, but is a mixture of As_2S_3 and S ($2\text{H}_2\text{AsO}_4\text{Aq} + 2\text{H}_2\text{S} = \text{As}_2\text{O}_3\text{Aq} + 5\text{H}_2\text{O} + \text{S}$, $\text{As}_2\text{O}_3\text{Aq} + 3\text{H}_2\text{S} = \text{As}_2\text{S}_3 + 3\text{H}_2\text{O}$) (*v* Ludwig, *Ar Ph* [2] 97, 82, also H Rose, *P* 107, 186)

Properties—A yellow powder, easily fusible, may be sublimed in a stream of a gas which does not act on it

Reactions—1 Heated in a stream of *hydrogen*, it is reduced to metallic As, and H_2S 2 Dissolves easily in *ammonia, potash, and soda solutions*, with production of thio arsenate, and arsenate, of the alkali metal—8 Dissolves easily in *solutions of alkali sulphides*, forming thio arsenates The sulphide As_2S_5 behaves as a salt forming compound, or as the anhydride of thio arsenic acid, the salts which are generally formed directly from it are pyro-thio arsenates $\text{M}_2\text{As}_2\text{S}_5$, these yield two other series of salts, viz ortho thio arsenates M_2AsS_5 , and meta thio arsenates MAsS_5 (*v* ARSENIC, THIO ACIDS or).

Arsenic, sulpho acids of, v ARSENIC THIO-ACIDS OF

Arsenic, sulpho (or thio) bromide of. $\text{AsS.Br}_3 (= \text{AsSBr.SBr}_3)$ Mol w unknown. $[-17^\circ]$ Dark red crystals deposited at -18° on addition of a small quantity of powdered As to a solution of S in Br in ratio S Br_2 , decomposed by water into $\text{As}_2\text{O}_3\text{Aq}$, HBrAq , and S (Hannay, *C J* 33, 291)

Arsenic, sulpho (or thio) iodide of AsSI Said to be formed by the mutual action of As_2S_3 and I (Schneider, *J pr* [2] 23, 486)

Arsenic, sulphhydrates (or hydrosulphides) of Only one compound As, S, and H is definitely known, AsS(SH)_3 , v *Thioarsenicacids* under ARSENIC, THIO ACIDS OF (v also the art HYDROSULPHIDES)

Arsenic, tellurides of (v ARSENIC, Combinations, No 6)

Arsenic, thio acids of (In connection with these compounds v the art HYDROSULPHIDES) Arsenious sulphide, As_2S_3 , dissolves in alkalis or alkali sulphides to form salts, and from these other salts are obtained by double decomposition. The sulphide As_2S_3 may be regarded as the anhydride of three thio acids AsS(SH) , As(SH)_2 , and $\text{As}_2\text{S(SH)}_2$, corresponding to the three hypothetical oxy acids (v ARSENIOSACID), none of these acids is known, all attempts to prepare them having resulted only in the production of As_2S_3 and H S, but thio or sulph arsenites are known belonging to the three types, MA_2S , M_2AsS_3 , and M_3AsS . The more important of these salts are described below. Arsenic pentasulphide, As_2S_5 , dissolves in alkalis and alkali sulphides to form salts from which other salts are obtained (v *infra*). According to Nilson (*J pr* [2] 14, 1, 145) the pp obtained by adding dilute HClAq to a solution of Na_2AsS_4 (v ARSENIC PENTASULPHIDE, Preparation of) has the composition of ortho thio arsenic acid H_2AsS_3 [= AsS(SH)], no other thio arsenic acid is known, but the salts may be divided into three classes, analogous to the arsenates, viz *pyrothio arsenates* $\text{M}_2\text{As}_2\text{S}$ (hypothetical acid = $\text{H}_2\text{As}_2\text{S}_3$), *meta thio arsenates* MAsS_3 (hypothetical acid = HAS_2), and *ortho thio arsenates* M_3AsS (acid (?) H_3AsS_3)

I THIO ARSENITES As already stated, no thio arsenious acid is known. The salts which have been examined belong for the most part to the type $\text{M}_2\text{As}_2\text{S}_3$, they are produced either by the direct union of As_2S_3 with metallic hydrosulphides, e.g. BaAs_2S_3 , or by ordinary double decomposition of $(\text{NH}_4)_2\text{As}_2\text{S}_5\text{Aq}$ by solutions of metallic salts, e.g. PbAs_2S_3 . A few salts belonging to the forms MA_2S and M_2AsS_3 are also known, e.g. KAsS_2 and K_2AsS_3 , they are formed by the action of alkali sulphides on As_2S_3 (comp reactions given for ARSENIC TRISULPHIDE, p 816). The thio arsenites of the alkali and alkaline earth metals and of magnesium are soluble in water, but the solutions are decomposed on boiling, the others are insoluble in water. Most of these salts give off all their sulphur when strongly heated out of contact with air. These salts have been chiefly investigated by Berzelius (v *Gm* 4, 275)

Only those salts which have been fairly satisfactorily examined are mentioned in the following brief account —

Ammonium thio-arsenites $(\text{NH}_4)_2\text{As}_2\text{S}_3$ is obtained by dissolving As_2S_3 in $(\text{NH}_4)_2\text{SAq}$ and adding alcohol, if NH_4HSAq is added before precipitation by alcohol the salt obtained has the composition $(\text{NH}_4)_2\text{As}_2\text{S}_3$

Barium thio arsenites $\text{Ba}_2\text{As}_2\text{S}_3$ is obtained as a pasty brownish red very soluble mass by digesting As_2S_3 with $\text{BaS H}_2\text{Aq}$, from the solution alcohol throws down $\text{Ba}_3(\text{AsS}_3)_2$

Calcium thio arsenites The salt $\text{Ca}_2(\text{AsS}_3)_2$ is obtained as crystals by digesting As_2S_3 with milk of lime and allowing the solution to evaporate, from the brownish mother liquor alcohol precipitates white $\text{Ca}_2(\text{AsS}_3)_2 \cdot 15\text{H}_2\text{O}$

Lithium thio arsenites Closely resemble the potassium salts (q v)

Potassium thio arsenites The salt KAsS_2 may be obtained in solution by dissolving As_2S_3 in K_2SAq , but this solution decomposes on evaporation, in the solid form by heating KAsS_2 , or by fusing As_2S_3 with K_2CO_3 . By adding alcohol to a solution of As_2S_3 in K_2SAq , a white pp. of K_2AsS_3 is obtained. All these salts readily undergo change in aqueous solutions. Berzelius describes several other more or less indefinite bodies as potassium thio arsenites

Sodium thio arsenites Closely analogous to the potassium salts

The following thio arsenites seem also to exist, they are generally obtained from

$(\text{NH}_4)_2\text{As}_2\text{S}_5\text{Aq}$ by double decomposition — $(\text{BiS})_2\text{As}_2\text{S}_3$, CeAs_2S_3 , CdAs_2S_3 , CoAs_2S_3 , CuAs_2S_3 , FeAs_2S_3 , $\text{Au}(\text{AsS}_3)_3$, MgAs_2S_3 , MnAs_2S_3 , HgAs_2S_3 , $\text{Hg}(\text{AsS}_3)_2$, NiAs_2S_3 , SnAs_2S_3 , SnAs_2S_3 , PtAs_2S_3 , AgAs_2S_3 , $(\text{US})\text{As}_2\text{S}_3$, ZnAs_2S_3 . Thio arsenites of *chromium*, *molybdenum*, and *zirconium*, seem also to exist

II THIO ARSENATES As already stated, it is probable that ortho thio arsenic acid H_2AsS_3 has been prepared. The thio arsenates may be divided into three classes, of which the thio potassium salts are representatives KAsS_2 , K_2AsS_3 , and KAsS . The thio arsenates are obtained 1 By digesting As_2S_3 with solutions of the alkali sulphides, on cooling some As_2S_3 is precipitated — 2 By dissolving As_2S_3 in solutions of alkali polysulphides — 3 By precipitating solutions of arsenates by H_2S , or by $(\text{NH}_4)_2\text{SAq}$, in the latter case the liquids must be boiled to remove NH_3 — 4 By fusing As_2S_3 with alkali carbonates — 5 By dissolving As_2S_3 in KOHAg or NaOH aq , arsenate is formed as well as thio arsenate. The thio arsenates of the alkali metals are yellow or red, very soluble in water, crystallisable, fairly stable, compounds, their aqueous solutions are slowly decomposed by exposure to air. The other thio arsenates are more easily decomposed, those of the heavy metals are insoluble in water, they are best prepared by decomposing the solution of an alkali thio-arsenate by a solution of a salt of the metal. Soluble thio arsenates are decomposed by HClAq with precipitation of As_2S_3 . The salts obtained by the methods enumerated are usually *pyro* thio-arsenates $\text{M}_2\text{As}_2\text{S}_3$, the *meta* and *ortho* salts are produced from these, very frequently by the action of alcohol on their solutions, alcohol usually precipitates an *ortho* salt and leaves a *meta*-salt in solution. The *ortho* salts are frequently crystalline, most of the others are

amorphous Heated in absence of air, most thio-arsenates yield thio arsenites, and then As_2S_3 which sublimes, and a metallic sulphide which remains, some, however, are unchanged by heat alone, e.g. $\text{M}_2\text{As}_2\text{S}_7$ where $\text{M} = \text{Li}, \text{K}, \text{Na}$. Heated in air, the thio arsenates, as a class, give off As_2S_3 and As_2O_3 , and leave a sulphate in the cases of alkaline salts, or an oxide in the cases of salts of heavy metals. The thio-arsenates have been chiefly investigated by Berzelius (*v Gm* 4, 275), also by Nilson (*J pr* [2] 12, 295, 13, 1).

The following are the thio arsenates which have been fairly well investigated —

Ammonium thio arsenates The *pyro* salt $(\text{NH}_4)_2\text{As}_2\text{S}_7$ has not been obtained as a solid; a solution of As_2S_3 in $(\text{NH}_4)_2\text{SAq}$ probably contains this salt, it is decomposed on evaporation, alcohol precipitates the *ortho* salt $(\text{NH}_4)_2\text{As}_2\text{S}_5$, in white prismatic crystals, while the *meta* salt NH_4AsS_4 remains in solution.

Barium thio arsenates A solution of BaHAsO_4 is decomposed by H_2S , but the pure *pyro* thio arsenate, $\text{Ba}_2\text{As}_2\text{S}_7$, has not been obtained, this solution is decomposed by alcohol into $\text{Ba}_3(\text{AsS}_4)_2$ which precipitates, and $\text{Ba}(\text{AsS}_4)_2$ which remains in solution.

Magnesium thio arsenates The *pyro* salt $\text{Mg As}_2\text{S}_7$ is a yellow solid, very soluble in water, by adding $\text{Mg}(\text{SH})\text{Aq}$ to this solution until H_2S ceases to come off, and evaporating *in vacuo*, crystals of $\text{Mg}_3(\text{AsS}_4)_2$ are obtained, alcohol decomposes this salt, dissolving out $\text{Mg As}_2\text{S}_7$.

Potassium thio arsenates The *pyro* salt, $\text{K As}_2\text{S}_7$, is best obtained by treating $\text{K}_2\text{HAsO}_4\text{Aq}$ with H_2S and evaporating *in vacuo*, it forms a yellow viscid mass which liquefies on exposure to the air and then crystallises in rhombic plates. By adding alcohol to a conc solution of this salt an oily liquid is obtained which crystallises when warmed giving K_3AsS_7 , and KAsS_4 remains in solution. A salt containing both sulphur and oxygen, AsSO OKH O is described by Bouquet and Cloez (*A Ch* [3] 13, 41), produced by the action of H_2S on cold saturated KHAsO_4Aq , it may perhaps be regarded as a double compound of the hypothetical oxysulphide $\text{As}_2\text{S}_7\text{O}_2$ with K_2O , but the data are very meagre.

Sodium thio arsenates The *ortho* salt $2\text{Na}_2\text{As}_2\text{S}_7 \cdot 15\text{H}_2\text{O}$ is obtained in large white, or yellowish, monoclinic prisms, by digesting NaSAq with As_2S_3 , or with As_2S_5 and sufficient S° to form As_2S_7 , and allowing to crystallise (Frese nius, *Fr* 1, 192). The same salt is also obtained by decomposing $\text{Na}_2\text{HAsO}_4\text{Aq}$ by H_2S , and adding alcohol to the solution, according to the conditions under which this liquid is allowed to crystallise, crystals of varying form and some what varying appearance are obtained (Berzelius). The crystals are not dehydrated in dry air, but when slowly heated the salt may be obtained without water of crystallisation. It is doubtful whether the *meta* and *pyro* thio-arsenates have been obtained, the solution from which the *ortho* salt is thrown down by alcohol probably contains NaAsS_4 , and the solution before alcohol is added probably contains $\text{Na}_2\text{As}_2\text{S}_7$. The double thio-arsenate $\text{Na}_2(\text{NH}_4)_2(\text{AsS}_4)_2$ is also described by Berzelius (*l c*).

Besides the above salts, the following thio arsenates seem to have been obtained in fairly definite forms $\text{Ca As}_2\text{S}_7$, $\text{Ca}_2(\text{AsS}_4)_2$, $\text{Ce As}_2\text{S}_7$, $\text{Ce}_2(\text{AsS}_4)_2$, $\text{Ce}_3(\text{AsS}_4)_3$, $\text{Co As}_2\text{S}_7$, $\text{Au}(\text{AsS}_4)_2$, $\text{Fe}(\text{AsS}_4)_2$, $\text{Fe}_2\text{As}_2\text{S}_7$, $\text{Pb As}_2\text{S}_7$, $\text{Pb}_2(\text{AsS}_4)_2$, $\text{Mn As}_2\text{S}_7$, $\text{Hg As}_2\text{S}_7$, $\text{Hg As}_2\text{S}_5$, $\text{Ag As}_2\text{S}_7$, $(\text{US})\text{As}_2\text{S}_7$, The arsenates of Sb, Bi, Cd, Cr, Li, Ni, Pt, Sr, Y, Zn, and Zr, probably exist.

Arsenic acid and Arsenates v ARSENIC ACIDS or

Arsenides Binary compounds of arsenic with more positive elements, *v ARSENIC COMBINATIONS*, No 9

Arsenous acids and Arsenites, v ARSENIO ACIDS or **M P M**

ARSENIC COMPOUNDS, ORGANIC This article is devoted to compounds in whose molecules arsenic is supposed to be directly united to carbon. They are produced by distilling alkyl iodides with an alloy of arsenic with potassium or sodium (thus MeI gives AsMe , AsMe_2 , and AsMe_3 —Cahours a Riche, *C R* 39, 541), or by heating AsCl_3 with compounds of mercury with alkyls or aromatic radicles or by the action of sodium on a mixture of AsCl_3 and a haloid derivative. The methyl derivatives will be described first, followed by the methyl-ethyl, ethyl, phenyl, and finally by the benzyl, derivatives. The nomenclature employed is somewhat different from that used for derivatives of nitrogen. Thus the radicles AsMe , AsMe_2 , AsMe_3 , and AsMe_4 are called methyl arsine, dimethyl arsine, tri methyl arsine, and tetra methyl arsonium respectively.

Methyl arsine dichloride AsMeCl_2 , (133°) At 40°–50° di methyl arsine trichloride produces AsMeCl_2 , thus $\text{AsMe}_3\text{Cl}_3 = \text{MeCl} + \text{AsMeCl}_2$. Liquid which does not fume. M sol water but not decomposed by it. It violently attacks the mucous membrane. At –10° absorbs Cl_2 forming AsMeCl_3 , which at 0° splits up into MeCl and AsCl_3 (Baeyer, *A* 107, 257).

Methyl arsine di-iodide AsMeI_2 [*c* 25°] From the oxide, AsMeO , and HI . From cacodyl and iodine (Cahours, *C R* 50, 1022). Yellow needles (from alcohol). Converted by H_2S into AsMeS , and by HCl into AsMeCl_2 .

Methyl arsine sulphide AsMeS [110°] From H_2S and AsMeCl_2 . Plates (from alcohol). Insol water. Pps Ag , Cu , and Pb , as sulphides from their salts.

Methyl-arsine disulphide AsMeS_2 . Formed by passing H_2S into an acidified solution of methane arsonic acid (G Meyer, *B* 16, 1440).

Methyl-arsine oxide AsMeO [95°] Formed by action of K_2CO_3 on the chloride AsMeCl_2 . Crystallises from CS_2 in irregular cubes, smells like *Asa foetida*. M sol cold, v sol hot, water, slightly volatile in vapour of water and alcohol, v sol aqueous acids forming neutral solutions.

Methane arsonic acid $\text{MeAsO}(\text{OH})_2$. From AsMeCl_2 and excess of moist Ag_2O . From AsMeO in aqueous solution by action of H_2O . From aqueous sodium arsenite and MeI (M). Large spear shaped laminae composed of small needles (from alcohol).

Salts — $\text{BaA}' \cdot 6\text{H}_2\text{O}$ ppd as anhydrous rhombic crystals, by adding alcohol to aqueous solution, the crystals soon change to hydrated needles — $\text{Ag}_2\text{A}''$ nacreous crystals which explode above 100° — CaA'' aq

Tetra-methyl di-arsenide As_2Me_4 , *Cacodyl Alkarsin*. Mol w 210 [α -6°] (α 170°) V D 7.1 (air = 1)

Preparation—By heating di methyl arsine chloride (cacodyl chloride) with zinc at 100° in bulbs filled with CO_2 (Bunsen, *P* 40, 219, 42, 145, *A* 37, 1, 42, 14, 46, 1)

Properties—Stinking oil, heavier than water. Takes fire in air or in chlorine. Reduces HgCl_2 to mercurous chloride

Reaction— $\text{As}_2\text{Me}_4 + 2\text{MeI} = \text{AsMe}_2\text{I} + \text{AsMe}_2\text{I}$ (Cahours, *A* 122, 209)

Combinations—When gradually mixed with air, chlorine, or bromine, it forms derivatives of cacodyl, behaving like a molecule of such a metal as potassium ($\text{AsMe}_2)_2 + \text{Cl}_2 = 2(\text{AsMe}_2)\text{Cl}$, and ($\text{AsMe}_2)_2 + \text{O} = (\text{AsMe}_2)_2\text{O}$

Tetra-methyl-di-arsine oxide $(\text{AsMe})_2\text{O}$ *Cacodyl oxide*. Mol w 226 [α -25°] (120°) S G 1.462 V D 7.55 (calc 7.83)

Formation—Cadet's fluid (*Crell N Chem Arch* 1, 212), obtained by distilling KOAc with an equal weight of As_2O_3 , is cacodyl oxide mixed with some cacodyl. HgO converts both into cacodylic acid, whence a mixture of HgCl_2 and fuming HCl forms cacodyl chloride. The latter is converted into cacodyl oxide by distilling with aqueous potash in a current of CO_2 (Baeyer, *A* 107, 282) $2\text{AsMe}_2\text{Cl} + 2\text{KHO} = \text{H}_2\text{O} + 2\text{KCl} + (\text{AsMe}_2)_2\text{O}$

Properties—Pungent, stinking oil. Slowly oxidises in air forming cacodylic acid. Acids convert it into salts of cacodyl

Compounds—Forms with HgCl_2 a compound $(\text{AsMe}_2)_2\text{O} \cdot 2\text{HgCl}_2$, crystallising in tu metric plates S 3.47 at 100°. Distilled with fuming HCl this forms cacodyl chloride— $(\text{AsMe}_2)_2\text{O} \cdot 2\text{HgBr}_2$ — $(\text{AsMe}_2)_2\text{O} \cdot \frac{2}{3}\text{AgNO}_3$, explodes at 100°— $(\text{AsMe}_2)_2\text{O} \cdot \text{PtCl}_4$, aq. red brown pp. converted by KBr into $(\text{AsMe}_2)_2\text{O} \cdot \text{PtBr}_2$, aq. and by KI into $(\text{AsMe}_2)_2\text{O} \cdot \text{PtI}_2$

Di methyl arsine chloride AsMe_2Cl (α 100°) V D 4.66 (calc 4.85). Obtained from cacodylic acid as above, or by action of chlorine water on cacodyl—Heavy oil, attacks the mucous membrane, combines with Cl_2 forming AsMe_2Cl_2 , Zn, Sn, and Fe liberate AsMe_2

Compounds— $\text{AsMe}_2\text{Cl} \cdot \text{CuCl}$ (Bunsen)— $(\text{AsMe}_2\text{Cl})_2 \cdot \text{PtCl}_4$

Di methyl arsine bromide AsMe_2Br yellow oil

Di methyl arsine iodide AsMe_2I (160°) oil (Cahours, *A* 92, 364)

Di methyl arsine cyanide AsMe_2Cy [33°] (140°) V D 4.63. Prisms. Excessively poisonous

Di methyl arsine sulphide $(\text{AsMe}_2)_2\text{S}$ Combines with S to form $(\text{AsMe}_2)_2\text{S}_2$ [60°]

Di-methyl-arsine fluoride AsMe_2F Liquid

Di-methyl-arsine trichloride AsMe_2Cl_3 Cacodyl trichloride. From PCl_3 and cacodylic acid, or from cacodyl chloride and Cl_2

Reactions—1 At 50° it splits up as follows $\text{AsMe}_2\text{Cl}_3 = \text{MeCl} + \text{AsMe}_2\text{Cl}_2$ —2 With water it forms cacodylic acid

Di-methyl-arsinic acid $\text{AsMe}_2\text{O}(\text{OH})$ *Cacodylic acid*. Mol w 188. [200°]

Formation—From cacodyl and HgO in presence of water

Properties—Large prisms (from alcohol), without odour, but poisonous. V sol water, m sol alcohol, insol ether. Not acted on by HNO_3 , HCl , aqua regia, KMnO_4 , or CrO_3 .

Reactions—1 H_2PO_4 reduces it to cacodyl oxide—2 Aqueous H_2S forms cacodyl sulphide—3 An alcoholic solution gives with alcoholic HgCl_2 a pp of $(\text{AsMe}_2)_2\text{O} \cdot \text{HgCl}_2$ —4 Cacodylates are converted by dry H_2S into thio cacodylates, e.g. $(\text{AsMe}_2\text{S})_2$, $\text{Pb} - \text{AsMe}_2\text{S} \cdot \text{Cu} - (\text{AsMe}_2\text{S})_2$, $\text{Sb} - (\text{AsMe}_2\text{S})_2$, $\text{Bi} - \text{AsMe}_2\text{S} \cdot \text{Au}$

Salts—Soluble in water, but amorphous. AgA' needles— AgHA' , needles— $\text{AgA}'\text{AgNO}_3$

Compounds— HCl forms a crystalline compound $(\text{AsMe}_2\text{O} \cdot \text{HCl})$ decomposed by water. This compound distilled in a current of HCl splits up thus $\text{AsMe}_2\text{O} \cdot \text{HCl} + 2\text{HCl} = \text{AsMe}_2\text{Cl}_2 + \text{MeCl} + 2\text{H}_2\text{O} - \text{HA}'\text{HF}$ prisms

Tri-methyl arsine AsMe_3 , Mol w 120 (α 100°) **Formation**—1 $2\text{AsCl}_3 + 3\text{ZnMe}_2 = 3\text{ZnCl}_2 + 2\text{AsMe}_3$ (Hofmann)—2 From AsMe_2I and solid potash (Cahours, *C* R 49, 87)

Properties—1 Combines directly with Cl_2 , Br_2 , I_2 , S, and O

Iodide AsMe_2I , Splits up on distillation into MeI and AsMe_2I , cacodyl iodide—**Oxide** AsMe_2O deliquescent crystals—**Sulphide** AsMe_2S prisms (from alcohol)—**Bromide** AsMe_2Br

Tetra methyl arsonium iodide AsMe_4I

Formation—1 From sodium arsenide and MeI at 180°, and treating the product (AsMe_4I) with KOH (Cahours, *C* R 36, 1001, *A* 122, 192)

Properties—Plates (from alcohol mixed with MeI)

Combinations— AsMe_2I_2 — $(\text{AsMe}_2\text{I})_2\text{ZnI}_2$ — $(\text{AsMe}_2\text{I})_2\text{CdI}_2$ — $\text{AsMe}_2\text{IAsI}_2$

Reactions—1 With ZnMe_2 gives AsMe_3 (?) (Cahours)—2 KOH no action—3 Moist Ag_2O gives AsMe_2OH , deliquescent alkaline crystals—4 Ag_2SO_4 gives crystalline $(\text{AsMe}_2)_2\text{SO}_4$ —5 AgNO_3 forms crystalline AsMe_2NO_3

Penta methyl arsine AsMe_5 , From AsMe_2I and ZnMe_2 . With iodine forms MeI and AsMe_2I , with HCl forms CH_3 and AsMe_2Cl (Cahours)

Di methyl ethyl arsine— AsMe_2Et From AsMe_2I and ZnEtI , Liquid (Cahours)

Methyl di ethyl arsine AsMeEt_2 , From AsMeI_2 and ZnEtI , (Cahours)

Di methyl-di ethyl arsonium salts

Iodide— AsMe_2EtI From Cacodyl and EtI , thus $\text{AsMe}_2 + 2\text{EtI} = \text{AsMe}_2\text{EtI} + \text{AsMe}_2\text{Cl}$ (Cahours, *A* Riche, *C* R 39, 544)

Hydroxide very deliquescent

Chloride AsMe_2EtCl deliquescent needles

Platino chloride $(\text{AsMe}_2\text{EtCl})_2 \cdot \text{PtCl}_4$

Bromide AsMe_2EtBr deliquescent

Iodide AsMe_2EtI prisms

Periodide $\text{AsMe}_2\text{EtI}_2$ lustrous prisms

Nitrate $\text{AsMe}_2\text{EtNO}_3$ deliquescent grains

Sulphate $(\text{AsMe}_2\text{Et})_2\text{SO}_4$ octahedra

Ethyl arsine iodide AsEtI_2 From AsEtI and I_2 (Cahours, *C* R 50, 1022, *A* 116, 367)

With moist Ag_2O it forms the acid $\text{AsEtO}(\text{OH})_2$

Ethyl arsine chloride AsEtCl_2 (156°) From HgEt_2 and AsCl_3 (La Coste, *A* 208, 33) Liquid, m sol water

Ethane arsonic acid $\text{EtAsO}(\text{OH})_2$. From the preceding by the action of diluted HNO_3 . Small crystals (from alcohol)— $\text{Ag}_2\text{A}''$ pearly scales

Tetra ethyl-di arsenide As_2Et_4 , Mol w 266 (185°–190°) From an alloy of arsenic and sodium on EtI (Landolt, *A* 89, 319) Heavy stinking oil, takes fire in air. Reduces salts of silver and mercury. Unites directly with sulphur and

halogens Alcoholic HgCl_2 gives a crystalline precipitate $\text{AsEt}_2\text{Cl}_2\cdot 2\text{Hg}_2\text{O}(?)$

Iodide AsEt_2I (c 230°) Oil

Di ethyl-arsinic acid $\text{AsEt}_2\text{O}(\text{OH})$ [190°] From AsEt_2 and HgO under water (Landolt, *A* 92, 365) Large plates, soluble in water Not attacked by HNO_3 or aqua regia

Salts— $\text{BaA}'_2\text{HA}'_2$ 2aq Very sol in water, difficultly sol in alcohol

Tri ethyl arsine AsEt_3 Mol w 162 (140°–170°) SG 11 151 VD 5 28 (calc 5 62)

Formation—1 From AsCl_3 and ZnEt_2 (Hofmann & Cahours, *C R* 41, 831)—2 Together with AsEt_2 by the action of EtI on an alloy of arsenic and sodium—3 By distilling AsEt_2I with solid potash (Landolt, *A* 89, 322)

Properties—Oil of disagreeable odour Fumes strongly in air Combines directly with non metals Does not reduce ammoniacal silver nitrate (difference from AsEt_2)

Combinations— AsEt_2Br_2 deliquescent— AsEt_2I_2 [160°] (190°) (Cahours & Riche, *A* 92, 365)— AsEt_2S [c 100°] Prisms (from ether), pps sulphides from solutions of metallic salts— $(\text{AsEt})_2\text{PtCl}_2$ — $(\text{AsEt}_2)_2\text{PtCl}_2$ — $(\text{AsEt}_2)_2\text{PdCl}_2$ (Cahours & Gal, *C R* 71, 208)— $(\text{AsEt}_2)_2\text{OAsCl}_2\text{Cl}_2\cdot \text{Hg Cl}_2(?)$ — AsEt_2AuCl — $\text{AsEt}_2\text{PETe}(\text{C}_2\text{H}_5)_2\text{BrBr}$

Tri-ethyl-arsine oxide AsEt_2O Formed by exposure of an ethereal solution of AsEt_2 to the air An oil, insoluble in acids, except HNO_3 .

Tetra-ethyl arsonium iodide AsEt_4I

Formation—1 From AsEt_2 and EtI (Landolt, *A* 89, 331)—2 Arsenic with EtI at 180° gives red needles of $\text{AsEt}_2\text{IAsI}_2$, which is then boiled with potash (Cahours & Riche, *C R* 39, 546)—3 An alloy of arsenic with Zn or Cd heated with EtI gives $(\text{AsEt}_2\text{I})_2\text{ZnI}$ or $(\text{AsEt}_2\text{I})_2\text{CdI}_2$, these are boiled with potash (Cahours, *A* 122, 200)

Properties—Needles, v sol water and alcohol, insol ether

Reactions—1 With moist Ag_2O , gives an alkaline hydrate—2 Combines with I_2 forming brown needles of AsEt_2I_2

Tetra-ethyl arsonium saltz (Landolt, *A* 92, 371)

Chloride AsEt_2Cl_2 4sq deliquescent crystals, insol ether— $(\text{AsEt}_2\text{Cl})_2(\text{BiCl}_2)_2$ (Jorgensen, *J pr* [2] 3, 346)

Platino chloride $(\text{AsEt}_2\text{Cl})_2\text{PtCl}_4$ sl sol cold water

Bromide AsEt_2Br deliquescent mass— $(\text{AsEt}_2\text{Br})_2(\text{BiCl}_2)_2$

Sulphate $\text{AsEt}_2\text{SO}_4\text{H}$ grains, v sol water and alcohol, sl sol ether

Bromo tetra ethyl - arsonium bromide $(\text{CH}_3\text{BrCH}_2)_2\text{AsEt}_2\text{Br}$ From ethylene bromide and AsEt_2 at 50° (Hofmann, *Pr* 11, 62) Rhombic dodecahedra (from alcohol) V sol water, sl sol alcohol Aqueous AgNO_3 pps half its bromine as AgBr

Reactions—1 With moist Ag_2O it gives vinyl triethyl arsonium hydroxide, $\text{C}_2\text{H}_5\text{AsEt}_2(\text{OH})$ —2 With AsEt_2 it gives $\text{As}_2(\text{C}_2\text{H}_5)_4\text{Et}_2\text{Br}_2$ —3 With ammonia at 100° it gives a compound $\text{NAs}(\text{C}_2\text{H}_5)_2\text{Et}_2\text{H}_2\text{Br}_2$ This compound and the preceding are converted by Ag_2O into oxides and thence into platinochlorides (eg $\text{NAs}(\text{C}_2\text{H}_5)_2\text{Et}_2\text{H}_2\text{Cl}_2\text{PtCl}_4$) and other salts—

4 AuCl_3 gives crystals of AsEt_2AuCl —5 PtCl_4 gives crystals of $\text{As}_2\text{Et}_2\text{Pt}$ (Hofmann, *A* 103, 857)

Di-methyl-di-isoamyl-arsonium iodide

$\text{AsMe}_2(\text{C}_4\text{H}_9)_2\text{I}$ From cacodyl and iso amyl iodide at 180°, as follows $\text{As}_2\text{Me}_6 + 2\text{C}_4\text{H}_9\text{I} = \text{AsMe}_6(\text{C}_4\text{H}_9)_2\text{I} + \text{AsMe}_6\text{I}$ (Cahours & Riche)

Tri-propyl arsine AsPr_3 At 180°, arsenic combines with PrI forming AsPr_2IAsI . Distilled with solid potash, this gives AsPr_3 (Cahours, *C R* 76, 1383) Arsenic acts similarly on isobutyl iodide at 180° (Cahours, *C R* 77, 1406) Calcium butyrate distilled with As_2O_3 gives a distillate resembling Cadet's liquid, probably containing the propyl homologues of cacodyl compounds (Wohler, *A* 68, 127) Potassium valerate distilled with As_2O_3 appears similarly to give 'butyl cacodyl' derivatives (Gibbs, *Am S* [2] 15, 118)

AROMATIC DERIVATIVES

Literature—Michaelis, *A* 201, 184, 207, 195, 208, 1, 233, 60, *B* 8, 131b, 9, 1566, 10, 622, 11, 1883, 18, 2176, 14, 912, 15, 1952, 2876, 18, 42, La Coste, *A* 184, 1, 208, 1

Di phenyl-di arsenide $\text{C}_6\text{H}_5\text{As}_2\text{C}_6\text{H}_5$, *Arseno benzene* [196°] Prepared by reduction (best with phosphorous acid) of an alcoholic solution of phenyl arsine oxide (Michaelis & Schulte, *B* 14, 912, 15, 1952) Yellowish needles Sol benzene, chloroform, and CS_2 , sl sol alcohol, insol water and ether On heating it gives triphenyl arsine and arsenic

Reactions—1 Heated with 1 mol of sulphur phenyl arsine sulphide is formed, with more sulphur, phenyl sulphide and As_2S_3 —2 Alcoholic NH_4HS reduces it on heating to benzene, As_2S_3 , and As_2H_4 acts in a similar manner—3 On oxidation it gives benzene arsonic acid—4 Combines directly with halogens

Di iodide— PhAsIAsI Ph Yellow needles Very unstable Prepared by reduction of phenyl arsine iodide (which is formed by dissolving phenyl arsine oxide in HI)

Phenyl arsine chloride PhAsCl_2 (c 253°) Obtained in theoretical quantity by heating AsCl_3 (800g) with HgPh_2 (70g) Colourless liquid with unpleasant odour, insol water, sol KOHaq

Phenyl arsine tetra chloride PhAsCl_4 [45°] Formed by passing Cl_2 into the preceding at 0° Yellow needles, fuming in moist air, readily decomposed into Cl_2 and PhAsCl_2 , when heated at 150° it gives $\text{C}_6\text{H}_5\text{Cl}$ and AsCl_3

Phenyl arsine bromide PhAsBr_2 (285°) SG 12 210 Colourless liquid formed by the action of conc HBr upon PhAsO Gives with bromine AsBr_3 and PhBr

Phenyl arsine iodide PhAsI_2 Oil

Phenyl arsine oxide PhAsO [120°] Formed by treating PhAsCl_2 with Na_2CO_3 Crystals (from alcohol), smells like anise, insol water, sl cold, m sol hot, alcohol, slightly volatile with steam Heated with HCl it forms PhAsCl_2 . Above its melting point it decomposes thus

Phenyl-arsono oxy chloride PhAsOCl_2 [100°]. Formed by decomposing the tetrachloride with the theoretical quantity of water, or by the union of chlorine with the oxide Crystalline, dissolved by water, being converted into benzeno arsonic acid At 120° it splits up thus:

Benzene arsenic acid $C_6H_5AsO(OH)_2$.

Formed by dissolving $PhAsCl_2$ or $PhAsOCl_2$ in water. Long columns, begins to soften at 138° , changing to an amorphous anhydride, which is re converted by water into the acid. M sol cold, v sol hot, water.

Reactions—1 Not affected by reducing or oxidising agents—2 Potash fusion produces phenol.

Salts— NH_4As needles— KHA amorphous— BaH_2As_2 needles, v sol water— CaH_2As_2 needles— $CaA''2aq - CuA''$ v sl sol water— PbA'' insol water.

Tetra phenyl-di-arsenide $As_2(C_6H_5)_4$, *Phenyl cacodyl* [135°] Formed by reduction of tetra phenyl diarsine oxide with phosphorous acid. White crystals. Sl sol alcohol and ether. It quickly oxidises in the air, forming di-phenyl arsenic anhydride (Ph_2As_2O).

Di-phenyl arsine chloride Ph_2AsCl , *Phenyl cacodyl chloride* [333°] SG 11 142 Prepared by heating $HgPh_2$ with a large excess of $PhAsCl_2$ at 320° . The product is then fractionally distilled. Yellow oil, insol water, sol alcohol, ether, and benzene, sl sol aqueous alkalis. Not affected by heating with Na_2CO_3 . Combines with bromine and chlorine. Conc HNO_3 slowly converts it into di-phenyl arsenic acid.

Di-phenyl arsine trichloride Ph_2AsCl_3 , [174°] From the preceding and chlorine. Colourless tables (from benzene). At 200° it decomposes thus $Ph_2AsCl_3 = PhAsCl_2 + PhCl$.

Di-phenyl arsine chloro bromide $Ph_2AsClBr$, Formed by passing dry bromine vapour into Ph_2AsCl . Excess of Br produces di-bromo benzene.

Tetra phenyl di-arsine oxide $(Ph_2As)_2O$ [92°] Formed by heating Ph_2AsCl with alcoholic KOH.

Di-phenyl arsine bromide Ph_2AsBr [356°] From the oxide and HBr.

Di-phenyl arsine oxy chloride $(Ph_2AsCl)_2O$ [117°] From the oxide and chlorine.

Di-phenyl-arsenic acid $Ph_2AsO(OH)_2$ [174°] SG 155 From the oxy chloride or the tri chloride by the action of water. White needles, sol water and alcohol, sl sol benzene and ether. Not attacked by CrO_3 or boiling conc HNO_3 .

Salts— NaA' — NH_4A' unstable feathery crystals— BaA'_2 — CuA'_2 — $HO CuA'$ — AgA' — PbA' .

Tri phenyl arsine $AsPh_3$, [59°] (above 360°) SG 1306 Prepared by heating phenyl arsine oxide at 200° , thus $3PhAsO = AsPh_3 + As_2O_3$. More readily by the action of sodium (50 g) on $AsCl_3$ (54 g) and chloro benzene (101 g), diluted with 4 vols dry ether. Is also a by product in preparing Ph_2AsCl from $PhAsCl_2$ and $HgPh_2$. Tri clinic crystals isomorphous with $SbPh_3$ (Philips, B 19, 1031). Insol water and dilute acids, v sol hot alcohol, benzene, and ether. With $HgCl_2$, it forms leaflets of $AsPh_3.HgCl_2$, whence aqueous KOH forms $AsPh_3(OH)_2$, [108°], thus $AsPh_3.HgCl_2 + 2KOH = AsPh_3(OH)_2 + 2KCl + Hg$.

Tri-phenyl-arsine chloride Ph_3AsCl_2 , [171°] From $AsPh_3$ and chlorine. Tables, decomposed at 280° into Ph_2AsCl and $PhCl$.

Tri-phenyl-arsine sulphide Ph_3AsS [162°] Prepared by digesting Ph_3As with S dissolved in CS_2 , or by action of ammonium sulphide on Ph_3AsCl_2 . Silky needles, insol water and ether.

Tri phenyl-arsine oxy-nitrate

$(C_6H_5)_3As(OH)NO_3$, [84°] Formed by adding HNO_3 to an aqueous solution of the hydroxide $(C_6H_5)_3As(OH)_2$ (Philips, B 19, 1033). Long glistening needles. V sol alcohol sl sol water.

Tri-nitro-tri-phenyl arsine oxide

$(C_6H_5)_3NO_3AsO$ [254°] Formed by nitration of tri phenyl arsine hydrate, $(C_6H_5)_3As(OH)_2$, with HNO_3 and H_2SO_4 . Nearly colourless large crystals. V sol acetic acid, insol alcohol and ether.

Tri-amido-tri phenyl-arsine $(C_6H_5)_3As[NH_2]_3$, [c 176°] Formed by reduction of tri nitro tri phenyl arsine oxide $(C_6H_5)_3AsO$ with tin and HCl in acetic acid solution (P). Colourless crystalline solid. V sol alcohol and dilute acids, insol water.

Salts— $B''H_2Cl_2$, crystalline solid, easily soluble in water and alcohol— $(B''H_2Cl_2)_2(PtCl_2)$, yellow pp, insol cold water.

Tri acetyl derivative $(C_6H_5)_3As(ONHAc)_3$, [c 230°] Very sparingly soluble in alcohol, more easily in acetic acid.

Tri-p-ethoxy tri-phenyl-arsine

$(EtO C_6H_4)_3As$, *Tri phenetyl arsine* [89°] Formed by the action of sodium upon a mixture of p-bromo phenetol and $AsCl_3$ (Michaels a. Weitz, B 20, 52).

tri-p methoxy tri-phenyl arsine

$(MeO C_6H_4)_3As$, *Tri anisyl arsine* [156°] Obtained by the action of sodium upon a mixture of p-bromo anisol and $AsCl_3$ containing some acetic ether. Transparent colourless crystals. V sol benzene, sl sol alcohol and ether. HI splits it up into di-anisyl arsine iodide $(C_6H_4(OMe)_2AsI)$ and anisol, by longer and higher heating anisol and AsI_3 are formed. By heating with an excess of $AsCl_3$, it yields anisyl arsine chloride $C_6H_4(OMe)AsCl_2$ (Michaels a. Weitz, B 20, 48).

Di-p-methoxy-di-phenyl-arsine chloride $(C_6H_4(OMe)_2AsCl)_2$ [14] *Di-anisyl arsine chloride* [80°] Formed by dissolving the oxide in HCl. Long thin needles. V sol ether, less in alcohol.

Di-methoxy-di-phenyl-arsine oxide

$\{(C_6H_4(OMe)_2As)_2O\}$ [14] *Di-anisyl arsine oxide*, *Tetra anisyl di-arsine oxide* [130°] Crystalline. Formed by the action of alkalis on the iodide which is obtained by heating tri anisyl arsine with HI.

p-Methoxy-benzene-arsine chloride

$C_6H_4(OMe)AsCl_2$ [14] *p-Anisyl arsine chloride* [230° at 117 mm] Colourless liquid. Formed by heating tri anisyl arsine $(C_6H_4(OMe)_2)_3As$ with an excess of $AsCl_3$ at 200° . Alkalis yield the oxide $C_6H_4(OMe)AsO$, a colourless crystalline solid. It combines with Cl_2 to form $C_6H_4(OMe)AsCl_3$, which is a thick yellow liquid decomposed by water giving anisyl-arsinic acid $C_6H_4(OMe)AsO(OH)_2$.

p-Methoxy-benzene-arsenic acid

$(C_6H_4(OMe)_2)_2As_2O_3$, *Anisyl-arsenic acid* [160°] Formed by the action of water upon the chloride $C_6H_4(OMe)AsCl_2$. Colourless crystalline solid. Sol hot, sl sol cold, water, v sol alcohol. On heating it gives the anhydride $C_6H_4(OMe)_2As_2O_3 - AgA''$ white pp.

Phenyl-di methyl-arsine $PhAsMe_2$, (200°) From $ZnMe_2$ and $PhAsCl_2$. Mobile liquid, sol alcohol and benzene, insol water.

Phenyl tri methyl arsonium iodide

$PhAsMe_3I$ [244°] From the preceding and

Mel White needles, sol water and alcohol, insol ether — $(\text{PhAsMe}_2\text{Cl})_2$, PtCl_4 , [219°], v sol hot water

Di phenyl-methyl-arsine Ph_2AsMe (806°) From Ph_2AsCl and ZnMe_2 in benzene (Michaelis & Link, *A* 207, 199) Insol water

Di phenyl di methyl arsonium iodide PhAsMe_2I [190°] From the preceding and **Mel** Needles, sl sol cold, v sol hot, water Decomposed by heat into **Mel** and Ph_2AsMe — $(\text{Ph}_2\text{AsMe}_2\text{Cl})_2$, PtCl_4 , [219°]

Phenyl di ethyl arsine PhAsEt_2 , (240°) From PhAsCl_2 and ZnEt_2 Colourless liquid Combines with Cl_2 forming $\text{PhAsEt}_2\text{Cl}_2$

Phenyl tri ethyl arsonium iodide PhAsEt_3I [118°] From the preceding and **EtI** at 100° Prisms, turned yellow by sunlight, sol water and alcohol, insol ether Decomposed when heated in an indifferent gas into **EtI** and PhAsEt_2 Gives with AgCl the chloride PhAsEt_2Cl , whence $(\text{PhAsEt}_2\text{Cl})_2$, PtCl_4 Gives with AgO the hydroxide PhAsEt_2OH , an alkaline syrup, absorbing CO_2 from the air

Di phenyl ethyl arsine PhAsEt (320°) From PhAsCl and ZnEt Colourless liquid

Di phenyl ethyl arsine chloride Ph_2AsEtCl , [137°] From the preceding and **Cl** Needles (from benzene), fumes in the air, decomposed by water

Di phenyl di ethyl arsonium iodide PhAsEt_2I [184°] From Ph_2AsEt and **EtI** Flat white needles

Di phenyl methyl ethyl-arsonium iodide PhAsMeEtI [170°] S 11 at 15°, 8±4 at 100° From Ph_2AsMe and **EtI** or from Ph_2AsEt and **Mel** Trimetric prisms, insol ether Split up by heat into **EtI** and PhAsMe

Derivatives — $(\text{Ph}_2\text{AsMeEt})_2$, PtCl_4 , [214°]

Picrate $\text{Ph}_2\text{AsMeEtO}$ $\text{C}_6\text{H}_3(\text{NO}_2)_3$, [93°] Sl sol cold water

Tolyl arsine chloride $\text{C}_6\text{H}_4\text{AsCl}_2$, *Ortho* (265°) *Para* [31°] (267°)

From AsCl_3 and mercuric di tolyl (*o* or *p*) Bromine converts them into di bromo toluenes

Tolyl arsine tetrachloride $\text{C}_6\text{H}_4\text{AsCl}_4$, *Tolyl arsine oxide* $\text{C}_6\text{H}_4\text{AsO}$

Ortho [145°] *Para* [156°] From $\text{C}_6\text{H}_4\text{AsCl}_2$ and aqueous Na_2CO_3 Combine with Cl_2 forming oxy chlorides

Toluene arsonic acid $\text{CH}_3\text{C}_6\text{H}_4\text{AsO}(\text{OH})_2$, *Ortho* [160°] The *para* compound decomposes above 800° without previous fusion

From the tetrachloride or the oxychloride, $\text{C}_6\text{H}_4\text{AsOCl}_2$, by treatment with water The *ortho* acid forms a crystalline anhydride $\text{C}_6\text{H}_4\text{AsO}_2$ — $\text{Ag}_2\text{A}''$ — BaA'' — CaA'' (La Coste & Michaelis, *A* 201, 255)

Di *p* tolyl arsine chloride $(\text{C}_6\text{H}_4)_2\text{AsCl}$ (c 343°) From $\text{C}_6\text{H}_4\text{AsCl}_2$ and $\text{Hg}(\text{C}_6\text{H}_4)_2$ Liquid, not affected by aqueous Na_2CO_3 Chlorine gives $(\text{C}_6\text{H}_4)_2\text{AsCl}_2$

Tetra *p* tolyl di-arsine oxide $((\text{C}_6\text{H}_4)_2\text{As})_2\text{O}$, [98°] Silky needles (from ether) Obtained by boiling the preceding with alcoholic **KOH**

Di *p* tolyl-arsinic acid $(\text{C}_6\text{H}_4)_2\text{AsO}(\text{OH})_2$ [167°] Formed by boiling $(\text{C}_6\text{H}_4)_2\text{AsCl}_2$ with water Oxidised to 'dibenzarsinic' acid

Tri *p* tolyl arsine $(\text{C}_6\text{H}_4)_3\text{As}$ [145°] Obtained by heating $\text{C}_6\text{H}_4\text{AsO}$

Tri *p* tolyl arsine dichloride $(\text{C}_6\text{H}_4)_3\text{AsCl}_2$, [214°] Not attacked by water

Vol. I

***p*-Carboxy-phenyl-arsine chloride**

$\text{CO}_2\text{H C}_6\text{H}_4\text{AsCl}_2$, [168°] From the corresponding iodide and AgCl , or from the product $(\text{COCl C}_6\text{H}_4\text{AsCl}_2)_2$ (?) of the action of PCl_5 upon $\text{CO}_2\text{H C}_6\text{H}_4\text{AsO}(\text{OH})_2$, by treating with water Needles (from benzene), decomposed by water.

***p* Carboxy phenyl arsine iodide**

$\text{CO}_2\text{H C}_6\text{H}_4\text{AsI}$, [153°] From $\text{CO}_2\text{H C}_6\text{H}_4\text{AsO}(\text{OH})_2$ by **HI** and **P**. Yellow needles (from chloroform)

***p* Carboxy phenyl arsine hydroxide**

$\text{CO}_2\text{H C}_6\text{H}_4\text{As}(\text{OH})_2$, *Benzarsenous acid* From the preceding by heating with aqueous Na_2CO_3 Colourless needles (from water) At 145°–160° it gives off H_2O leaving the oxide $\text{CO}_2\text{H C}_6\text{H}_4\text{AsO}$ — $\text{Ca}(\text{C}_6\text{H}_4\text{AsO}_2)_2$, Aq plates, changing at 200° into $\text{Ca}(\text{C}_6\text{H}_4\text{AsO}_3)_2$ — $\text{AgC}_6\text{H}_4\text{AsO}_3$

***p* Carboxy benzene arsonic acid**

$\text{CO}_2\text{H C}_6\text{H}_4\text{AsO}(\text{OH})_2$, *Benzarsenic acid* Formed by oxidising toluene arsonic acid with alkaline KMnO_4 Transparent interlaced needles, m. sol water, v sl sol alcohol At 190° it becomes $\text{CO}_2\text{H C}_6\text{H}_4\text{AsO}$, at 230° it gives off benzoic acid — $\text{Ag}_2\text{A}'''$ — CaHA''' aq — $\text{KH}_2\text{A}'''$ — MeHA'''

***p* Di-carboxy di phenyl arsine iodide**

$(\text{CO}_2\text{H C}_6\text{H}_4)_2\text{AsI}$, [above 280°] From $(\text{CO}_2\text{H C}_6\text{H}_4)_2\text{AsO}(\text{OH})_2$, conc **HI**, and **P** Converted by aqueous NaCO_3 into the hydroxide $(\text{CO}_2\text{H C}_6\text{H}_4)_2\text{AsOH}$ (*Dibenzarsenous acid*) — CaA'' 2aq

***p* Di carboxy di phenyl-arsinic acid**

$(\text{CO}_2\text{H C}_6\text{H}_4)_2\text{AsO}(\text{OH})_2$, *Dibenzarsenic acid* Formed from $(\text{C}_6\text{H}_4)_2\text{AsO}(\text{OH})_2$ and alkaline KMnO_4 , at 60° Leaflets, insol water, sl sol. alcohol — $\text{Me}_2\text{HA}'''$ (above 280°)

***p* Tri *o*-carboxy-tri-phenyl-arsine**

$(\text{CO}_2\text{H C}_6\text{H}_3)_3\text{As}$, *Tribenzarsenous acid* From the following acid and **HI** Small colourless needles — $\text{Na}_2\text{A}''$ 2aq — $\text{Ag}_2\text{A}''$

***p* Tri-carboxy-tri-phenyl-arsine hydroxide**

$(\text{CO}_2\text{H C}_6\text{H}_3)_3\text{As}(\text{OH})_2$, *Tribenzarsenic acid* From tri tolyl arsine and alkaline KMnO_4 — $(\text{CO}_2\text{K C}_6\text{H}_3)_3\text{AsO}$

Benzyl arsine chloride $\text{PhCH}_2\text{AsCl}_2$, (175°) at 50mm Formed by heating tri benzyl arsine with excess of AsCl_3 Easily oxidised by air $\text{PhCH}_2\text{AsCl}_2 + \text{O} = \text{PhCH}_2\text{Cl} + \text{AsOCl}$

Di benzyl-arsinic acid $(\text{PhCH}_2)_2\text{AsO}(\text{OH})_2$ [210°]

Preparation — Sodium [50 g] acting upon a solution of benzyl chloride (100 g) and AsCl_3 (72 g) in dry ether (500 g) containing acetic ether (5 g) forms $(\text{PhCH}_2)_2\text{As}$, $(\text{PhCH}_2)_3\text{AsCl}$, and $(\text{PhCH}_2)_3\text{AsCl}_2$ Alcohol extracts the first, and converts the two latter into $(\text{PhCH}_2)_2\text{AsCl}(\text{OH})_2$ and $(\text{PhCH}_2)_3\text{AsCl}(\text{OH})_2$ respectively, and they are then converted by aqueous **NaOH** into $(\text{PhCH}_2)_2\text{AsO}(\text{ONa})$ and $(\text{PhCH}_2)_3\text{AsO}$ (Michaelis & Paetoff, *A* 233, 60)

Properties — Pearly white plates (from alcohol), attacks the mucous membrane, v sol hot alcohol, m sol hot water, sl sol ether When strongly heated it gives benzoic aldehyde and dibenzyl

Salts — BaA' , 8aq — CaA' , 6aq — AgA'

Reactions — 1 Conc **HCl** forms AsCl_3 , toluene, and benzyl chloride — 2 Boiling dilute HNO_3 has no effect, HNO_3 of SG 1.8 forms a compound $(\text{PhCH}_2)_2\text{As}(\text{OH})_2\text{NO}_2$, [129°], conc

X

HNO_3 forms benzoic and arsenic acids — 3 Combines with HCl forming $(\text{PhCH}_2)_3\text{AsCl}(\text{OH})_2$ which crystallises from aqueous HCl in needles $[128^\circ]$, this is decomposed by more water, giving $(\text{PhCH}_2)_3\text{AsO OH}$ again — 4 HBr forms $(\text{PhCH}_2)_3\text{AsO}(\text{OH})\text{HBr}$

Di-benzyl thio arsenic acid $(\text{PhCH}_2)_2\text{AsO SH}$ $[199^\circ]$ From di benzyl arsenic acid and H_2S in alkaline solution

Tri benzyl arsine $(\text{PhCH}_2)_3\text{As}$ $[104^\circ]$ The preparation is described under di benzyl arsenic acid (*v sup*) Monoclinic needles (from alcohol) Insol water, v sol ether, benzene, and glacial acetic acid, sl sol cold alcohol Like AsMe_3 , but unlike AsPh_3 , it combines with alkyl iodides It is not affected by boiling conc HCl It combines with S and halogens Boiling dilute HNO_3 forms benzoic and arsenic acids An ethereal solution gives with an ethereal solution of HgCl_2 a pp of $(\text{PhCH}_2)_3\text{AsHgCl}_2$ $[159^\circ]$

Tri benzyl arsine oxide $(\text{PhCH}_2)_3\text{AsO}$ $[220^\circ]$ From tri benzyl arsine chloride or oxychloride by treatment with alkalis, or together with di benzyl arsenic acid by the action of wet ether upon the product of the action of sodium upon benzyl chloride and AsCl_3 Prisms (from dilute alcohol), v e sol alcohol, sl sol water and ether

Tri benzyl arsine oxy chloride $(\text{PhCH}_2)_3\text{AsCl}(\text{OH})$ $[163^\circ]$ Formed by union of HCl with the preceding V e sol alcohol, insol dilute HCl

Tri benzyl arsine oxy bromide $(\text{PhCH}_2)_3\text{AsBr}(\text{OH})$ $[129^\circ]$ Tables (from alcohol)

Tri benzyl arsine iodide $(\text{PhCH}_2)_3\text{AsI}$ $[c 95^\circ]$ Formed in impure condition by action of aqueous HI on the oxide Converted by alcohol into the oxy iodide, $(\text{PhCH}_2)_3\text{AsI}(\text{OH})$ aq $[78^\circ]$

Tri benzyl arsine oxy nitrate $(\text{PhCH}_2)_3\text{As}(\text{NO}_3)(\text{OH})$ $[170^\circ]$ Slender needles (from alcohol)

Tri benzyl arsine sulphide $(\text{PhCH}_2)_3\text{AsS}$ $[214^\circ]$ Prisms (from glacial HOAc) Insol alcohol and ether

Tri benzyl-methyl arsonium iodide $(\text{PhCH}_2)_3\text{AsMeI}$ $[143^\circ]$ From $(\text{PhCH}_2)_3\text{As}$ and MeI at 100° Slender needles (from water) Gives with moist Ag_2O the alkaline hydroxide, $(\text{PhCH}_2)_3\text{AsMe}(\text{OH})$

Tri benzyl methyl arsonium chloride $(\text{PhCH}_2)_3\text{AsMeCl}$ $[201^\circ]$ — *Platinochloride* $((\text{PhCH}_2)_3\text{AsMe})_2\text{PtCl}_6$ $[173^\circ]$

Tri benzyl ethyl arsonium iodide $(\text{PhCH}_2)_3\text{AsEtI}$ $[148^\circ]$ White plates (from water)

Tri benzyl-propyl arsonium iodide $(\text{PhCH}_2)_3\text{AsPrI}$ $[146^\circ]$ The isomeride, $(\text{PhCH}_2)_3\text{AsPrI}$ melts at $[143^\circ]$

Tri-benzyl isoamyl arsonium iodide $(\text{PhCH}_2)_3\text{As}(\text{C}_4\text{H}_9)\text{I}$ $[146^\circ]$

Tetra benzyl arsonium chloride $(\text{PhCH}_2)_4\text{AsCl}$ $[160^\circ]$ From $(\text{PhCH}_2)_3\text{As}$ and PhCH_2Cl at 170° Triclinic crystals containing aq (from water), insol dilute HCl Converted by aqueous KBr into the bromide $(\text{PhCH}_2)_4\text{AsBr}$, $[178^\circ]$, and by aqueous KI into the iodide, $(\text{PhCH}_2)_4\text{AsI}$, $[168^\circ]$, which forms a peroxide, $(\text{PhCH}_2)_4\text{AsI}_2$, $[150^\circ]$ Moist Ag_2O forms an alkaline hydroxide, split up by heat thus $(\text{PhCH}_2)_3\text{AsOH} = \text{PhCH}_2 + (\text{PhCH}_2)_2\text{AsO}$ *Platinochloride* $((\text{PhCH}_2)_4\text{As})_2\text{PtCl}_6$

Di naphthyl di arsenide $\text{C}_{10}\text{H}_7\text{As As C}_{10}\text{H}_7$, *Arseno-naphthalene* $[221^\circ]$ Prepared by heating an alcoholic solution of naphthyl-arsine oxide with phosphorous acid (Michaelis & Schulte, *B* 15, 1954) Slender yellow needles, sl sol alcohol, benzene, CS_2 and chloroform, insol water and ether Converted by Cl into $\text{C}_{10}\text{H}_7\text{AsCl}_2$ With sulphur it gives $\text{C}_{10}\text{H}_7\text{AsS}$ It is oxidised by HNO_3 to naphthalene arsenic acid

Naphthyl-arsine chloride $\text{C}_{10}\text{H}_7\text{AsCl}_2$ $[68^\circ]$ From mercury di naphthyl and AsCl_3 Crystalline powder, insol water, v sol alcohol

Naphthyl arsine oxide $\text{C}_{10}\text{H}_7\text{AsO}$ $[245^\circ]$ From the preceding by treatment with aqueous Na_2CO_3 Powder, sl sol alcohol, ether, and water On dry distillation it gives C, As, and naphthalene

Naphthalene arsenic acid $\text{C}_{10}\text{H}_7\text{AsO}(\text{OH})_2$ $[197^\circ]$ Needles Formed by action of water on $\text{C}_{10}\text{H}_7\text{AsCl}_2$, which is obtained by treating $\text{C}_{10}\text{H}_7\text{AsCl}_2$ with chlorine (W Kelbe, *B* 11, 1503)

ASAFETIDA A gum resin obtained by drying the juice contained in the root of *Ferula asafetida*, a Persian plant Potash fusion gives resorcin and protocatechuic acid Asafetida contains ferulic acid (*q v*), but its odour is due to 3 p.c. of an essential oil $(135^\circ-140^\circ)$ which appears to be a mixture of $\text{C}_{10}\text{H}_7\text{S}$ and $\text{C}_{10}\text{H}_7\text{S}_2$ Its alcoholic solution is ppd by HgCl_2 (Pelletier, *Bull Pharm* 3, 556, Johnston, *P M* Dec 1838, Hlasiwetz, *A* 71, 23)

ASARITE — Impure asarone

ASARONE $\text{C}_8\text{H}_8\text{O}_2$ $[59^\circ]$ (296°) SG 12 1 165 Contained in the root of *Asarum europaeum* Needles or plates, v sol alcohol, ether, and glacial HOAc , sl sol hot water (Blanchet & Sell, *A* 6, 296, C Schmidt, *A* 53, 156, Butle row & Rizza, *B* 17, 1159, *Bl* [2] 43, 114, Polack, *B* 17, 1415)

ASCLEPIONE $\text{C}_{20}\text{H}_{16}\text{O}_2$ $[104^\circ]$ Extracted by ether from the coagulum got by heating the milky juice of *Asclepias syriaca* Radiating crystals, insol water and alcohol Not attacked by boiling KOH aq (List, *A* 69, 125, Gram, *C* 1886, 735)

ASEBOTOXIN C 60.5 p.c., H 7.4 p.c., O 32.1 p.c. $[120^\circ]$ A glucoside extracted by water from the leaves of *Andromeda japonica* Brittle mass The addition of conc HCl to its alcoholic solution gives a blue colour (Eijkman, *R* 1, 224, *Ph* [3] 13, 365) It is accompanied by a glucoside, asebotin $\text{C}_{20}\text{H}_{16}\text{O}_{12}$, crystallising in yellow needles $[147.5^\circ]$ and also by asebo quercetin $\text{C}_{20}\text{H}_{16}\text{O}_{11}$ and asebofusin $\text{C}_{18}\text{H}_{14}\text{O}_8$ (Eijkman, *J* 1883, 1410, *R* 2, 99, 200)

ASH OF ORGANIC BODIES

The inorganic constituents contained in vegetable and animal products are usually determined by incineration of the substance, and determination of the weight and composition of the ash The first question to be considered is — Does this ash accurately represent the inorganic constituents of the substance?

The sulphuric acid originally present is undoubtedly but imperfectly represented The tendency to the reduction of sulphates to sulphides during ignition with carbonaceous, and especially with nitrogenous, matter, is generally overborne by the oxidation of the sulphur contained in the albuminoids The sulphuric acid found in the ash is thus greater

than that originally present, it entirely fails, however, to represent the sulphur present in the original substance, this must be determined by a special experiment

The carbonic acid originally present in the substance is generally quite undiscoverable by an analysis of the ash. Carbonic acid may be lost by the decomposition of calcium and magnesium carbonates during ignition, or by the decomposition of carbonates by the action of silica, or of phosphates containing less than three equivalents of base. On the other hand carbonates are produced when tribasic alkali phosphates are ignited with carbon, they are also formed in large quantity during the incineration of organic substances containing nitrates, or salts of organic acids. Treatment of an ash

Phosphoric acid may be lost if acid phosphates are heated to a high temperature with carbonaceous matter. The alkali metals are also liable under some circumstances to suffer loss by volatilisation.

The ash constituents are obtained with the smallest loss when the ignition is conducted at a low temperature, preferably in a muffle. In some cases an excess of lime or baryta must be added to prevent losses of phosphoric acid and chlorine, this treatment also prevents the fusion of the ash (Strecker, *A* 73, 366).

1 ASH OF ANIMALS.—The proportion of ash in some of the principal parts and products of the animal body, and its percentage composition, are shown in the following table. The figures are taken from Wolff's *Aschen Analysen*.

• ASH OF ANIMAL PARTS AND PRODUCTS

	Number of Analyses	Pure ash in 100 dry substance	100 parts of pure ash contain									
			K ₂ O	Na ₂ O	CaO	MgO	Fe ₂ O ₃	P ₂ O ₅	SO ₂	SiO ₂	Cl

* These numbers represent per cent of pure ash in fresh substance

with ammonium carbonate, and re-ignition, is sometimes employed with the view of converting caustic lime and magnesia into carbonates. Such treatment converts sulphides and cyanides into carbonates, sulphate of calcium is also partially converted into carbonate if only a small proportion of alkali carbonate is present. Treatment with carbonic acid water is more free from objection, but its action is slow.

The chlorides found in an ash may be below the truth from volatilisation of alkali chlorides, if too high a temperature has been employed, or from loss of hydrochloric acid due to the action of organic acids produced during the charring of the organic matter, or from a similar action of silica, or dibasic phosphates, at a high temperature.

(1880), with the exception of the analysis of bone ash, which is quoted from *C J* 24, 80.

The bone ash represents the mean composition of all the carcass bones of the 'fat ox' analysed at Rothamsted. In this analysis, alkalis, and sulphuric and carbonic acids, were not determined, the whole amount of these constituents was, however, but 4.5 per cent. The 'pure ash' in Wolff's Tables is exclusive of sand, charcoal, and carbonic acid.

The amount of ash yielded by the entire bodies of the principal animals reared on the farm, and its composition, have been determined by Lawes and Gilbert (*T* 1883 865), they also separately analysed the ash of the carcass and offal parts. The percentage composition of the ash of the entire bodies of calf, ox, lamb, sheep,

and pig will be found below. The composition in 1,000 parts of the fasted live weight of the animal body is also given. The latter will afford data for calculating the loss which a farm suffers by sale of stock. The fasted live weight is inclusive of contents of stomach and intestines, but the constituents of these contents are not reckoned among the animal constituents. The 'pure ash' is inclusive of carbonic acid.

2 ASH OF PLANTS. The composition of the ash of plants of agricultural importance will be given under the headings of the different crops, some general considerations will, however, be best made in the present place.

podaceæ, and of silica by the *Equisetaceæ* and *Graminaceæ*.

The ash constituents which enter the circulation of the plant are (1) partly employed in the formation of new tissue, (2) partly deposited as incrusting matter on the older tissues, while (3) soluble salts that are of no advantage to the plant first accumulate in the sap, and then are gradually removed from the plant by the action of rain and possibly by diffusion into the soil through the roots. The ash constituents most largely consumed in the formation of tissue are potash and phosphoric acid, in all the actively growing parts of a plant potash and phosphoric acid greatly preponderate. Magnesia, lime,

Percentage Composition of Ash from entire Bodies of Animals

	K ₂ O	Na ₂ O	CaO	MgO	Fe ₂ O ₃	P ₂ O ₅	SO ₃	SiO ₂	Cl	CO ₂
Fat calf	5.4	3.8	44.0	2.2	0.5	40.4	1.1	0.1	1.6	1.3

The ash constituents of a plant are obtained from the soil by the roots. All matters in the soil which are soluble and diffusible will enter the plant by the root, the abundant evaporation of water from the surface of a growing plant maintaining a rise of liquid in the capillary vessels. The substances entering the plant are not, however, limited to those existing in solution in the soil, as the roots of plants exercise a solvent or digestive action on constituents of the soil not otherwise soluble in water. The wide differences in the assimilating powers of the roots of different plants are well illustrated by the special assimilation of alumina by the *Lyco-*

oxide of iron, and sulphuric acid, must also be reckoned as essential for plant growth. The incrusting ash constituents are calcium salts and silica, these are chiefly precipitated in the leaves, where evaporation is most active. The soluble salts remaining unused in the sap generally contain a large proportion of chlorides, and of sodium salts.

A vigorous plant will take from a rich soil a much larger quantity of ash constituents, especially of alkali salts, than is necessary for its growth. For the same reason a plant growing on different soils may yield a very different ash. Thus a clover or bean plant will be rich in

potash or lime according as one or the other preponderates in the soil. On the other hand plants clearly exercise a selective power, potash being stored up in large quantity, though soda rather than potash may be abundant in the soil. This selective power is apparently not a property of the roots, but simply results from the fact that potash is removed from the sap to form tissue, while soda is not, potash salts can thus continue to enter the roots by diffusion or otherwise, while sodium salts having accumulated in the sap the tendency of diffusion is now for them to pass through the roots into the moist soil (see Dehérain, *Cours de Chimie agricole* [1873] 77). The Rothamsted experiments show that potash greatly preponderates in hay, and in barley straw, when the soil supplies a sufficient quantity, but when potash fails, soda is retained by the plant to a considerable extent.

The variations in the composition of the ash of any plant do not extend to the seed, the ash of this is of very definite composition whatever the nature of the soil. The ash of a seed consists chiefly of potassium phosphate, soda is practically absent.

While the seed is forming a migration of phosphoric acid and potash, and of nitrogenous matter and carbohydrates, sets in from all parts of the plant the roots included, a great part of these important constituents is finally stored in the seed. The extent to which the exhaustion of the plant, and the enrichment of the seed, proceeds, depends on the climate during the ripening period. R W

ASPARAGINE

$C_4H_7N_2O_4$, *ie* $CO_2H \cdot CH_2 \cdot CH(NH_2) \cdot CO \cdot NH_2$ or $CONH_2 \cdot CH_2 \cdot CH(NH_2) \cdot CO_2H$ *Amido succinamic acid*. M_w 150 (containing aq) $S_{G \ 45} 1.52$ S_c 1.8 at 10.5° , 53 at 100° . Occurs in juice of most plants, especially in growing buds and germinating seeds (*eg* asparagus, marsh mallow, comfrey, potatoes, deadly nightshade, chestnuts, liquorice root, lettuce, convolvulus root, dahlia tubers, young shoots of vetch, peas, beans, and other leguminous plants). Lupine seeds that have not begun to grow contain no asparagine, after 15 days' germination more than 20 p.c. of asparagine may be extracted by water (Schulze & Barbiéri, *J pr* [2] 27, 339). When twigs full of young leaf buds of the plane, birch, or horse chestnut are cut off and allowed to open by placing the cut end in water, the leaves are found to contain asparagine (*S & B*, *J pr* 133, 145). Asparagine may be formed by adding conc ammonia to mono ethyl aspartate (Schaal, *A* 157, 24).

Properties—Trimetric prisms (containing aq) exhibiting left handed hemihedry. Sol water, acids, and alkalis, insol alcohol and ether. Its solution in water or alkalis is levorotatory, in acids it is dextrorotatory. In HCl solution $[\alpha]_D =$ about $+36^\circ$, in aqueous solution about -6° , in ammoniacal solution about -11° .

Reactions—1 Boiling with lime, or baryta-water, or with dilute H_2SO_4 rapidly converts it into aspartic acid—2 Nitrous acid forms malic acid—3 Impure asparagine is liable to undergo fermentation, changing to ammoniac succinate. 4 Mol and KOH produce an amide of fumaric acid, $CO_2H \cdot CH \cdot CH \cdot CONH_2$ (Michael & Wing, *Am* 6, 419, Griess, *B* 12, 2117).

Salts— $HA \cdot HCl$ — $(HA)_2 \cdot HCl$ — CuA_2 — CaA_2 — ZnA_2 — $HA \cdot HgCl_2$ — AgA — $HA \cdot (AgNO_3)_2$ — $HA \cdot C_2H_5(NO_2)_2 \cdot OH$ yellow prisms (Smolka, *M* 6, 915).

Estimation—Heat the extract containing it with dilute HCl for some hours and determine the amount of NH_4Cl formed. This corresponds to half the nitrogen in asparagine (Sachsse, *J pr* [2] 6, 118). Glutamine also splits off half its amidogen as ammonia when treated with HCl. Or the extract may be treated with bromine and NaOH (measuring evolved N_2) both before and after heating with HCl (Sachsse). But asparagine gives off too much N_2 when so treated (Morgen, *Fr* 20, 37). It even gives off a little N_2 when treated with NaBrO before heating with HCl. These two errors nearly balance one another (E Schulze, *J pr* [2] 31, 235). Solutions of sodic aspartate give off no N_2 with NaBrO, but if NH_3 be present more N_2 is evolved than corresponds to the NH_3 . The increase may be 6 p.c. Leucine behaves in the same way as asparagine, but tyrosine behaves in exactly the opposite manner. Urea has the same influence as NH_3 . It is therefore better to determine the free NH_3 by distilling with MgO , CaO or even NaOH (comp Berthelot & André, *C R* 103, 1051). The presence of peptones will, of course, invalidate the determination, these are often absent from vegetable solutions, if present they must be removed. Albuminoids may be pptd by lead salts. Peptones by tannin or phosphotungstic acid (E Schulze, *lc*).

Dextro asparagine

$C_4H_7(NH_2)(CO_2H) \cdot CO \cdot NH_2$ Dextro hemihedral crystals Dextrorotatory $[\alpha]_D = +5.41^\circ$. Very sweet taste (ordinary asparagine is tasteless). Rather more soluble in water than ordinary asparagine. Occurs in the mother liquors obtained in recrystallising the crude asparagine prepared from the shoots of the vetch, 20 kilos of crude asparagine, obtained from 6500 kilos of vetch gave 100 grms of the pure dextro asparagine.

The compounds prepared from dextro-asparagine exhibit the same properties as those prepared from the laevo asparagine except that their rotatory power is reversed. By heating with 2 mols of aqueous HCl at 170° – 180° both asparagines give the same inactive aspartic acid (Pittu, *C R* 103, 134, *B* 19, 1691).

Additional References—Vauquelin & Robiquet, *A Ch* 57, 88, Dessaignes, *A* 82, 237, Piria, *A Ch* [3] 22, 160, Pasteur, *A Ch* [3] 31, 70, Mercadante, *G* 5, 187, Portes, *B* 9, 1934, Dubrunfaut, *J pr* 53, 508, Gorup Besanec, *A* 125, 291, Champion a Pellet, *B* 9, 724, Becker, *B* 14, 1031, De Luca & Ubaldini, *C R* 59, 527, Buchner, *Z* 1862, 117, Campani, *Z* [2] 6, 87, E Schulze, *B* 15, 2855, *J pr* [2] 20, 397, 27, 339.

ASPARTIC ACID $C_4H_7NO_4$, *ie*

$CO_2H \cdot CH_2 \cdot CH(NH_2) \cdot CO_2H$ *Amido succinic acid*. $Mol w$ 133 $S_{G \ 12.5} 1.66$ $S_{45} 1.66$ $S_{45} 1.66$ $S_{20} 2.0$, 5.4 100° .

Formation—1 By boiling asparagine with lime, baryta, PbO , KOH, or HCl dissolved in water—2 By boiling albumen or casein with dilute H_2SO_4 (Kreussler, *J pr* 107, 289, Rutschausen, *J pr* 107, 218)—3 By treating proteids with bromine (Hlasiwetz & Habermann, *A* 159, 325)—4 From casein by treatment

with SnCl_4 and HCl ($\text{H} \text{ a } \text{H}$, *A* 169, 162) —5 From diazo succinic ether by reduction with zinc dust and acetic acid (Curtius & Koch, *B* 19, 2460)

Preparation 100 grms of asparagine are boiled for 2 or 3 hours with an inverted condenser with 408 c.c. of pure aqueous hydric chloride (containing 11925 g HCl per c.c.) To the cooled solution is then added 204 c.c. of aqueous NH_3 (corresponding to the acid volume for volume) On standing for several hours the aspartic acid separates in colourless crystals The yield is 90 p.c. of the theoretical (Schiff, *B* 17, 2929)

Properties —Small trimetric rectangular plates Sol water, insol alcohol Its solution in alkalis is levorotatory, its solution in HCl aq is dextrorotatory, $[\alpha]_D^{20} = +28^\circ$ The rotation is affected by the nature of the solution (Becker, *B* 14, 1035) Aspartic acid (1 mol) prevents the pptn of $\text{Cu}(\text{OH})_2$ (1 mol) by KOH

Reactions —1 Nitrous acid converts it into malic acid —2 MeI and KOH form fumaric acid (Korner & Menozzi, *R Istut Lombard* 13, 352) —3 Not affected by boiling water or by magnesia —4 Heating in a current of HCl at 180° – 200° produces two anhydrides (a) insoluble in water ($\text{C}_4\text{H}_2\text{N}_2\text{O}_7$), (b) slightly soluble in water ($\text{C}_4\text{H}_2\text{N}_2\text{O}_6$) Both are converted by boiling baryta into aspartic acid, but when the former is heated for 2 hours at 125° with half its weight of water it produces a gummy mass, soluble in water forming a solution that has all the characters of a proteid It is pptd by acids, by NaCl , MgSO_4 , tannin, and HgCl_2 forming gelatinous pps CuSO_4 and KOH give a violet solution (Grimaux, *C R* 93, 771)

Salts — $\text{H}^+\text{H}^+\text{HCl}$ deliquescent crystals — $\text{H}^+\text{H}^+\text{H}_2\text{SO}_4$ — NaHA^+ aq trimetric prisms, *S* 99 at 12° — BaHA^+ 4aq — BaA^+ 3aq — CaA^+ 4aq — HgA^+ — PbHA^+ — PbA^+ — AgHA^+ — AgA^+ — CuA^+ 4aq *S* 835 at 15° , 43 at 100° , v sol dilute HOAc The insolubility of this salt may be used to detect and to isolate aspartic acid (Hoffmeister, *Sitz B* 75, 469) — CuA^+ 3aq (Curtius & Koch, *B* 19, 2460)

Mono ethyl ether A^+EtH Its hydrochloride (A^+HEtH) HCl forms large colourless needles, [199 $^\circ$]

Di ethyl ether A^+Et_2 Its hydrochloride $\text{A}^+\text{Et}_2\text{HCl}$ forms excessively hygroscopic concentric needles

Di methyl ether A^+Me_2 Its hydrochloride $\text{A}^+\text{Me}_2\text{HCl}$ forms very hygroscopic glistening prisms (Curtius & Koch, *B* 18, 1293)

Amides of ASPARAGINE

Di-phenyl amide

$\text{CO}_2\text{H} \cdot \text{C}_6\text{H}_5\text{NH}_2 \cdot \text{CONPh}_2$ [230 $^\circ$] Formed, together with phthalimide, by the action of NH_3 on the diphenylamide of phthalyl amido succinic acid $\text{CO}_2\text{H} \cdot \text{C}_6\text{H}_5\text{N}(\text{C}_6\text{H}_5)_2 \cdot \text{CONPh}_2$ (Piutti, *G* 16, 14)

Inactive aspartic acid $\text{C}_4\text{H}_7\text{NO}_4$ *S* 42 at 7°

Formation —1 By the action of boiling HCl on the product obtained by heating the acid ammonium salts of malic, maleic or fumaric acid —2 By heating an aqueous solution of the hydrochloride of active aspartic acid for several hours at 170° (Michael & Wing, *B* 17, 2984, *Am* 7, 278)

Properties —Monoclinic needles Converted by nitrous acid into inactive malic acid

Salts — PbA^+ — AgA^+ — $\text{H}_2\text{A}^+\text{HCl}$

Levo-aspartic acid $\text{C}_4\text{H}_7\text{NO}_4$ Obtained from dextro asparagine by treatment with HCl (Piutti, *B* 19, 1693) Levorotatory Its properties are the same as those of the dextrorotatory acid Combines with dextro acid to form an inactive modification

Additional References —Plisson, *A Ch* 40, 303, 45, 315, Boutron Chautard, *A Pelouze*, *A Ch* 52, 90, Liebig, *P* 31, 232, *A* 26, 125, 161, Wolf, *A* 75, 293, Piria, *A Ch* [3] 22, 160, Dessaignes, *C R* 30, 324, 31, 432, *A* 83, 83, *J Ph* [3] 32, 49, Pasteur, *A Ch* [3] 34, 30, *A* 82, 324, Pott, *J pr* [2] 6, 91, Radziszewski & Salkowski, *B* 7, 1050, Ritthausen & Kreussler *J pr* [2] 3, 314, Scheibler, *J Ph* [4] 4, 152 *B* 2, 296, Kreussler, *Z* [2] 6, 93

ASPHALT A natural product of the decomposition of vegetable substances It is found on the shores of the Dead Sea, also in a molten state in Trinidad, and as a mineral deposit at Seyssel It frequently impregnates other rocks When distilled with water, *petroleum* $\text{C}_{20}\text{H}_{42}$ (280°), *S G* 21 89, *V D* 95, passes over (Bous singault, *A Ch* [2] 64, 141, Voelckel, *A* 87, 139)

ASPIDOSAMINE $\text{C}_{22}\text{H}_{32}\text{N}_2\text{O}_2$ [c 100 $^\circ$] In quebracho bark (Hesse, *A* 211, 263) Turns yellow in air v e sol ether, chloroform, benzene or alcohol, v sl sol light petroleum, insol water Its alcoholic solution turns litmus blue, neutralises HCl and tastes bitter

Reactions —1 Solution of hydrochloride gives with FeCl_3 a brownish red colour —2 Conc H_2SO_4 gives a bluish solution —3 Conc H_2SO_4 and MoO_3 gives a blue liquid —4 Conc H_2SO_4 and $\text{K}_2\text{Cr}_2\text{O}_7$ gives a dark blue colour —5 Boiling aqueous HClO_4 gives a magenta colour

Platinchloride — $\text{B}^+\text{H}^+\text{PtCl}_6\text{3aq}$

ASPIDOSPERMATINE $\text{C}_{22}\text{H}_{32}\text{N}_2\text{O}_2$ [162 $^\circ$]

In quebracho bark (Hesse, *A* 211, 259) Crystalline v sol chloroform, alcohol, or ether In alcohol (97 p.c.) it turns litmus blue, has a bitter taste, and is levorotatory $[\alpha]_D^{20} = -72.3^\circ$ at 15° in a 2 p.c. solution

Reactions —1 HClO_4 gives a magenta colour 2 Conc H_2SO_4 and $\text{K}_2\text{Cr}_2\text{O}_7$ give no colour —3 FeCl_3 gives no colour

Salts —Dilute HCl is neutralised by aspidospermatine NaOH or NH_3 give in the solution a flocculent pp (m sol pure water) which soon becomes crystalline Salts are amorphous —(B^+HCl) PtCl_6 4aq

ASPIDOSPERMINE $\text{C}_{22}\text{H}_{32}\text{N}_2\text{O}_2$ [206 $^\circ$] $[\alpha]_D^{20}$ (alcohol) —100 $^\circ$, (chloroform) —83.6 $^\circ$, (dilute HCl) —62 $^\circ$ (in all cases 2 p.c. solution at 15°) *S* (alcohol) 2 at 14° , (ether) 74 at 14° (Wulfsberg, *Ph* [3] 11, 269) An alkaloid present (with others) in bark called in the Argentine Republic quebracho blanco or quebracho colorado (Fraude, *B* 11, 2189, Hesse, *A* 211, 251, Arata, *C J* 40, 622) Needles or pointed prisms (from alcohol or light petroleum) M sol alcohol, sl sol ether or light petroleum, v sol benzene or chloroform Levorotatory

Reactions —1 HCl and PtCl_6 give a blue pp —2 HClO_4 gives a magenta colour —3 Conc H_2SO_4 no colour —4 Conc H_2SO_4 and MoO_3 no colour —5 Conc H_2SO_4 and $\text{K}_2\text{Cr}_2\text{O}_7$ a brownish-red turning dark green —6 Salts give with

NH_3 , NaOH , Na_2CO_3 , or NaHCO_3 , a white flocculent pp becoming crystalline

Salts—Very unstable, even ether or CHCl_3 can partly decompose them— $\text{B}'\text{H}_2\text{PtCl}_4\text{aq}$

ASSAMAR A name given by Reichenbach (*A* 49, 3) to a bitter, deliquescent, transparent yellow solid which may be extracted by alcohol from toasted bread. It is insol ether. The same name was given by Volckel (*A* 85, 74) to a thick yellow neutral syrup obtained from the aqueous portion of the product of the distillation of cane sugar. It is sol ether. Both substances reduce aqueous AgNO_3 .

ASYMMETRIC CARBON A name applied to an atom of carbon that is united to four different atoms or radicles. All compounds that in the liquid state or in solution rotate light contain asymmetric carbon (Van 't Hoff, *La chimie dans l'espace*, Le Bel, *Bl* [2] 22, 337).

ATHAMANTA, OIL OF $\text{C}_{10}\text{H}_{18}$ (163°) SG 84. An essential oil obtained from the leaves of *Athamanta oreoselinum*. It forms a liquid compound with HCl (190°) (Schnedermann & Winckler, *A* 51, 436).

ATHAMANTIN $\text{C}_{24}\text{H}_{40}\text{O}$, [79°] In the root and seeds of *Athamanta oreoselinum*. Fibrous, silky crystals, or sometimes rectangular prisms, insol water, v sol alcohol and ether. It gives valeric acid on dry distillation. Aqueous acids and alkalis split it up into valeric acid and oreoselone $\text{C}_{14}\text{H}_{22}\text{O}_4$. Chloro, and tri nitro, athamantin are amorphous (Schnedermann, *A* 51, 315, Geyger, *A* 110, 359).

ATHEROSPHERMINE [128°] An alkaloid in the bark of *Atherosperma moschatum*. A greyish white powder with bitter taste. V sol water, m sol alcohol, sl sol ether. The solution of its hydrochloride gives pps with phosphomolybdic acid, picric acid, tannin, and PtCl_4 . It liberates iodine from iodic acid (Zeyer, *J* 1861, 769).

ATMOSPHERE The word *Atmosphere* ($\alpha\tau\mu\sigma\phi\acute{\alpha}\rho\alpha$, vapour, $\sigma\phi\alpha\iota\sigma\phi\acute{\alpha}$, a globe) in its most extended sense signifies the gaseous envelope which surrounds any liquid or solid body more commonly, however, it is taken to mean the invisible elastic fluid which surrounds the earth. A variety of phenomena, e.g. solar and terrestrial radiation, animal and vegetable life, weather, the disintegration of rocks and the formation of soils, the propagation of sound, &c., are dependent on the existence of a terrestrial atmosphere. The earth is not the only planetary body which possesses an atmosphere. The Sun, Jupiter, Mars, Saturn, have doubtless very dense atmospheres, but as yet we have no exact knowledge of their physical and chemical natures.

The phenomena of solar eclipses, and the facts that a single star seems to disappear instantly when it is occulted opposite the smooth part of the moon's limb, and that there is no change of colour or other effect such as a refractive atmosphere would occasion, make it certain that the moon's atmosphere, if it exists at all, must be of extreme tenuity. This conclusion is strengthened by evidence afforded by the spectroscope. It has been observed that the spectrum of the moon's light is identical with the solar spectrum and there is no trace of any absorptive action, moreover, it is found that

the spectrum of a star during its occultation disappears as suddenly as the star itself.

Wollaston's arguments as to the finite extent of the terrestrial atmosphere were deemed inconclusive even by his contemporaries. There is indeed direct evidence for the belief that air is present in a state of sensible density at much greater heights than 40 or 45 miles which was the limit Wollaston assigned. Liais, from observations on the phenomena of sunlight at Rio Janeiro, arrived at a superior limit of 200 miles, and Secchi, from observations on luminous meteors, calculated that air exists of appreciable density even at a height of 200 kilometres above the earth's surface. It is in fact probable that no actual limit exists. Up to the present it has been impossible to arrive at direct results other wise than by astronomical observations, as the law of the diminution of temperature which in great measure governs the extent of the repulsion among gaseous particles is unknown for the upper strata of the atmosphere. No arguments can be based on the finite expansibility of gases. Faraday's experiments on the limits of vaporisation of mercury have been controverted by Merget. It is obvious that the relative distribution of the mass of the air will be modified by the increase of attraction at the poles as compared with that at the equator, by the increase of temperature as we approach the torrid zone, and by the earth's motion.

The ponderability of air although suspected before the time of Aristotle was first conclusively demonstrated by Galileo, who found that a copper ball containing condensed air weighed more than when filled with air of ordinary tension. The weight of 1 litre of air, freed from aqueous vapour, carbonic acid, and ammonia, at 0°C, and under a pressure of 0.76 m. of mercury, at Paris (lat 48° 50'), and at a height of 60 m. above the sea level, was found by Regnault to be 1.293187 grams. According to Regnault 1 litre of oxygen at the normal temperature and pressure weighs 1.429802 grams, 1 litre of nitrogen under the same conditions weighs 1.256167 grams. If x be the volume of oxygen contained in 1 litre of air, and $1-x$ that of the nitrogen, then $1.429802x + (1-x) 1.256167 = 1.293187$, whence $x = 0.2132$ or in per cents 21.32, which is considerably higher than that found by eudiometric analysis. According to Magnus 1 litre of pure air at 0° and 76 m. weighs at Berlin (lat 52° 36') 1.29306 grams. Ph. v. Jolly found that at Munich (lat 48° 8', 515 m. above the sea's level) 1 litre of oxygen at 0° and 76 m. weighed 1.429094 grams, and 1 litre of nitrogen under the same conditions weighed 1.257614 grams. Reducing these numbers to the lat of Paris and to a height of 60 m. above the sea's level, they become

	Jolly	Regnault
Oxygen	1.429388	1.429802
Nitrogen	1.257873	1.256167

The *Bureau International des Poids et Mesures* adopts for the weight of 1 litre of dry air under a normal barometric height of 1 mm. and at the normal temperature τ

$$P_{76} = \frac{1.293052}{1 + 0.00367 + \frac{1}{760}}$$

on the assumption that the air contains .0004

parts of carbonic acid, and that 00367 is the coefficient of expansion of air at constant pressure for a normal degree

This expression is obviously only true for a particular ratio of oxygen and nitrogen. The composition of the air varies sufficiently to affect its value at different times (Ph v Jolly, W 6, 520)

The pressure exerted by the atmosphere upon the earth's surface, at the sea's level or upon any substance at that level, may be expressed by saying that it is equivalent to a barometric column about 76 centimetres (29.92 inches) high. Now at ordinary temperatures 1 cc of mercury weighs 13.58 grams. If we suppose that the base of the mercurial column is 1 sq centimetre it follows that the weight of the counterbalancing atmospheric column is $76 \times 13.58 = 1032$ grams. This is equivalent to 14.73 lbs upon a sq inch. It can be readily calculated that the total weight of the atmosphere of this average pressure is about $11\frac{1}{2}$ trillions of pounds, or $5\frac{1}{2}$ trillions kilos. Allowing for the space occupied by the land above the sea's level, the mass of the atmosphere may be taken as $\frac{1}{120000}$ part of that of the earth (Heischel)

The heights of the counterbalancing columns of air and mercury will of course be in the same ratio as the weights of equal volumes if it be assumed that the air is of uniform tension throughout. The height of this homogeneous atmosphere is between five and six miles: it was first calculated by Robert Boyle to disprove the conjectures of Kepler and others that the air could not extend beyond a couple of miles or so from the earth's surface.

As the air is an elastic fluid it follows from Boyle's law that its pressure must diminish as we ascend, hence the mercurial column stands lower on a mountain top than in the valley below. The fact that the barometric column is less on the top of an elevation than at the bottom was first noticed in 1643 by Claudio Bereguardi from observations on the tower of Pisa—that is, five years before Perrier made his famous experiments on the Puy de Dôme. The relation between the pressure and density of the air at different altitudes may be seen from the following table—

Metres above sea level	Bulk of air	Density	Barometer mm
0	1 cub metre	1	760
5,520	2 "	0.5	380
11,040	4 "	0.25	190
16,560	8 "	0.125	95
22,080	16 "	0.0625	47.5
27,600	32 "	0.0312	23.8

A pressure equivalent to the average pressure of the atmosphere at the level of the sea is frequently adopted by engineers and others as a *unit of pressure* and is styled an *atmosphere*. In this country an atmosphere is the pressure equal to 29.905 inches of mercury at 32° F at London, and is about 14.73 lbs on the sq inch. In the metric system it is the pressure of 760 mm (29.922 inches) of mercury at 0°C at Paris, and is equal to 1.033 kilos on a

sq centimetre. Hence the English 'atmosphere' is 0.99968 that of the metric system.

That the mercury in the Torricellian tube, or *barometer* as it was termed by Boyle, is constantly varying in height even at the same place, and that these variations are due to the fluctuating pressure of the atmosphere, appears to have been first clearly recognised by Descartes and by Boyle in 1658. It is, however, only within the last few years that we have acquired any very definite information respecting the distribution of the mass of the atmosphere over the earth. The pressure of the air at any given spot depends upon its relative position on the earth's surface—at this spot it varies also with the season of the year and the hour of the day. According to Buchan, whose isobaric charts are really the foundation of our exact knowledge of the subject, there are two broad belts of high pressure passing completely round the globe, one to the north and the other to the south of the equator. The southern belt of high pressure is nearly parallel to the equator, but the northern belt is more irregular in outline in consequence of the unequal distribution of land and water in the northern hemisphere. Between them is the low pressure of the tropical regions, through the centre of which is a narrow belt of still lower pressure towards which the north and south trades blow. A region of low pressure exists also round each pole—that round the north pole having two distinct centres, one in the north Atlantic, the other in the Pacific at each of these the diminution of pressure is much below the average of the north polar depression. As regards the seasons, it is found that in January the highest pressures are over the continents of the northern hemisphere, and the lowest pressures are over the northern portions of the Atlantic and Pacific, S America and S Africa, and the Antarctic Ocean. The maximum mean pressure at this time is found in Central Asia where it is 30.4 inches, the minimum is in the N Atlantic and round Iceland, where it is only 29.34 inches. The area of high pressure passes westwards through central and southern Europe, over the N Atlantic between the parallels of 5° and 45°, across N America (except to the North and North West), and over some portion of the Pacific. In July the mean pressure of Central Asia is only 29.468 inches—or one inch less than in January. The lowest pressures of the western hemisphere are now to be found over the continents, whilst the highest are over the ocean between 50° N lat and 50° S lat. Pressures are also higher at this time over S Africa and Australia.

Speaking generally, atmospheric pressure is more regular throughout the year over the ocean than over the land. To the westward of each continent there is at all seasons an area of higher pressure over the ocean than over the land, in amount varying from 0.1 to 0.3 inch. These regions of high pressure extend over about 80° of longitude and attain their maxima during winter. The prevailing winds and the general circulation of the atmosphere are intimately associated with these areas of high and low pressure. Winds, in fact, are caused by the flowing away of air from regions of high pressure to those of low pressure, in accordance

with Buys Ballot's law, which has been thus expressed by Buchan. 'The wind neither blows round the space of lowest pressure in circles returning on themselves, nor does it blow directly towards that space, but it takes a direction intermediate, approaching, however, more nearly to the direction and course of circular curves than of radii to a centre. More exactly the angle is not a right angle, but from 45° to 80° '.

The most important of the influences affecting atmospheric pressure during the months are temperature, and, as a secondary effect of temperature, humidity. By comparing the average pressure during the two months which exhibit the greatest divergence of temperature, viz January and July, Buchan finds the following general result.—The January pressure exceeds that in July over the whole of Asia except in the north east, the highest pressures being near the middle of the continent, over Europe to the south and east of a line drawn from the north of Russia to the south of Norway, thence to the north coast of Germany, across France to Bordeaux, along the north of Spain, and passing out into the Atlantic at Corunna, over N America except in the N East and N West. The July pressure exceeds that in January over the whole of the southern hemisphere, over the northern portion of the N Atlantic, and over the northern part of the Pacific. The pressure which is thus removed from Asia, Europe, and America in the northern hemisphere in July is transferred partly to the southern hemisphere, and partly to the more northerly portions of the Atlantic and Pacific Oceans.¹

At all places on the earth's surface where the alternation of day and night exists, the pressure of the atmosphere exhibits a remarkable diurnal variation. Generally speaking, the pressure is highest at about 9 A.M. and 9 P.M., and lowest at about 3 A.M. and 3 P.M., but the exact times vary somewhat with the locality and with the season of the year. The regularity of this variation within the tropics is so great that, as Humboldt remarked, the hour of the day may be approximately ascertained from the height of the mercurial column. This oscillation in atmospheric pressure is not confined to the sea's level; it takes place with equal regularity at heights of 13,000 feet. Within the tropics the oscillation amounts to about 2.2 mm., but as we approach the poles it decreases, until at 70° N lat it is only 0.3 mm. In our latitudes these horary variations are much less strongly marked than in the tropics, and are usually masked by climatic disturbances, but by comparing the results of a large number of observations, the fluctuation, which in these islands amounts to about 0.5 mm. on the mean of the year, can be clearly made out. In Paris eleven years' observation shows that the mean barometric oscillation amounts from 9 A.M. to 3 P.M. to 0.756 mm., and from 3 P.M. to 9 P.M. to 0.373 mm. The amount of the diurnal variation differs during the seasons of the year, being greater in summer

than in winter. This peculiar phenomenon has given rise to much discussion, but as yet the cause cannot be said to be satisfactorily determined. Unlike the oceanic tide, it cannot be ascribed to the influence of the moon, since Bouvard has shown that the portion of the horary oscillation of the pressure of the atmosphere which depends on the attraction of the moon cannot raise the mercury in the barometer at Paris more than 0.018 mm., whilst the total variation deduced from the 11 years' observation amounts to 1.129 mm. The fact that the two maxima of pressure occur when the temperature is about equal to the daily mean, and the two minima when the temperature is at its highest and lowest, has led to the supposition that the fluctuations in pressure are connected with the daily march of temperature, and also with the humidity of the air. Dove, Sabine, and Hopkins have offered explanations based on such connections, but they are insufficient to account for the facts. Lamont and Brown have sought to refer the phenomenon to the magneto electric influence of the sun, or in other words to connect it with the cause of the diurnal changes in terrestrial magnetism. There is every reason for supposing that the cause of the diurnal variation in atmospheric pressure is in some way dependent on, or originates with, the sun, but that its effects are greatly modified by a variety of local or accidental circumstances, as for example the prevailing winds, the amount of moisture in the air, and the relative distribution of land and water.

The atmosphere appears to receive its heat (1) from the direct rays of the sun, (2) by the reverberation of those rays from the surface of the earth, (3) by contact with the ground, and (4) through the influence of aqueous vapour.

Although the air is not absolutely diathermanous, the heat received by the air from the direct rays of the sun is the least important of the sources enumerated. We know very little at present as to whether the diathermancy of air varies with its density; that is, we have little evidence to determine whether the absorption of the sun's rays increases as they pass further into an atmosphere compressed by its own weight.

The greater portion of the heat which finds its way into the atmosphere is due to radiation from the earth's surface and to the air being in contact with the ground. The amount of heat thus sent into the air depends to a great extent on the nature of the soil which receives the solar radiations and on its capacity for retaining heat. Hence places in the same latitudes and not very far distant from each other, and in the same condition as regards protection, may have very different mean temperatures on account of the different capacities of various soils for absorbing and retaining heat.

Aqueous vapour is one of the most important agents in modifying the temperature of the atmosphere. A relatively large amount of heat is rendered latent in the process of evaporation from the surface of the earth, and becomes sensible on the condensation of the vapour in the upper regions of the air. Aqueous vapour also acts even when in the condition of a perfect gas

¹ For further details see Buchan, 'The mean pressure of the Atmosphere and the prevailing Winds over the Globe for the Months of the Year' (*TE* 25) also Julius Hann's *Erdkunde*, and R. H. Scott's *Elementary Meteorology*.

by retarding the transmission of the sun's rays through the air. As the quantity of aqueous vapour decreases as we ascend through the atmosphere, it follows that the amount of this absorption increases as the sun's rays penetrate further into the atmosphere.

The temperature of the atmosphere varies with a multitude of causes, such as the latitude, the season of the year, the hour of the day, the degree of humidity, &c. Among the causes which tend to raise the temperature of the air may be enumerated the proximity of a western coast in the temperate zone, the divided configuration of a continent into peninsulas with deeply indented bays and inland seas, the aspect or position of a portion of the land with reference either to a sea of ice spreading far into the polar circle, or to a mass of continental land of considerable extent lying in the same meridian, either under the equator or at least within a portion of the tropical zone, the prevalence of southerly or westerly winds on the western shore of a continent in the temperate northern zone, chains of mountains acting as protecting walls against winds coming from colder regions, the infrequency of swamps which in the spring and beginning of summer long remain covered with ice, and the absence of woods in a dry sandy soil, finally the constant serenity of the sky in the summer months, and the vicinity of an oceanic current bringing water which is of a higher temperature than that of the surrounding sea.

On the other hand, the following causes lower the temperature of the air of a place: elevation above the level of the sea, when not forming part of an extended plain, the vicinity of an eastern coast in high and middle latitudes, the compact configuration of a continent having no littoral curvatures or bays, the extension of land towards the poles into the regions of perpetual ice without the intervention of a sea remaining open in the winter, a geographical position in which the equatorial and tropical regions are occupied by the sea, and consequently the absence under the same meridian of a continental tropical land having a strong capacity for the absorption and radiation of heat, mountain chains whose form and direction impede the access of warm winds, the vicinity of isolated peaks occasioning the descent of cold currents of air down their declivities, extensive woods which hinder the insolation of the soil by the vital activity of their foliage, which produces great evaporation owing to the large surface it exposes, and increase the surface that is cooled by radiation, acting consequently in a threefold manner—by shade, evaporation, and radiation, the frequency of swamps or marshes which in the north form a kind of subterranean glacier in the plains lasting till the middle of summer, a cloudy summer sky which weakens the action of the solar rays, and finally a very clear winter sky favouring the radiation of heat (*Humboldt Recherches sur les Causes des Inflexions des Lignes Isothermes*. See also Mohn's *Grundsätze der Meteorologie*).

The temperature of the air varies in different strata of the mass, decreasing generally after a certain elevation in proportion as the distance

from the earth's surface increases, but it is not possible to connect the diminution in temperature with the elevation in accordance with any definite law. It is usually assumed that the temperature falls about 1°C for every 300 feet of perfectly dry air. As, however, the air invariably contains moisture, which is condensed by cooling and so produces heat, the decrement may be taken practically at about 1°C for every 500 feet. This estimate can only be taken as an extremely rough approximation, for it is obvious that the rate of cooling must be affected by a great variety of causes. Indeed the extensive series of aeronautical observations made at the instance of the British Association showed such great irregularities in the rate of diminution that Mr Glaisher concluded that no law exists.

The atmosphere always contains free electricity, which is generally positive, that is, of an opposite kind to that of the earth. Atmospheric electricity increases rapidly after sunrise, and reaches its first maximum for the day at about 8 A.M. In general the variation in potential follows the diurnal range of atmospheric pressure. In summer the hours of maxima appear to be 8 A.M. and 10 P.M. and the minima 4 A.M. and 4 P.M. In winter the hours of maximum intensity are 9 A.M. and 10 P.M. and the minima 4 A.M. and 4 P.M. This diurnal variation seems to depend mainly on the degree of humidity of the air, the humid months manifesting the greatest potential. The potential seems to increase from July to January, and then to decrease. According to Everett, the maxima occur in February and October, and the minima in June and November.

In clear weather the air is usually positively electrified, it is only during rain, or more properly speaking when rain begins, that the electricity is negative. On the approach of a storm the air is almost invariably negatively electrified, even when the storm clouds are at a considerable distance from the place of observation. When rain begins, the drops show negative electricity like the air. In light rain the potential is moderate, but heavy rain is almost invariably accompanied by a high potential. Dellmann's observations have shown, however, that the air may have a very high potential, extending over many days, without any other evidences of an approaching storm.

The sources from which the electricity of the atmosphere is derived are not clearly recognised. De la Rive attributed it mainly to chemical action at work on the earth, Pouillet to the evaporation of water, Volta and Saussure to the inequalities of atmospheric temperature. In all probability atmospheric electricity is not wholly due to any one of these causes; they may all be regarded as contributing to the amount.

The sun's light in its passage to the earth is partially absorbed and reflected by the atmosphere. Clausius has calculated that of the direct sunlight entering the atmosphere on a clear day 64 p.c. is absorbed, 186 is reflected and diffused, leaving therefore 75 p.c. to reach the earth. This light is, of course, refracted in its passage in amount depending upon the density of the air. Each ray entering the atmosphere otherwise than perpendicularly may be

supposed to describe a curve in coming to the earth, and as objects are seen in the tangent of the curve on entering the eye, all celestial bodies not in the zenith appear further removed from the horizon than they actually are

The refractive power of dry air free from carbonic acid is the mean of the refractive powers of the oxygen and nitrogen under the pressure which each gas exerts in the mixture. This fact furnishes a proof of the physical nature of the atmosphere, since, as Dulong has shown, the refractive power of a compound gas is not equal to the refractive powers of its components, but is sometimes greater and sometimes less. Moist air is rather less refractive than dry air. Precipitated vapour, as mist or fog, slightly increases the refractive power.

Although many of the more striking physical properties of the air were recognised even in the earliest ages, it is only within comparatively recent time that anything very definite has been known concerning its chemical nature.

It had long been observed that many metals on exposure to fire lost their peculiar lustre, and it was also known that by the prolonged action of heat they were ultimately converted into calces or earthy powders often possessing characteristic colours. The fact that the calx weighs more than the metal from which it was derived was known to Geber, and was well understood by the alchemists of the 16th century. Cardan (1506-1576) in noticing the increase of weight which accompanies the calcination of lead, says that it is due to a gas (*flatus*) which feeds flame and rekindles a body presenting an ignited point, and Cesalpinus in the *De Metallicis* (published at Nuremberg in 1602) also states that the 'crasse' which forms on the surface of lead exposed to heated air contains an aerial substance which increases the weight of the metal. Rey of Perigord seems to have first clearly recognised that the augmentation in weight was due to the action of the air. 'Je responds et soutiens glorieusement que ce surcroît de poids vient de l'air qui dans le vase a été épaissi.' Hooke in 1665 asserted that air contains a principle analogous to if not identical with that contained in nitre, and he seems to have believed that a certain portion only of the air is required to support combustion and respiration. The conception of the complex nature of the air was greatly strengthened by the observations of Mayow on respiration. His experiments are so precise and his facts so incontestable that, to quote Chevreul, one is surprised that the truth was not fully recognised until a century after his researches. Boyle also considerably extended our knowledge of the physical and chemical constitution of the air in the various treatises which he published between 1672 and 1692.

Two years after the sagacity of Rutherford had demonstrated the existence of nitrogen, Priestley obtained oxygen gas by heating the calx of mercury or red precipitate. The significance of this discovery in its relation to the constitution of the air and true nature of calcination was first clearly and irrefragably demonstrated by Lavoisier. By heating mercury in contact with a measured volume of air, he showed that about one fifth of the volume of

the air is absorbed by the metal with the formation of 'red precipitate,' from which the gas can be recovered by heating to a still higher temperature, and that the remaining four fifths had all the properties of the 'mephitic air,' or nitrogen, of Rutherford. This experiment not only demonstrated the compound nature of the air and the character of its constituents, but it also showed approximately the relative quantities in which these constituents were present. It was of course quickly recognised that the active properties of air depended upon oxygen, and it was reasonable to assume that the relative amount of this gas determined the quality of air, hence arose the art of eudiometry. Priestley, who discovered nitric oxide in 1772, had observed that this gas became red in contact with the air and that the ruddy gas, unlike nitric oxide, was readily soluble in water. When it was subsequently ascertained that the formation of the soluble red gas was due to the action of oxygen on the nitric oxide, the idea of basing a eudiometric method upon this reaction was suggested by Priestley. Careful experimenters were, however, unable to distinguish air which was reputed to be unhealthy from that which experience had proved to be beneficial and salubrious. Thus, in Priestley's hands, air from the country seemed no better than that obtained from the worst ventilated workshops of Birmingham. Cavendish, after a critical examination of the method, made numerous analyses of air. 'During the last half of the year 1781,' he says, 'I tried the air of near sixty different days in order to find whether it was sensibly more phlogisticated at one time than another, but found no difference that I could be sure of, though the wind and weather on these days were very various, some of them being very fine and clear, others very wet, and others very foggy. On the whole, there is great reason to think that the air was in reality not sensibly more dephlogisticated on any one of the sixty days on which I tried it than the rest.' Cavendish devised a scale of graduation applicable to all nitric oxide eudiometers, by means of which the late Dr Wilson calculated that the mean of his results furnished the following numbers, expressing the centesimal composition of the air by volume:

Oxygen	20 833
Nitrogen	79 167
	100 000

Cavendish concludes his account of these observations by pointing out the character of the information furnished by the eudiometer. Etymologically the name was without significance. 'In so far as the instrument takes cognisance of the impurity of the atmosphere, it betrays no difference between one specimen of air and another, so that, apparently, there are no degrees of goodness to be measured. Thus it may be inferred that our sense of smelling can, in many cases, perceive infinitely smaller alterations in the purity of the air than can be perceived by the nitrous test' (Cavendish, 'Account of a New Eudiometer,' *T* 1783).

These conclusions were confirmed by Humboldt and Gay Lussac in their celebrated

memoir on the composition of the air, published in 1804. They employed the eudiometric method of Volta, *i.e.* explosion with hydrogen, and from an extensive series of analyses made on air collected in the most variable weather they concluded that 100 vols of air contained 21 of oxygen and 79 of nitrogen.

The constant proportion of the two principal constituents of the atmosphere appeared now to be so well established that many chemists, after the recognition of the atomic theory, were inclined to think that air was a definite compound of oxygen and nitrogen. The two main constituents of the air are, however, not present in the simple ratio demanded by the law of Gay Lussac. There is no evidence of chemical combination on mixing oxygen and nitrogen in the proportion in which these gases are present in air: the properties of the mixture are identical with those of air and are such as might be predicated to result from such a mixture. Moreover, oxygen and nitrogen can be isolated from air by mechanical means, or by taking advantage of the different intestinal movements of the gases. Graham separated the gases by atmolysis, and Bunsen demonstrated that the two gases were absorbed by solvents on which they exerted no chemical action in exact accordance with the law of partial pressures. Lastly the more accurate eudiometric processes of the last forty years have shown that the proportion of oxygen to nitrogen even in so called normal air is not absolutely constant. This fact was first clearly demonstrated by Bunsen in a series of analyses made during January and February 1846, he found that the percentage amount of oxygen varied from 20.97 to 20.84 by volume, *i.e.* a difference of 0.13 p.c., whereas the error of experiment never exceeded 0.3 p.c. Even wider variations were found by Regnault in the course of a long series of analyses made on air collected in different parts of the world. In more than 100 analyses of air taken at various times of the year in and about Paris the lowest quantity of oxygen found was 20.913 and the highest 20.999, an extreme difference of 0.086, the experimental error being 0.02 p.c. Air collected from different parts of Europe, from valleys and from the tops of mountains and during different seasons of the year, showed variations in the amount of oxygen from 20.903 to 21.01 p.c.

Angus Smith found similar differences in London air in the course of numerous analyses made during 1869, the percentage amount of oxygen varied between 20.857 and 20.95. That these variations are due to local or accidental causes in the case of a town is established by the circumstance that the air in the streets is almost invariably poorer in oxygen than the air of the parks and open spaces. As types of normal air, Angus Smith found the following means of numerous analyses of air in Scotland (1868-5)

	Oxygen
Seashore and the heath	20.999
Tops of hills	20.98
Not mountainous	20.978
Forests	20.97

In marshy places the oxygen sank as low as 20.922.

In Glasgow, in a series of 80 analyses the oxygen varied from 20.889 in the closer parts to 20.929 in the more open places. A. R. Leeds found that the air of New York showed variations from 20.821 to 21.029 p.c., and lastly Jolly found that air in Munich freed from carbonic acid and aqueous vapour varied in weight as much as 9 mgm per litre, this variation depending upon the direction of the wind. By eudiometric measurement he obtained variations from 20.53 to 21.01 p.c. Southerly winds as a rule showed a relatively low percentage of oxygen. According to E. W. Morley these deficiencies in the relative amount of oxygen are to be attributed to the down rush of air poorer in oxygen from the higher regions of the atmosphere. It was conjectured by Dalton and Babinet that air in the upper strata of the atmosphere contained relatively less oxygen than that immediately above the earth.

From Regnault's observations it would seem that sea air contains slightly less oxygen than land air. The mean of 17 samples collected in the Arctic seas was 20.91, the extremes being 20.91 and 20.85. The mean of all the samples collected at sea was 20.84, in a series of twenty only five showed amounts of 20.96 and upwards. On the other hand, the observations of Levy indicate that sea air differs but little in composition from land air, but that in the tropics it experiences close to the sea a diurnal variation in the amount of oxygen and carbonic acid, due to the action of the sun's heat in disengaging these gases from the water. Subsequent experiments on the composition of air over the sea have not confirmed these observations so far as the carbonic acid is concerned (*vide infra*).

We have comparatively little information in regard to the relative quantities of the constituents of the air at great heights. Such experimental evidence as exists seems to indicate that air contains relatively less oxygen in the higher strata than near the surface of the earth.

Very little is known respecting the proportion of ozone in the atmosphere, or of the circumstances which influence its production. The ozonometric methods hitherto devised are in capable of affording accurate quantitative estimations. Air over marshes or in places infested by malaria contains little or no ozone. No ozone can be detected in towns or in inhabited houses.

Houzeau (*A. Ch.* [4] 27, 5) determines the relative amount of ozone in the air by exposing strips of red litmus paper dipped to half their length in a 1 p.c. solution of potassium iodide. The paper in contact with ozone acquires a blue colour from the action of the liberated potash upon the red litmus. The iodised litmus paper is preferable to iodised starch paper (Schönbein's test paper) which exhibits a blue coloration with any reagent which liberates iodine, *e.g.* nitrous acid, chlorine, &c. From observations made with iodised litmus paper Houzeau concludes that ozone exists in the air normally, but the intensity with which it acts at any given point of the atmosphere is very variable. Country air contains at most $\frac{1}{10000}$ of its weight or $\frac{1}{750000}$ of its volume of ozone.

The frequency of the ozone manifestations varies with the seasons, being greatest in spring, strong in summer, weaker in autumn, and weakest in winter. The maximum of ozone is found in May and June, and the minimum in December and January. In general ozone is more frequently observed on rainy days than in fine weather. Strong atmospheric disturbances, as thunder storms, gales, and hurricanes, are frequently accompanied by great manifestations of ozone. According to Houzeau atmospheric electricity appears to be the most active cause of the formation of atmospheric ozone.

The existence of *hydrogen peroxide* in air was first established by Meissner in 1863, but we have no knowledge of the proportion in which it is present. All information as to its relative distribution is obtained from determinations of its amount in rain water and snow. The proportion seems to vary, like that of ozone, with the seasons of the year and with the temperature of the air. It is not improbable that the amount of hydrogen peroxide in air is greater than that of ozone, and it is possible that many so called ozone manifestations are in reality due to peroxide of hydrogen (*v* Houzeau, *C R* 76, 491, Schönbein, *J pr* 106, 270, Meissner, *J* 68, 181, Schöne, *B* 12, 346, 13, 1503).

The amount of *aqueous vapour* in the air is subject to great variations. It depends principally upon the temperature, on the distance from the equator, and on the level of the sea, on the form in which the aqueous vapour is precipitated, on the connexion between such precipitations and the change of temperature, and on the direction and succession of winds. The air is rarely saturated with aqueous vapour. In our moist climate saturation is sometimes very nearly attained, but in some parts of Central Asia, Russia, and Africa, extraordinary degrees of dryness have been noticed. In these islands the most humid month is January, and the dries is May.

The existence of *carbonic acid* in the atmosphere was first inferred by Dr Macbride of Dublin, in 1764, from the observation that quicklime after exposure to the air effervesced on treatment with an acid. From the ease with which determinations of its amount may be effected our knowledge of the distribution of atmospheric carbonic acid and of the causes which affect its proportion is probably more precise than in the case of any other constituent of the air. In fresh country air the amount is remarkably constant, and may be stated as about 0.34 p.c. In large towns and cities it is usually greater, thus Angus Smith, from numerous analyses made in London during November 1869, found as a mean 0.44 p.c. in upwards of 70 analyses the proportion fell below 0.4 p.c. on only 5 occasions. In Glasgow, Smith found on an average 0.5 p.c. The amount will of course be affected by any circumstances which interfere with the rapid diffusion of the carbonic acid produced by respiration and the combustion of fuel; hence during fogs the proportion is very greatly increased, an amount as high as 0.1 p.c. having been occasionally noticed. Smith gives the following summary of results obtained in Manchester (*Air and Rain*, p. 52)

	For cent.
In Manchester streets in usual weather	0.408
During fogs	0.679
Where the fields begin	0.369

In country air the amount of carbonic acid is invariably greater at night than during the day. This remarkable diurnal variation was first pointed out by Saussure (*P* 19, 391), and has been fully confirmed by subsequent observers. Thus, as the mean of numerous analyses made at Clermont Ferrand, Truchot (*C R* 77, 675) obtained during the day 0.353, and during the night 0.403 (*v* also G. F. Armstrong, *Pr* 1880 343, and Muntz & Aubin, *C R* 92, 1299). These differences are mainly due to the exhalation of carbonic acid from plants at night. In the air of towns, and in the absence of vegetation, no such diurnal variations can be detected.

The amount of carbonic acid in the air is not sensibly altered by rain; this indeed would follow from the law of partial pressure. Over the sea the amount of carbonic acid is about 0.3 p.c., and, contrary to the statement of Lewy, no diurnal variation in the amount can be perceived (Thorpe, *C J* [2] 5, 189). Schulze (*Landw. Versuchs St* 14, 866) obtained similar results with sea air at Rostock; the mean of a large number of observations made from 1868 to 1871 was 0.292 p.c. No definite change in the amount was observed at different seasons of the year or at different times of the day. Fog and also a fall of snow were often associated with an increase of carbon dioxide (*v* also Fittbogen & Hasselbarth, *C C* 1874 694).

Very little is known concerning the distribution of carbonic acid in the higher strata of the atmosphere. According to Saussure and Schlägenter the amount of carbonic acid on the mountains is greater than on the plains. Truchot however found only 0.203 on the top of the Puy de Dôme (1446 m), and 0.172 on the Peak of Sancy (1884 m), as against 0.313 at Clermont Ferrand. Additional observations are required.

The existence of *nitric acid* in the air was first inferred by Priestley. The amount, however, is so small that it can only be detected in rain-water. Nitroxigen compounds are occasionally produced during thunder storms, and it is said that the rain collected during a storm often contains notable quantities of nitrous and nitric acids. Boussingault found that a million parts of rain water contained 0.83 parts of nitric acid. Reichardt found in hail stones collected during a thunderstorm 0.526 parts per million.

According to Barral each hectare at Paris receives annually from the rain about 63.6 kilos of combined nitric acid. Bineau found that 1 litre of rain water at Lyons contained in winter 0.3 mgm nitric acid, in spring 1.0, in summer 2.0 mgm, and in autumn 1.0 mgm. Bobierre found that a cubic metre of rain-water collected at Nantes in 1863 contained on an average 7.36 grams in the upper part, and 5.682 grams in the lower part, of the town (*C R* 1864, 755). Angus Smith (*Air and Rain*, p. 287) obtained the following results from a large number of observations on rain-water.

	Nitric acid (pta. per million)
Scotland inland country places . . .	0 305
Ireland—Valentia . . .	0 370
England—sea coast country places . . .	0 371
Scotland " " country places, west . . .	0 372
" " " " east . . .	0 476
" " " " average . . .	0 424
Liverpool . . .	0 582
England inland country places . . .	0 749
London 1869 . . .	0 840
England towns . . .	0 863
Manchester mean of 1869 and 1870 . . .	1 032
Scotland towns (Glasgow excluded) . . .	1 164
Glasgow . . .	2 436

The amount of nitric acid in the rain-water of towns is uniformly greater than in rain water collected in the country, from which we infer that much of the nitric acid in the air is due to the oxidation of ammonia derived from the decomposition of nitrogenous organic matter.

The ammonia in the air exists partly as carbonate, partly as nitrate and nitrite, ammonia itself being converted into nitrous and nitric acids and water by ozone. Scheele observed that a bottle containing hydrochloric acid became coated near the stopper with a film of sal ammoniac on exposure to the air. A piece of pipe clay heated to redness and exposed to the air for a few days yields a perceptible amount of ammonia when reheated; this is not the case if the clay is kept in a stoppered bottle.

The quantity of ammonia contained in the air is extremely variable; the results on record differ from 135 to 0.1 of ammonia (calculated as carbonate) in 1,000,000 parts of air. Fresenius found that a million parts by weight of air contained during the day 0.098 parts of ammonia, and during the night 0.169 parts. According to H. T. Brown the amount ordinarily present is much larger than this: a million parts of country air at a height of 2 metres from the ground contained from 5.1 to 6.08 parts, the same amount of town air contained from 4.06 to 8.73 parts of ammonium carbonate (*Pr* 18, 286). Direction of wind appears to have no influence on the amount. The quantity decreases after heavy rain but is restored to the normal amount (about 6 pts in 1,000,000) in a few hours. Truchot (*C R* 77, 1159) found from 0.93 to 2.79 mgm per cubic metre in the air of Auvergne, the highest results being obtained on misty days and the lowest on clear days. From observations made on the Puy de Dôme, Truchot concludes that the quantity increases with the elevation and is greater in cloudy than in clear air. On the other hand, Muntz and Aubin (*C R* 95, 788), from observations made on rain water, find that the upper strata of the air contain much less ammonia than air near the surface of the earth. Nitric acid also was entirely absent from rain water collected at an elevation of 2877 m. Lewy (*C R* 91, 94) finds that the air in summer contains invariably larger quantities of ammonia (2.8 mgm NH_3 in 1000 c.m.) than in winter (1.7 mgm in 1000 c.m.).

The proportion of ammonia contained in rain water is as might be expected subject to equally wide variations. Lawes and Gilbert found that 1,000,000 pts of rain water collected

in the country contained from 0.927 to 1.142 pts of ammonia. Water collected in towns always contains much larger amounts than that collected in the country. Barral found that 1,000,000 parts of Paris rain water contained 8.49 pts of ammonia. Angus Smith obtained 1.07 pts of ammonia in the rain water of inland country places in England, whereas the water collected in the inland country places and more sparsely populated districts of Scotland contained only 0.53 pts of ammonia per million. The rain water of London contained 8.45, that of Liverpool 5.38, that of Manchester 6.47, and that of Glasgow 9.10 parts per million. The larger proportion in the cities is due to the influence of animal life and to the constant presence of azotised organic matter in the air of thickly populated districts. Dews and fogs and snow always contain larger quantities of ammonia than rain water. (For references, see Angus Smith, *Air and Rain*.)

In addition to these substances—oxygen, nitrogen, carbon dioxide, ozone, water vapour, ammonia, and nitrous and nitric acids—which are the essential and necessary constituents of atmospheric air, it frequently contains a variety of accidental substances such as common salt, alkaline sulphates, and organic matter dead and living, derived from the proximity of the sea and of marshy districts, or to the influences of towns. Moscati nearly 80 years ago observed that the dew condensed on bottles filled with ice and suspended over the rice fields of Tuscany, when collected quickly became putrescent and deposited flakes of a body containing nitrogen, and similar appearances were noticed by Rigaud de Lisle in 1812 in the dew collected in the marshes of Languedoc. The water deposited flakes of nitrogenised organic matter and gave with silver nitrate a precipitate which became immediately purple (Compare A. H. Smeë, *Pr* 20, 442). Vogel also observed that the moisture condensed on cold surfaces in inhabited rooms quickly became putrid owing to the presence of organic matter resembling albumin. Angus Smith found that the moisture condensed from breath after standing for some time formed a thick glutinous mass, which was seen under the microscope to be a closely matted confervoid growth. Between the stalks of the confervæ a number of greenish globules were to be seen in a state of constant movement, also various species of volvox accompanied by monads many times smaller. As far back as 1722, Loewenhoeck (*Opera omnia*, vol. 1, 1722) showed that rain water, even when recently collected, contained infusoria derived apparently from the air. Similar observations were made by Ehrenberg and Gaultier de Claubry (*C R* 41, 645). The first attempt to throw light upon the question of the relative distribution of the organisms present in air was made by Pasteur, by subjecting certain putrescible solutions to the action of the air obtained from various localities.

Tyndall (*Les Microbes*, Paris, 1882) has shown that the micro organisms contained in air are rapidly deposited in the absence of any strong aerial currents. Upon this fact Hesse (*Mittheilungen aus dem kaiserlichen Gesundheitsamte*, Berlin, 1884) has based a method for quantitatively estimating the relative pro-

portion of micro organisms in air The method consists in aspirating air through wide-mouthed glass tubes, coated internally with gelatine-peptone, prepared according to Koch's method, which is afterwards kept at a temperature of 20°-26° for a few days, when the organisms which have been arrested—consisting of the various monads, bacilli, and micrococci, capable of development and growth in the nutrient gelatine—are recognised by the colonies to which they give rise. By means of this method Dr Percy F Frankland has made a number of estimations of the micro organisms contained in the air of towns, and in the country, and in inhabited buildings. By simultaneously exposing small circular glass dishes partially filled with the nutrient gelatine to the action of the air, a rough estimate was obtained not only of the number of micro organisms in a given volume of the air, but also of the number which fell during a given time on a definite horizontal area. As the mean of a series of observations made on the roof of the South Kensington Museum between Jan and June 1886, it was found that there were 35 organisms in 10 litres of air, whilst 279 was the average number which fell in 1 sq ft in 1 minute. Similar experiments made near Reigate and in the vicinity of Norwich showed an average of 14 organisms in 10 litres of air, whilst 79 fell per sq ft per minute. Experiments made in Kensington Gardens, Hyde Park, and on Primrose Hill, gave an average of 24 organisms in 10 litres, and a deposition of 85 per sq ft per minute. At St Paul's Cathedral, 56 organisms were found at the base, 29 in the Stone Gallery, and 11 in the Golden Gallery, in 10 litres of air. At Norwich Cathedral 18 at the base, 9 at a height of 180 ft, and 7 at 300 ft. In inhabited buildings great variations were observed, as a rule the number of micro organisms was less than that found in the open air when the air of the room was undisturbed, but rose rapidly when the air was set in motion by draughts or by the presence of many people (P F Frankland, *Pr* 40, 509).

Angus Smith has sought to base a system of chemical climatology on the examination of rain water collected under different conditions and at various places. Rain falling through the air over the sea always contains common salt and sulphates, the latter in larger proportion to the chlorides than is found in sea water. The sulphates increase inland they seem to be a measure of the products of decomposition, the sulphuretted hydrogen which is evolved in the putrefaction of certain organic compounds being oxidised in the atmosphere. In large towns, the amount of the sulphates is greatly increased owing to the combustion of coal containing iron pyrites. Indeed the rain water of large towns is frequently acid from the presence of free sulphuric acid. When rain contains 40 parts per million of free acid, vegetation is rapidly affected. The following analyses by Angus Smith will serve to show the general character of the rain-water (and therefore of the impurity of the atmosphere) in various parts of Great Britain. The results, which are the mean of many experiments, are expressed in parts per million of rain water

Although the atmosphere is subject to continual change from a multitude of causes, such as the respiration of animals and plants, the combustion of organic matter, various processes in the arts &c, still from its immense mass and uninterrupted motion such changes have only the very slightest effect on its composition. Let us very briefly consider the chief circumstances which tend to influence the proportion of its components.

Nitrogen is undoubtedly a primitive substance no other body occurs in such large quantities as an element. This gas is probably the source of all nitrogenous bodies, in the formation of which it is continually abstracted from the air. A portion only of the nitrogen so abstracted finds its way back to the air as such the most considerable compensating influence known to us is the nitrogen evolved by volcanoes.

By the respiration of animals and the oxidation of the spent portions of their tissue, by the respiration of plants at night time, and by the combustion of fuel, large quantities of carbonic acid are being continually added to the atmosphere. Enormous quantities also are evolved from volcanoes and other subterranean sources. Poggendorff has indeed calculated that the amount so added is at least ten times as much as is derived from all other sources put together. Taking the weight of carbonic acid in the air as 0.6 per cent, it can be calculated from the area of the terrestrial oblate spheroid that the weight of the carbonic acid in the atmosphere is about 3,223,000 × 10 kilos (Le Conte, *P M* [5] 15, 46, v also E H Cook, *P M* [5] 14, 387). At least 50,000 million kilos of carbonic acid are daily added to the air. The main compensating influence is of course the action of growing plants in sunshine, carbon dioxide is also removed directly and indirectly by zoophytes and by certain chemical actions such as the conversion of felspar into kaolin, &c. Sterry Hunt ('Chemical and Geological Relations of the Atmosphere,' *Am S* 1880) has calculated that a weight of carbonic acid equal to more than twenty-one times that of our present atmosphere would be absorbed in the production from orthoclase of a layer of kaolin extending over the earth's surface with a thickness of 500 metres, an amount representing

but a small proportion of the results of fel spathic decay in the sedimentary strata of the globe

Dumas and Boussingault, in their well known memoir on the *Composition of the Air* (A Ch [3] 8) made some interesting calculations on the duration of the supply of atmospheric oxygen. They found that, taking all the known sources of diminution, and assuming that the oxygen disengaged by plants compensates only for the causes of diminution at present unknown, then even in this exaggerated case three times the amount of oxygen thus abstracted would only amount in 100 years to about $\frac{1}{1000}$ of the total quantity, an amount barely appreciable by our most exact eudiometric methods.—T E T

ATOMIC AND MOLECULAR WEIGHTS—

Two theories regarding the ultimate constitution of matter have opposed each other from the beginnings of philosophy, one asserts that any mass of apparently homogeneous matter is really homogeneous, the other affirms that every portion of matter of sensible size is built up of a vast number of small particles which are not themselves capable of further subdivision. The earliest exponent of the second theory of whom we possess any definite record was the Greek philosopher Democritus, who flourished about 450 B C. The doctrines of Democritus were developed by Epicurus, and the teachings of the Epicurean philosophy are preserved in the Latin poem of Lucretius (B C 99-55). These early atomists tried to assign to the atoms, of which they said matter is composed, only such properties as should suffice for their presentation in time and space. They taught that nothing exists save atoms and empty space, that the atoms or 'first beginnings,' are of many different forms, and different weights, and the number of atoms of each form is infinite, that all change is only combination or separation of atoms, and that the atoms are in constant motion. To meet the objection that if a mass of matter is at rest the parts of it cannot be in motion, Lucretius uses the illustration of a flock of grazing sheep with skipping lambs, to one looking from a distance the flock appears as a white motionless patch on the green hillside, but a closer view shows that the parts of the flock are continually changing their positions. Every atom, Lucretius asserts, is indestructible, and its motion is indestructible likewise, if this were not so how could we account for the preservation of fixed types in nature? Roses always bear roses, and each animal reproduces its like, because the 'first beginnings' (or atoms) of which each is composed are the same and are never destroyed or worn out. 'First-beginnings are of solid singleness, and in no other way can they have been preserved through ages during infinite time past in order to reproduce things.' Here we see how clearly the early atomists recognised that every event in nature occurs in accordance with strict laws. Nothing happens by chance, was a fundamental doctrine of these philosophers. 'I teach

by what law all things are made, what necessity there is then for them to continue in that law, and how impotent they are to annul

the binding statutes of time.' The way to gain a knowledge of the laws of nature, Lucretius teaches, is to examine natural events. (See for instance the analysis of the effects of the thunderbolt in Book vi 323-398.) The differences between a hard body such as iron, and a soft body such as air, depend, according to Lucretius on the motions of the atoms of the two bodies, in the hard body the atoms move to and fro within very small distances, in the soft body they move freely and rebound from each other only at comparatively long intervals. 'Bodies are partly first beginnings of things, partly those which are formed by a union of first beginnings.'² The latter are produced by the atoms grouping themselves in *concilio*, this term seems to mean something very like our expression in *combination*. The properties of the body formed by the grouping together of atoms need not resemble the properties of the atoms themselves (see, for instance, Book I 915-920). Not only must the atoms enter into *concilium* with each other in order that any kind of matter may be produced, but the properties of the matter thus formed depend on the mutual relations of the atoms, 'it matters much with what others and in what positions the same first beginnings of things are held in union, and what motions they do mutually impart and receive.'³

Although this theory was so nearly complete, yet, as taught by Lucretius, it had few of what we now regard as the essential features of a good scientific theory, it was not stated in terms which permitted of numerical applications to actual phenomena. Few or no exact applications of the theory could be made to natural phenomena. It was scarcely able to predict events in nature except in a wide and loose way. It savoured too much of a dogma. It was rather a speculation as to what might be the cause of natural occurrences, than an attempt to determine what these causes really were.

The teachings of the Epicurean philosophers were opposed by those of the school of Aristotle. The Aristotelians magnified the names of things and made them as real or even more real than the things themselves, they identified 'modes of predication with modes of existence' (Lange). Matter occupied a foremost position in the Epicurean scheme of the universe, but by the followers of Aristotle it was regarded only as the 'potentiality of becoming anything or everything.' Aristotelianism prevailed in the middle ages and atomism fell more and more into disrepute.

But in 1592, Gassendi, Canon and Provost at Digne in Provence, revived the atomic theory of the Greek philosophers, and attempted to found on it an interpretation of natural events. The influence of Gassendi was continued through Newton and Boyle, the former of whom, as we know, demonstrated that not only do masses of matter attract each other, but that every particle of each mass attracts every particle of the other mass with a force varying directly as the masses of the particles and inversely as the square of the distance between the particles. As Newton accepted the atomic conception of the structure of matter, his demonstration of the action of the force of gravitation gave a new

¹ Lucretius, *De Rerum Natura*, I 548-550 (Munro's translation)

² Id. V 55-58

³ Id. I 483-4.

⁴ Id. II. 1007-9

point of departure for the theory of atoms. From this time a science of atomic physics became possible. But the difficulty was, and still is, to form a clear mental picture of the mechanism of the action of the force of gravitation in terms of the atomic conception of matter. Newton gave the mathematical construction, and clearly separated this from the physical explanation which belonged to the region of conjecture.

Not much was done, after Newton, to advance the application of the atomic theory until the early years of the present century, when Dalton made a serious attempt to determine the conditions under which the atoms of elementary bodies unite to form the atoms of compound bodies.

The great advance made by Dalton consisted in his asserting the possibility of finding the relative weights of the atoms of all kinds of matter, and in his demonstration of the method whereby these relative weights could be determined.

Many analyses of chemical compounds had been made before the time of Dalton, the results were usually stated in percentages, and they seemed to have but few mutual relations. Richter (1791-1802) had shown that a definite mass of each acid combines with a specified mass of a given base, he had arranged several acids and bases in order of neutralisation. Fischer, in 1803, published a table of chemical equivalents which expressed the quantities of bases which were of equal value as regarded power of neutralising a constant quantity of a specified acid. Lavoisier, Cavendish, and others, had to some extent grasped the conception of the elements combining in definite proportions. They had never doubted that every chemical substance was of definite composition, and that it would be possible by careful analyses of many compounds to find the laws of elementary combinations. Proust had analysed several pairs of oxides of the same metal, from some of his numbers the law of combining weights might have been deduced, had he stated his results so as to show the quantities of oxygen in combination with a fixed quantity of metal.

Dalton analysed two compounds of carbon and hydrogen, and found that in one there was twice as much hydrogen as in the other combined with the same quantity of carbon. He found similar regularities in the quantities of oxygen which combined with a specified quantity of carbon, in the quantities of oxygen which combined with a specified quantity of nitrogen, &c. Meanwhile he had been thinking much regarding the ultimate particles of bodies, he had pictured to himself a quantity of gaseous matter as resembling a heap of small shot, as built up of little definite parts or atoms. He saw how the facts of chemical combination he had been studying would help him to find the relative weights of these small particles. Dalton's genius recognised the unity which bound together so many diverse physical and chemical facts. He at once stated clearly the quantitative laws of chemical combination and referred these laws to one underlying conception, the conception namely of the atom. 'In all chemical investigations it has justly been considered an important object to ascertain the relative weights of the simples which constitute a compound. But unfortunately the inquiry has terminated here, whereas

from the relative weights in the mass, the relative weights of the ultimate particles or atoms of the bodies might have been inferred, from which their number and weights in various other compounds would appear, in order to assist and to guide future investigation, and to correct their results. Now it is one great object of this work to show the importance and advantage of ascertaining the relative weights of the ultimate particles both of simple and compound bodies, the number of simple elementary particles which constitute one compound particle, and the number of less compound particles which enter into the formation of one more compound particle.'

That he might determine the relative weight of the 'ultimate particle' of an element it was necessary for Dalton to have some means of fixing the number of particles of that element in one 'ultimate particle' of several of its compounds. Thus, masses of hydrogen and oxygen combine in the ratio of 1 to 8, now, if we assume that the ultimate particle, or atom, of water is 9 times heavier than the atom of hydrogen, the most probable conclusion is that one atom of water is formed by the union of one atom of hydrogen, the mass of which is taken as unity, with one atom of oxygen, the mass of which is 8 times that of the hydrogen atom, but if we choose to assume that the atom of water is 16 times heavier than that of hydrogen, then the experimental results—1 of hydrogen combines with 8 of oxygen, by weight—are most readily interpreted by saying that one atom of water is formed by the union of 2 atoms of hydrogen, weighing 2, with one atom of oxygen, weighing 16. We cannot then determine how many times the atom of oxygen is heavier than that of hydrogen unless we have previously determined how many times the atom of the compound formed by the union of hydrogen and oxygen, that is the atom of water, is heavier than the atom of hydrogen.

Dalton framed certain empirical rules regarding the composition of the atoms of compounds formed by the union of two elements. His principal rules were these: 'If there are two bodies, A and B, which are disposed to combine, the following is the order in which combination may take place, beginning with the most simple, namely

1 atom of A + 1 atom of B = 1 atom of C, binary,	
1 atom of A + 2 atoms of B = 1 " D ternary,	
2 atoms of A + 1 atom of B = 1 " E ternary,	
1 atom of A + 3 atoms of B = 1 " F quaternary,	
3 atoms of A + 1 atom of B = 1 " G, quaternary	
&c &c	

'1st When only one combination of two bodies [elements] can be obtained, it must be presumed to be a *binary* one, unless some cause appears to the contrary.

'2nd When two combinations are observed they must be presumed to be a *binary* and a *ternary*.

'3rd When three combinations are obtained, we may expect one to be a *binary*, and the other two *ternary*.

'4th When four combinations are observed, we should expect one *binary*, two *ternary*, and one *quaternary*, &c &c.'

'From the application of these rules to the

'Dalton, *A New System of Chemical Philosophy* (1808)

chemical facts already well ascertained, we deduce the following conclusions 1st That water is a binary compound of hydrogen and oxygen, and the relative weights of the two elementary atoms are as 1.7 nearly [more correctly 1.8] 2nd That ammonia is a binary compound of hydrogen and azote, and that the relative weights of the two atoms are as 1.5 nearly [more correctly 1.466]

In all these cases the weights are expressed in atoms of hydrogen, each of which is denoted by unity. But even if these rules were admitted, it was not always possible to fix the relative weight of an elementary atom, thus, two compounds of carbon and oxygen were known to Dalton, containing, according to his analyses, 2.7 parts by weight of carbon combined with (i) 7 and (ii) 3.5 parts by weight of oxygen, hence, by rule 2, the first of these is a compound of one atom carbon with one atom oxygen, and hence the atomic weight of carbon is 2.7, and the second is a compound of 2 atoms carbon ($=5.4$) with 1 atom oxygen ($=3.5 \times 2$). But the results of analyses might also be stated thus (i) 5.4 carbon + 14 oxygen, (ii) 5.4 carbon + 7 oxygen, and the conclusion might be drawn that the first is a compound of 1 atom carbon (5.4) with 2 atoms oxygen (7×2), and the second is a compound of 1 atom carbon (5.4) with one atom oxygen (7). Both ways of stating the results of experiments would be in keeping with Dalton's rules, but the first would lead to the number 2.7, and the second to the number 5.4, as representing the relative weight of the atom of carbon. Another objection to the Daltonian rules of atomic syntheses was that, although to-day we may know of but one compound of two specified elements, to-morrow we may know of several compounds of these elements.

Berzelius continued the work which Dalton had begun, his aim was to discover the laws of atomic combinations. Why does a specified element by combining with oxygen produce only two or perhaps three different oxides? Why do not the elementary atoms combine in a great many different ratios? What are the limiting forms of the compound atoms produced by the union of any specified elementary atoms? Berzelius busied himself with such questions as these. And that he might find some solutions to such questions, Berzelius was obliged to frame empirical rules, as Dalton had done before him.

The following may be taken as an example of the Berzelian rules. If an element forms two oxides with twice as much oxygen by weight in one as in the other, relatively to a fixed mass of the element, the atom of that compound which contains the smaller mass of oxygen is to be regarded as composed of one atom of oxygen and one atom of the specified element, and the atom of the other compound is to be regarded as composed of two atoms of oxygen and one atom of the specified element, but if the masses of oxygen in the two oxides are in the ratio 2.3 relatively to a specified mass of the other element, then the atom of the compound with less oxygen is to be regarded, as before, as composed of one atom of oxygen and one atom of the specified element, but the

atom of the compound with more oxygen is to be regarded as composed of three atoms of oxygen and two atoms of the other element.

But such rules were only empirical, and, however satisfactory might be the particular results obtained by their application, it was impossible to rest contented until some general principle had been attained which should admit of universal application. In the course of his inquiries regarding the syntheses of atoms, Berzelius performed a vast number of very careful analyses, the results of which firmly established the quantitative laws of chemical combination. These laws (*v* COMBINATION, CHEMICAL, LAWS *or*) assert —(1) that the masses of the constituents of every homogeneous kind of matter stand in an unalterable proportion to one another, and also to the mass of the compound they produce—the mass of the compound being always equal to the sum of the masses of the constituents, (2) that when two elements combine to form more than one compound, the masses of one of the elements which combine with a constant mass of the other element bear a simple relation to each other, and (3) that the masses of different elements which combine with one and the same mass of another element are also the masses of these different elements which combine with each other, or they stand in a simple relation to those masses. These laws may all be expressed in the statement that the elements combine only in the ratios of their combining weights or, in simple multiples of these ratios. By the combining weight of an element is here meant the smallest mass of that element which is found to combine with one part by weight of hydrogen or with 8 parts by weight of oxygen.

As Berzelius was pursuing his investigations into the gravimetric composition of compounds, Gay Lussac was making experiments on the volumetric composition of gaseous compounds. In 1809 this naturalist was able to prove (1) that the volumes of the gaseous elements which combine to form a gaseous compound stand in an unalterable proportion to each other, (2) that when two gaseous elements combine to form more than one gaseous compound, the volumes of one of the elements which combine with a constant volume of the other element bear a simple relation to each other, and (3) that the volumes of different gaseous elements which combine with one and the same volume of another gaseous element are also the volumes of these different elements which combine with each other, or they stand in a simple relation to those volumes. These laws may all be expressed by saying that the gaseous elements combine only in the ratios of their combining volumes, or in simple multiples of these ratios. By the combining volume of a gaseous element is here meant the smallest volume of that element which is found to combine with one unit volume of hydrogen, and a unit volume of hydrogen is defined to be the volume, at normal temperature and pressure, occupied by one unit mass of this element.

Gay Lussac argued that the ratios of the masses of the combining volumes of gaseous elements are also the ratios of the masses of the atoms of these elements, and the conclusion

¹ Dalton, *l.c.*

was drawn that equal volumes of gaseous bodies, measured at the same temperature and pressure, contain equal numbers of atoms. This conclusion, if admitted, seems to put into our hands a means for finding the relative masses of the atoms of many compounds and hence of many elements. But the application leads to unlooked for results. Consider the case of hydrogen and oxygen. Experiment shows that two volumes of hydrogen—weighing two—combine with one volume of oxygen—weighing 16—and produce two volumes of water gas—weighing 18, hence, if equal volumes of gases contain equal numbers of atoms, two atoms of hydrogen—weighing two—combine with one atom of oxygen—weighing 16—and the product is two atoms of water gas—each weighing 9. But each of these atoms of water gas contains atoms of hydrogen and oxygen, now, the atom of oxygen has been shown to weigh 16 times as much as the atom of hydrogen, hence the atom of water gas contains half an atom of oxygen. Again, consider the case of hydrogen and chlorine. Experiment shows that one volume of hydrogen—weighing one—combines with one volume of chlorine—weighing 35.5—and that the product is two volumes of hydrochloric acid weighing 36.5, hence, if equal volumes of gases contain equal numbers of atoms, one atom of hydrogen has combined with one atom of chlorine to produce two atoms of hydrochloric acid. But as each atom of hydrochloric acid is composed of both hydrogen and chlorine, it follows that each atom of hydrochloric acid is formed by the union of half an atom of hydrogen and half an atom of chlorine. But these conclusions are at variance with the fundamental definition of the atom, which states that the atom is the smallest mass of a body that can exhibit the properties of that body.

The discovery that gaseous elements combine in fixed quantities by volume had done something to advance the study of atomic synthesis, but it had not removed the fundamental difficulty, the difficulty, namely, of finding some generally applicable principle by means of which the relative weights of the ultimate particles, or atoms, of compounds might be determined. This difficulty was overcome by Avogadro. In 1811 this Italian naturalist introduced into chemistry the conception of two orders of small particles—the *molecule*, and the *atom*. The molecule of an element or a compound, said Avogadro, is the smallest mass of it which exhibits the properties of that element or compound, the molecule of an element or a compound is formed by the union of smaller particles of matter which we shall call atoms, in the case of the molecule of an element the atoms are all of one kind, in the case of the molecule of a compound the atoms are of two, or more than two, different kinds. As the properties of the molecule of a compound are very different from the properties of the atoms which compose it, so it is probable that the properties of the molecule of an element are different from the properties of the atoms by the union of which the molecule is produced. A chemical action between two gases was conceived by Avogadro as being separable, in thought if not in actuality, into two stages, in

the first stage the molecules of the reacting gases are shattered, and in the second stage the parts of these molecules, that is the atoms, are rearranged to form the molecules of the new bodies.

Avogadro modified the generalisation made by Gay Lussac, and re stated it thus — '*Equal volumes of gases, temperature and pressure being the same, contain equal numbers of molecules*'. The reactions between hydrogen and oxygen, and hydrogen and chlorine, which could not be explained by the generalisation of Gay Lussac, are perfectly consistent with the generalisation of Avogadro. Two volumes of hydrogen combine with one volume of oxygen, and the product is two volumes of water gas, that is, in terms of Avogadro's statement, $2p$ molecules of hydrogen, each composed of x atoms, combine with p molecules of oxygen, each composed of x' atoms (x may or may not equal x'), and the product is $2p$ molecules of water gas. One volume of hydrogen combines with one volume of chlorine to form two volumes of hydrochloric acid, that is, in terms of Avogadro's statement, p molecules of hydrogen, containing x atoms, combine with p molecules of chlorine, containing x' atoms (x may or may not equal x'), to form $2p$ molecules of hydrochloric acid.

Not only are these, and other, reactions, between gases explicable in terms of the generalisation of the Italian naturalist, but this statement gives us a means of determining the relative masses of the molecules of all gaseous bodies, and also of determining the minimum number of atoms in each of these molecules. That is to say, the generalisation of Avogadro gives us what we could not obtain from the rules of Dalton or Berzelius, or from the generalisation of Gay Lussac. For it is evident that, if the number of molecules in equal volumes of two gases is the same, the masses of the two kinds of molecules must be in the same ratio as the densities of the two gases, and hence, if the density of one of the gases be taken as unity, the density of the other, in terms of this one, expresses the relative mass of a molecule of this other gas. Let the two gases be hydrogen and oxygen, experiment shows that a given volume of oxygen is sixteen times heavier than the same volume of hydrogen, hence, if equal volumes contain equal numbers of molecules, a molecule of oxygen is sixteen times heavier than a molecule of hydrogen. Let us call the mass of a molecule of hydrogen one, then, in order to find how many times greater than the mass of this molecule is the mass of the molecule of any gas, we have only to determine the density of the specified gas in terms of hydrogen as unity, the number expressing the density of the gas expresses also the relative mass of the molecule of the gas. But, further, the generalisation of Avogadro puts into our hands a means whereby the minimum number of atoms in a gaseous molecule may be determined, and hence a means whereby the maximum relative values to be assigned to the masses of atoms may be determined. Consider the mutual action of hydrogen and chlorine, hydrogen and bromine, nitrogen and hydrogen, and oxygen and hydrogen. Having regard only to the volumes of the reacting gaseous elements and the volumes of the

gaseous compounds produced, the actions in question may be stated thus —

(i) One volume of hydrogen combines with one volume of chlorine to produce two volumes of hydrochloric acid, (ii) One volume of hydrogen combines with one volume of bromine gas to produce two volumes of hydrobromic acid, (iii) one volume of nitrogen combines with three volumes of hydrogen to produce two volumes of ammonia, (iv) one volume of oxygen combines with two volumes of hydrogen to produce two volumes of water gas

Now, as equal volumes contain equal numbers of molecules, these statements may be put as follows —

(i) p molecules of hydrogen combine with p molecules of chlorine, and the product is $2p$ molecules of hydrochloric acid, (ii) p molecules of hydrogen combine with p molecules of bromine gas, and the product is $2p$ molecules of hydrobromic acid, (iii) p molecules of nitrogen combine with $3p$ molecules of hydrogen, and the product is $2p$ molecules of ammonia, (iv) p molecules of oxygen combine with $2p$ molecules of hydrogen, and the product is $2p$ molecules of water gas

Therefore in (i) one molecule of hydrogen has produced, by union with chlorine, two molecules of hydrochloric acid, both of which are composed of hydrogen and chlorine, in (ii) one molecule of hydrogen has produced, by union with bromine, two molecules of hydrobromic acid, both of which are composed of hydrogen and bromine, in (iii) one molecule of nitrogen has produced, by union with hydrogen, two molecules of ammonia, both of which are composed of nitrogen and hydrogen, and in (iv) one molecule of oxygen has produced, by union with hydrogen, two molecules of water gas, both of which are composed of oxygen and hydrogen. In other words, in reactions (i) and (ii) every molecule of hydrogen has separated into at least two parts, in reaction (iii) every molecule of nitrogen has separated into at least two parts, and in reaction (iv) every molecule of oxygen has separated into at least two parts

These parts of molecules are called atoms

If we assume the truth of Avogadro's generalisation, then the foregoing reactions are most simply interpreted by saying that the molecules of hydrogen, nitrogen, and oxygen, are each built up or composed of two atoms. As hydrogen is the standard element to which the atomic and molecular weights of all other bodies are referred, we say that the *atomic weight of hydrogen is one*, and, because of such reactions as those just stated, that the *molecular weight of hydrogen is two*. But if the molecular weight of hydrogen is two, the molecular weight of oxygen must be 32, the molecular weight of nitrogen must be 28, the molecular weight of hydrochloric acid must be 36.5, the molecular weight of hydrobromic acid must be 81, the molecular weight of ammonia must be 34, and the molecular weight of water gas must be 18, because oxygen is 16 times heavier than an equal volume of hydrogen, nitrogen is 14 times, hydrochloric acid is 18.25 times, hydrobromic acid is 40.5 times, ammonia is 17 times, and water-gas is 9 times, heavier than an equal volume of hydrogen

By such reactions and such modes of reason

ing as these, we arrive at the following practical definition of the molecular weight of a gaseous element or compound — *The molecular weight of a gaseous element or compound is a number which expresses how many times greater than two unit masses of hydrogen is the mass of the specified element or compound which occupies (under the same conditions of temperature and pressure) the same volume as is occupied by these two unit masses of hydrogen*

Determinations of the sp. gravs. of gases are subject to several sources of error. But the values to be assigned to the combining weights of the elements, that is, the masses of the elements which combine with one part by weight of hydrogen or 8 parts by weight of oxygen, can be determined with great accuracy. Now, it is evident that the molecular weight of an element must be equal to the combining weight of this element or to a simple multiple of this number, and that the molecular weight of a compound must be equal to the sum, or to a multiple of the sum, of the combining weights of its constituent elements, hence the data which are required for an accurate determination of the molecular weight of an element are (i) an exact determination of the combining weight of the element, and (ii) a measurement of the relative density of the element in the state of gas, similarly the data which are required for an accurate determination of the molecular weight of a compound are (i) exact determinations of the combining weights of the constituent elements, and (ii) a measurement of the relative density of the compound in the state of gas. Thus, 35.37 parts by weight of chlorine combine with 1 part by weight of hydrogen, therefore the molecular weight of chlorine is ≈ 35.37 , but a given volume of chlorine is 35.5 times heavier than an equal volume of hydrogen, therefore the molecular weight of chlorine is approximately $35.5 \times 2 = 71$, now, $2 \times 35.37 = 70.74$, hence the molecular weight of gaseous chlorine is 70.74. Again, phosphorus hydride is composed of masses of phosphorus and hydrogen united in the ratio 10.32 to 1, therefore the molecular weight of this compound is ≈ 11.32 , but this compound in the state of gas is 17 times heavier than hydrogen, therefore its molecular weight is approximately equal to $17 \times 2 = 34$, now, $8 \times 11.32 = 90.56$, hence the molecular weight of gaseous phosphorus hydride is 33.96

Having thus arrived, by the help of Avogadro's generalisation, at a definition of molecular weight, and having determined that the molecules of hydrogen, nitrogen, and oxygen, and of some other elements, are very probably composed each of two parts or atoms, we proceed to find an exact meaning for the term atom. If the atom is assumed to be the ultimate portion of any homogeneous kind of matter of which cognisance is to be taken in chemistry, then it is evident that a molecule of a compound gas, formed by the union of (say) three elements, A, B, and C, must be formed by the union of at least one atom of the element A, one atom of the element B, and one atom of the element C. In general terms, no molecule of a compound gas can be formed by the combination of less than a single atom of each of the elements by the union of which the compound in question is

produced This is equivalent to saying, the atom of an element is the smallest mass of that element which combines with other atoms to produce a molecule

We cannot as yet determine the absolute mass of the atom of any element, but we have agreed to call the mass of an atom of hydrogen unity, and to represent the masses of the atoms of other elements in terms of the atom of hydrogen, hence we arrive at the practical definition of the maximum atomic weight of an element as follows —

The maximum atomic weight of an element is a number which expresses how many times greater is the smallest mass of that element which combines with other elements to form a compound gaseous molecule, than the smallest mass of hydrogen which combines with other elements to

14 435 times heavier than the same volume of hydrogen at the same temperature and pressure, therefore the relative density of any gas referred to air as unity multiplied by $14\ 435 \times 2$ (= 28 87) gives the relative density of that gas referred to hydrogen as twice unity, that is, gives (approximately) the molecular weight of the gas Let it now be required to determine the atomic weight of oxygen, the definition of atomic weight tells that the molecular weights of several gaseous compounds containing oxygen must be determined, that these compounds must be analysed and the results in each case stated in parts by weight of each element per molecule of the compound, and that the smallest mass of oxygen thus found in any molecule is to be taken as the atomic weight of oxygen Here are some of the data which have been thus accumulated —

Data for determining the atomic weight of Oxygen

Gaseous compound	Sp Gr air=1	Sp Gr $\times 28\ 87$, \therefore approximate molecular weight	Molecular weight	Analysis, stated in parts by wt per molecule
Carbon dioxide	1 53	44 2	43 89	31 92 oxygen + 11 97 carbon
Sulphur dioxide	2 25	64 9	63 90	31 92 „ + 31 98 sulphur
Sulphur trioxide	2 9	83 7	79 86	47 88 „ + 31 98 „

produce a compound gaseous molecule, such smallest mass of hydrogen being taken as unity

The term, and the conception underlying the term, molecule, are applied to compounds and elements alike, the term, and the conception

Were these the only known gaseous compounds containing oxygen we should conclude that the atomic weight of oxygen is 31 92, that of hydrogen being unity But the following numbers show that this conclusion is incorrect —

Data for determining the atomic weight of Oxygen

Gaseous compound	Sp Gr air=1	Sp Gr $\times 28\ 87$, \therefore approximate molecular weight	Molecular weight	Analysis, stated in parts by wt. per molecule
Carbon monoxide	97	27 97	28 93	15 96 oxygen + 11 97 carbon
Water	63	18 2	17 96	15 96 „ + 2 hydrogen
Nitric oxide	1 04	30 0	29 97	15 96 „ + 14 01 nitrogen

underlying the term, atom, are applied in strictness to elements only

The foregoing definitions of atomic weight and molecular weight are practical, because they indicate the nature of the data which must be obtained before the atomic or molecular weight of a gaseous body can be found Suppose it is required to find the molecular weight of oxygen, the mass of this element which combines with unit mass of hydrogen must be accurately measured, and the relative density of oxygen gas must be determined, the standard of reference being hydrogen taken as twice unity Now, the relative densities of gases are determined by experiments in terms of air taken as unity, but a specified volume of air is

These numbers show that at least three compounds exist the gaseous molecule of each of which contains 15 96 parts by weight of oxygen, hence, as no molecule is known containing less than this mass of oxygen, 15 96 is taken as the atomic weight of oxygen Before, then, the atomic weight of an element can be determined with a fair degree of probability a number of gaseous compounds of the element must be analysed, if only a few gaseous compounds of a specified element are known it is probable that the value deduced, from analyses of these compounds, for the atomic weight of the element, is too large, it certainly cannot be too small Thus, let us consider the data for finding the atomic weight of aluminium —

Data for determining the atomic weight of Aluminium.

Gaseous compound	Sp Gr air=1	Sp Gr $\times 28\ 87$, \therefore approximate molecular weight	Molecular weight	Analysis, stated in parts by wt. per molecule
Aluminium chloride	9 35	270 0	266 26	54 04 aluminium + 212 22 chlorine
„ bromide	18 6	537 5	532 54	54 04 „ + 478 5 bromine
„ iodide	27 0	780 0	813 22	54 04 „ + 759 18 iodine

As no other gaseous compounds of aluminum, except these three, have been prepared in a state of purity and analysed, we conclude that the atomic weight of this metal is not greater than 54.04, but as only three gaseous compounds of aluminum are known, it is not unlikely that the true value to be assigned to the atomic weight of this element is $\frac{54.04}{3}$ or $\frac{54.04}{3}$ or $\frac{54.04}{4}$, &c. The greater the number of compounds of a given element which have been gasified and analysed, the greater is the probability that the value thence obtained for the atomic weight of the element represents the true value of this constant.

Avogadro's generalisation—equal volumes of gases contain equal number of molecules—places in the hands of chemists an instrument whereby they may determine the relative weights of the molecules of all gaseous or gasifiable compounds and elements, and the maximum values to be assigned to the atomic weights of all elements which form gaseous or gasifiable compounds. But at present the densities of only 14 elements have been determined in the gaseous state, and gaseous compounds of only 42 different elements have been prepared and analysed. Hence the application of the method introduced by Avogadro is limited. There are two other methods of general applicability for determining the values to be assigned to the atomic weights of elements, let us consider these methods briefly.

In 1819 a paper was published by two French naturalists, Dulong and Petit, on the specific heats of 13 solid elements, viz., copper, gold, iron, lead, nickel, platinum, sulphur, tin, zinc, bismuth, cobalt, silver, and tellurium (*A Ch* 10, 395).

The products obtained by multiplying the generally accepted atomic weights of the nine elements from copper to zinc in this list by the specific heats of these elements, and sub multiples of the generally accepted atomic weights of the remaining four elements by the specific heats of these elements, had all nearly the same value. Generalising from these results, Dulong and Petit concluded that 'the atoms of all the simple bodies have exactly the same capacity for heat'. This generalisation has, on the whole, been borne out by subsequent research.

The table on p. 342 contains most of the well established data regarding the specific heats of solid elements in so far as direct determinations are concerned.

The values to be assigned to the specific heats of beryllium, boron, carbon, and silicon, have been the subject of many experiments and of much discussion. Nilson and Pettersson (*B* 13, 1451, v also *C N* 42, 297) made a series of determinations with a specimen of metallic beryllium containing about 5 per cent of beryllium and iron oxides. The following were the most important results—

Specific Heat of Beryllium (Nilson & Pettersson)

Temp	Interval	Spec ht	Spec. ht $\times 9.1$	Spec. ht. $\times 13.65$
0°	- 40	3973	8.6	5.4
0	-100	4246	3.86	5.8
0	-214	475	4.26	6.4
0	-800	5055	4.6	6.9

Nilson and Pettersson concluded from these numbers that the atomic weight of beryllium is

18.65, but L Meyer (*B* 13, 1780) showed that the true values for the spec heat of this metal at various temperatures, as calculated from the data summarised in the preceding table, are as follows—

Specific Heat of Beryllium (Meyer)

Temp	Spec ht	Increase in spec ht. for 1°	Sp ht $\times 9.1$	Sp ht $\times 13.65$
20°	3973	00101	3.62	5.43
73.2	4481	00085	4.08	6.12
157	5193	00063	4.73	7.10
256.8	5819		5.29	8.94

These numbers show that the specific heat of beryllium increases as temperature increases, but that the rate of this increase is considerably less for the interval 157° to 256° than for that of 20° to 157°. Humpidge (*Pr* 39, 1), working with a specimen of beryllium prepared with great care and containing 99.2 per cent of the metal and 7 per cent of beryllium oxide, obtained the following results—

Specific Heat of Beryllium (Humpidge)

Temp	Spec heat	Spec ht $\times 9.1$
100°	4702	4.28
200	5420	4.93
400	6172	5.61
500	6206	5.65

The value approximates to a constant between 450° and 500°. There can now be little doubt that the specific heat of beryllium is considerably larger at high than at low temperatures, that this value is nearly constant at about 500° and upwards, and that at these temperatures beryllium is not an exception to the law of Dulong and Petit (For more details v BERYLLIUM).

Very varying values had been obtained for the specific heats of the three elements, boron, carbon, and silicon, before the researches of Weber. The following table summarises the chief results—

Specific Heats of Boron, Carbon, and Silicon (Weber's numbers not included)

(Temp about 35°-55°)					
	Spec heat	Sp ht	x at wt	Observer	Date.
BORON					
<i>amorphous</i>	254		2.8	Kp	1864
<i>crystalline</i>	230		2.6	do	do
"	252		2.8	M D	1873
"	257		2.8	Rg	1869
<i>graphitic</i>	235		2.6	do	do
CARBON					
<i>diamond</i>	143		1.7	B W	1863
"	147		1.8	Rg	1841
"	366	Temp 30°-1000°	4.4	Dewar	
<i>graphite</i>	174		2.1	Kp	1864
"	188		2.3	B W	1868
"	198		2.4	Rg	1866
<i>gas-carbon</i>	185		2.0	Kp	1864
"	166		2.2	B W	1868
"	197		2.4	Rg	1841
"	32	Temp 30°-1000°	3.8	Dewar	
SILICON					
<i>fused</i>	138		3.9	Kp	1864
"	166		4.6	Rg	1861
<i>crystalline</i>	165		4.6	Kp	1864
"	171		4.8	M D	1873
"	173		4.8	lg	1861

Weber, about 1872, made a careful series of determinations of the specific heats of these three elements (*P M* [4] 49, 161 and 276), his

more important results are presented in the following table —

Specific Heats of Boron, Carbon, and Silicon
(Weber)

	Temp	Spec heat	Sp ht x at wt.
BORON crystalline ¹	-40°	1915	2 11
	+77°	2737	3 01
	177°	3378	3 72
	233°	3663	4 03
CARBON diamond	-50°	0635	0 76
	+10°	1128	1 35
	85°	1765	2 12
	250°	3026	3 63
	606°	4408	5 29
	985°	4589	5 51
	-50°	1138	1 37
	+10°	1604	1 93
	61°	1990	2 39
	201°	2966	3 56
Porous wood carbon	0°-23°	1053	1 95
	0°-99°	1935	2 07
	0°-223°	2385	2 84
	-40°	136	3 81
SILICON crystallised	+57°	1833	5 13
	128°	196	5 50
	184°	2011	5 63
	232°	2029	5 68

These numbers show that the specific heats of boron, carbon, and silicon increase as temperature increases, but that, in each case, the value of this increase for a given temperature interval is considerably less at high than at low temperatures. The observed variation in the rate of increase of the specific heat of crystallised boron¹ is nearly identical with the observed variation in the rate of increase of the specific heat of crystallised carbon for equal intervals of temperature up to 230-250°, if it is assumed that this identity remains at higher temperatures, then the specific heat of crystallised boron¹ may be calculated, from the observations made with crystallised carbon, at temperatures up to about 1000°. The value thus calculated for the specific heat of boron at 1000° is 50. The specific heat of crystalline silicon attains an almost constant value at about 230° (For more details of Boron, Carbon, Silicon).

Looking at the determinations of the specific heats of solid elements as a whole, it appears clear that the specific heat of any element varies with the temperature, and that the relation between the variation of specific heat and that of temperature differs for each element, and, moreover, that the value of the specific heat of an element depends to some extent on the physical condition of the element. But there seems certainly to be an interval of temperature for which the specific heat of an element attains a constant, or nearly constant, value, this temperature-interval varies for each element, especially for the non-metallic elements with small atomic weights, for many elements it may be approximately taken as 0° to 100°(C).

¹ There is, however, considerable doubt whether the material used by Weber was pure boron.

For this interval of temperature only can any element be said to obey the law of Dulong and Petit.

This law may now be stated in a practical form thus — *The atomic heat, i.e. the product of specific heat, at the temperature interval for which sp ht is nearly constant, into atomic weight, of all solid elements is nearly a constant, the mean value of which is 6.4.* If this is granted it follows that the atomic weight of any solid element is approximately equal to the quotient

$\frac{6.4}{\text{spec heat}}$, provided that the specific heat of the element has been determined for a considerable range of temperature, and, if the specific heat has been found to vary considerably with variations of temperature, that the determinations have been continued until a constant, or a nearly constant, value has been obtained.

Attempts have been made to determine the specific heats of several elements by an indirect method. The method is based on the generalisation, $\frac{AC}{n} = \text{a constant (about 6.4)}$, where A = the

formula weight of a solid compound, C = the specific heat of the compound, and n = the number of elementary atoms in the formula of the compound. This generalisation has been stated in various forms, the earliest appears to be that given by F. Neumann, in 1831. 'The amounts of chemically similar compounds expressed by their formulae possess equal specific heats' (P. 23, 1). The statement is sometimes put thus 'the molecular heat of a solid compound is equal to the sum of the atomic heats of its constituent elements,' by 'molecular heat' is here meant the product of the specific heat of the compound into the mass expressed by its formula. The form given above, $\frac{AC}{n} = \text{a}$

constant, is the outcome of investigations made principally by Garnier (C. R. 35, 278, 37, 130), and Cannizzaro (Bl. 1863 171).

As an example of the application of this generalisation, to find a value for the specific heat of an element in the solid form, let us take Kopp's calculation of the specific heat of solid chlorine (*A. Suppl.* 3, 321). The data are these — molecular heats (as defined) of metallic haloid salts $\text{RCl} = 12.8$, $\text{RBr} = 13.9$, $\text{RI} = 13.4$, $\text{RCl}_2 = 18.5$, $\text{RI}_2 = 19.4$. In each case R represents one atom of a metal the atomic heat of which is 6.4. The atomic heat of solid bromine = atomic heat of solid iodine = 6.6 (approximately). Now, as the metallic chlorides, bromides, and iodides, examined are chemically similar, and as the 'molecular heats' of the similar salts are nearly the same, Kopp has concluded that the atomic heat of solid chlorine is approximately equal to 6.4. This conclusion is in keeping with the observed values, thus RCl (12.8) — $\text{R}(6.4) = 6.4$, RCl_2 (18.5) — $\text{R}(6.4) = 12.1$, and $\frac{12.1}{2} = 6.05$.

Further data are presented by the following 'molecular heats' $\text{KClO}_2 = 24.8$, $\text{KAsO}_2 = 25.3$. The argument here is, that as these values are nearly the same, and as the difference in composition between the two compounds is represented by the exchange of Cl for As, it follows that the atomic heat of solid chlorine is approximately

equal to that of arsenic, but the atomic heat of arsenic, as determined by direct experiment, is 6.1, hence the atomic heat of solid chlorine is approximately equal to 6.1.

This indirect method often leads, as might be expected, to several values for the specific (or atomic) heat of an element. Thus, from determinations of the 'molecular heats' of various oxides and other salts containing metals the atomic heat of each of which has been directly determined to be approximately 6.4, the following values for the atomic heat of solid oxygen are arrived at

From RO	4.6
" RO ₂	3.7
" R ₂ O	4.8
" KAsO ₄	4.2
" KClO ₄	3.5 (assuming at ht of Cl = 6)
" KMnO ₄	3.8.

The mean of these values is 4.1

The indirect method of finding the atomic heat of an element is undoubtedly useful, but no great stress can be laid on conclusions arrived at by this method only. It is certain that an erroneous conclusion regarding the value of the atomic weight of an element may be deduced from measurement of the specific heats of solid compounds of that element. For example, Donath determined the specific heat of uranous uranic oxide to be 0.798 (*B* 12, 742), assuming the specific heat of solid oxygen to be 0.25 ($= \frac{4.1}{16}$), the specific heat of uranium was calculated to be 0.497, now $0.497 \times 120 = 5.96$, therefore, as analyses of compounds had proved that the atomic weight of uranium is 120, it was concluded by Donath that the atomic weight of uranium is 120. But pure metallic uranium was prepared shortly afterwards, and the specific heat of this metal was directly determined to be 0.28, now $0.28 \times 120 = 3.3$, but $0.28 \times 240 = 6.6$, hence the atomic weight of uranium is much more probably 240 than 120. The larger value (240) has been confirmed by the preparation and analyses of two gaseous compounds of uranium (*v* regarding this subject, Kopp, *B* 19, 813).

The following statements fairly summarise the results of the determinations of the atomic heats of the elements

I. *Solid elements, 45 in number, the specific heats of which have been directly determined, and the atomic heats of which are all approximately equal to 6.4* Li, Na, Mg, Al, P, S, K, Ca, Ti, Mn, Fe, Co, Ni, Cu, Zn, As, Se, Br, Zr, Mo, Ru, Rh, Pd, Ag, Cd, In, Sn, Sb, Te, I, La, Ce, Di, W, Os, Ir, Pt, Au, Hg, Tl, Pb, Bi, Th, U (Cr)

II. *Solid elements, 6 in number, the specific heats of which have been directly determined, and vary considerably with temperature, and the atomic heats of which appear to be approximately equal to 5.5* Ga (? inaccurately determined), Be, B, C, Si, Ge

III. *Solid elements, 5 in number, the specific heats of which have been indirectly determined and the atomic heats of which are probably approximately equal to 6.4* V, Rb, Sr, Cs, Ba

IV. *Gaseous elements, specific heats in solid form very doubtful, and apparently variable* H, (F), N, O, Cl

It has been already shown that the applica-

tion of Avogadro's law enables a maximum value to be found for the atomic weight of any element which forms one or more compounds gasifiable without decomposition. The maximum value thus found for the atomic weight of aluminium was 54.04, but as this value was based on analyses of only three gaseous compounds, it was asserted that the true value was possibly one half or one third, &c. of this number. Now, the specific heat of aluminium has been determined to be 22, hence, assuming the law of Dulong and Petit, the atomic weight of aluminium must be approximately equal to 30 ($30 \times 22 = 6.6$), therefore the value $\frac{54.04}{3} = 27.01$

is assigned to the atomic weight of this metal. The maximum values assigned to the atomic weights of iron (111.8), copper (126.8), and gallium (138), by the application of Avogadro's law have, in each case, been halved when determinations have been made of the specific heats of these metals.

Various observations on the connexions between the chemical composition and the crystalline form of solid compounds had been made previous to the year 1819, in which year the 'law of isomorphism' was propounded by E. Mitscherlich, this law was subsequently modified and extended, and in 1821 Mitscherlich stated it as follows: 'Equal numbers of atoms similarly combined exhibit the same crystalline form, identity of crystalline form is independent of the chemical nature of the atoms, and is conditioned only by the number and configuration of the atoms'. Further research has shown that Mitscherlich's statement was too absolute. On the one hand, many solid compounds are known, the atomic compositions of which are very similar, and which, nevertheless, crystallise not only in different forms, but in different systems, thus

PbCrO₃ is monoclinic, but PbMoO₃ is quadric, AgCl and AgBr are regular, but AgI is hexagonal, KNO₃ is rhombic, but CsNO₃ and RbNO₃ are hexagonal.

On the other hand, many solid compounds crystallise in identical or very similar forms, and nevertheless exhibit unlike atomic compositions, thus the crystalline form of the following salts is the same: K₂TiF₆H₂O, CuTiF₄H₂O, K₂NbOF₅H₂O, CuNbOF₄H₂O, K₂WO₄F₂H₂O, CuWO₄F₂H₂O. Many ammonium salts crystallise in the same forms as the corresponding salts of potassium, but the number of atoms in one formula weight of these salts is different. It is indeed somewhat difficult to give an exact meaning to the expression 'isomorphous crystals,' by this phrase some naturalists mean crystals any one of which is capable of growing in unmodified form when immersed in a solution of any other (Kopp, *B* 12, 900 *et seq.*), others include crystals belonging to the same system but exhibiting very small differences in the measurements of their angles, *e.g.* the rhombohedral carbonates of magnesium, calcium, iron, zinc, and manganese, others even include crystals which very closely resemble each other but yet belong to different systems. The fact that the same compound may crystallise in two, or even three, distinct forms, further complicates the connexion between isomorphism and

chemical composition, thus, arsenious oxide, As_2O_3 , and antimonious oxide, Sb_2O_3 , both crystallise in regular octahedra and also in rhombic forms, titanium dioxide, TiO_2 , crystallises in two forms belonging to the quadric system, but exhibiting very different relations of crystalline axes, and also in a third form, viz rhombic prisms

The constituents of isomorphous compounds are sometimes themselves isomorphous, e.g. the double compounds $3\text{Ag}_2\text{S Sb}_2\text{S}_3$ and $3\text{Ag}_2\text{S As}_2\text{S}_3$ crystallise in identical forms, and the sulphides Sb_2S_3 and As_2S_3 also crystallise in identical forms. On the other hand, the constituents of isomorphous compounds are sometimes not isomorphous, e.g. the sulphates of magnesium, nickel, and zinc, crystallise in rhombic forms, but the oxides of magnesium and nickel crystallise in regular, and oxide of zinc, in hexagonal, forms. Isomorphism is sometimes not shown in comparatively simple analogous compounds of two elements, while the more complicated analogous compounds of the same elements crystallise in identical or very similar forms, e.g. many of the simpler compounds of cadmium are not isomorphous with the analogous compounds of the magnesium metals (Mg , Ca , Mn , Fe , Co , Ni , Zn , Cu), but the comparatively complex salts of cadmium, such as $\text{CdSO}_4 \cdot \text{K}_2\text{SO}_4 \cdot 6\text{H}_2\text{O}$, are usually isomorphous with the analogous salts of the metals named. Hence it is necessary to distinguish strict isomorphism as applied to bodies which exhibit the same or nearly the same crystalline form, from the isomorphism of bodies which, although themselves crystallising in different forms, nevertheless combine with one and the same third body to produce compounds into which they enter as corresponding elements or groups, and which crystallise in the same forms (*v. Kopp, Lehrbuch der Physikal. Chemie*, 2, 141). The crystalline forms of several elements have been determined, but the statement that such or such elements form an isomorphous group usually means only that analogous compounds of these elements are for the most part isomorphous (*v. Isomorphism*).

Notwithstanding the many qualifying clauses with which any general statement of the connexion between crystalline form and chemical composition must, at present, be guarded, it has frequently been found possible to use the knowledge we have of the connexion in question as a guide in researches concerning the atomic weights of elements. In these cases it is assumed that, as a general rule, those masses of two bodies which can mutually replace each other in compounds without change of the crystalline form of the compounds, or in other words those masses which are crystallographically equivalent, have similar atomic compositions. By compounds of similar atomic composition is here meant compounds which are very analogous in their chemical relations, and the formulae of which contain equal numbers of atoms, or groups of atoms which react through series of changes as if each were a single atom.

Now, if the atomic weight of a specified element is known, and if experiment shows that the mass of this element expressed by its atomic weight is crystallographically equivalent to x unit masses of another element, it follows

that the value of x is very probably the value of the atomic weight of the second element. Thus, the facts that gallium sulphate formed a double compound with ammonium sulphate, and that this double sulphate was isomorphous with the alums, indicated that the double sulphate in question was a true alum, hence the general formula which expresses the composition of alums expresses the composition of the double sulphate of gallium and ammonium. The formula in question is $\text{X}_2\text{SO}_4 \cdot \text{M}_2\text{SO}_4 \cdot 24\text{H}_2\text{O}$, where M = an alkali metal or thallium, but in common alum $\text{X}_2 = \text{Al}_2 = 2 \times 27.02$ parts by weight of aluminium, and in gallium alum X_2 was experimentally determined to be 138 parts by weight of gallium. Hence, as two atoms of aluminium were replaced by 138 unit masses of gallium without change of crystalline form, and as the aluminium and gallium compounds were very similar in their chemical relations, the conclusion was drawn that 138 represents the relative weight of two atoms of gallium, therefore the value $\frac{1}{2} \times 138 = 69$ was deduced for the atomic weight of gallium. This number was afterwards confirmed by analyses of gaseous gallium chloride, and by determinations of the specific heat of the metal. It was at one time supposed by H. Rose (*P.* 108, 273) that a metal existed closely allied to, but not the same as, niobium, but Marignac (*A. Ch.* 60, 257) found that compounds obtained from this hypothetical metal were isomorphous with the corresponding compounds of tin and titanium, and that the groups of atoms SnF and TiF could be replaced by an atom of Rose's 'hyponiobium' without change of crystalline form. Hence Marignac suggested that 'hyponiobium' was a compound, and, because of various reactions, that it was a compound of niobium and oxygen in the proportion expressed by the formula NbO , where Nb has the value 94. If this were admitted it followed that the groups NbO , SnF , and TiF , were crystallographically equivalent in various compounds, but if so, it also followed, from analyses of the various compounds, that one atom of tin (= 117.8 parts by weight), and one atom of titanium (= 48 parts by weight), were replaced by 94 parts by weight of niobium in isomorphous compounds, therefore the atomic weight of niobium was 94. This value was confirmed by determinations of the relative densities, and by analyses, of the gaseous chloride and oxychloride of niobium. In this case the comparison of the crystalline forms of compounds led at once to a determination of the atomic weight of an element, to a proof of the non-existence of a hypothetical metal, and to the recognition that a body supposed to be an element was really a compound. An analogous case is furnished by Roscoe's researches on vanadium, in this case also the study of isomorphism led to the correct determination of the atomic weight of vanadium, and to the discovery that the body supposed to be vanadium was in reality a compound of this metal with oxygen (*T.* 1868 1 et seq.).

No practical definition of the atomic weight of an element can be given in terms of the data of isomorphism. The foregoing examples serve to show how these data are applied to supplement those gained by the analyses of gaseous

compounds, and by determinations of the specific heats, of the elements

If the atomic weight of calcium is known, then the isomorphism of the carbonates of Mg, Sr, Ba, Pb, Mn, Zn, and Fe, with the carbonate of calcium, helps to fix values for the atomic weights of these 7 elements, the isomorphism of the sulphates of Co, Ni, and Cu, with sulphate of iron gives data from which values may be deduced for the atomic weights of Co, Ni, and Cu, values are found for the atomic weights of Tl and Hg from considering compounds of these elements isomorphous with corresponding compounds of Pb, similarly, Zn and Cd—Fe, Al, and Cr—form many isomorphous compounds, many manganates are isomorphous with selenates and chromates, some chromates are isomorphous with molybdates and tungstates, permanganates are frequently isomorphous with perchlorates and periodates, hence values are found for the atomic weights of Se, Cr, Cl, and I, and also for Mo, and W, from copper we pass to silver through the isomorphism of Cu_2S and Ag_2S , silver leads on to sodium and the alkali metals on the one hand and to gold on the other hand, the compounds RS_2 and RAS_2 are isomorphous, hence conclusions can be drawn regarding the atomic weight of As, and from this the passage is easy to conclusions regarding the atomic weights of P, V, Sb, and Bi, iron is connected with Ti, and this with Si, Zr, Sn, and Th, lastly, given the atomic weight of Pt, Ir, Pd, Rh, Ru, or Os, values can be assigned to the other metals of this group from a study of the composition of isomorphous compounds of these metals. Thus it is seen how helpful is the study of isomorphism in determining the atomic weights of the elements

These then are the three generally applicable methods whereby values may be found for the atomic weights of the elements—the method founded on the law of Avogadro, the method based on the study of the specific heats of solid elements, and the method which considers the relations between the chemical composition and the crystalline form of similar compounds. The first of these methods can be applied to determine the atomic and molecular weights of elements and the molecular weights of compounds, but the application is restricted to bodies which are gasifiable without decomposition, the second and third methods can be applied, strictly speaking, only to find values for the atomic weights of solid elements or of elements which form solid compounds.

All the methods are essentially physical, they are based on physical conceptions, and they are to a great extent developed by physical reasoning.

The conception of the molecule of a gaseous element or compound which is implied in the statement, 'equal volumes of gases contain equal numbers of molecules,' is wholly physical. The image of the molecule which this statement calls up in the mind is that of a small definite portion of matter 'which moves about as a whole so that its parts, if it has any, do not part company during the motion of agitation of the gas' (Clerk Maxwell). It is when this conception is applied to chemical changes that we are forced to admit that in many of these changes the parts of molecules do part company,

thus we are led to the chemical conception of the atom, as a portion of matter smaller than the molecule, and either itself without parts, or else composed of parts which, so far as we know at present, do not part company during any of the changes which the atom undergoes. Then we proceed to study the properties of these atoms, and among these properties we seem to find two of great importance, the property namely which is expressed in the statement that the atoms of all solid elements, at certain temperatures, have equal capacities for heat, and the property which may be expressed in the statement that identity of crystalline form among compounds is usually accompanied by equality in the number of atoms of which the chemically reacting masses of these compounds are composed.

But here we ask the *molecules* of isomorphous compounds built up of equal numbers of atoms? Can the physical conception of molecule, which has been gained by the study of gaseous phenomena, be applied to solid compounds? And the answer at present is it is those small masses of isomorphous compounds which take part in chemical reactions, which as a rule, are composed of equal numbers of atoms. The physical definition of molecule cannot, in the present state of knowledge, be safely applied to solid and liquid bodies. Thus we seem to arrive at two conceptions, and two definitions, of the molecule. On the one side we have the physical conception, as that of a small mass of a gaseous element or compound which moves about as a whole, and the parts of which do not part company during the motion of agitation of the gas, and on the other side we have the chemical conception, as that of the smallest mass of an element or compound which takes part in a chemical change, and which exhibits the properties of the specified element or compound.

The first of these definitions holds good whether the small particles of a gas are themselves composed of smaller particles, or are chemically indivisible. The volume occupied by a number of gaseous molecules is independent of the numbers of atoms which by their union form these molecules. In one case a gaseous molecule may consist of a single atom (Hg and Cd), in another case a gaseous molecule may be formed by the union of 2 atoms (HCl), 3 atoms (H_2O), 9 atoms ($\text{C}_2\text{H}_4\text{O}$), 11 atoms ($\text{C}_2\text{H}_4\text{O}_2$), or a much larger number of atoms, but in every case, equal volumes of the gases contain equal numbers of molecules. But we know of no single property of liquid and solid compounds which is similarly independent of the number of atoms forming the atomic complex or reacting chemical unit of the compound.

Let us consider the conception of the chemically reacting unit or collocation of atoms a little more closely. We have already seen that the application of the empirical laws of chemical combination could not lead to final determinations of the atomic weights of elements, because these laws could not enable chemists to determine which of several values should be given to the smallest mass of a compound capable of exhibiting the properties of that compound. The values 8, 16, 24, &c would be assigned to the atomic weight of oxygen, according as the

'atom' of water—that is, in Daltonian language, the smallest mass of water which exhibits the properties whereby water is distinguished from all other kinds of matter—was assumed to be 9, 18, 27, &c times heavier than the atom of hydrogen. But a study of the properties of water leads to the conclusion that the 'atom' of water very probably contains two atoms of hydrogen and one of oxygen, and that the atomic weight of oxygen is therefore more probably represented by the number 16 than by the number 8. Thus, if 9 grams of water react with chlorine or bromine in sunlight 8 grams of oxygen are evolved, and 36.5 grams of a compound of hydrogen with chlorine, or 81 grams of a compound of hydrogen with bromine, are produced, in the former case, the 36.5 grams of the chlorine compound are proved by analysis to be composed of 35.5 grams of chlorine and 1 gram of hydrogen, in the latter case, the 81 grams of the bromine compound are proved to be composed of 80 grams of bromine and 1 gram of hydrogen, in both cases the whole of the oxygen of the 9 grams of water is removed from combination with the hydrogen and makes its appearance as free oxygen. Again, if 9 grams of water are acted on by potassium, 5 grams of hydrogen are evolved, and 28 grams of a compound of potassium, hydrogen, and oxygen, containing 8 grams of oxygen—i.e. all the oxygen originally combined with hydrogen in the 9 grams of water—are at the same time produced, if these 28 grams of the new compound are dried, fused, and, while molten, are acted on by potassium, 5 grams of hydrogen are evolved, and 47 grams of a new compound of potassium and oxygen are produced, which 47 grams contain the whole of the oxygen (i.e. 8 grams) originally combined with hydrogen in the 9 grams of water. These experiments prove that the hydrogen in a specified mass of water can be removed from that mass of water in two equal portions, but, so far as these experiments go, that the oxygen in the same mass of water is either not removed at all, or is wholly removed, from combination with hydrogen. Hence the conclusion is drawn that the smallest reacting mass of water contains one chemically indivisible mass of oxygen, but two chemically indivisible masses of hydrogen. But masses of hydrogen and oxygen are combined in water in the ratio 1:8, hence, if the smallest reacting mass of water is composed of 2 smallest parts, i.e. atoms of hydrogen, and one smallest part, i.e. atom, of oxygen, it follows that the atomic weight of oxygen is at least 16, that of hydrogen being unity, and that the relative mass of the smallest reacting portion, that is the *reacting weight*, of water is represented by the number 18, not by the number 9.

What value is to be assigned to the reacting weight of marsh gas? Masses of carbon and hydrogen combine to form marsh gas in the ratio 3:1, hence the value we are seeking can not be less, but may be greater, than 4. If 4 grams of marsh gas are acted on by chlorine, a series of 4 compounds is produced, the first of these compounds contains chlorine and hydrogen combined with carbon, the masses of carbon and hydrogen being in the ratio 3:75, the second and third contain the same three elements, in the second the carbon and hydrogen are in the

ratio 3:5, and in the third in the ratio 3:25, the fourth is a compound of the whole of the carbon originally combined with hydrogen in the 4 grams of marsh gas with chlorine, and contains no hydrogen. If now 4 grams of marsh gas are burnt in a plentiful supply of oxygen 11 grams of carbon dioxide are produced, or if the same mass of marsh gas is burnt in a limited supply of oxygen 7 grams of carbon monoxide are produced, in each case the oxide of carbon formed contains the whole of the carbon originally combined with hydrogen in the 4 grams of marsh gas used. No compound has yet been obtained from 4 grams of marsh gas containing a smaller mass of carbon than was originally present in the marsh gas, i.e. containing less than 3 grams of carbon. The conclusion drawn from these experiments is that the smallest mass of marsh gas which can take part in chemical changes is itself most probably composed of at least 4 atoms of hydrogen combined with at least one atom of carbon, but if this is granted it follows that an atom of carbon is 12 times heavier than an atom of hydrogen, and that the reacting weight of marsh gas is represented by a number certainly not smaller than 16.

We have thus determined, on chemical grounds and by chemical reasoning, the following values for the atomic weights of two elements ($H=1$) $C=12$, $O=16$. Now let us consider a compound of these elements. The simplest formula that can be given to acetic acid consistently with the values $H=1$, $C=12$, $O=16$, is CH_3O . If this acid is neutralised by soda, and the sodium salt so formed is analysed, this salt is found to be composed of the same masses of carbon and oxygen, combined with $\frac{1}{2}$ the mass of hydrogen, which were present in the mass of acid used, hence the smallest reacting mass of acetic acid must contain at least 4 atoms of hydrogen. But if this is granted it follows, from the fact that the elements are combined in the ratio $C:2H:O$, that this smallest reacting mass must also contain at least 2 atoms of carbon and 2 atoms of oxygen, and that the formula expressing the composition of the reacting weight of the acid in question must be written $C_2H_4O_2$. Further evidence in support of this conclusion is afforded by the preparation of thioacetic acid, which is composed of carbon, hydrogen, oxygen, and sulphur, the carbon and hydrogen being present in the same ratio as in acetic acid, but the oxygen being present in the ratio of 16 to 4 hydrogen (i.e. $O:4H$), and the sulphur in the ratio 32 to 4 hydrogen. Now the atomic weight of sulphur is almost certainly 32, hence the simplest formula which expresses the composition of the reacting weight of thioacetic acid is C_2H_4OS . In this case, $\frac{1}{2}$ of the oxygen of the reacting weight of acetic acid is replaced by sulphur without any further change in the composition of the acid, hence, there must be at least 2 atoms of oxygen in the reacting weight in question, because atoms are (by definition) chemically indivisible.

This is an example of the general proposition that when $\frac{1}{n}$ of a constituent element of the reacting weight of a given compound can be replaced by another element without any other

change in the composition of the original substance, it follows that the reacting weight in question must contain at least n atoms of the element which has been removed, and that if the atomic weight of the replacing element is known, it is easy to calculate, from the composition of the original substance, the masses of the other constituents which must be present united with the n atoms of the specified element, and hence to assign a minimum value to the reacting weight of the original substance.

When a formula has been assigned to a compound by such chemical methods as those now sketched, it is frequently possible to argue from this to the formulae of similar compounds. Thus, the properties and the methods of formation of sulphide of hydrogen show that this compound is similar to oxide of hydrogen (water), but if the reacting weight of water is represented by the formula H_2O , that of sulphuretted hydrogen is probably represented by the formula H_2S , again, the marked analogies between the sulphide, selenide, and telluride, of hydrogen suggest that these compounds have similar compositions, but if the first named is H_2S , the others are probably H_2Se , and H_2Te , respectively. If these formulae are admitted, values are at once found for the atomic weights of the three elements, sulphur, selenium, and tellurium. Again, the metal magnesium reacts with water in the ratio of 24 parts by weight of the metal to 18 parts by weight of water, the products of this action being, (1) an oxide of magnesium containing 16 parts by weight of oxygen united with 24 parts by weight of magnesium, and (2) two parts by weight of hydrogen, hence, as the reacting weight of water is represented by the formula H_2O , that of magnesium oxide is probably represented by the formula MgO , where $Mg = 24$ parts by weight of magnesium, and hence the atomic weight of magnesium is probably 24.

The chemical methods for determining the atomic weights of elements then lead to a definition of atomic weight which may be stated thus: the atomic weight of an element is a number which tells how many times greater is the smallest mass of that element found in the chemically reacting weight of any of its compounds than the smallest mass of hydrogen found in the chemically reacting weight of any compound of hydrogen, such smallest mass of hydrogen being taken as unity. The difficulty in applying this definition lies in the vagueness of the expression 'the chemically reacting weight of a compound'. This expression cannot be defined, the illustrations already given indicate the interpretation usually put upon it, and also the methods whereby approximately accurate values are obtained for it in special cases.

The physical conception of molecule is clear, and admits of being put into words which have a definite quantitative meaning, this conception leads to that of the atom, the definition of which may also be put into a quantitative form. But the definition of the molecule is strictly applicable only to gases, hence arises the need of a subsidiary definition. We conceive chemical changes occurring among liquid and solid bodies as occurring among the smallest particles of these bodies which are capable of existing as wholes and of exhibiting the properties of the

bodies in question. These smallest particles we may call the chemically reacting units, or the reacting weights, of the bodies, they are generally called molecules, but if we use this term we must not forget that it is employed in a somewhat vague manner, and without the strict quantitative signification which is attached to it when we speak of the molecule of a gas.

It seems probable that the mass of the chemically reacting unit of a compound varies, within certain not very wide limits, in different reactions. This mass must of course always be expressed by a whole multiple of a certain number, but it is probable that the value of the multiple varies. Thus many of the reactions of potassium permanganate can be simply expressed by assigning to the reacting weight of this salt the formula $KMnO_4$, but other reactions indicate that this formula should be doubled and written $K_2Mn_2O_8$. Again, periodic acid generally reacts as if the smallest particle which exhibits the chemical properties of this acid had the mass 228, and were composed of hydrogen, iodine, and oxygen, combined as shown in the formula H_5IO_6 , but some of the reactions of periodic acid are more simply explained by doubling the formula, and writing it $H_{10}I_2O_{12}$. Indeed, even in the case of gaseous elements and compounds, we have sometimes direct evidence to show that the molecular weight of the gas varies with variations of temperature. Consider, for instance, the following data —

SPEC GRAV OF IODINE GAS (AIR = 1)

Pressure	Temperature	Sp gr
760 mm	448°	8.74
"	855	8.07
"	(approx) { 1275	5.82
"	{ 1470	5.06
76 mm	{ 1250	4.72

SPEC GRAV OF SULPHUR GAS (AIR = 1)

Pressure	Temperature	Sp gr
760 mm	520°	6.62
"	660	2.93
"	860	2.23

(cf SULPHUR, vol IV)

SPEC GRAV OF ACETIC ACID GAS (AIR = 1)

Pressure	Temperature	Sp gr
760 mm	124°	8.20
"	130	8.11
"	160	2.48
"	230	2.09
"	280	2.08
"	338	2.08

SPEC GRAV OF NITROGEN TETROXIDE GAS (AIR = 1).

Pressure	Temperature	Sp gr
125 mm	— 6°	3.01
138 "	+ 1°	2.84
760 "	70	1.93
" "	135	1.60
" "	185	1.57

The density of iodine gas would be 8.77 if the composition of the molecule were represented by I_2 , and 4.38 if the composition of the molecule were represented by I the numbers given point to the existence of molecules having the composition I_2 at comparatively low

temperatures, and having the composition I at high temperatures when the gas is under a small pressure. The numbers given for sulphur gas suggest the existence of molecules S_8 at temperatures from b p to c 550°, and of molecules S_2 from c 650° to c 1000°, but more recent results throw considerable doubt on the accuracy of this conclusion (*cf* SULPHUR, vol IV). In the case of acetic acid gas, experiments indicate the existence of two different molecules, the data point to the existence of the molecules $C_2H_3O_2$ (calculated sp gr = 2.08, air = 1) at about 230° and upwards, but to the existence of heavier molecules, $C_4H_7O_4$ (calculated sp gr = 3.12, air = 1), at about 120°–130°. Lastly, the existence of the molecules N_2O_4 (calculated sp gr = 3.18) in gaseous nitrogen tetroxide at low temperatures and pressures, and of the molecules NO_2 (calculated sp gr = 1.59) at higher temperatures, is indicated by the numbers which represent the observed relative densities of this gas. The sp grs of some gases slowly decrease as temperature rises until a value is attained which remains constant throughout a considerable interval, *eg* iodine, acetic acid, nitrogen tetroxide, gases, in other cases the sp gr remains nearly constant throughout a considerable range of temperature, and then rapidly decreases until another constant value is reached, which again remains constant for a considerable temperature interval, *eg* sulphur gas (*v* DISOCIATION, also ALLOTROPY, and ISOMERISM). But in both classes of gases the data point to the existence, at different temperatures, of more or less stable molecules, the mass of the heavier of which is a whole multiple of that of the lighter.

The practical conclusions to be drawn from these facts are, that before the molecular weight of a gas can be regarded as satisfactorily determined, observations of the sp gr of that gas must be made throughout a considerable range of temperature, and that the number which represents the sp gr in question for such a range of temperature is to be taken as the basis for calculating the molecular weight of the gas, or it may be in some cases the numbers which represent the sp grs, each for a considerable temperature interval, are to be used for finding the different molecular weights of the gas.

If then the mass of the molecule of a gas may have a different value, and therefore the molecule be composed of a different number of atoms, at a high than at a low temperature—and so far as data goes it seems that the mass of the molecule, if variable, is greater at temperatures near the condensation point than at temperatures far removed from this point—it is at least very probable that, if we carry over the conception of the molecule from gases to liquids and solids, we must be prepared to regard the mass of the molecule of a liquid or solid compound as considerably greater than that of the molecule of the same compound in the gaseous state. But, in practice, when we speak of the molecular weight of a liquid or solid compound we use the term molecular weight with a meaning different from that which we assign to it when we speak of the molecular weight of a gas. In the latter case the term signifies a small mass of matter, itself built up of smaller parts,

which collides with other similar small masses, rebounds, vibrates, but yet remains intact, when a number of these small parts of matter are heated, in the former case the term summarises a number of chemical data in a convenient form, and asserts that the number of atoms which are so associated as to act in many changes as a chemical whole, is not less than a certain specified number.

The chemical formulæ of solid and liquid bodies do not then stand on the same footing as the formulæ of gases (*v* FORMULÆ). But the question arises are these collocations of atoms which we have called reacting chemical units also the reacting physical units of this or that compound? Are the physical constants of compounds conditioned by the masses of these reacting units? If these questions are answered in the affirmative, it is possible that measurements of some physical constant for a series of chemically similar compounds might enable just conclusions to be drawn regarding the relative masses of the reacting units of these compounds. Many measurements of this kind have been made, but no wide generalisation has yet been found which enables us to determine the relative masses of the reacting units of solid and liquid compounds from a knowledge of the physical constants of these compounds. All the generalisations which have been, or which at present can be, ventured upon, are for the most part empirical: the theory of the grained structure of matter has been developed, so far as it has been developed, only for gases, as regards gases, conclusions can be drawn from the fundamental principles of the theory, and these conclusions can be tested by experiment, but as regards liquids and solids, no such general conclusions can be drawn, and the theory can be used as a guide in experimental research only in a wide and general manner. What is wanted now is therefore not only further experimental determinations of the physical constants of series of chemically similar compounds, but a great development of the general theory of the structure of matter, especially in the direction of applying this theory to liquid and solid bodies (*v* MOLECULAR THEORIES, also PHYSICAL METHODS). The great difficulty lies in the fact that most of the physical constants of liquid and solid compounds appear to be conditioned both by the nature and number, on the one hand, and by the modes of combination, on the other hand, of the atoms which form the atomic complexes we have called reacting chemical units. But the kinetic theory of gases has been chiefly developed from the study of properties which are independent of the nature and number, and are conditioned only by the states of union, of the parts of molecules.

But although we must for a time be content with the conception of the chemically reacting unit of a liquid or solid compound, and although we may at times wistfully contrast this with the clear physical conception of the molecule of a gas, yet there is one well established chemical generalisation by the application of which values may be obtained for the atomic weights of many elements. This generalisation may be stated thus—*The properties of the elements vary periodically with variations in the atoms*

weights of the elements, or thus —If the elements are arranged in order of increasing atomic weights, the properties of the elements vary from element to element, but return more or less nearly to the same values at certain fixed points in the series. Let the elements be arranged in the order of their atomic weights, from hydrogen to uranium, let them be divided, broadly, into series of sevens, let the second series be placed under the first, the third under the second, and so on, then the elements contained in any one vertical column are called a *group*, and those in any one horizontal column are called a *series*. In this arrangement hydrogen is placed in a series by itself, and under it, that is in the same group, is placed the element (lithium) which comes next after hydrogen in order of increasing atomic weight, certain gaps are also supposed to occur in the list of elements, so that an element which immediately succeeds another in order of increasing atomic weights is sometimes placed, not in the group immediately succeeding, but in the group next but one or next but two &c. after, that which contains the element with the smaller atomic weight. Thus uranium (240) comes after thorium (232) in order of atomic weights, thorium is placed in group IV, but uranium is placed in group VI. Certain elements are also placed in an eighth group by themselves, and the last member of each series in this group is repeated as the first member of the next series in group I.

The following table shows the arrangement of the elements in accordance with the *periodic law*. The formula at the head of each group represents the composition, either of the highest, or of the most characteristic, oxide of the elements belonging to that group, in each case the formula gives the number of atoms of oxygen referred to two atoms of the element

parts, and to examine the nature of the connexion between the atomic weights, and such measurable properties, of the elements, as atomic volume

$$\left(= \frac{\text{atomic weight}}{\text{S.G. of solid element}} \right),$$

position in electrical series, fusibility, composition of oxides, chlorides, &c., wave lengths of characteristic lines in the spectra, heats of combustion or of combination with chlorine, &c. &c. The expression 'properties of the elements' is also to be taken as including the properties of the compounds of the elements, so that the periodic law asserts that *e.g.* the melting points of similar compounds (say of chlorides) vary periodically with variations in the atomic weights of the elements.

The periodic law will be discussed in detail in the article with that heading, meanwhile suffice it to say that the law rests on a firm basis of well established facts of diverse kinds. We shall here make use of this law to establish values for the atomic weights of one or two typical elements.

At the time of the publication of Mendeléeff's first memoir on the periodic law no elements were known which could be placed in group III series 4 and 5. Calcium (40) and titanium (48) were known, zinc (65) and arsenic (75) were known calcium and zinc evidently belong to the group which comprises magnesium, strontium, cadmium, and barium, titanium must be placed in the same group as carbon, silicon, and tin, and arsenic could not be separated from phosphorus, vanadium, and antimony. Hence two gaps occurred in group III (series 4 and 5), and one in group IV (series 5). From considering the difference between the values of the atomic weights of consecutive elements, (1) in

Series	GROUPS

In order to establish the existence of a periodic connexion between the atomic weights and the properties of the elements, it is necessary to break up the phenomena connoted by the phrase 'properties of the elements' into

the same series—the average value of this difference is about 2 in series 3, 4, and 5—and (2) in the same group—the average value of this difference for the first, second, and third members of groups I, II, and III, and for the first

and second members of groups IV, V., VI., and VII., is about 15, and for the succeeding members of these groups it is about 23—Mendeléeff assigned the value 44 as approximately that of the atomic weight of the unknown element in series 4 of group III., and the value 69 as approximately that of the atomic weight of the unknown element in series 5 of the same group. Mendeléeff also predicted many of the properties of these two unknown elements from considering the positions they occupied in the 'periodic' arrangement of the elements. Thus, the relations of the unknown element with atomic weight 44 to aluminium should be similar to those between (1) calcium and magnesium, (2) titanium and silicon, (3) vanadium and phosphorus, (4) chromium and sulphur, again the relations between (1) beryllium and calcium, (2) carbon and titanium, (3) nitrogen and vanadium, (4) oxygen and chromium, (5) fluorine and manganese, ought to be similar to the relations between boron and the unknown element. As regards the properties of the second unknown element with atomic weight 69, it was known that (1) zinc is more like magnesium than it is like calcium, (2) arsenic more resembles phosphorus than it does vanadium, (3) selenium shows closer analogies with sulphur than with chromium, and (4) bromine and chlorine are more like each other than either is like manganese, hence, it was argued, the unknown element (69) will resemble aluminium more closely than it resembles the other unknown element (44), and more closely than the second unknown element itself resembles aluminium. The relationships indicated were of course studied in detail by Mendeléeff. Thus, take the pairs of consecutive elements in series 3 and 4, the resemblance between any of these pairs (Na, K, Mg, Ca, Si, Ti, P, V, S, Cr, Cl, Mn) is less marked in the higher than in the lower groups. Or, take the two elements in each group belonging respectively to series 3 and 5, the resemblance between any of these pairs (Na, Cu, Mg, Zn, P, As, S, Se, Cl, Br) is more marked in the higher than in the lower groups.

The relationships examined by Mendeléeff were those between atomic weights, fusibilities, atomic volumes, composition of oxides, chlorides and other compounds, acid or basic character of oxides, power of forming double salts and composition of these salts if formed, &c &c. As a result of his study of these relationships, Mendeléeff tabulated many properties of the two unknown elements. Since the memoir of the Russian naturalist was published, several new elements have been discovered, some of the properties of two of these elements will now be compared with the properties which Mendeléeff asserted ought to characterise the elements belonging respectively to series 4 and 5 of group III.

Mendeléeff's Eka-aluminium (III-5)

Atomic weight about 69
 Readily obtained by reduction
 Melting point low Sp gr = 5.9
 Not acted on by air
 Will decompose water at a red heat
 Slowly attacked by acids or alkalis.
 Will form a potassium alum more soluble,

but less easily crystallisable, than the corresponding aluminium salt

Oxide = Eb_2O_3 Chloride = Eb_2Cl_3

Gallium.

Atomic weight = 69

Readily obtained by electrolysis of alkaline solutions

M P = 30.15° Sp gr = 5.93

Non volatile, and but superficially oxidised in air at bright red heat

Decomposes water at high temperatures
 Soluble in hot hydrochloric acid, scarcely attacked by cold nitric acid, soluble in caustic potash

Forms a well defined alum

Chloride = Ga_2Cl_3 Oxide = Ga_2O_3

Mendeléeff's Eka boron (III-4).

Atomic weight about 41

Oxide Eb_2O_3 , soluble in acids, sp gr about 3.5, analogous to but more basic than Al_2O_3 , less basic than MgO , insoluble in alkalis

Salts of Eb colourless, and will yield gelatinous precipitates with KOH , K_2CO_3 , Na_2HPO_4 , &c

Sulphate, Eb_2SO_4 , will form a double salt with K_2SO_4 , probably not isomorphous with the alums

Chloride EbCl_3 or Eb_2Cl_3 , sp gr about 2, less volatile than Al_2Cl_3

Scandium.

Atomic weight = 44

Oxide Sc_2O_3 , sp gr = 3.8, soluble in strong acids, analogous with but more decidedly basic than Al_2O_3 , insoluble in alkalis

Solutions of Sc salts colourless and yield gelatinous precipitates with KOH , K_2CO_3 , and Na_2HPO_4

Sulphate, Sc_2SO_4 , forms a double salt, not an alum, $\text{Sc}_2\text{SO}_4 \cdot 3\text{K}_2\text{SO}_4$

Gallium and scandium are, therefore, the elements which Mendeléeff named *eka aluminium* and *eka boron*, and many properties of which were accurately and in detail tabulated by him, while the elements were yet unknown

Much discussion has of late been carried on, and a great deal of experimental work has been done, regarding the value to be given to the atomic weight of beryllium. Chemists are agreed that the value in question is either (in round numbers) 9 or $9 \times 1\frac{1}{2} = 13.5$, if the former value is adopted, beryllium must be placed in group II series 2, if the latter value is preferred, the metal must find a place between carbon and nitrogen. If the former value is adopted, the formula of beryllium oxide becomes BeO , if the latter value is preferred, the formula of this oxide must be written Be_2O_3 . The periodic law is a guide in the solution of this problem. Briefly, the law directs us to study the properties of the element itself and the composition and properties of its compounds, to compare these with those of elements which must come in the same group and the same series as beryllium, to compare the relations between beryllium and these other elements with the relations which have been established between elements occurring in positions similar to that occupied by beryllium and the other elements in question, and to adopt

that value for the atomic weight of beryllium which best harmonises with the outcome of this study. There can be no doubt that the value which best harmonises with the results of this study is 9, hence the atomic weight of beryllium is almost certainly 9. This result is confirmed by the application of the law of Dulong and Petit, and also of the law of Avogadro, for the specific heat of beryllium at about 500° is nearly constant and is approximately represented by the number 62 ($62 \times 9 = 558$), and the vapour densities of beryllium chloride and bromide show that the formulae of these compounds, as gases, are BeCl_2 and BeBr_2 , respectively ($\text{Be} = 9$).

The atomic weight of tellurium had for long been supposed to be greater than that of iodine (127), but if this were so tellurium must be placed in group I series 9, that is to say, in a group which contains the alkali metals. This position cannot be defended, moreover, every chemist knows that tellurium exhibits marked analogies to sulphur and selenium. But if tellurium is to find a place in group VI the value to be given to its atomic weight must be greater than 120 and less than 127. In 1883 Brauner undertook an experimental criticism of the methods whereby the atomic weight of tellurium had been determined by different chemists. Brauner proved that these methods almost necessarily gave too large values, he also made very careful determinations of the atomic weight of the element by two new methods, and obtained a series of numbers varying from 124.94 to 125.4, with a mean value of 125. The periodic law has, therefore, prevented chemists from finally adopting an erroneous value for the atomic weight of tellurium, notwithstanding the great weight of authority which was in favour of regarding that value as correct.

These examples will suffice to show how the periodic law is used as a guide in determining what multiple of the combining weight of an element is to be adopted as the atomic weight of that element. Incidentally, these examples also impress us with the extreme importance of the constants which we call the atomic weights of the elements. Given this constant for a new element, and we may, to a considerable extent, predict the properties of the element and its compounds. The periodic law also enables values to be given, if not to the molecular weights, then certainly to the reacting weights of compounds, because the position of an element in a group and series determines the formulae of the salts of that element, and, as we assume the atomic weights of the other elements in these salts to be known, therefore determines the relative masses of the chemically reacting units of these salts. There are at least one or two elements in each group which form some gasifiable compounds, the molecular weights of these compounds are therefore known, hence conclusions may tentatively be drawn regarding the molecular weights of similar compounds of other elements in the same group. But no great stress must be placed on such reasoning as this. Aluminium and indium occur in group III (series 3 and 7), these metals exhibit fairly marked analogies, yet the molecular formulae of gaseous aluminium chloride is Al_2Cl_6 while that of gaseous indium chloride is InCl_3 , thallium

belongs to the same group as aluminium and indium (series 11), yet the formula of the only chloride of thallium which is stable as a gas is TlCl .

There is then at present one generally applicable method for determining the molecular weights of gaseous elements and compounds, this method springs out of the application of the generalisation of Avogadro to chemical changes occurring between gaseous elements. The application of the generalisation in question leads to practical definitions of the terms molecular weight and atomic weight. In addition to this method there are three others which serve to determine, more or less accurately, the values of the atomic weights of the elements, and two of these are also employed to find the relative masses of the small particles of solid and liquid compounds which take part in chemical changes.

The methods founded respectively on the laws of Avogadro, Dulong and Petit, and Mitscherlich, are essentially physical methods, they are outcomes of the physical theory of the grain structure of matter. The applications of this theory to chemical phenomena which have been considered in the present article have been treated in a purely empirical manner. But it is possible to deduce the law of Avogadro from the first principles of the theory in question. The theory assumes that the temperature of a gas represents the mean kinetic energy of the molecules of that gas, hence, if M and M_1 represent the masses, and V^2 and V_1^2 the mean squares of the velocities, of the molecules of two gases at the same temperature, it follows, from the laws of energy, that

$$MV^2 = M_1V_1^2$$

But if the pressures of the two gases are equal, then

$$NMV^2 = M_1N_1V_1^2$$

where N and N_1 represent the number of molecules in unit volume of the two gases, because, according to the theory, the pressure of a gas on the walls of the containing vessel is an effect of the impacts of the molecules of the gas, and this depends on the number and velocity per unit of time of these molecules. From these equations it follows that

$$N = N_1$$

that is, when two gases are at the same pressure and temperature the number of molecules in unit volume of either gas is the same. But this is the law of Avogadro.

Neither the law of Dulong and Petit, nor the law of isomorphism, can as yet be satisfactorily deduced from the first principles of the molecular theory. We know very little, if any thing, of the structure of gaseous molecules, and of the molecular phenomena of solids our accurate knowledge may be said to be almost nothing (*v* AGGREGATION, STATES OF, p. 87, also MOLECULAR STRUCTURE OF MATTER, THEORIES REGARDING, also PHYSICAL METHODS APPLIED TO CHEMICAL PHENOMENA).

The atomic weights of all the known elements have been more or less accurately determined, but only fourteen elements have been gasified, and hence the molecular weights of only fourteen elements have been determined. The molecules of the greater number, but by no means of all,

of these elements are *most probably* (v remarks on p 340 regarding the molecules of hydrogen, &c) composed of two atoms, they are diatomic. The following table shows the classification of

the elementary molecules, so far as the available data permit, in accordance with their atomosity, that is, the number of atoms of which each molecule is composed

ATOMICITY OF ELEMENTARY MOLECULES (the temperatures are approximate)

Monatomic	Diatomic	Triatomic	Tetrameric	Hexatomic
Sodium Potassium Zinc Cadmium Mercury Iodine at c 1500° (? Bromine at c 1800°) Antimony at c 1700°	Hydrogen Chlorine Bromine Iodine at 200°-1000° Oxygen Sulphur at 800° and upwards Selenium at 1200° and upwards Tellurium Nitrogen Phosphorus } at white Arsenic } heat	Oxygen as ozone Selenium at 700°-800°	Phosphorus Arsenic (both at temps nearly up to white heat)	Sulphur at 450- 550° (very doubtful, v Biltz a Meyer, B 21, 2013)

The following table presents the data available for calculating the molecular weights of the elementary gases —

MOLECULAR WEIGHTS OF ELEMENTARY GASES

I	II	III	IV	V	I	II	III	IV	V
Name of element	Relative density air=1	Temp of observation	Density × 28.87	Molecular weight	Name of element	Relative density air=1	Temp of observation	Density × 28.87	Molecular weight
¹ Hydrogen	0.6926	0°	2	2	¹¹ Bromine	5.54	100°	159.9	159.5

Biltz a. Meyer (*Z P C* 4, 249) have obtained values which point to a mol w for phosphorus between P₄ and P₂, for bismuth between Bi₄ and Bi, and for thallium as Tl, at very high temperatures

The following table presents a summary of the atomic weights of the elements and of the evidence upon which each value is based —

ATOMIC WEIGHTS OF THE ELEMENTS

I Element	II Principal compounds of which have been determined	III Specific heat, how determined	IV Isomorphism, compounds compared [see Note A, p 361]	V Atomic Weight		VI Compounds analysed &c. in order to find combining weight of the element [see Note B, p 361]	VII Combining weight [see Note B, p 361]	VIII Remarks [see Note C, p 361]
				(1) By vapour density method	(2) By sp heat method			
Hydrogen	H ₂ , HCl, HBr, HI, H ₂ S, H ₂ Se, H ₂ Te, H ₂ N, H ₂ P, H ₂ O &c.	Indirectly [from sp heat of H ₂ O, NH ₃ , NH ₄ NO ₃] [Atomic heat abnormal?]	—	1	—	—	—	—
Lithium	None	Directly	Li compounds with analogous compounds of alkali metals	—	7.01	• Lithium chloride	7.01	—
Beryllium	BeCl ₂ , BeBr ₂	Directly sp heat varies much with temperature	A few Be compounds with analogous compounds of Cd and Zn	9.08	9.08	• Beryllium sulphate	4.54	—
Boron	BP ₃ , BCl ₃ , BBr ₃ , B(CH ₃) ₃	Directly sp heat varies much with temperature	—	10.9	10.9	• Borax, boron chloride	3.66	—
Carbon	CH ₄ , CH ₂ F ₂ , CH ₃ Cl, CH ₃ Br, CH ₃ I, CH ₂ Cl ₂ , CO, CO ₂ , COCl ₂ , COS, CS ₂ , C ₂ H ₂ , C ₂ H ₄ , C ₂ H ₆ , &c	Directly sp heat varies much with temperature	CN compounds with those of P, Cl, Br, and I	11.97	11.97	• Diamond burnt to CO ₂	3.95	—
Nitrogen	NH ₃ , NO, NO ₂ , N ₂ O, N ₂ O ₄ , &c	Indirectly very un decided [from sp heats of various compounds]	NH ₃ compounds with those of alkali metals	14.01	—	• Ammonium chloride, silver nitrate	4.67	—
Oxygen	OH, ON, OC, O ₃ , P, O ₂ , O ₃ , O ₄ , &c	Indirectly very un decided [from sp heats of various compounds]	—	15.96	—	• Synthesis of water	7.98	—
Fluorine	PF ₃ , F(CH ₃), F ₂ B, F ₂ Si, F ₂ P, &c	Indirectly very un decided [from sp heat of CaF ₂ &c]	Metallofluorides with analogous compounds of Cl, Br and I	19.1	—	• Sodium fluoride, potassium fluoride, calcium fluoride	19.1	—
Sodium	None	Directly	Na compounds with those of other alkali metals	—	23	• Sodium chloride	23	—
Magnesium	"	"	Mg compounds generally with those of Zn, Mn, and Fe (in ferrous salts)	—	24	• Magnesium sulphate, do chloride	12	—
Aluminium	AlCl ₃	"	With Cr, Mn and Fe in R ₂ O ₃ and derivatives	27.03	27.02	• Ammonia alum., aluminium bromide, solution of alumina in soda	9.007	—

I. Element	II Principal compounds vapour densities of which have been determined	III Specific heat how determined	IV Isomorphism compared [see Note A, p 361]	V Atomic Weight		VI Compounds analysed &c in order to find combining weight of the element [see Note B p 361]	VII Combining weight [Notes B, p 361]	VIII Remarks [see Note C, p 361]
				(1) By vapour density method	(2) By sp heat method			
Silicon . . .	SiF_4 , SiCl_4 , SiH_4 , Si_2Cl_6 , Si_2OCl_2 , &c	Directly, sp heat varies much with temperature	With C, Ti, Zr, Sn and Th in compounds of type RO_2	28.3	28.3	1. Silicon chloride and bromide	7	
Phosphorus	$\text{Si}_2\text{O}(\text{C}_2\text{H}_5)_2$, &c PF_3 , POCl_3 , PBr_3 , P_2O_5 , P_2O_3 , &c	Directly	Phosphates with vanadates and arsenates, organic compounds of P with those of N, As, and Sb	30.96	30.96	10. Phosphorus chloride, synthesis of phosphorus pentoxide	10.39	
Sulphur . . .	S_2 , S_8 , SO_2 , SO_3 , SOCl_2 , S_2O_3 , &c	"	With Se compounds, with Te compounds of type R^+Te^- salts of H_2SO_4 with those of H_2CrO_4 and H_2TeO_4	31.98	31.98	12. Synthesis of silver sulphide reduction of silver sulphate by hydrogen	15.99	
Chlorine . .	Cl_2 , $\text{Cl}(\text{OH})$, Cl_2H_2 , Cl_2Zn , Cl_2Hg , Cl_2Sn , Cl_2C , Cl_2Si , Cl_2U , Cl_2Th , Cl_2Mo , Cl_2W , &c	Indirectly, doubtful [from comparison of various haloid compounds]	Chlorides with analogous compounds of Br and I	35.37	—	14. Potassium chlorate synthesis of silver chloride		
Potassium	KI	Directly	K compounds with those of other alkali metals	39.04	39.04	15. Potassium chloride, do bromide	39.04	
Calcium . . .	None	"	Ca compounds with those of Sr, Ba, and in some cases Pb	—	39.9	16. Calcium chloride, calcium carbonate	19.95	
Scandium . .	"	Sp heats of some compounds determined	(? Sc compounds with those of other earth metals)	—	—	17. Synthesis of scandium sulphate	14.66	Sc. The atomic weight of this metal is most probably $14.66 \times 3 = 44$. If this is so the oxide is Sc_2O_3 and is analogous with the oxides of the earth metals
Titanium . .	TiCl_4	Directly	TiO_2 and some derivatives with analogous compounds of C, Si, Zr, Sn and Th	48	48	18. Titanium chloride and bromide	13	
Vanadium	VOCl_3	Sp heats of one or two compounds determined	Vanadates with phosphates and arsenates	51.2	—	19. Vanadium pentoxide, do oxychloride	17.07	
Chromium	Cr_2O_3 , CrCl_3 , CrCl_4	Directly (? too low)	Salts of H_2CrO_4 with those of H_2MnO_4 and H_2TeO_4 , Cr_2O_3 with Al_2O_3 , Mn_2O_3 and Fe_2O_3	52.4	52.4	20. Chromium chloride silver chromate Potassium dichromate	20.3	
Manganese .	MnCl_2	" (1 too high)	Mn_2O_3 with Al_2O_3 , Cr_2O_3 and Fe_2O_3 , with MnO with H_2CrO_4 and H_2TeO_4 , RMnO_4 with RCO_2	55	55	21. Manganese chloride manganoso - man ganic oxides, man ganous salts, Si, per manganate	57.5	
Iron	FeCl_3 , FeCl_4	Directly	Fe_2O_3 and derivatives with Al_2O_3 , Cr_2O_3 , Mn_2O_3 and derivatives. Some Fe salts with those of Ni, Co, and Cu	55.9	55.9	22. Synthesis of ferrous oxide, reduction of ferric oxide, analysis of ferrous and ferric chlorides	57.95	

Nickel . . .	Ni(CO)	Directly	Ni with Co compounds some Ni compounds with those of Fe (ferrous salts)	—	58.6	Nickel chloride, nickelous oxide, strychnine - nickel cyanide	72.3
Cobalt . . .	—	—	Co with Ni compounds some Co compounds with those of Iron (ferrous salts)	—	59	Ammonium cobalt cyanide phenyl cyanide strychnine ammonium cobalt cyanide strychnine and brucine cobalt cyanides	29.5
Copper .	Cu ₂ O.	—	Most Cu compounds with those of Ni and Co some with Fe (ferrous) compounds Cu and Ag compounds of type R ₂ O	63.2	63.2	Reduction of copper oxide, electrolysis of copper sulphate	63.2
Zinc . . .	ZnCl ₂ , Zn(OH) ₂ , Zn(C ₂ H ₃) ₂ .	—	Zn compounds with those of Mg and Mn	64.9	64.9	Synthesis of zinc	39.45
Gallium	Ga ₂ Cl ₃ , GaCl ₃ , GaCl ₄ .	Directly [? too low]	Ga-alum with other alums	65.48	65.48	Solution of zinc in dilute sulphuric acid	39.74
Germanium	GeBr ₄ , GeCl ₄ , GeS	Directly	—	69.9	69.9	Oxidation of the metal gallium-ammonia alum	23.3
Arsenic	AsH ₃ , AsCl ₃ , AsI ₃ , As(CH ₃) ₃ , Cl ₄ , As ₂ O ₅ &c	—	As compounds with those of Sb and Bi, also of Ni, Fe and SO arsenates with phosphates and vanadates	72.32	72.32	Arsenic bromide, do chloride, do oxide	18.08
Selenium	SeH ₂ , SeO ₂ , SeCl ₄ , SeCl ₂ , Br.	—	Se with S compounds	74.9	74.9	Germanium tetra-	24.97
Bromine	BrH, Br ₂ , Br ₂ O, Br ₂ Sn, Br ₂ U &c	—	Bromides, with analogous compounds of Cl and I	78.8	78.8	Reduction of selenium dioxide, reduction of silver selenite	39.4
Rubidium	RbCl, RbI	Indirectly doubtful (some compounds with those of other alkali metals)	Rb compounds with those of other alkali metals	79.75	79.75	Synthesis of silver bromide potassium bromide	79.75
				86.2	—	Rubidium chloride	86.2

I Element	II Principal compounds vapour densities of which have been determined	III Specific heat, how determined	IV Isomorphism compared [see Note A, p 361]	V Atomic Weight		VI Compounds analysed &c. in order to find combining weight of the element [see Note B, p 361]	VII Combining weight [Note B, p 361]	VIII Remarks [see Note C, p 361]
				(1) By vapour density method	(2) By specific heat method			
Strontium	None	Indirectly (comparison of compounds of Sr, Ca, and Ba)	Sr compounds with those of Ca and Ba, and with some Pb salts	—	—	Strontium chloride	43.65	87. The atomic weight of strontium must be taken as $43.65 \times 2 = 87.3$ if the formulae of the salts are to become analogous to those of the Ba and Ca salts.
Yttrium	"	Sp. heats of a few compounds determined	Yt compounds with those of other earth metals	—	—	Synthesis of yttrium sulphate	29.87	Yt. Atomic weight probably = $29.87 \times 3 = 89.6$ because of analogy of Yt salts with those of the earth metals
Zirconium	ZrCl ₄	Directly [? too low]	ZrO ₂ with TiO ₂ , ThO ₂ , SnO ₂ , and SiO ₂	90	90	Zirconium chloride	45	
Niobium	NbCl ₅ , NbOCl ₃	—	Nb with Ta compounds, Nb fluorides and oxyfluorides with Mo do do	94	—	potassium niobium fluoride Niobium chloride potassium niobium oxyfluoride	31.33	
Molybdenum	MoCl ₅	Directly [? too high]	Mo with W compounds, some salts of H ₂ MoO ₄ with those of H ₂ CrO ₄ , Mo with Nb fluorides and oxyfluorides	95.8	95.8	Molybdenum dichloride rude tetrachloride, and pentachloride	19.16	
Ruthenium	RuO ₃	Directly	Most Ru compounds with those of Rh, Pd, Ir, Pt, and Os	101.4	101.4	Potassium ruthenium chloride &c	25.38	
Rhodium	None	"	Most Rh compounds with those of Ru, Pd, Ir, Pt and Os	—	102.7	Potassium rhodium chloride	25.66	
Palladium	"	"	Most Pd compounds with those of Ru, Rh, Ir, Pt and Os	—	106.3	Palladium chloride	26.68	
Silver	AgCl	"	Some Ag compounds with those of Na and other alkali metals Ag with Cu compounds of type R ₂ O. A few Ag and Au compounds	107.66	107.66	Silver chlorate, bromate, iodate synthesis of silver bromide and iodide	107.66	
Cadmium	CdBr ₂	"	Some Cd compounds with those of Be and Zn	112	112	Cadmium bromide	56	
Indium	InCl ₃ , InCl	"	Some In compounds with those of Cd and Be	113.4	113.4	Synthesis of indium oxide	37.8	
Tin	SnCl ₄ , Sn ₂ Cl ₆ , SnCl ₂	"	SnO ₂ with TiO ₂ , ZrO ₂ , and ThO ₂	117.8	117.8	Synthesis of stannic oxide	58.9	
Antimony	SbCl ₃ , SbBr ₃ , SbI ₃ , Sb(CH ₃) ₃ , Sb ₂ O ₃ , SbCl ₅	"	Sb compounds with those of As and Bi	120	120	Antimony bromide reduction of antimony oxide analysis of antimony sulphide	40	

Tellurium	TaCl ₅ , TeCl ₄ , TeCl ₃	Directly	Most Te compounds with those of S and Se	125	125	65*
Iodine	IH, IO ₂ , I(OH), I.P., I.Hg, I.P., I.A., I.S., I.A., I.A.	"	Iodides with analogous com- pounds of Cl and Br	125.53	125.53	126.53
Cesium	CsCl	Indirectly doubtful [comparison of com- pounds with those of other alkali metals]	Cs compounds with those of other metals of alkalis	132.7	—	132.7
Barium	None	Indirectly doubtful [comparison of com- pounds of Ca, Sr, Ba]	Ba compounds with those of Ca and Sr	—	—	68.4
Lanthanum	"	"	Most La compounds with those of Ce, Di, Er, and Yt	—	133.5	46.17
Cerium	"	"	Some compounds of these metals with Ca compounds	—	139.9	46.6
Didymium	"	"	Some compounds of these metals with Ca compounds	—	144	48
Erbium	"	"	Some compounds of these metals with Ca compounds	—	(142)	(47.6)
Ytterbium	"	"	Sp heats of a few com- pounds determined	—	—	53.3
Tantalum	TaCl ₅	—	Ta with Nb compounds	182	—	60.67
Tungsten	WOCl ₅ , WOCl ₄ , WOCl ₃	Directly	W with Mo compounds. Some salts of H ₂ WO ₄ with those of H ₂ O, CrO ₃ , and H ₂ TeO ₄	183.6	183.6	80.6

Br. Atomic weight is $68.4 \times 2 = 136.8$,
 because of analogies between salts
 of Ba, Sr, and Ca

Er. This metal belongs to the
 earth group hence its atomic
 weight is taken as 53.3 = 32.16
 Yt. See above similar reasons to those
 which apply in cases of Se, Yt, and
 Er the atomic weight of Yter-
 bium is supposed to be 3 times its
 combining weight = 172

Notes to Table of Atomic Weights

A As the method based on isomorphism of compounds is chiefly used as a means of verifying values assigned to atomic weights by other methods, no numbers are given in column IV, but merely an indication of the various compounds which have been compared crystallographically, and on which arguments for or against a given value for the atomic weights in column V have been, or may be, based.

B This column (VI) is not to be regarded as containing anything like a complete summary of the processes employed for determining the combining weights of the elements, only the more important processes are indicated—references are given to the original papers.

By combining weight is here meant the smallest mass of the element which combines with 8 parts by weight of oxygen, 1 part of hydrogen, or 35.5 parts of chlorine.

A complete account of all researches on this subject will be found in *A Recalculation of the Atomic Weights*, by F. W. Clarke (Part v of the *Constants of Nature* published by the Smithsonian Institution), and also in *Die Atomgewichte der Elemente*, by L. Meyer and K. Seubert (Leipzig, 1883).

C When the atomic weight given in column V section (2) is a multiple of the combining weight in column VII, no number being given in section (1) of column V, it is to be inferred that, besides the argument drawn from the value of the specific heat of the element in question, there are other chemical reasons for adopting the special multiple which appears in V (2), these reasons may be broadly described as based on analogies between salts of the given element and salts of other elements the atomic weights of which have been established by the two leading physical methods. M M P M

ATOMICITY Term used to denote number of atoms in any specified gaseous molecule, usually in the molecule of an element.

ATOMIC VOLUMES v **PHYSICAL METHODS**, sect **VOLUMETRICAL**.

ATRACYLIC ACID $C_{10}H_{16}S_2O_6$. Potassium atractylate K_2A''' occurs in the root of *Atractylis gummifera*, from which it may be extracted by boiling 70 p.c. alcohol (Lefranc, *Bl* [2] 11, 499, *J Ph* [4] 9, 81, 10, 325, 17, 187, 263, *C R* 67, 954, 76, 438). Boiling potash hydrolyses it, forming valeric acid and so called (β) atractylic acid, $C_{20}H_{30}S_2O_{10}$, which is further split up into H_2SO_4 , valeric acid and atractylin.

ATRACYLIN $C_{20}H_{30}O_6$. From (β) atractylic acid by boiling with aqueous KOH. White gummy substance, with sweet taste, v sol water and alcohol, insol ether and aqueous NaCl. Forms a violet red solution in warm H_2SO_4 . Boiling KOH forms atractyligenin and a saccharine substance.

ATRANORIC ACID $C_{10}H_{16}O_4$ [190°–194°]. Extracted by ether from certain lichens (*Lecanora atra*, *Stereocaulon vesuvianum*, *Cladonia rangiformis*). Trimetric crystals, $a:b:c=1:398:306$, sl sol alcohol, cold ether, and benzene, m sol hot benzene, sol alkalis forming a yellow solution. Heated with water in a sealed tube it splits up into atranoronic acid, $C_6H_8O_4$, and atraric acid, $C_4H_8O_2$ (Paternò,

G 9, 279, 10, 157, 12, 256, Coppola, *G*, 12, 19).

ATRANORINIC ACID $C_6H_{10}O_4$ [101°]. Formed by heating atranoric acid (q v) with water. Needles, m sol water, sol alcohol and ether. Its alkaline solutions are yellow. Its aqueous solutions give a green pp with $AgNO_3$, a brownish green colour with Fe_2Cl_6 , and a blood red colour with bleaching powder (Paternò, *G* 12, 256).

ATRABIC ACID $C_{10}H_{16}O_2$ [141°]. Produced by heating atranoric acid with water (Paternò, *G* 12, 257). Iridescent laminae, sl sol water, m sol alcohol and ether. Its alkaline solutions are colourless. It gives a brownish pp with $AgNO_3$ and no colour with Fe_2Cl_6 .

ATRIPAIC ACID $C_6H_8O_{12}$ 6aq [98° when hydrated]. An acid obtained from the sugar cane (Savary, *C C* 1884, 968).

Ethyl ether (184°–188°).

ATROGLYCERIC ACID $C_9H_{10}O_4$ α CH(OH) CPh(OH) CO₂H [146°] $\alpha\beta$ Di oxy- α phenyl propionic acid. From $\alpha\beta$ di bromo- α phenyl propionic acid and excess of alkali (Kast, *A* 206, 30). Crystalline aggregates, sol water and ether. Salts— CaA' — BaA' .

Nitrile CH_2OH CPh(OH) CN [57°]. From benzoyl carbinol and HCN (Plöchl & Blumlein, *B* 16, 1292).

ATROLACTIC ACID v α OXY- α PHENYL PROPIONIC ACID.

ATROLACTYL TROPEINE $C_{14}H_{19}NO_6$. *Pseudo atropine* [121°]. Crystalline solid. Very similar in physiological action to atropine. Formed by the action of dilute HCl on tropine atrolactate.

Salts—Mostly soluble— $BHClAuCl$, sparingly soluble tables. The picrate also forms sparingly soluble tables (Ladenburg & Roth, *B* 16, 1027, *A* 217, 87).

Phenyl naphthalene dihydride ($825^\circ \pm 1^\circ$). Formed, together with atronic acid, by the dry distillation of (α) or (β) iso atronic acid (Fittig, *A* 206, 51). Liquid. Chromic acid oxidises it to α benzoyl benzoic acid.

Atrone sulphonic acid $C_{10}H_{11}SO_3H$ [130°]. Needles, v sol water— BaA'' — CaA'' 2aq.

ATRONIC ACID $C_{10}H_{11}O_2$ α $C_6H_5 \begin{matrix} \diagup CH(CO_2H) \\ \diagdown CPhH-CH \end{matrix}$ (?) *Phenyl naphthalene dihydride carboxylic acid* (?) [164°]. Formed, together with atrone by the dry distillation of (α)- or (β) iso atronic acid (Fittig, *A* 206, 46). Prisms, insol water, sol alcohol and glacial HOAc. Salts— CaA' 6aq— BaA' 4aq.

Iso-atronic acid $C_{10}H_{11}O_2$ [157°]. Obtained by heating (α), or (β), iso atronic acid with conc H_2SO_4 (Fittig, *A* 206, 86). Leaflets, insol water, sol alcohol, ether, and glacial HOAc.

Salts— CaA' — BaA' 6aq.

ATRONYLENE SULPHONIC ACID $C_{10}H_{11}SO_3H$ [c 258°]. Formed by heating (α)-, or (β), iso atronic acid or iso atronic acid with 9 pts conc H_2SO_4 at 90° (Fittig, *A* 206, 60). Prisms (from 50 p.c. acetic acid). Insol water, v sol alcohol. The aqueous solutions of its salts when exposed to sunlight deposit small

needles of atronyl sulphone $C_{10}H_{10}SO_2$. [198°]

ATROPIC ACID $C_9H_9O_3$, \pm CH_2 , CPh CO₂H
 α -Phenyl-acrylic acid M w 148 [107°]
 (203°) at 75 mm S 144 at 19°

Formation.—1 By boiling atropine with baryta (Richter, *J* pr 11, 33, Kraut, *A* 128, 282, Fittig & Wurster, *A* 195, 147)—2 By heating atropine with fuming HCl at 120° (Lossen, *A* 138, 230)
 3 By the action of HCl on ethyl tropic acid, CH₃CPH(OEt)CO₂H, obtained from acetophenone chloride by alcoholic KCN and saponification (Ladenburg & Rugheimer, *B* 13, 2041)—
 4 By action of boiling NaOH upon α chloro β phenyl propionic acid which is formed by the action of HCl upon acetophenone cyanhydrin or by heating α oxy α phenyl propionic acid with saturated HClAq at 130° (Spiegel, *B* 14, 237, 1354)

Properties.—Needles (from water) or mono clinic prisms (from alcohol), v sol CS₂

Reactions.—1 Chromic acid mixture forms benzoic acid—2 Potash fusion forms phenyl acetic acid—3 Sodium amalgam reduces it to α phenyl propionic acid—4 Fuming HCl forms α chloro α phenyl propionic acid, which is converted by aqueous Na₂CO₃ at 120° into tropic acid, CH₃(OH)CPhHCO₂H—5 ClOH forms chloro tropic acid CH₃(OH)CPhClCO₂H (Ladenburg & Rugheimer, *B* 13, 376)—6 Cold conc HBrAq forms both α , and β , bromo α phenyl propionic acid, at 100° it forms only β bromo α phenyl propionic acid—7 Bromine forms CH₂Br CPhHBr CO₂H

Salts.—Neutral atropates are not ppd by manganous salts (difference from cinnamates)—CaA₂ 5aq (K)—CaA₂ 2aq (L)

(α) Iso-atropic acid $C_9H_9O_3$ (?) [237°]

Preparation.—(α), and (β), isotropic acids are both formed when atropic acid is heated alone or with water, they may be separated by crystallisation from 50 p c acetic acid

Properties.—Crystalline aggregates, sl sol boiling water, sol alcohol Chromic acid gives anthraquinone and α benzoyl benzoic acid V also ATRONENE, ATRONIC ACID, and ATRONYLENE SULPHONIC ACID

Salts.—CaA'' 2aq—BaA'' 2½aq

Ethyl ether Et.A'' (180°)

(β) Iso-atropic acid $C_{10}H_{10}O_3$, [206°] Rect angular tables (from water) More soluble in water, alcohol, and HOAc than the (α) acid Gives the same reactions as the (α) acid

Salts.—CaA'' 3aq (Fittig, *A* 206, 34, *B* 12, 1739, compare R Meyer, *A* 219, 290)

ATROPINE $C_{17}H_{23}NO_3$, \pm e

CH₃OH.CPhH CO O CH₂.CH₂.C₆H₅NMe

Daturine [114°] S 83

Occurrence.—Together with hyoscyamine in all parts of *Atropa belladonna* (Geiger & Hesse, *A* 5, 43, 6, 44, Mein, *A* 6, 67), and in the seeds of *Datura stramonium* (Geyger, *A* 7, 272, Planta, *A* 74, 245)

Formation.—Crystalline tropine tropate has no action on the eyes, but when treated with dehydrating agents, such as ZnCl₂, Ac₂O, or HCl, atropine is formed It is best to evaporate frequently with very dilute HCl at 100° (Ladenburg, *A* 217, 78, *B* 12, 942, 13, 104,

909, *C* R 90, 921) Tropine contains hydroxyl which is etherified by tropic acid

Preparation.—Dry belladonna leaves are digested for three days with cold water, the extract is evaporated, and after mixing with Na₂CO₃ the syrupy liquid is agitated with benzene The benzene solution is decanted off and shaken with dilute sulphuric acid The acid liquid is rendered alkaline with Na₂CO₃ and the solution agitated with chloroform, the extract is filtered and, after addition of light petroleum, allowed to evaporate spontaneously, when the atropine separates out first, the mother liquors containing another alkaloid (Pesci, *G* 10, 426)

Properties.—Needles (from dilute alcohol) Sl sol water, v sol alcohol, and chloroform, m sol ether The solutions are alkaline to test paper, and taste bitter Its salts enlarge the pupil of the eye 0.5 to 2 g is a fatal dose Three drops of a 1 p c solution of (artificial) atropine enlarges the pupil to the maximum extent Atropine overcomes the stoppage of the heart's action produced by muscarine

Reactions.—1 When evaporated to dryness with fuming HNO₃ a residue is left which is turned violet by alcoholic KOH—2 Chromic acid mixture forms benzoic acid—3 A solution in HCl gives with gold chloride an oily pp that quickly changes to lustreless crystals which melt under water or, when dry, at 136°—4 Tannin gives, in very dilute neutral solutions a white pp, sol HCl—5 Potassio mercuric iodide gives a white cheesy pp—6 I in KI gives a brown oil which solidifies after some time—7 Picric acid gives, in somewhat dilute acid solutions, a crystalline pp—8 Conc H₂SO₄ gives, on warming, a pleasant odour—9 Cyanogen gas passed into an alcoholic solution gives, after some time, a red colour—10 Chloride of iodine forms a dark yellow pp, sol on warming, and separating out on cooling in brown crystals (Dittmar, *B* 18, 1612)—11 Decomposed by hot baryta water or cold conc HCl into tropic acid and tropine (Kraut, *A* 128, 280, 133, 87, 143, 240, Lossen, *A* 138, 230)—12 Hot conc HClAq at 120° gives tropine, tropic acid, atropic acid, iso atropic acids, and (at 180°) tropidine—13 With NaNO₂, H₂SO₄, and subsequently NaOH a violet colour is developed—14 Glacial HOAc and H₂SO₄ produce on prolonged warming a greenish yellow fluorescence (Fluckiger, *Ph* [3] 16, 800)—15 H₂SO₄ and KClO₄ give a greenish-blue colour (Vitali, *Ph* [3] 12, 459)

Salts.—B'H₂AuCl₃ [135°–137°]—B'H₂PtCl₆ [208°]—B'HCl₂2HgCl₂ (Gerrard, *Fr* 24, 601) B'HI₃ brown prisms (Jørgensen, *Z* 5, 673)—B'HI₄—B'H₂HSO₄ needles, got by adding an ethereal solution to an alcoholic solution of H₂SO₄ Valerate B'C₆H₅O₂½aq [42°] (Callmann, *J* pr 76, 69)

Additional References.—Günther, *J* 1860, 781, *Fr* 8, 476, Lefort, *Ph* [3] 2, 1029, *C* C 1873, 797, Brunner, *B* 6, 96, Newark, *C* C 1872, 536, Gulielmo, *Fr* 2, 404, Ludwig, *Ar. Ph* [2] 107, 129, Schmidt, *A* 208, 196

Ethyl atropine $C_{17}H_{23}EtNO_3$ Formed by action of Ag₂O on its hydriodic, B'HI, obtained

by heating atropine with EtI at 100° (Lossen, *A* 188, 289) A syrup, sol. water

Apoatropine $C_{17}H_{21}NO_2$ [60°–62°] Formed by treating atropine with HNO_3 (Pesci, *G* 11, 588, 12, 60) Prisms, sl sol water, v e sol alcohol Decomposed by baryta water at 100° into tropine and atropic acid Does not enlarge the pupil Salts — B^+HAuCl_4 [180°] amorphous — $B^+H_2SO_4$ 5aq

Pseudo-atropine v ATROLACTYL TROPEINE

Hydro-apo atropine

$CH_3CHPhCOOCH_2CH_2C_6H_4NMe$ Prepared by the action of nascent hydrogen on apo atropine (Pesci, *Atta d Acad des Lincei*, 5, 329) Oil Decomposed by baryta water at 100° into a phenyl propionic acid and tropine Forms a crystalline compound with $HgCl_2$ Neutral $KMnO_4$ oxidises it to 'homo apo atropine' $C_{17}H_{21}NO_2$, an alkaline oil which forms the following salts B^+CO_2 , $B^+H_2PtCl_4$, B^+HAuCl_4 , $B^+H_2SO_4$ 2aq, $B^+H_2PdCl_4$, its hydrochloride gives white pps with tannin, Mayer's reagent, and $HgCl_2$, and it gives a blood red colour with fuming HNO_3 , heated with baryta water it gives a phenyl propionic acid and tropine (Pesci, *G* 12, 285, 329, Merling, *B* 15, 289)

Homo atropine v PHENYLGLYCOLYL TROPEINE

Meta atropine v TROPINE

ATROPYL TROPEINE $C_{17}H_{21}NO_2$ *Anhydro-atropine* Obtained by heating tropine hydrochloride with atropic acid and HCl (Ladenburg, *A* 217, 102, *B* 13, 1085) Oil — B^+HAuCl_4 , small needles

ATROXINDOLE v o AMIDO a PHENYL PROPIONIC ACID, p 179

AURANTIIN $C_{22}H_{26}O_{12}$ 4aq [171°] S 33 [α_D] = -64.57° A glucoside in the flowers of *Citrus decumana* (E Hoffmann, *B* 9, 691) Yellow monoclinic prisms Bitter taste Gives a brownish red colour with $FeCl_3$

AURATES Auric hydroxide $Au_2O_3H_2$ (= $Au_2O_3 \cdot H_2O$) reacts with HNO_3 Aq to form the compound $Au(NO_3)_3 \cdot 3H_2O$, from this several basic nitrates and one or two sulphates of gold may be produced (Schottlander, *A* 217, 312) But $Au_2O_3 \cdot H_2O$ also dissolves in KOH Aq, and on evaporation at a gentle heat and finally *in vacuo*, crystals are obtained, which when dissolved in water, recrystallised, drained, and dried *in vacuo*, are said to have the composition $Au_2O_3 \cdot K_2O \cdot 3H_2O$ (= $Au_2O_3 \cdot K_2O \cdot 3H_2O$) Aurate of potassium is very soluble in water, forming an alkaline liquid which is easily decomposed by organic compounds and by heat, the solution gives pps with solutions of various metallic salts, e.g. $CuCl_2$, these pps are said to be aurates, but very little is known about their composition An aurate of ammonium of indefinite composition, known as *fulminating gold*, is formed by pptg a solution of a gold salt by excess of NH_3 Aq, and boiling in NH_3 Aq, or by digesting $Au_2O_3 \cdot H_2O$ in $(NH_4)_2SO_4$ Aq (Freymy, *A Ch* [3], 31, 480, Figuier, *id* [3] 11, 841) M M P M

AURIC ACID The hydrated oxide of gold $Au_2O_3 \cdot H_2O$ is sometimes called auric acid because of its salt-forming reactions with alkalis (*v supra*) This compound is best prepared by adding $NaOH$ Aq to very dilute $AuCl_3$ Aq, in the ratio $2NaOH : AuCl_3$, (the $AuCl_3$ Aq should be prepared in about the ratio $AuCl_3 : 800H_2O$), warming till the liquid is dark brown, adding Na_2SO_4 Aq,

allowing pp to settle, washing repeatedly by decantation, and then on a filter, until the washings are free from H_2SO_4 and HCl, boiling pp with conc HNO_3 Aq, and again washing free from acid (Thomson, *Th* 3, 891) According to Kruss (*B* 19, 2546), $Au_2O_3 \cdot H_2O$ is better prepared from $AuCl_3$ Aq by ppg with *magnesia alba*, boiling with dilute HNO_3 Aq, washing with water, and drying over P_2O_5 , $Au_2O_3 \cdot H_2O$ is easily soluble in HBr Aq and HCl Aq, with production of much heat, and formation of $AuCl_3$ Aq and $AuBr_3$ Aq respectively (*v Gold*) M M P M

AURINE v ROSOLIC ACID

AUSTRALENE v TURPENTINE OIL.

AXIN v AGE, p 87

AZAMMONIUM COMPOUNDS Compounds obtained by oxidising mono alkylated o amido azo compounds, or by heating azimido compounds with alkyl iodides followed by moist Ag O (Zincke a Lawson, *B* 20, 1178) Thus $C_6H_5N \cdot N \cdot C_6H_5 \cdot NH \cdot C_6H_5$ gives, on oxidation with chromic acid, $C_{22}H_{16}N_2O$ which might be expected to have the formula

Naphthalene - di - phenyl - azammonium hy drate

The chromate is obtained by the oxidation of benzene azo - phenyl - (β) - naphthylamine $C_{10}H_7 \begin{array}{c} \diagup N C_6H_5 \\ | \\ N-NHC_6H_5 \end{array}$ (?) with $K_2Cr_2O_7$, and acetic acid

It is converted into the chloride by boiling with alcohol and HCl till all the chromic acid is reduced The hydrate is obtained from the chloride by Ag_2O Its solution has a greenish fluorescence, is strongly alkaline, and tastes bitter, it decomposes on evaporation

Salts —Like the base, they have a greenish fluorescence in aqueous and alcoholic solution, and a bitter taste — $C_{22}H_{16}N_2 \cdot Cl$ glistening prisms, v sol alcohol, less in water, it forms sparingly soluble double chlorides with $SnCl_4$, $ZnCl_2$, $HgCl_2$, &c — $(C_{22}H_{16}N_2) \cdot Cr_2O_7$, sl sol crystalline pp — $C_{22}H_{16}N_2 \cdot H_2SO_4$ glistening transparent needles or prisms, v sol hot alcohol, sl sol cold water — $C_{22}H_{16}N_2 \cdot NO_3$, long flat glistening needles, v sol hot alcohol, sl sol water — $(C_{22}H_{16}N_2) \cdot Cr_2O_7$, long yellow needles, sol acetic acid, v sl sol water — $(C_{22}H_{16}N_2) \cdot C_6H_5 \cdot (NO_2)_2O$ [243°], small yellow needles, v sl sol water (Zincke a Lawson, *B* 20, 1172)

AZARONE $C_{17}H_{16}O_2$ [59°] (296°) S G 113 1165, 10743 Obtained by distilling the rhizomes of *Azaron europaeum* with steam (Boutleroff a Rizza, *Bl* [2] 43, 114) White crystalline body, sl sol water, sol alcohol, ether CCl_4 , and acetic acid Combines with Br, forming $C_{17}H_{14}Br_2O_2$

AZAUROLIC ACIDS

Ethyl azaurolic acid $C_7H_8N_2O$ [142°] From ethyl nitrolic acid (2 g) by the action of water and sodium amalgam The yield (25 g) is bad Formed also by reducing di-nitro ethane (V Meyer a Constam, *A* 214, 330, *B* 14, 1455)

Properties —Orange red prisms (from alco-

bol) M sol hot alcohol, sl sol ether, v sl sol water, chloroform, benzene or light petroleum. Alkalies form a deep orange solution. At 142° it melts, with decomposition, leaving a liquid which, after solidifying, melts again at 133°.

Reactions—1 Ammoniacal solution gives with AgNO₃ a brown pp., and with salts of Zn or Pb, yellow pps. A solution of the ammonium salt deposits, on evaporation, needles of the free acid. 2 Heat, dilute acids, nascent hydrogen, and ammonia all convert it into ethyl leucazone. $2C_2H_5N_2O + H_2O = C_4H_9N_2O + O + NH_3O$ the oxygen converting another portion of ethyl azaurolic acid into acetic acid, N, and N₂O—3 K₂Cr₂O₇ and H₂SO₄ give acetic acid and CO₂.

Constitution—Its formation from ethyl nitrolic acid indicates the group $MeC \begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix}$, and the presence of Me C is shown by the production of acetic acid on oxidation. Ethyl azaurolic acid would then be $MeCH \begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix} O$ or, more probably, $MeCH(NO)N \begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix} CH(NO)Me$ or perhaps $MeC(NO)N \begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix} CMcNOH$.

Ethyl leucazone C₄H₉N₂O [158°] Formed together with nitrogen, N₂O, and hydroxylamine by heating ethyl azaurolic acid with dilute HCl (M a C). Satiny needles. Reddens litmus. Combines with acids, bases, and salts. V sol alcohol or water, insol ether. Its aqueous solution is turned red by FeCl₃ and oxidised to acetic acid by K₂Cr₂O₇ and H₂SO₄.

Salts—B⁺H₂SO₄ [161.5°], prisms, sol ordinary (90 per cent) alcohol—Ba(C₄H₉N₂O)₂—C₄H₉N₂OAgNO₃.

Propyl azaurolic acid C₃H₇N₂O [127.5°] From propyl nitrolic acid by sodium amalgam.

AZELAIC ACIDS C₆H₁₀O₄

n Azelaic acid

CO₂HCH₂CH₂CH₂CH₂CH₂CH₂CO₂H [118°] Formed by reducing butyroluronic acid with HI and P (Tonnies, B 12, 1200). Slender needles (from chloroform).

Azelate acid C₆H₁₀O₄. **Ancholic acid** *Lep argyric* acid. Mol. w 188 [106°] (above 360°) S 108 at 12°, S (ether) 1.88 at 11°.

Formation—1 By the oxidising action of HNO₃ upon Chinese wax (Buckton, C J 10, 166), cork, oleic acid (Laurent, A Ch [2] 66, 164), cocoa nut oil (Wirz, A 104, 265), castor oil (Arppe, A 120, 288, Gantner a. Hell, B 14, 560, 154b), and enmmnic acid (Krafft, B 11, 1415)—2 From oleic and KMnO₄Aq (Saytzeff, J pr [2] 33, 301).

Preparation—Castor oil is oxidised by HNO₃ (S G 125). Heptonic acid is distilled off with steam, and the hot residual liquor poured off from a heavy nitrogenous oil. On cooling, suberic and azelaic acids crystallise. Pure suberic acid is got by washing the mixed acids with ether, which dissolves azelaic acid as well as oily impurities. The ether is evaporated, the residue dissolved in boiling water and NaCl added. Only matter then separates and azelaic acid crystallises from the brine (Dale a. Schorlemmer, C J 85, 684, cf Gantner a. Hell, B 14, 1545).

Properties—Large thin plates, not volatile with steam. Sol water, alcohol, and ether. Nitric acid oxidises it to succinic acid. It does not give a homologue of suberone when distilled

with slaked lime, hence its constitution is probably not analogous to that of the homologous suberic acid.

Salts—K₂A" small plates—K₂A" 2aq needles—KHA"—KH₂A"—Na₂A" aq soluble plates—Na₂HA"—(NH₄)₂A" large plates—(NH₄)HA"—BaA" aq S 65 at 16°, 628 at 100°—SrA" aq—CaA" crystalline powder, S 185 at 17°, 193 at 100°—MgA" 3aq—MnA" 3aq slender needles, S 206 at 14°, 108 at 100°—NiA" 6aq—CoA" 6aq—ZnA" crystalline pp, S 026 at 12°—PbA" white pp, S 006 at 24°—Ag A" white pp, S 0015 at 14°—CuA"—Fe(OH)A" 2aq—CdA".

Ethyl ether Et₂A" (260°) Decomposed on boiling.

AZIDINES Compounds related to hydrazines (*q v*) in the same way that amidines are related to amines. Thus the hydrochloride of phenyl hydrazine acting on a solution of benzamide ether in absolute alcohol produces dark red needles of di phenyl benz azidine, PhC(NH NPhH)N NPhH, while formamide ether gives, when similarly treated, di phenyl formazidine CH(NH NPhH)N NPhH [185°] (Pinner, B 17, 182, 2002).

AZIMIDO-COMPOUNDS This term was originally applied by Griess (B 15, 1878) to the compounds obtained by the action of nitrous acid upon ortho diamines, which are probably

of the form $R' \begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix} NH$, and was extended by

Zincke (B 18, 3134) to compounds, probably of

the form $R' \begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix} NR'$, got by oxidising o amido

azo compounds (hydrazimido compounds). The first formula may also be written $R' \begin{smallmatrix} \diagup NH \\ \diagdown \end{smallmatrix} N$,

which stands to $R' \begin{smallmatrix} \diagup NH \\ \diagdown \end{smallmatrix} Cl$ in the relation that diazobenzene anilide stands to a mixture of diazobenzene chloride and aniline.

Azimidobenzene C₆H₅N₂, i.e. C₆H₅ $\begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix} NH$

or C₆H₅ $\begin{smallmatrix} \diagup NH \\ \diagdown \end{smallmatrix} N$ [99°] From aqueous o

phenylene diamine sulphate and KNO₃ (Ladenburg, B 9, 222). Needles (from benzene).

Azimidonitrobenzene C₆H₄N₂O₂, i.e.

C₆H₄(NO₂) $\begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix} NH$ or C₆H₄(NO₂) $\begin{smallmatrix} \diagup NH \\ \diagdown \end{smallmatrix} N$ [211°]

Formed by passing nitrous acid into a solution of nitro o phenylene diamine (Hofmann, Pr 10, 496). Long white prisms, v sol alcohol and ether, sl sol cold water. Nitrous acid does not affect it, hence it does not contain NH₂.

Salts—C₆H₄KN₂O₂—C₆H₄AgN₂O₂ Not affected by boiling HCl, or KOH.

Azimidotoluene C₇H₇N₂, i.e.

CH₃C₆H₄ $\begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix} NH$ or CH₃C₆H₄ $\begin{smallmatrix} \diagup NH \\ \diagdown \end{smallmatrix} N$

[83°] (328°) From aqueous tolylene-o-diamine sulphate and KNO₃ (L). Prisms containing C₆H₅ (from toluene). V sol alcohol, m sol ether and boiling water. Not affected by HClAq

at 160° Salts —B'HCl decomposed by water —B',H,PtCl₆.

Acetyl derivative C₆H₅AcN₂ [180°] From acetyl *o* tolylene diamine, HCl, and NaNO₂ (Boessneck, *B* 19, 1758) Needles

(*β*) Azimido-benzoic acid C₆H₄N₂O₂ *s.e.*

From the hydrochloride of di azimido benzoic acid, CO₂H C₆H₃(NH₂)₂ [1 3 4] and KNO₂ (Griess, *B* 2, 436) Also by the action of boiling potash upon C₆H₃(CO₂H)(NO₂)(NH CO NH₂) [1 3 4] and upon C₆H₃(CO₂H)(NO₂)(NH CO NH₂) [1 4 3] (Griess, *B* 15, 1880) This seems to indicate the symmetrical formula Short needles, containing water of crystallisation, v. sl sol water Not attacked by warm fuming HNO₃

(*γ*) Azimido benzoic acid Prepared similarly from CO H C₆H₄(NH₂)₂ [1 2 3] Long hair like needles (G)

Azimido benzene *γ* carboxylic ether C₆H₄N₂O₂ *s.e.* C₆H₄ $\begin{array}{c} \diagup \text{N} \diagdown \\ \diagdown \text{N} \diagup \end{array}$ CO₂Et or C₆H₄ $\begin{array}{c} \diagup \text{N} \diagdown \\ \diagdown \text{N} \diagup \end{array}$ CO₂Et

[73°] From the hydrochloride of *o* azimido phenyl carbamic ether and KNO₂ (Rudolph, *B* 12, 1295)

Phenyl azimido naphthalene

C₁₀H₇ $\begin{array}{c} \diagup \text{N} \diagdown \\ \diagdown \text{N} \diagup \end{array}$ N C₆H₅ [108°] Fine white needles

Soluble in hot acetic acid, sparingly in alcohol and benzene Formed by oxidation of benzene azo (*β*) naphthylamine with CrO₃ in acetic acid solution It is not attacked by strong H₂SO₄, acetic anhydride, or reducing agents (Zincke, *B* 18, 3136)

***o* Oxy phenyl azimido-naphthalene**

C₁₀H₇ $\begin{array}{c} \diagup \text{N} \diagdown \\ \diagdown \text{N} \diagup \end{array}$ N C₆H₄(OH) [1 2] [140°] White

silky needles Easily soluble in alcohol and benzene Formed by oxidation of an alkaline solution of *o* oxy benzene azo (*β*) naphthylamine with lead peroxide It is not attacked by strong H₂SO₄, acetic anhydride, acetyl chloride, or reducing agents (Z)

***p* Oxy-phenyl-azimido-naphthalene**

C₁₀H₇ $\begin{array}{c} \diagup \text{N} \diagdown \\ \diagdown \text{N} \diagup \end{array}$ ⁽¹⁾ ⁽⁴⁾ N C₆H₄(OH) [199°] Thick crystals

or white needles Soluble in hot alcohol and hot acetic acid, sparingly in benzene Formed by oxidation of an alkaline solution of *p* oxy benzene azo (*β*) naphthylamine with lead peroxide It is not attacked by reducing agents

Acetyl derivative

C₁₀H₇ $\begin{array}{c} \diagup \text{N} \diagdown \\ \diagdown \text{N} \diagup \end{array}$ N C₆H₄(OAc) [165°], thin silky plates (Z)

Tolyl - azimido - toluene C₁₁H₁₁N₂ *s.e.*

C₆H₄ $\begin{array}{c} \diagup \text{N} \diagdown \\ \diagdown \text{N} \diagup \end{array}$ NC₆H₄ [125°] $\nabla D = 7.23$ (for 8 32)

Formation—1 By oxidation of *p* toluene *o*-azo *p* toluidine [1 4] C₆H₄Me N₂ C₆H₄Me(NH₂) [4 1 2]—2 By heating the imide of *o* diazo-toluene azo toluene or by boiling its acetic acid solution, N₂ being evolved—3 Together with an

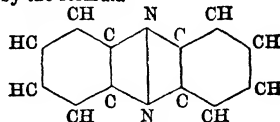

amido phenol or diamine by reducing with SnCl₂, the azo compounds obtained by combining *o* diazo toluene azo-toluene with phenols or amines (Zincke & Lawson, *B* 19, 1455, 20, 1178)

Properties—Thin colourless plates Sol benzene, hot alcohol, and hot HOAc. Not attacked by hot Ac₂O, cold H₂SO₄, or reducing agents

AZINES Compounds of the type

X'' $\begin{array}{c} \diagup \text{N} \diagdown \\ \diagdown \text{N} \diagup \end{array}$ Y'' Thus, phenazine may be repre-

sented by the formula

or

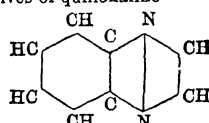

and the nomenclature of other azines may be gathered from two examples (Hinsberg, *B* 20, 21)

Phen naphthazine C₆H₅ $\begin{array}{c} \diagup \text{N} \diagdown \\ \diagdown \text{N} \diagup \end{array}$ C₁₀H₇.

Tolu naphthazine C₆H₄ $\begin{array}{c} \diagup \text{N} \diagdown \\ \diagdown \text{N} \diagup \end{array}$ C₁₀H₇.

Derivatives of quinoxaline

are called quinoxalines, *e.g.* tolu quinoxaline

C₆H₅ $\begin{array}{c} \diagup \text{N}-\text{CH} \\ \diagdown \quad \parallel \\ \text{N}-\text{CH} \end{array}$, and naphtho quinoxaline,

Formation—1 From *o* diamines and *o*-quinones or *o*-di oxy compounds—2 By oxidation of a mixture of *o* diamine and phenols (*e.g.* (*β*) naphthol)—3 By boiling certain azo dyestuffs, derived from secondary amines, with dilute acids, *e.g.* sulpho benzene azo phenyl (*β*) naphthyl amine yields naphtho phenazine and sulphanic acid C₆H₄(SO₂H) N₂ C₆H₄ NHC₆H₅ = C₆H₅ $\begin{array}{c} \diagup \text{N} \diagdown \\ \diagdown \text{N} \diagup \end{array}$ C₆H₄ + C₆H₄(SO₂H) NH₂ (Witt, *B* 20, 571)—4 By fusing *o* quinones with ammonium acetate, or by heating them with alcoholic NH₃ (Japp, *C J* 51, 100)

Properties—Weak crystalline bases, their salts being decomposed by water Reduced by SnCl₂ to hydrides, R $\begin{array}{c} \diagup \text{NH} \diagdown \\ \diagdown \text{NH} \diagup \end{array}$ R', whence Fe₂Cl₄ regenerates the original azine

Azine-ammonium bases Compounds of the

form X'' $\begin{array}{c} \diagup \text{N} \diagdown \\ \diagdown \text{N} \diagup \end{array}$ Y'' They have also been called

Azonium bases (Witt, *B* 20, 1183), a term previously applied by Fischer to quaternary hydrazine derivatives.

AZINSUCCINIC ACID

(OO₂H)₂C₂H₂NNC₂H₂(CO₂H)₂. Crystalline solid. Very soluble in water and alcohol. Not decomposed by acids or alkalis. The ethers of this acid are obtained by the spontaneous decomposition of the ethers of diazosuccinic acid C₂H₂N₂(CO₂R)₂ on keeping, half the nitrogen being evolved. A⁺Ba₂, sparingly soluble yellowish white powder.

Tetra-methyl ether A⁺Me, [150°], milky white prisms, easily soluble in hot water and alcohol, sparingly in cold water, alcohol, and hot ether, not volatile with steam (Curtius & Koch, *B* 18 1299).

AZO ANILINE *v* Amido benzene azo aniline under Azo compounds

AZO COLOURING MATTERS

History—The series of compounds comprised under this class contains one or more diatomic groups NN linking together acid or basic aromatic radicles. Of a very large number of azo compounds known to science only a certain proportion are of technical value, and these are manufactured in large quantities owing to their importance as colouring matters. The first azo compound introduced into commerce was the oxalate of amidoazobenzene ('aniline yellow,' *v* benzene azo aniline), C₆H₅N₂C₆H₄NH₂, manufactured in 1863 by the firm of Simpson, Maule & Nicholson, by the action of nitrous gas on aniline dissolved in alcohol. Three years later triamidoazobenzene, NH₂C₆H₄N₂C₆H₄(NH₂)₂ (*v* Amido benzene-azo-phenylene diamine under Azo compounds), was manufactured at Manchester and introduced under the name of 'Manchester brown' ('Bismarck brown,' 'Phenylene brown,' 'Vesuvine'). This compound was prepared by the action of nitrous acid upon *m*-phenylene diamine. In 1875 diamidoazobenzene, C₆H₅N₂C₆H₄(NH₂)₂ (*v* Benzene azo phenylene diamine), was discovered independently by Caro and Witt (*B* 10, 213, 350) and introduced into commerce by the latter under the name of 'chrysoidine'. These basic colouring matters were soon followed by acid azo compounds of greater technical value (*B* 10, 1378, 1509), and numerous patents have since that time been taken out, the general mode of preparation being similar in principle to that first employed in 1870 by Kekulé and Hidegh (*B* 3, 233). These are the chief points in the industrial history of these compounds, the chemical history will be referred to under the individual compounds. **Azobenzene**, C₆H₅N₂C₆H₅ (*v* Benzene azo benzene), which may be regarded as the prototype of the azo compounds, has been known since 1814 (Mitscherlich, *A* 12, 311), but the industrial development of these products is largely due to the researches of Griess upon the diazo compounds (*A* 106, 128, 113, 201, 117, 1, 120, 125, 121, 257, 187, 89). The theoretical views which have led to the adoption of the formulae at present generally received have been developed chiefly by Kekulé (*Z* 1866, 2, 309, 689).

Formation—1 Compounds of the azoben-

zene type are produced by the action of mild reducing agents, such as alcoholic potash, alcoholic KOH and zinc dust, iron and acetic acid, or sodium stannite, upon the corresponding nitro bodies. 2C₆H₅NO₂ + 4H₂ = C₆H₅N₂C₆H₅ + 4H₂O

2 By the oxidation of the corresponding amido-derivatives by potassium permanganate, bleaching powder, chromic acid, hydric peroxide, &c., thus 2C₆H₅NH₂ + O₂ = C₆H₅N₂C₆H₅ + 2H₂O (Glaser, *Z* [2] 2, 308). This method is applicable to the sulphonic acids and other derivatives of the amido compounds 2C₆H₅(CH₃)HSO₃NH₂ + O₂ = N₂(C₆H₅CH₃HSO₃)₂ + 2H₂O [illustrating the production of azotoluenedisulphonic acid from toluidinesulphonic acid, Kornatzki, *A* 221, 179].

3 By the action of ethyldichloramine (Tscherniak, *B* 9, 147) upon certain aromatic amines (*c p* toluidine) 2C₆H₅NH₂ + C₂H₅NOCl₂ = C₆H₅NH₂HCl + HCl + C₆H₅N₂C₆H₅ (Pierson & Heumann, *B* 16, 1048).

4 By the action of nitroso compounds upon amines and phenols C₆H₅NO + H₂N₂C₆H₅ = C₆H₅N₂C₆H₅ + H₂O (production of azobenzene from nitrosobenzene and aniline, Baeyer, *B* 7, 1638). Similarly HO C₆H₄NO + H₂N₂C₆H₅ = HO C₆H₄N₂C₆H₅ + H₂O (production of benzene azophenol from nitrosophenol and aniline, Kilmich, *B* 8, 1026). According to Henriques, substituted amidoazo compounds are produced by the action of ethyl β naphthyl nitrosamine upon aniline, &c. N(C₁₀H₇)EtNO + H₂N₂C₆H₅ = N(C₁₀H₇)Et(N₂C₆H₅) + H₂O. The diazo compound immediately becomes transformed into the isomeric benzeneazo ethyl β naphthyl amine, C₆H₅N₂C₁₀H₇NH Et (*B* 17, 2668, *v* also O. Witt, *B* 10, 1309). Amidoazobenzene reacts in a similar manner with the same nitrosamine forming C₆H₅N₂C₆H₄N₂C₆H₅NH Et.

5 From azoxy compounds by intramolecular transposition, such as the formation of oxy azobenzene (benzene azo phenol) by warming azoxybenzene with strong sulphuric acid C₆H₅N=N>O = C₆H₅N₂C₆H₄OH (Wallach & Belli, *B* 13, 525).

6 By the action of phenylhydrazine upon the naphthoquinones C₁₀H₆O₂ + H₂NNH C₆H₅ = C₁₀H₆NH C₆H₅ + H₂O. The naphthoquinone hydrazide then undergoes intramolecular transposition with the formation of an azo compound HO C₁₀H₆N=N C₆H₅. The compound thus obtained from (a) naphthoquinone is identical with benzene azo- (a) naphthol, while (β) naphthoquinone gives a compound which is isomeric and not identical with benzene azo- (β) naphthol (Zincke & Bindewald, *B* 17, 3026).

Preparation—The method in general use for the preparation of azo colours is that depending upon the readiness with which diazo compounds react with amines and phenols. In practice it is not necessary to isolate the diazo salt, but the amido compound which is to be converted into a diazo salt is treated with the necessary quantity of sodium nitrite and acid to diazotise the NH₂ group, and the solution of the diazo salt is then mixed with the solution of the amine in acid or the phenol dissolved in alkali. During the process of diazotising, the solution containing the amido compound must be kept well cooled, as the diazo salts are very unstable,

especially in aqueous solution. Most aromatic amido-compounds lend themselves to this reaction, the azo colours of commerce being produced by the action of diazotised amines, amido sulphonic acids, or amido carboxylic acids, upon amines, phenols, amido sulphonic and oxy sulphonic acids. A selection of typical reactions illustrating the formation of these compounds by the present method may be here conveniently discussed.

(a) When a salt of diazobenzene acts upon aniline the first product of the reaction is always diazobenzeneanilide (diaoamidobenzene) $C_6H_5N_2Cl + C_6H_5NH_2 = C_6H_5N_2NH.C_6H_5 + HCl$. The latter compound was first produced by the action of nitrous gas upon aniline dissolved in cold alcohol (Griess, *A* 121, 258). When allowed to stand in the presence of aniline and aniline hydrochloride, or when acted upon by hydrochloric acid or unstable metallic chlorides in the cold, the diazobenzeneanilide is slowly converted into the isomeric amidoazobenzene, $C_6H_5N_2.C_6H_5NH_2$. This last compound is manufactured on a commercial scale for the preparation of other azo colours and the indulines (*q v*). In the case of other amines in which the para position with respect to the NH_2 group is open (or the ortho position in the naphthalene series), the transformation of diazo into amidoazo compounds takes place with great readiness. Thus, by the action of nitrous acid upon *o* and *m* toluidine, *m* xyldine and the naphthylamines, amidoazo compounds are at once formed.

(b) The salts of the aromatic diazo compounds react with primary and secondary monamines, but not with tertiary monamines of the fatty series. The resulting products are diazo-compounds, such as $C_6H_5N_2.NH.C_6H_5$ (diazobenzene ethylamide) and $C_6H_5N_2.N(CH_3)_2$ (diazobenzene dimethylamide). The diazo compounds of this class do not furnish isomeric azo compounds (Baeyer and Jager, *B* 8, 148). True azo compounds of a mixed aromatic and fatty type are produced by the action of diazo compounds upon the sodium derivatives of nitro hydrocarbons of the fatty series, *e.g.*

(formation of benzeneazomethane, V Meyer and pupils, *B* 8, 751, 1073, 1078, 9, 384, 12, 2285).

(c) Diazo compounds always furnish true azo compounds with secondary and tertiary aromatic monamines, such as $C_6H_5N_2.C_6H_5NMe_2$ (benzene-azo dimethylaniline) by the action of diazobenzene upon dimethylaniline (Griess, *B* 10, 528), and $C_6H_5N_2.C_6H_5NH.C_6H_5$ (benzene azo diphenylamine) by the action of diazobenzene upon diphenylamine (Witt, *B* 12, 259, and *C J* 85, 185).

(d) The action of diazo compounds upon aromatic diamines is typified by the action of diazobenzene chloride upon *m* diamidobenzene to produce chrysoidine $C_6H_5N_2Cl + C_6H_4(NH_2)_2 = C_6H_5N_2.C_6H_4(NH_2)_2.HCl$. Nitrous acid gives with ortho-diamines a class of substances termed by Griess azimido-compounds

(Hofmann, *A* 115, 249, Ladenburg, *B* 11, 319,

Rudolph, *B* 12, 1296, Griess, *B* 15, 1878). Metadiazines give under the same circumstances compounds of the type of triamidoazobenzene (Bismarck brown) $2C_6H_4(NH_2)_2 + HNO_2 = (NH_2)C_6H_4N_2.C_6H_4(NH_2)_2 + 2H_2O$ (Caro & Griess *Z* 1867, 278). By acting with an excess of HNO_2 upon *p* and *m* $C_6H_4(NH_2)_2$ in acid solution with suitable precautions both these diamines can be diazotised and give azo-colours when combined with phenols (Griess, *B* 17, 607 and 19, 317).

(e) The formation of azo colours from diazo-compounds and phenols as illustrative of the general method of technical production is shown by the following typical examples. $C_6H_5N_2.NO_2 + C_6H_5ONa = C_6H_5N_2.C_6H_5OH + NaNO_2$ (benzeneazophenol from diazobenzene nitrate and sodium phenate Kekulé and Hudeg, *B* 3, 233). By a similar reaction would be formed such compounds as benzeneazoresorcin, $C_6H_5N_2.C_6H_3(OH)_2$ (Typke, *B* 10, 1576), benzene-azo (α) naphthol, $C_6H_5N_2.C_{10}H_7OH_1$, &c (*ibid.* 1580). Azosulphonic acids are formed by the action of diazosulphonic acids upon phenols, or by the action of diazo salts upon phenolsulphonic acids, thus, for example, *p* sulphobenzene-azo β naphthol (Poirrier's 'Orange No II'), $HSO_3.C_6H_5N_2.C_{10}H_7OH_1$ from diazo benzene sulphonic acid and sodium (β) naphtholate, benzene azo (β) naphthol disulphonic acid, $C_6H_5N_2.C_{10}H_6(HSO_3)_2$, OH_2 from diazo benzene and (β) naphthol sodium disulphonate ('Orange G,' Meister, Lucius & Bruning), or *p* sulphobenzene azo (β) naphthol disulphonic acid, $HSO_3.C_6H_5N_2.C_{10}H_6(HSO_3)_2$, OH_2 from diazotised sulphamic acid and (β) naphtholdisulphonic acid sodium salt (Meldola, *B* 13, 942).

Classification and Nomenclature—Azo compounds may be described as primary, secondary, tertiary, &c according as they contain 1, 2, 3, &c N_2 groups. The modes of formation above described have been illustrated by reference to primary azo compounds, all of which (with the exception of the mixed aromatic and fatty compounds) may be regarded as derivatives of azobenzene, $C_6H_5N_2.C_6H_5$, benzeneazonaphthalene, $C_6H_5N_2.C_{10}H_7$, and azonaphthalene, $C_{10}H_7N_2.C_{10}H_7$, or generally, in the case of phenolic azo compounds, as $R.N_2.Pl$, where *R* may stand for C_6H_5 , $C_{10}H_7$, C_6H_4 , HSO_3 , $C_6H_4NO_2$, &c, and *Pl* for C_6H_5OH , $C_{10}H_7OH$, $C_{10}H_6(HSO_3)_2$, &c. It will be found convenient to write the formulae of azo compounds so as to represent the order of introduction of the radicals. Thus, $C_6H_5N_2.C_6H_5OH$ indicates the product from diazobenzene and phenol, and would be described as benzene azo phenol, $C_6H_5(HSO_3)N_2.C_{10}H_7OH_1$ as *p* sulphobenzene-azo (α) naphthol, obtained by the action of diazotised sulphamic acid upon (α) naphthol; while $C_6H_5N_2.C_{10}H_6(HSO_3)_2OH_1$ is the isomeric benzene azo-(α)-naphtholmonosulphonic acid obtained by the action of diazobenzene upon (α) naphtholmonosulphonic acid. The same rules may be followed with the more complicated types of azo compounds, thus, for instance $C_6H_5N_2.C_6H_5N_2.C_6H_3(OH)_2$, benzeneazobenzeneazoresorcin obtained by the action of diazotised amidoazobenzene upon resorcin, in like manner $C_6H_5N_2.C_6H_5N_2.C_6H_3(OH)_2$ may be called benzene-azotoluene azoresorcin by the action of diazotised

benzene azoamidotoluene upon resorcin, and $C_6H_5.N_2.C_6H_4(OH).N_2.C_6H_5$, benzeneazodioxibenzeneazobenzene by the successive introduction of two diazobenzene groups into resorcin. Secondary and tertiary azo compounds of the types $(R.N_2).PI'$, and $(R.N_2)_2.PI''$ have been termed by Wallach *disazo* and *trisazo* compounds (*B* 15, 22 and 2812, v also Heumann, *ibid* 813).

Secondary and tertiary azo compounds—The typical secondary azo compound of the type $(R.N_2).PI'$ is this so called 'phenolbidiazobenzene,' $(C_6H_5.N_2).C_6H_4.OH$, discovered by Griess (*B* 10, 628). Compounds of this class are formed by the successive introduction of two diazotised radicles into a phenol. The resorcin secondary azo compounds have been especially studied by Wallach (*B* 15, 22, Wallach a B Fischer, *ibid* 2814), and the cresol compounds by Nöling a Kohn (*B* 17, 351). Analogous amido compounds of the type $(R.N_2).C_6H_4(NH_2)$ have been obtained by the introduction of diazotised radicles into chrysoidine (Griess, *B* 16, 2028). Secondary azo compounds of the type $R''(N_2).PI$ have been obtained by Wallach by acetylating one amido group in a diamine, diazotising the acetamidamido compound, and combining with a phenol so as to produce a compound of the type $R''\langle\begin{smallmatrix} N_2 & PI \\ NH & Ac \end{smallmatrix}\rangle$. The acetyl group is then removed, the NH_2 group diazotised, and the diazo compound $R''\langle\begin{smallmatrix} N_2 & PI \\ N_2 & Cl \end{smallmatrix}\rangle$ again combined with a phenol (*B* 15, 2825 and Wallach a Schulze, *ibid* 3020). The metadiamines appear to lend themselves most readily to this method. The most direct method of preparing secondary azo compounds of this class is by diazotising both amido groups in a *p* or *m* diamine, and then acting with the product upon a phenol or phenolsulphonic acid (Griess, *B* 17, 607 and 19, 817). Another method of obtaining secondary azo compounds of these types is by diazotising a *p* nitramido compound and combining with a phenol or secondary or tertiary amine so as to produce $NO_2.R''N_2.PI$ or $NO_2.R''N_2.R''NR_2$. The nitro group is then reduced, the amido azo compound diazotised and again combined with a phenol &c, thus producing $R''(N_2.PI)_2$, $R''\langle\begin{smallmatrix} N_2 & R'NR_2 \\ N_2 & PI \end{smallmatrix}\rangle$ &c (Meldola, *C J* 43, 425, 45, 106 and 47, 657). If the nitro azo compound is combined with a monamine and the nitro group reduced, a diamidoazo compound of the type $NH_2.R'N_2.R''N_2.NH_2$ is produced in which both amido groups can be diazotised and combined with phenols so as to form tertiary azo compounds, $PI.N_2.R'N_2.R''N_2.PI$ (*ibid*). Secondary azo compounds of these types are also formed by reducing *p* nitracetanilide, diazotising and combining with a phenol or amine so as to produce azo-compounds of the type $C_6H_5\langle\begin{smallmatrix} NH & Ac \\ N_2 & PI \end{smallmatrix}\rangle$. The acetyl group is then removed, the amido azo-compound diazotised and again combined with a phenol (Nietzki, *B* 17, 343 and 1350).

Secondary azo compounds of the type $R'N_2.R''N_2.PI$ are obtained by diazotising amido-azo compounds and combining the diazo azo salt with phenols. The typical compound,

$C_6H_5.N_2.C_6H_4.N_2.C_6H_4.OH$, was first prepared by Caro and Schraube (*B* 10, 2230) and several members of this group have since been introduced into commerce under the names of 'Biebrich scarlet,' 'Croceine scarlet,' &c. These scarlets are of considerable technical importance, especially the latter, which are prepared by the action of diazotised amidoazo benzene sulphonic acid and its homologues upon (β) naphthol (α) sulphonic acid. By the action of diazotised amidoazobenzene upon chrysoidine a tertiary azo compound of the type $R'N_2.R''N_2\langle\begin{smallmatrix} N_2 \\ R'N_2 \end{smallmatrix}\rangle.C_6H_4(NH_2)_2$ is formed (Griess, *B* 16, 2036).

Secondary azo-compounds of some importance have recently been prepared by diazotising diamidodiphenyl (benzidine) and its homologues and combining the tetrazo salt with phenols, amines, and their sulphonic acids, of these colouring matters 'Congo red,' $C_6H_5.N_2.C_6H_4(HSO_3)NH_2$ may be mentioned as a typical example. Tertiary azo compounds derived from triphenyl carbinol are obtained by diazotising the rosanilines and combining with phenols (Meldola, *C J* 47, 668).

Constitution of Azo compounds When a diazo compound combines with an amine or phenol to form an azo compound the N_2 group invariably takes up the para position with respect to the NH_2 , NHR , NR_2 , or HO if this position is open. The proof of the constitution of azo compounds is furnished by the products which they yield on complete reduction. Thus, amidoazobenzene, $C_6H_5.N_2.C_6H_4.NH_2$, gives on reduction aniline and *p* phenylene diamine, chrysoidine gives aniline and (1, 2, 4) triamido benzene (Witt, *B* 10, 658). The constitution of some of the azo compounds obtained by combining diazosulphonic acids with phenols has been established by Griess (*B* 11, 2191). The constitution of the azo naphthol colours has been determined chiefly by Liebermann and his pupils (*B* 14, 1310 and 1795, Jacobson, *ibid* 1791, also Witt, *C J* 35, 179). When diazo compounds act upon substituted phenols, such as salicylic acid, the N_2 group also takes up the para position with respect to the HO group (P. F. Frankland, *C J* 37, 746), thus (a) naphthaleneazosalicylic acid gives on reduction a $C_{10}H_7.NH_2$ and $C_6H_4(HO)(NH_2)CO_2H$ [1 4 2]. When the para position with respect to the NH_2 or HO group is already occupied the N_2 group enters the ortho position (Nöling a Witt, *B* 17, 77, Liebermann a Kostanecki, *ibid* 130, 876, Griess, *ibid* 338, Nöling and Kohn, *ibid* 351). This law holds good also when the para position is occupied by an azo-group, as in the formation of $(C_6H_5.N_2)_2.C_6H_4.OH$ from benzeneazophenol by the introduction of another $C_6H_5.N_2$ group (Nöling a Kohn, *B* 17, 368). In the case of the (β) naphthalene derivatives the N_2 group also enters the ortho (α) position with respect to the hydroxyl or amido group. Thus (β) naphthol orange, $HSO_3.C_6H_4.N_2.C_6H_4.OH$, gives on reduction sulphanic acid and (α) amido (β) naphthol, the latter yielding (β) naphthoquinone on oxidation (Liebermann, *B* 14, 1310). Similarly the azo-derivatives of (β) naphthylamine yield α diamido-naphthalene ($NH.NH_2 = \alpha, \beta$) on reduction

(Lawson, *B* 18, 796 and 2422) The fact that such compounds as benzenesazo (β) naphthol are insoluble in cold aqueous alkalis has led Liebermann to the suggestion that these compounds no longer contain HO, but possess the formula $C_6H_5N \begin{smallmatrix} \text{NH} \\ \text{O} \end{smallmatrix} > C_{10}H_7$ (*B* 16, 2858) A similar conclusion has been suggested by Meldola with respect to the (β) naphthylamine derivatives, for which he proposes the formula $RN \begin{smallmatrix} \text{NH} \\ \text{NH} \end{smallmatrix} > C_{10}H_7$, thus indicating a relationship to the azimido compounds above referred to (*C J* 45, 117) This conclusion is supported by the investigations of Zincke and his pupils (*B* 18, 3125, 3132 and 3142) This author has shown that these (β) naphthalene, as well as other ortho amidoazo compounds, can be oxidised to com-

pounds of the azimido type, $RN \begin{smallmatrix} \text{N} \\ \text{N} \end{smallmatrix} > C_{10}H_7$, and he suggests for them the alternative formula

$B.NH \begin{smallmatrix} \text{HN} \\ \text{N} \end{smallmatrix} > C_{10}H_7$. According to a recent paper by Nietzki & Goll (*B* 19, 1281) it appears, however, that amidoazo (β) naphthalene contains an NH_2 group, or at any rate can be diazotised under certain conditions There can be no doubt that the question of the constitution of the azo compounds is much more complicated than was at first supposed, since by the action of diazo compounds upon phenols two isomeric azo compounds may be formed at the same time, the isomerism probably depending upon the position of the RN_2 groups with respect to the HO as well as upon the formation of bodies of the oximido type This appears to be the case especially with the azo derivatives of resorcinol (Wallach, *B* 15, 22 and 2814)

General properties and technology—The individual azo colours will be described under their respective headings, so that it will be only necessary here to give a brief account of the general characters of these colouring matters The parent azo compounds, $C_6H_5N_2C_6H_5$, $C_6H_5N_2C_{10}H_7$, $C_{10}H_7N_2C_{10}H_7$, although possessed of colour are not of any value as dye stuffs it is only when acid or basic radicles are present in one or both aromatic nuclei that true colouring matters are formed The colours produced by these compounds are of various shades of yellow, orange, brown, red, scarlet, indigo blue and violet No pure blue or green azo compound is known Of the basic primary azo compounds, amidoazo benzene, chrysoidine, and 'phenylene brown,' show a gradation in shade from yellow through orange to brown The two last compounds are now alone of technical value Among the acid azo colours a regular gradation of shade is also observed with the increase in molecular weight This is well seen in the colours produced by the action of diazo benzene and its homologues upon the naphthol-sulphonic acids, the lowest members of the series being orange, and the highest members scarlet of an increasing shade of blueness The acid primary azo compounds are dyed from acid baths and have great affinity for silk and wool, but do not readily dye cotton without the use of mordants Primary azo colours as a rule dis-

solve in strong sulphuric acid with a red or orange colour Azo-colours can be produced directly in the fibre of cotton by impregnating the latter with a phenol and a diazo compound, and then developing by means of an acid (T Holliday, *S C I* 4, 204) A similar process has been described by Grassler (*S C I* 4, 262) who uses the nitrite in the form of an ammonium salt or in combination with ammonium salts, so that on heating the impregnated fabric the nitrous acid is liberated in the presence of the amine and phenol, and the colour is developed without the use of acid Oxyazo compounds, which are not sulphonic acids, and which are insoluble, can be made soluble by warming them in aqueous or alcoholic solutions of bisulphites A soluble double compound is thus formed which is decomposed on heating with the liberation of the colouring matter so that the process is especially applicable for calico printing (Meister, Lucius & Bruning, *B* 17, 452) The secondary azo-colours derived from diazotised amidoazobenzene and its homologues in combination with naphtholsulphonic acids are scarlets of greater tinctorial power and purity than the primary azo scarlets, and possess a certain affinity for cotton, especially the 'crocine scarlets' already referred to The secondary azo colours derived from diazotised benzidine ('Congo red' series) and its homologues are reds or yellows which also possess a certain affinity for cotton, but many of these colours are too sensitive to acids to be of much use technically The stability of these colours is increased, however, by using the higher homologues of benzidine It is only among secondary azo compounds that true shades of violet and indigo blue are found (Nietzki, *B* 17, 344, Meldola, *C J* 47, 665) Some of these blue shades are now met with in the market, a typical compound of the class being a salt of ditolyltetrazo (β) naphtholdisulphonic acid,

$C_6H_5N_2C_{10}H_7(HSO_3)(OH)\beta$ (Azo blue of F Bayer & Co)

Secondary azo compounds dissolve as a rule in strong sulphuric acid with a violet, blue, or green colour The tertiary azo-compounds have but little tinctorial value For observations on the absorption spectra of azo colours see papers by H W Vogel (*B* 11, 623), Landauer (*B* 14, 391), and Stebbins (*Am* 6, 117 and 149)

R M

AZO-COMPOUNDS (V also Azo COLOURING MATTERS AND DIAZO COMPOUNDS) The nomenclature of these compounds is based on the following rules Imagine N_2 displaced by H_2 and the compound to break up accordingly, one H going to one half and one to the other If both the resulting compounds are aromatic, name the compound richest in carbon according to the rules followed in this dictionary, and prefix azo- to the name Before azo write the name of the hydrocarbon from which the other half of the molecule is derived Then prefix all the substituents of the latter so that they may follow one another in this order chloro, bromo, iodo, cyano, nitro, oxy, amido, sulpho, and carboxy When both halves of the azo-compound contain the same number of atoms of carbon, then the half which contains CO_2H is put last If neither contain CO_2H , the one containing

B B

SO_3H comes last, if neither contain this, preference is given to OH , NH_2 , NO_2 , Br , or Cl , in succession.

If one half of an azo compound is derived from a fatty hydrocarbon the name of this half is written last.

The compounds obtained by the action of diazo-compounds upon (β) naphthylamine, (β) naphthol, or more generally upon amido or oxy compounds in which the p position is already occupied, are described as if they were ordinary azo compounds. It is, however, not improbable that they may have a different constitution. Thus the compounds obtained from diazo compounds and (β) naphthylamine behave like diazoamides in their decomposition by acids into (β) naphthylamine, a phenol, and nitrogen, but act on reduction like amido azo derivatives giving (1,2) naphthylene diamine and the amine. Three views may be taken with regard to the constitution of these bodies—(1) That they are true diazoamides, (2) that they are o amido azo derivatives, (3) that they are hydrazimido compounds, *z.e.* dihydrides of azimido compounds.

The first hypothesis easily explains their decomposition by acids, and their reduction to naphthylene diamine might be accounted for by assuming an intermediate change into the amido azo compound. However, the fact that a different isomeric body is formed by diazotising (β) naphthylamine and combining it with the other amine does not agree with this view, since compounds of the form $\text{X N}_2\text{NH}_2$ and $\text{Y N}_2\text{NHX}$ are always found to be identical. The other reactions of these bodies are also inconsistent with this hypothesis. The hypothesis that the compounds are o amido azo derivatives does not readily account for their behaviour on oxidation, which tends to show that they do not contain an NH_2 group.

The third hypothesis leads to the formula

It is strongly supported by the fact that on oxidation these bodies give rise to white crystalline azimido-compounds, which probably have

the constitution $\text{C}_{10}\text{H}_7\left\langle\begin{array}{c} \text{N} \\ \text{N} \end{array}\right\rangle\text{NR}$, analogous to

Griess's azimidobenzene $\text{C}_6\text{H}_5\left\langle\begin{array}{c} \text{N} \\ \text{N} \end{array}\right\rangle\text{NH}$ obtained

by the action of nitrous acid on o phenylene diamine. The corresponding compounds from (β) naphthol and diazo salts may also be obtained by the action of hydrazines upon (β) naphthoquinone, and hence may be represented in a similar manner by the formulae

The formation of hydrazimido compounds from a diazo salt and (β) naphthylamine can be explained by assuming the intermediate formation of true diazo amides $\text{C}_{10}\text{H}_7\text{NH NNR}$, which by taking up H_2O (or HCl) would form $\text{C}_{10}\text{H}_7\text{NH N(OH)NHR}$ or $\text{C}_{10}\text{H}_7\text{NH NH N(OH)R}$, and by again eliminating H_2O it might give the hydrazimido compound. The decomposition by

acids might also be explained as a change inverse to the above, resulting in the formation of the diazo amide, which would then be decomposed. The *ortho* amido azo derivatives of the benzene series would also seem to be similarly constituted, for on oxidation they also give colourless crystalline azimido compounds.

Apparently opposed to the hydrazimido-hypothesis, is the behaviour of these bodies towards nitrous acid, which converts them into diazo compounds. In many points, however, these diazo compounds greatly differ from the ordinary diazo compounds, and their constitution may possibly be expressed by the formula.

ation from hydrazimido compounds. By SnCl_2 or SO_2 these diazo compounds are not reduced to hydrazines but to non basic stable bodies which probably have the constitution

N_2 on heating and are converted into azimido-

compounds $\text{R}'\left\langle\begin{array}{c} \text{N} \\ \text{N} \end{array}\right\rangle\text{N R}'$ identical with those

obtained by oxidation of the o amido azo compounds. On the hydrazimido hypothesis the body derived from diazo benzene and phenyl (β) naphthylamine would be represented by the

reactions. Thus conc HCl removes aniline,

forming an azine $\text{C}_{10}\text{H}_7\left\langle\begin{array}{c} \text{N} \\ \text{N} \end{array}\right\rangle\text{C}_6\text{H}_5$, while ox-

idising agents produce a powerful ammonium base $\text{C}_{10}\text{H}_7\text{N}_3(\text{C}_6\text{H}_5)\text{OH}$ (Meldola, *C J* 45, 107, Nolting a Wilt, *B* 17, 77, Lawson, *B* 18, 796, 2422, Sachs, *B* 18, 3125, Zincke, *B* 18, 3132, 3142, Zincke a Lawson, *B* 19, 1452).

DESCRIPTION OF AZO COMPOUNDS

Acetophenone azo (β) naphthol [41]

$\text{C}_6\text{H}_5(\text{CO CH}_3)-\text{N}_2-\text{C}_{10}\text{H}_7(\text{OH})$ Formed by diazotising p amido acetophenone and combining the diazo compound with (β) naphthol in alkaline solution (Klingel, *B* 18, 2695). Slender red needles. V sol alcohol, sl sol ether, insol water. Dyes silk a dull red.

o Amido benzene azo aceto acetic acid

$\text{C}_6\text{H}_4(\text{NH}_2)-\text{N}_2-\text{CH}(\text{CO CH}_3)\text{CO}_2\text{H}$ [157°] Orange red tables. Easily soluble in acetic acid, alcohol, ether and chloroform, sparingly in water. Formed by reduction of o nitro benzene azo aceto acetic acid with FeSO_4 and NH_3 (Bamberger, *B* 17, 2420).

p Amido-benzene p -azo aniline

$\text{C}_6\text{H}_4(\text{NH}_2)-\text{N}_2-\text{C}_6\text{H}_4(\text{NH}_2)$ *p* Azo aniline. Di-amido azo benzene [235°] Long flat yellow needles. Easily soluble in alcohol, sparingly in benzene and ligroine.

Preparation—1 The mono acetyl derivative of p phenylene diamine is diazotised and combined with aniline, the anilide thus obtained is dissolved in aniline and warmed with aniline hydrochloride by which it is converted into the mono acetyl derivative of amido benzene azo

aniline, which is finally saponified.—2 From its diacetyl derivative which is formed by the action of zinc and ammonia on acetyl *p* nitro aniline (Mixer, *Am* 5, 282)

The mono azo salts are green, the di azid red $B''H_2Cl_2$ needles

Mono acetyl derivative $C_{12}H_8N_2(NH_2)(NHAc)$ [213°], glistening golden yellow plates Its salts are red (Nietzki, *B* 17, 345)

Di acetyl derivative [282°] (M)

Amido-benzene azo aniline

[4 1] $C_6H_5(NH_2)-N_2-C_6H_4NH_2$ [1 4] [142°] Obtained by reducing nitro benzene azo nitro benzene [206°] with alcoholic ammonium sulphide (Janovsky, *M* 6, 460) Minute plates (from alcohol) Salt $-B''HCl$ This body is probably identical with the preceding, the melting point having perhaps been misprinted

m **Amido-benzene-*m* azo aniline**

[3 1] $C_6H_5(NH_2)-N_2-C_6H_4(NH)$ [1 3] From the nitro compound by ammonium sulphide (Janovsky, *M* 6, 458) Minute flat yellow needles with green lustre (from alcohol)

Amido-benzene-azo benzene-*p* sulphonic acid

[4 1] $C_6H_4(HSO_3)-N-N-C_6H_4NH_2$ [1 4] S 0144 at 22° Yellowish white microscopic needles or scales (containing aq) Nearly insoluble in water, alcohol, ether, and chloroform Formed by the action of diazo benzene *p* sulphonic acid on aniline (to extent of about 30 p c) Prepared from benzene azo aniline and fuming H_2SO_4 at about 70° On reduction with tin and HCl it gives *p* phenylene diamine and sulphamic acid

Salts $-ANH_2^*$ orange yellow plates $-A_2Ba$ gaa sparingly soluble trimetric orange needles $-A_2Ca$ 2aa (Griess, *B* 15, 2184)

Amido-benzene-azo-benzene *p* sulphonic acid

[4 1] $C_6H_4(SO_3H)-N-N-C_6H_4NH_2$ [1 4] S 0196 at 22° Pearly plates (containing aq) Formed by reduction of the sparingly soluble nitro-benzene azo benzene *p* sulphonic acid with ammonium sulphide On complete reduction with tin and HCl it gives *p* sulphamic acid and *p* phenylene diamine, and hence ought, according to theory, to be identical with the preceding compound, this, however, does not appear to be the case

Salts $-KA'$ aq yellow trimetric plates $-NaA'$ needles $-BaA'$ 6aa large glistening monoclinic needles $-CaA'$ 4aa yellow pearly plates $-PbA'$ monoclinic plates (Janovsky, *B* 16, 1488, *M* 4, 279, 652)

Di-amido-benzene-azo-*p* benzene-*p* sulphonic acid $(NH_2)_2C_6H_3-N_2-C_6H_4SO_3H$ *Chrysoidine sulphonic acid* Brownish red glistening needles Sl sol water

Formation —1 By combination of *p* diazo benzene sulphonic acid with *m* phenylene diamine —2 By sulphonation of chrysoidine On reduction it gives sulphamic acid and (1 2 4) tri amido benzene (Griess, *B* 15, 2196)

m **Amido-benzene-*p* azo-di methyl aniline**

[3 1] $C_6H_5(NH_2)-N_2-C_6H_4NMe_2$ [1 4] [160°] Golden laminae, sol alcohol Formed by the action of warm dilute H_2SO_4 on its acetyl derivative [184°] which is obtained by mixing diazotised acetyl *m* tolylene diamine with dimethyl-aniline (Wallach, *A* 234, 263)

***p*-Amido-benzene-azo-dimethylaniline**

[4 1] $NH_2C_6H_4N_2C_6H_4NMe_2$ [1 4] [188°] By

warming the alcoholic solution of the nitro-compound $NO_2C_6H_4N_2C_6H_4NMe_2$ with ammonium sulphide (Meldola, *C* J 45, 107)

Properties —Brick red needles (from dilute alcohol) Insol boiling water, but forms yellow solutions in most solvents Reduced by zinc dust and HCl it gives dimethyl *p* phenylene diamine and *p* phenylene diamine On adding acetic acid to an alcoholic solution, the liquid turns green, on dilution with water it becomes red In conc H_2SO_4 the solution is orange A very dilute solution mixed with nitrous acid and exposed to the air turns blue (test for nitrous acid) $-B''(HCl)PtCl_4$

Methylo iodide —Insoluble brown scales

Acetyl derivative —Orange needles (from alcohol) [217°]

***p* Amido-benzene-azo-(*β*) naphthol**

[4 1] $NH_2C_6H_4N_2N(C_{10}H_7)OH$ [α β] Formed by reducing para nitro benzene azo compound with ammonium sulphide and ammonia Forms a crimson solution in H_2SO_4 (Meldola, *C* J 47, 663)

***p* Amido-benzene-azo-(*α*) naphthol**

[4 1] $NH_2C_6H_4N_2N(C_{10}H_7)OH$ [α β] Formed by reducing para nitro benzene azo (α) naphthol in hot dilute $NaHO$ with ammonium sulphide, ppd by HCl (Meldola, *C* J 47, 662) Dark brown powder, sl sol hot water, v sol hot alcohol Forms a red solution in conc H_2SO_4

***p* Amido-benzene-azo-(*β*) - naphthol di-sulphonic acid** *Acetyl derivative*

$C_6H_4(NHAc)-N_2-C_{10}H_6(OH)(SO_3H)_2$ Golden glistening plates Scarlet red dye stuff Formed by diazotising the mono acetyl derivative of *p*-phenylene diamine and combining it with (β) naphthol (R) di sulphonic acid (modification in soluble in alcohol) By saponification of the acetyl group it yields a bordeaux red dye stuff By diazotising the latter and combining it with (β) naphthol di sulphonic acid a blue colouring matter is produced (Nietzki, *B* 17, 344)

***p* Amido-benzene-azo (α) naphthylamine**

[4 1] $NH_2C_6H_4N_2N(C_{10}H_7)NH_2$ [1 4] [160°] Formed by reducing $NO_2C_6H_4N_2C_{10}H_7NH_2$ with aqueous ammonium sulphide (Meldola, *C* J 43, 432) Ochreous needles Readily soluble in alcohol, acetone, benzene and chloroform Its salts form crimson aqueous solutions, excess of acid throws down the neutral salts $-B''(HCl)PtCl_4$

***p* Amido benzene-azo-o-oxy-benzoic acid**

[4 1] $NH_2C_6H_4-N_2-C_6H_3(OH)(CO_2H)$ [1 4 2] From the sodium salt of *p* nitro benzene azo salicylic acid by reduction with ammonium sulphide Colourless needles Sl sol boiling water Its alkaline solutions are yellow Glacial $HOAc$ forms a crimson solution Blackens at 219°-220° C (Meldola, *C* J 47 667)

m **Amido-benzene-azo-phenol**

[3 1] $C_6H_5(NH_2)-N_2-C_6H_4OH$ [1 4] [168°] Brownish yellow scales Obtained by saponification of the acetyl derivative

Acetyl derivative

$C_6H_5(NHAc)N_2C_6H_4OH$ [c 208°] Prepared by diazotising the mono acetyl derivative of *m*-phenylene diamine and combining it with phenol. (Wallach, *B* 15, 3020)

***p* Amido benzene azo phenol**

[4 1] $NH_2C_6H_4N_2N(C_6H_4)OH$ [1 4] [181°] Obtained by heating *p* nitro benzene azo-phenol with ammonium sulphide Brown scales (from

water), ν sol. alcohol— $B'_2H_2PtCl_6$ (Meldola, *C J* 47, 658)

***p*-Amido-benzene-azo diphenylamine**

[4 1] $NH_2C_6H_4N_2C_6H_5NHC_6H_5$ [1 4] [α 91°] Got by reducing the nitro compound by ammonio sulphide (Meldola, *C J* 43, 440)

Properties—Sl sol in boiling water, ν sol alcohol, acetone, chloroform and benzene, forming yellow solutions HCl added to the alcoholic solution turns it first green, then red. Soluble in conc H_2SO_4 is violet, turned red by diluting

Salts—Form crimson aqueous solutions Dye wool orange

***m*-Amido-benzene-azo-*m*-phenylene-diamine**

[3 1] $C_6H_4(NH_2)_2-N_2-C_6H_3(NH_2)_2$ [1 2 4] *Dismaise brown* [137°] Ppd by adding $NaNO_2$ to a neutral solution of *m* phenylene diamine hydrochloride (Caro a Griess, *Z* 1867, 278) Brown plates Sl sol in hot water, ν e sol alcohol and ether Dyes wool brown Absorption spectrum (Hartley, *C J* 51, 180)

Salts— B'_2HCl — $B''H_2PtCl_6$

***p*-Amido-benzene-azo-phenylene diamine**

*[4 1] $C_6H_4(NH_2)_2-N_2-C_6H_3(NH)_2$ [1 2 or 3 4] From benzene azo benzene by nitration and reduction (Janovsky, *M* 6, 466)

***p*-Amido-benzene-azo-resorcin**

[4 1] $NH_2C_6H_3N_2N_2C_6H_3(OH)_2$ [1 2 4] By dissolving *p* nitro benzene azo resorcin in dilute NaOH and warming with ammonium sulphide (Meldola, *C J* 47, 661) Its alkaline solutions are red, its acid solutions are pale orange— $B'_2H_2SO_4$ silvery scales— $B''H_2PtCl_6$

***p*-Amido-benzene azo *m* xylydine**

[4 1] $NH_2C_6H_3N_2C_6H_2MeNH_2$ [1 3 5 2] [163°] Formed by reducing $NO_2C_6H_3N_2C_6H_2MeNH_2$ with aqueous ammonio sulphide (Meldola, *C J* 43, 432) Golden scales (from water) ν sol alcohol and benzene

Salts—The acid salts are very soluble in water Excess of HCl forms an amorphous brown pp of B'_2HCl — $(B''H_2Cl)PtCl_6$

Amido-thiophene-azo-benzene

$C_6H_3N_2C_6SH_2NH_2$ Formed by adding diazo benzene chloride to a tolerably concentrated solution of thiophenine hydrochloride— $B'HCl \frac{1}{2}$ aq yellow needles, soluble in water and alcohol (Stadler *B* 18, 2317)

Amido thiophene-azo-benzene-*p*-sulphon acid [4 1] $C_6H_3(SO_3H)N_2C_6SH_2NH_2$ Formed by combination of diazo benzene *p* sulphonic acid with thiophenine Yellow needles, red when dry Sl sol water and alcohol Dyes silk yellow (Stadler, *B* 18, 2318)

Amido-thiophene-azo-naphthalene

$C_{10}H_7N_2C_6SH_2NH_2$ Formed by adding (α)-diazo naphthalene chloride to a solution of thiophenine hydrochloride The hydrochloride forms microscopic red needles, sparingly soluble in water and alcohol (Stadler, *B* 18, 2318)

***m*-Amido-toluene-azo-aceto-acetic acid**

[4 2 1] $C_6H_3(CH_3)(NH_2)_2N_2CH(COCH_3)CO_2H$ [162°] Red glistening needles Formed by reduction of *m* nitro toluene azo aceto-acetic acid with $FeSO_4$ and NH_3 (Bamberger, *B* 17, 2421)

Amido toluene-azo-amido-cresol

[4 3 1] $C_6H_3(CH_3)(NH_2)_2N_2C_6H_3(OH)(OH)$ *Oryazolo toluidine* [212°] Small dark-red needles ν sol alcohol and ether, sl sol water Formed from amido toluene azoxy toluidine

$C_6H_3Me(NH_2)_2N_2O$ $C_6H_3Me(NH_2)_2$ by intramolecular change by heating it with H_2SO_4 at 110° It is reduced by $SnCl_2$ to tolylene-diamine $C_6H_3Me(NH_2)_2$ [1 2 4] together with di amido cresol (Limpricht, *B* 18, 1405)— $B''H_2SO_4$ — B'_2HCl — $B''H_2PtCl_6$

Amido toluene azo (β) naphthol

[6 3 1] $C_6H_3(CH_3)(NH_2)_2-N_2-C_{10}H_7OH$ [1 2].

Acetyl derivative

$C_6H_3(CH_3)(NHAc)_2-N_2-C_{10}H_7OH$ [276°] Insol water, sl sol alcohol, m sol a mixture of alcohol and chloroform Red colour Formed by diazotising the mono acetyl derivative of (1 2 4) tolylene diamine and combining it with (β) naphthol (Wallach, *B* 15, 2830)

Amido toluene azo nitro ethane

Acetyl derivative $C_{11}H_{11}N_2O_3$

[6 3 1] $C_6H_3Me(NHAc)_2N_2CH(NO)_2CH_3$ [143°] From $C_6H_3Me(NHAc)_2N_2Br$ and $NaCH(NO)_2CH_3$ (Wallach, *A* 235, 250) Red needles (from alcohol ether), ν sl sol water, insol ligroin

Amido toluene azo *o* toluidine

[4 3 1] $C_6H_3Me(NH_2)_2-N_2-C_6H_3Me(NH)_2$ [1 4 3] [197°] Formed by reducing nitro *o* toluidine $C_6H_3Me(NO)_2(NH_2)$ [1 4 2], or the corresponding azoxy compound, by sodium amalgam in alcoholic solution (Limpricht, *B* 18, 1406, Graeff, *A* 229, 350) Long red needles (from alcohol) or small yellow needles (from water) Sparingly soluble in water, easily in alcohol and ether

Salts— $B''H_2SO_4$ Slender reddish needles— B'_2HCl — $(B''H_2Cl)PtCl_6$ — B'_2HBr

Amido toluene azo *p* toluidine

[6 3 1] $C_6H_3Me(NH_2)_2-N_2-C_6H_3Me(NH_2)_2$ [159°] Red needles Sl sol cold, ν sol hot, water, ν sol alcohol Prepared together with the hydrazo compound by the prolonged action of sodium amalgam on an alcoholic solution of nitro *p* toluidine (Buckney, *B* 11, 1453)

Di amyl amido benzene azo di amyl aniline

[4 1] $(C_5H_{11})_2N_2C_6H_4-N_2-C_6H_3N(C_5H_{11})_2$ [1 4] *Di-amyl aniline azylene* [115°] Red pointed crystals Sol hot alcohol Formed by passing NO through an alcoholic solution of di amyl aniline **Salts**— $B''(C_5H_9NO_2)_2OH$, small yellow crystals Periodide B''_4I_6 small black crystals with violet reflex (Lippmann a Fleissner, *B* 15, 2142 and *B* 16, 1419)

Benzene-azo-aceto acetic acid

$C_6H_3-N_2-CHAcCO_2H$ [155°] Yellow leaflets (from alcohol) Prepared by the action of a solution of diazobenzene nitrate on an alkaline solution of acetaetic ether (V Meyer, *B* 10, 2076)

Salts— AK' yellow glistening leaflets— BaA'_2 , PbA'_2 , CuA'_2 , and AgA' are yellow pps

Ethyle ether [75°] Light yellow crystals, very readily saponified (Zublin, *B* 11, 1417)

Benzene azo-acetone $C_6H_3N_2CH_2COCH_3$

[149°] Glistening yellow prisms or needles Peculiar characteristic smell Only slightly soluble in hot water, and in aqueous alkalis

Formation—1 By heating benzene azo aceto acetic ether with a dilute alcoholic solution of NaOH—2 By heating benzene azo aceto acetic acid to 170°–180°, CO_2 being evolved (Richter a Munzer, *B* 17, 1928)

Benzene azo acetophenone

$C_6H_3N_2CH_2CO C_6H_5$ [129°] Slender golden needles ν sol hot alcohol and hot acetic acid Formed, together with benzene azo benzoyl acetic ether, by adding a solution of diazo-

benzene chloride to an acid alkaline solution of benzoyl acetic ether (Bamberger & Calman, *B* 18, 2563)

Benzene-o-azo-aniline (?)

$C_6H_5-N_2-C_6H_4NH_2$ (?) [128°] Formed by reducing benzene o azo nitro benzene with ammonium sulphide (Janovsky, *M* 8, 61, yellow crystals with blue reflex (from dilute alcohol). The salts are less soluble in water than those of the p compound

Benzene azo aniline C_6H_5, N_2, C_6H_5

$C_6H_5-N_2-C_6H_4NH_2$ [14] *Amido azo benzene* Mol w 197 [126°] (above 360°)

Formation—1 By reducing benzene azo nitro benzene [137°] with ammonium sulphide (G Schmidt, *Z* 5, 417, Janovsky & Eib, *B* 18, 1136)—2 Together with bromo aniline by the action of bromine vapour upon aniline (Kekulé, *Z* [2] 1, 688)—3 By action of mineral acid (one molecule or less) upon diazo benzene anilide (v Di azo compounds) (Martius & Griess, *Z* [2] 1, 132, Friswell & Green, *C J* 49, 746)

Preparation—1 Diazo benzene anilide is dissolved in 2 or 3 times its weight of aniline, $\frac{1}{10}$ th its weight of aniline hydrochloride is added at the ordinary temperature, and the mixture is kept for an hour at 30° to 40°, after standing for twenty four hours at the ordinary temperature, sufficient HCl is added to combine with the free aniline and the amidoazo benzene base precipitates, or it can be obtained as hydrochloride by adding more HCl. The yield is nearly theoretical (Witt & Thomas, *C J* 43, 113, Staedel & Bauer, *B* 19, 1953)—2 A conc solution (of rather less than 1 mol) of $NaNO_2$ is added to (1 mol of) aniline hydrochloride dissolved in (5 or 6 mols of) aniline at 30°–40°, kept at c 40° for 1 or 2 hours, and then at the ordinary temperature for 12 hours, completed as above, the yield is nearly theoretical

Properties—Yellow crystals, separates from benzene with benzene of crystallisation (W & T), orange prisms with blue reflex (from alcohol). V sl sol hot water, m sol ether and alcohol. Its salts are decomposed by water, they dye wool yellow. Tin and HCl give aniline and p-phenylene diamine. Combines with EtI forming the diiodide of $C_6H_5(NH_2)_2 N_2 C_6H_4NH_2$. The diazo compounds of benzene azo aniline and its sulphonic acids are used for the preparation of scarlets by combination with the naphthols and their sulphonic acids

Salts— $B'HCl$ steel blue needles or scales (from boiling $HClAq$)— $B'_2H_2PtCl_4$ — $B'HNO_3$ — $B'_2H_2SO_4$ — $B'_2H_2CO_3$

Acetyl derivative $C_6H_5, N_2, C_6H_4(NHAc)$ [142°] Yellow silky crystals. On reduction with alcoholic ammonium sulphide it gives acetyl amido hydrazobenzene (Schultz, *B* 17, 463, Berju, *B* 17, 1400, *C C* 1884, 871)

Reactions—1 By boiling benzene azo aniline with 10 pts of HCl (S G 112) it is completely decomposed in a few hours with formation of p phenylene diamine, aniline, chlorinated hydroquinones, NH_3 , and colouring matters (Wallach & Kölliker, *B* 17, 395)—2 An alcoholic solution of bromine forms a dibromo derivative [152°] which is reduced by tin and HCl to aniline and p phenylene diamine (Berju, *B* 17, 1400)—3 With phenyl thio carbimide

it forms benzene azo di-phenyl thio urea (q v), together with some benzene azo di phenyl thio urea azo benzene (v di azo compounds)—4, Carbonyl chloride forms benzene azo di phenyl-urea azo benzene ($Ph-N_2-C_6H_4NH_2$), CO (Berju, *B* 17, 1404)—5 Benzene azo aniline hydrochloride (2 mols) heated with acetone (1 mol) at 150°–160° under pressure forms a base C_6H_5, N_2 , [205°] Yellow needles, v sol alcohol, ether, and acids. By tin and HCl it is reduced to a base of melting point [185°] Dilute solutions of the salts have a blue fluorescence. Salts— $B'H_2SO_4$, slender soluble needles or small monoclinic prisms— $B'H_2CrO_4$, orange yellow needles— $B'H_2Cl_2PtCl_4$, flat yellow needles, sl sol cold water (Engler & Schestopal, *B* 20, 480)

Benzene-azo benzene C_6H_5, N_2, C_6H_5

$C_6H_5-N_2-C_6H_5$ *Azobenzene* Mol w 182 [68°] (293°) VD 6.5 (calc 6.3) S (alcohol) 8.5 at 16° (Moltchanofsky, *J R* 1882, 224) SV 220.4 (Ramsey)

Formation—1 By treating nitro benzene with alcoholic potash (Mitscherlich, *A* 12, 311, Schmidt & Schultz, *A* 207, 328), sodium amalgam in presence of alcohol and acetic acid (Werigo, *A* 135, 176, Alexejeff, *Z* [2] 3, 33), iron (3 pts) and acetic acid (1 pt) (Noble, *A* 98, 253), or with zinc dust (Alexejeff, *Bl* [2] 34, 684)—2 By oxidising aniline with aqueous $KMnO_4$ (Glaser, *A* 142, 364), red hot PbO (Schichuzky, *J R* 6, 245), H_2O_2 (Leeds, *C N* 44, 210, *B* 14, 1382) or bleaching powder (Schmitt, *J pr* [2] 18, 195)—3 It is the chief product of the action of sodium on p bromo aniline (Anschutz & Schultz, *B* 9, 1398, cf Claus, *B* 15, 315)

Preparation—1 By heating nitro benzene with a solution of sodium stannite prepared by dissolving the theoretical quantity of $SnCl_4$ in an excess of aqueous $NaOH$ (Witt, *B* 18, 2912)—2 400 grms of $NaOH$ (98 pc powdered) are boiled with 2000 cc of ordinary alcohol till most has dissolved, 500 g of nitrobenzene are slowly added to the boiling solution, and the formation of azoxybenzene completed by 2 or 3 hours' cohobation. 200 grms of zinc dust are then slowly added and the boiling continued for a day with occasional shaking. The alcohol is distilled off on a salt bath, warm water added, the insoluble portion filtered off, washed, freed from $Zn(OH)_2$ by HCl, and extracted with alcohol, the filtrate on cooling deposits the azobenzene in splendid large plates, good yield

Properties—Trimetric plates (Jeremejeff) Crystallises with C_6H_6 from benzene. Its absorption spectrum has been described by Hartley (*C J* 51, 176)

Reactions—1 Passed through a red hot tube it yields benzene and diphenyl (Fenko, *B* 20, 664) 2 *Chromic acid* in acetic acid at 200° forms benzene azoxy benzene—3 *Nitric acid* forms $Ph N_2 C_6H_4(NO_2)$ [14], $Ph N_2 C_6H_4(NO_2)$ [12], [41] $C_6H_5(NO_2) N_2 C_6H_4(NO_2)$ [14], [18] $C_6H_4(NO_2)_2 N_2 C_6H_4(NO_2)$ [13], and a nitrobenzene azo di nitro benzene—4 *Alcoholic ammonium sulphide* reduces it to hydrazone benzene (Hofmann, *Pr* 12, 576)—5 Hot conc HCl , HBr , or HI reduces it to benzidine, other products being formed at the same time—6 *Alcoholic SO_2* produces benzidine—7 With an ethereal solution of *zinc ethyl* it reacts forming ethane (1 vol), ethylene (3 vols), and a

product which, when treated with water, gives aniline 80 g of azo benzene gives 70 g of aniline The reactions are probably —

And then, on adding water

(Frankland & Louis, *C J* 37, 560) —8 *Aldehyde* at 200° forms a compound $\text{C}_{26}\text{H}_{22}\text{N}_2\text{O}_2$ [164°] In presence of chloride of zinc, aldehyde condenses with it to benzylidene benzidine $\text{PhCHN}(\text{C}_6\text{H}_4)\text{C}_6\text{H}_4\text{NCHPh}$ (?) [239°] (Barzilovsky, *J R* 1885, 366) —9 *Bromine* forms mono bromo derivatives, a di bromo derivative, [205°] (*v* Bromo benzene azo bromo benzene), and a tetra bromo derivative, $\text{C}_{12}\text{H}_6\text{Br}_4\text{N}_2$, [c 320°] (Werigo, *A* 165, 200)

Combinations — $\text{C}_{12}\text{H}_{10}\text{N}_2\text{C}_6\text{H}_5$ [38°] — ($\text{C}_{12}\text{H}_{10}\text{N}_2$), 3HCl unstable yellow crystals — ($\text{C}_{12}\text{H}_{10}\text{N}_2$), 3HBr unstable red crystals, got by passing HBr into a solution of azobenzene in CS_2 — $\text{C}_{12}\text{H}_{10}\text{N}_2\text{HBr}_3$ crystals, formed by adding bromine to a solution of the preceding body in chloroform — $\text{C}_{12}\text{H}_{10}\text{N}_2\text{Br}_6$ red prisms, got by adding excess of bromine to a solution of benzene azo benzene in chloroform (Werigo, *A* 165, 203)

Benzene azo benzene sulphonic acid

$\text{C}_6\text{H}_5-\text{N}_2-\text{C}_6\text{H}_4\text{SO}_3\text{H}$ [14] [127°] From benzene azo benzene and fuming H_2SO_4 (5 pts) at 180° (Gruess, *A* 131, 89, 154, 208, Janovsky, *M* 2, 221, 3, 237, *B* 15, 2576) Orange red plates (containing 3aq) Sol alcohol and ether Potash fusion converts it into K_2SO_4 and benzene azo phenol Ammonium sulphide followed by mineral acid converts it into di amido di phenyl sulphonic acid Nitric acid forms mono, di, and tri nitro derivatives (Janovsky, *M* 3, 508)

Salts — $\text{KA}'2\text{aq} - \text{BaA}' - \text{AgA}'$

Chloride $\text{C}_6\text{H}_4\text{N}_2\text{SO}_2\text{Cl}$ [82°] Orange clumps (from ether)

Amide $\text{C}_6\text{H}_4\text{N}_2\text{SO}_2\text{NH}_2$ Powder (Skandaroff, *Z* [2] 6, 643)

Benzene azo benzene disulphonic acid

$\text{C}_6\text{H}_5-\text{N}_2-\text{C}_6\text{H}_4(\text{SO}_3\text{H})_2$ [124] Formed, together with *sm*, and *sp*, sulpho benzene azo benzene sulphonic acids by heating benzene azo benzene (1 pt) with pyrosulphuric acid (4 pts) at 150° (Janovsky, *M* 3, 237) Very deliquescent needles Isomerides of this acid are described as sulpho benzene azo benzene sulphonic acid

Benzene azo benzoic acid

$\text{C}_6\text{H}_5\text{N}_2\text{C}_6\text{H}_4(\text{CO}_2\text{H})$ [14] *Azo benzene p carboxylic acid* Obtained by saponification of its nitrile by boiling with KOH Long glistening brown prisms Sol alcohol, ether, and warm benzene Salts — $\text{A}'\text{K}$ very soluble brownish-yellow needles — $\text{A}'_2\text{Ba}$ brownish yellow needles, sol alcohol, sl sol water (Mentha & Heumann, *B* 19, 3023)

Nitrile $\text{C}_6\text{H}_5\text{N}_2\text{C}_6\text{H}_4(\text{CN})$ [14] *p Cyano azo benzene* [101°] Formed by diazotising benzene azo aniline and allowing the solution of diazo benzene azo benzene chloride to drop into a hot solution of CuSO_4 and KCN Brown needles V sol ether, benzene, and warm alcohol, insol water Sublimable (*M* & H)

Benzene-azo-benzoyl-acetic acid

$\text{C}_6\text{H}_5\text{N}_2\text{CH}(\text{CO}_2\text{C}_6\text{H}_5)\text{CO}_2\text{H}$ [141°] Long yellow needles V sol alcohol, ether, and acetic acid Its ethyl ether is formed, together with benzene azo acetophenone, by adding a solution of diazobenzene chloride to an acid alkaline solution of benzoyl acetic ether By boiling with dilute NaOH it is converted into benzene azo acetophenone $\text{C}_6\text{H}_5\text{N}_2\text{CH}_2\text{CO}_2\text{C}_6\text{H}_5$ (Bamberger & Calman, *B* 18, 2663)

Benzene-azo-benzylidene aniline

$\text{C}_6\text{H}_5-\text{N}_2-\text{C}_6\text{H}_4\text{NCHC}_6\text{H}_5$ *Benzylidene amido azo benzene* [125°] Orange plates Formed by the action of benzaldehyde on benzene azo aniline By HCl it is resolved into its constituents (Berju, *B* 17, 1403)

Benzene-azo o bromo benzene

$\text{C}_6\text{H}_5-\text{N}_2-\text{C}_6\text{H}_3\text{Br}$ [12] *Bromo azo benzene* [87°] Glistening plates (from alcohol) Sl sol cold alcohol By the action of bromine (1 mol) upon a warm acetic acid solution of benzene azo benzene (1 mol) a mixture of *o*, *m*, and *p*, mono bromo benzene azo benzene is obtained, they can be separated by their different solubilities in alcohol By complete reduction they give aniline and *o*, *m*, or *p* bromaniline

Benzene azo m bromo benzene

$\text{C}_6\text{H}_5\text{N}_2\text{C}_6\text{H}_3\text{Br}$ [13] [56°] Yellowish green pearly plates V sol alcohol, ether and acetone On nitration it gives orange needles of $\text{C}_{12}\text{H}_6\text{Br}(\text{NO})_2\text{N}_2$ [123°] (Janovsky & Erb, *B* 20, 359)

Benzene azo p bromo benzene

$\text{C}_6\text{H}_5\text{N}_2\text{C}_6\text{H}_3\text{Br}$ [14] [82°] Is the chief product of the bromination of benzene azo benzene in acetic acid Orange yellow plates Sublimable V sol alcohol, ether, and acetone The corresponding hydrazo compound forms white needles On nitration it gives orange needles of $\text{C}_{12}\text{H}_6\text{Br}(\text{NO})_2\text{N}_2$ [108°] and also a di nitro derivative [190°] (Janovsky & Erb, *B* 19, 2155, 20, 357, *M* 8, 49, *v* also Bromo benzene azo bromo benzene)

Benzene azo tri-bromo resorcin

$\text{Ph}-\text{N}_2-\text{C}_6\text{Br}_3(\text{OH})_2$ [186°] From benzene-azo resorcin and bromine (Typke, *B* 10, 1578)

Benzene azo p chloro benzene

$\text{C}_6\text{H}_5-\text{N}_2-\text{C}_6\text{H}_4\text{Cl}$ [14] *Chloro-azobenzene* [89°] Yellowish brown plates Sublimes in brown needles Easily soluble in ether, benzene, and hot alcohol, sparingly in cold alcohol

Preparation — 100 grms of benzene azo aniline hydrochloride are suspended in 2 litres of water and 220 c.c. of conc HCl, and diazotised by slow addition of a conc solution of 20 grms sodium nitrite After standing for some time the diazo azo benzene solution is filtered and slowly added to a boiling solution of 40 grms CuCl_2 in 360 c.c. of conc HCl, and boiled for some time, the greyish black pp is treated with conc HCl and then with dilute NaOH to remove impurities, and extracted with hot alcohol, the alcoholic solution after treatment with animal charcoal deposits the benzene-azo chloro benzene on cooling in glistening brown plates, the yield is 88 p.c. of the theoretical (Heumann & Mentha, *B* 19, 1686)

Reactions — When its alcoholic solution is allowed to stand in the cold with SnCl_2 and 2 drops of H_2SO_4 it is converted into a chloro-di amido diphenyl $\text{NH}_2\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{ClNH}_2$ The

latter body is not formed, however, by heating the hydrazo compound, previously prepared, with HCl, but benzene azo chloro benzene, chloro aniline, and aniline are formed instead. On nitration with fuming HNO_3 , benzene azo chloro benzene gives *p* chloro benzene azo *p* nitro benzene $\text{C}_6\text{H}_4\text{Cl N}_2 \text{C}_6\text{H}_4(\text{NO}_2)$. By treatment with fuming sulphuric acid it is converted into *p* chloro benzene azo benzene *p* sulphonic acid $\text{C}_6\text{H}_4\text{Cl N}_2 \text{C}_6\text{H}_4(\text{SO}_3\text{H})$ (Mentha & Heumann, *B* 19, 2970).

Benzene azo *o* cresol

$\text{C}_6\text{H}_5-\text{N}_2-\text{C}_6\text{H}_3(\text{CH}_3)(\text{OH})$ [1 3 4] [130°] Glistening yellow plates. *v* sol alcohol, ether, chloroform, and benzene, sl sol hot, insol cold, water. Dissolves in dilute alkalis with a yellowish red colour. Obtained by the action of diazobenzene chloride on an alkaline solution of *o* cresol. It readily gives a dis azo compound when treated in alkaline solution with a further quantity of diazobenzene chloride.

Acetyl derivative [82°], yellow tables, *v* sol alcohol, ether, and benzene.

Benzoyl derivative [111°], small yellow needles, *v* sol ether, acetone, and hot alcohol (Liebermann & Kostanecki, *B* 17, 130, Nolting & Kohn, *B* 17, 363).

Benzene azo *m* cresol

$\text{C}_6\text{H}_5-\text{N}_2-\text{C}_6\text{H}_3(\text{CH}_3)(\text{OH})$ [1 2 4] [109°] Yellow needles. *v* sol alcohol, ether, chloroform and benzene. With alkalis it forms yellowish red salts. Obtained by the action of diazobenzene chloride on an alkaline solution of *m* cresol. It readily combines with another mol of a diazo compound to form dis azo compounds (Nolting & Kohn, *B* 17, 366).

Benzene azo *p* cresol

$\text{C}_6\text{H}_5-\text{N}_2-\text{C}_6\text{H}_3(\text{CH}_3)(\text{OH})$ [1 5 2] [109°] Orange yellow plates. Soluble in dilute alkalis. Dyes a canary yellow. Formed by the action of diazo benzene chloride on an alkaline solution of *p* cresol. It does not yield a dis azo compound.

Acetyl derivative $\text{Ph}-\text{N}_2-\text{C}_6\text{H}_4(\text{OAc})$ [68°], yellow needles, *v* sol alcohol, ether, chloroform, and acetone.

Benzoyl derivative $\text{Ph}-\text{N}_2-\text{C}_6\text{H}_4(\text{OBz})$ [113°], yellow needles, sol ether, benzene, and hot alcohol (Mazzara, *G* 9, 425, Liebermann & Kostanecki, *B* 17, 130, Nolting & Kohn, *B* 17, 352).

Benzene azo *p* cresol sulphonic acid

$\text{C}_6\text{H}_5-\text{N}_2-\text{C}_6\text{H}_3(\text{CH}_3)(\text{OH})(\text{SO}_3\text{H})$ [1 5 2 3] Small reddish brown tables or needles. Easily soluble in water, sparingly in alcohol. Formed by the action of diazobenzene chloride on an alkaline solution of *p* cresol sulphonic acid [1 4 2]. A'Na soluble reddish brown plates, dyes wool an orange yellow (Nolting & Kohn, *B* 17, 357, cf Stebbins, *A C J* 1, 465, 2, 263).

Benzene-azo ψ cumenol

$\text{C}_6\text{H}_5-\text{N}_2-\text{C}_6\text{H}_3(\text{CH}_3)_2\text{OH}$ [1 3 5 6 2] [94°] Glistening brown prisms. In small quantities it can be distilled undecomposed. Insoluble in alkalis. Formed by combining diazo benzene chloride with ψ cumenol [70°]. On reduction it yields aniline and amido ψ cumenol [167°] (Liebermann & Kostanecki, *B* 17, 886).

Benzene-azo-di ethyl amido benzoic acid
 $\text{C}_6\text{H}_5-\text{N}_2-\text{C}_6\text{H}_4(\text{NETe})\text{CO}_2\text{H}$ [1 4 2] [125°] From diazo benzene nitrate and di ethyl *m* amido benzoic acid. Red crystals with violet lustre

(from alcohol). Insol water, sl sol alcohol and ether. Salts $\text{BaA}'_2-\text{AgA}'$ (Griess, *B* 10, 526).

Benzene azo ethyl (β) naphthyl-amine

$\text{C}_6\text{H}_5-\text{N}_2-\text{C}_{10}\text{H}_7\text{NH}_2$ [103°] Red needles. Soluble in alcohol &c with an orange red colour, insol water. It forms bluish violet salts with acids. Formed by heating ethyl (β) naphthyl-nitrosamine with an acetic acid solution of aniline at 100°. Also produced by combining diazo benzene with ethyl (β) naphthylamine.

Nitrosamine $\text{C}_6\text{H}_5\text{N}_2\text{C}_{10}\text{H}_7\text{NETe}(\text{NO})$

[97°], red crystals (Henriques, *B* 17, 2669).

Benzene azo-ethyl phenylene diamine

$\text{C}_6\text{H}_5\text{N}_2\text{C}_6\text{H}_4(\text{NH}_2)\text{NH}_2$ *Ethyl chrysoidine*. Dyes a redder shade than ordinary chrysoidine. Formed by combining ethyl *m* phenylene diamine with diazo benzene— $\text{B}'\text{HCl}$ reddish brown needles with violet blue reflection, soluble in water and alcohol with an orange colour— $\text{B}'\text{HCl}\cdot\text{PtCl}_4$, insoluble red pp (Nolting & Stricker, *B* 19, 547).

Benzene-azo-indoxyl

[236°] Red needles or thick orange prisms. Sol alcohol and alkalis, *v* sl sol water. Formed by the action of diazo benzene chloride on indoxyl (Baeyer, *B* 16, 2190).

Benzene azo methane $\text{C}_6\text{H}_5-\text{N}_2-\text{CH}_3$ *Azo-phenyl methyl* (c 150°) Yellow oil of peculiar odour. Very volatile, and readily distills with steam. Formed by oxidation of a phenyl methyl hydrazine $\text{C}_6\text{H}_5\text{NHNHCH}_3$ with HgO (Tafel, *B* 18, 1742).

Benzene azo methazonic acid

$\text{Ph}-\text{N}_2-\text{C}_6\text{H}_3\text{N}_2\text{O}$, [164°] From diazo benzene nitrate and an aqueous solution of sodium methazonate (Kimich, *B* 10, 141). Orange needles (from alcohol), insol water— $\text{Na}_2\text{A}''2\text{aq}$ — $\text{BaA}''\text{aq}$.

Benzene azo di-methyl amido-benzoic acid

$\text{Ph}-\text{N}_2-\text{C}_6\text{H}_3(\text{NMe}_2)\text{CO}_2\text{H}$ [1 4 2] From diazo benzene nitrate and di methyl *m* amido-benzoic acid (Griess, *B* 10, 527). Orange nodules.

Benzene-azo-methyl-aniline

$\text{C}_6\text{H}_5-\text{N}_2-\text{C}_6\text{H}_4\text{NHMe}$ *Methyl-amido azo benzene* [180°] Red needles. Sol alcohol. Formed by heating benzene azo aniline with MeI — $\text{B}'\text{HCl}$ violet needles.

Acetyl derivative $\text{C}_6\text{H}_5\text{N}_2\text{C}_6\text{H}_4\text{NMeAc}$. [139°], yellow silky needles (Berju, *B* 17, 1401).

Benzene-azo-di-methyl-aniline

$\text{C}_6\text{H}_5\text{N}_2\text{C}_6\text{H}_4\text{NMe}_2$ *Di methyl-amido azo benzene* [115°] Yellow plates.

Preparation—1 A solution of 74 pts of NaNO_2 (100 p.c.) and 40 pts of NaOH in 540 pts of water is slowly added to a cooled solution of 100 pts of aniline, 130 pts of dimethylaniline, and 230 pts of HCl in 360 pts of water (Griess, *B* 10, 525; Mohlau, *B* 17, 1490)—2 By heating benzene azo aniline with MeI (Berju, *B* 17, 1402, *C C* 1884, 871).

Methylo iodide $\text{B}'\text{MeI}$ [174°] Plates.

Benzene-azo-methyl-ketole

$\text{C}_6\text{H}_5-\text{N}_2-\text{C}_6\text{H}_4\text{N}$ [116°] Yellow needles. Formed by the action of diazo benzene chloride upon methyl ketole in aqueous alcoholic solution in presence of sodium acetate (Fischer, *B* 19, 2990).

Benzene azo methyl phenylene diamine
 $C_6H_5.N_2.C_6H_4(NH_2)_2.NHMe$ *Methyl chrysoidine*
 Minute orange prisms. Dyes a somewhat redder shade than ordinary chrysoidine. Formed by combining diazobenzene with methyl m phenylene diamine (Nolting a Stricker, *B* 19, 549)

Benzene azo-(a) naphthol
 $C_6H_5-N_2-C_{10}H_7OH$ (a) *Naphthoquinone phenyl hydrazide* [206°] Small needles with blue reflection (from alcohol) or flat needles or plates (from benzene)

Formation—1 By combining (a) naphthol with diazobenzene—2 By the action of phenyl hydrazine hydrochloride upon (a) naphthoquinone suspended in acetic acid

Reactions—Dissolves both in acids and alkalis. Bromine forms two bromo derivatives [185°], and [196°] (Margary, *G* 14, 271)

Salts— AK crystalline pp. The hydrochloride, hydrobromide and sulphate form bluish or greenish glistening needles, sparingly soluble in water, alcohol, and acetic acid (Typke, *B* 10, 1580)

Methyl ether A'Me [83°], brown crystals

Ethyl ether A'Et [100°], long needles

Acetyl derivative $C_{10}H_7N_2(OAc)$ [128°], small brownish red needles (Liebermann, *B* 16, 2858, Zincke a Bindewald, *B* 17, 3026)

Benzene o azo (a) naphthol

$C_6H_5 \begin{array}{c} \diagup Oa \\ \diagdown N, H C_6H_5 \beta \end{array}$ [1 2] (?) [138°] (*B*) *Naphthoquinone phenyl hydrazide*. Formed by the action of phenylhydrazine hydrochloride upon (*B*) naphthoquinone. Long red needles, sol hot alcohol and hot acetic acid. It does not combine with acids or bases. By $SnCl_4$ it is reduced to (*B*) amido (*a*) naphthol. By treatment in hot acetic acid solution with HNO_3 it gives di nitro (*a*) naphthol. By the action of alkaline reducing agents it is at once converted into (*B*) amido (*a*) naphthol, no intermediate product could be detected (Zincke a Bindewald, *B* 17, 3030, Zincke a Rathgen, *B* 19, 2482)

Bromo derivative $C_{10}H_6N_2Br_2O$, [215°–219°] slender red needles

Benzene azo (*B*) naphthol $C_{10}H_7N_2O$ *s.s.*

$C_6H_5.N_2.C_{10}H_7OH$ or $C_{10}H_7 \begin{array}{c} \diagup O\beta \\ \diagdown N, H C_6H_5 \alpha \end{array}$ [1 2] [184°]

Formation—By the action of a diazobenzene salt on an alkaline solution of *B* naphthol. It is *not* formed by the action of diazobenzene hydrate on finely divided (*B*) naphthol (difference from (*a*) naphthol) (Liebermann, *B* 16, 2858)

Properties—Golden plates or long metallic glistening needles. Soluble in ether, benzene, ligroine and CS_2 . Dissolves in H_2SO_4 with a magenta-red colour. Is insoluble in caustic alkalis. It has a slightly basic character, dissolving in HCl with a red colour, and forming an unstable hydrochloride crystallising in needles. By $SnCl_4$ it is reduced to (*a*) amido (*B*) naphthol and aniline. The same reduction products are also formed at once by treatment with alkaline reducing agents (*e.g.* zinc dust and $NaOH$, ammonium sulphide, &c.), no intermediate product was detected. When treated in hot acetic acid solution with HNO_3 , it gives

di nitro (*B*) naphthol (Zincke a Rathgen, *B* 19, 2482)

Bromo-derivative $C_{10}H_7Br_2N_2O$ [168°]. Brownish red needles (Zincke a Bindewald, *B* 17, 8031)

Benzene azo (*a*) naphthol sulphonic acid
 $C_6H_5-N_2-C_{10}H_6(SO_3H)(OH)$ From sodium (*a*) naphthol sulphionate, aniline nitrate, and KNO_3 (Hofmann, *B* 10, 1378). Slender brown needles (from alcohol mixed with $HClAq$). Dyes orange— AgA' — BaA'_2

Benzene azo (*B*) naphthol sulphonic acid
 $C_6H_5-N_2-C_{10}H_6(SO_3H)_2OH$ Brown needles with yellowish green reflex. Difficultly soluble in water and alcohol. Prepared by the action of an alkaline solution of (*B*) naphthol sulphonic acid on diazobenzene nitrate or chloride— Ag_2Ba . Yellowish red microscopic leaflets. Slightly soluble in water (Griess, *B* 11, 2197). Its absorption spectrum has been examined by Hartley (*C J* 51, 196)

Benzene azo (*B*) naphthol disulphonic acid
 $C_6H_5-N_2-C_{10}H_4(SO_3H)_2(OH)$ From sodium (*B*) naphthol disulphonate and diazo benzene nitrate. Sol water. Barium salt is sl sol water (Stebbins, jun, *A C J* 2, 236)

Benzene azo (*a*) naphthylamine
 $C_6H_5-N_2-C_{10}H_7NH_2$ Prepared by the action of diazobenzene sulphate on (*a*) naphthylamine (Griess, *T* 1864, iii 679, Weselsky a Benedikt, *B* 12, 228)— $B' H SO_4$ 4aq microscopic needles, difficultly soluble in water

Benzene-azo-(*B*)-naphthylamine

$C_6H_5-N_2-C_{10}H_7NH_2$ or $C_{10}H_7 \begin{array}{c} \diagup NH \\ \diagdown N, H C_6H_5 \end{array}$
Benzene hydrazimido naphthalene [104°] Red trimetric tables or long fine red needles. Easily soluble in alcohol and acetic acid, insoluble in water. Dissolves in strong H_2SO_4 with a blue colour. Its salts exist only in presence of a large excess of acid. Formed by combination of diazobenzene with (*B*) naphthylamine. By boiling with 20 p.c. aqueous H_2SO_4 it is slowly decomposed into (*B*) naphthylamine, phenol, and nitrogen. On reduction it gives aniline and (1, 2) naphthylene diamine. On oxidation it gives benzene azimido naphthalene (*q v*)

Acetyl derivative $C_{10}H_7AcN_2$ [153°] Small red needles, easily soluble in alcohol, insoluble in water

Benzoyl derivative $C_{10}H_7BzN_2$ [163°], red crystals (Lawson, *B* 18, 796)

Benzene-o-azo-nitro-benzene
 $C_6H_5-N_2-C_6H_4(NO_2)$ [1 2] *Nitro azobenzene* [123°] Formed by nitration of benzene azo benzene in acetic acid at 100°. Orange yellow minute needles. V sol alcohol. Alcoholic $NaOH$ gives a beautiful emerald green colouration, by long boiling or by treatment with sodium amalgam it is further reduced to a compound $C_{12}H_{11}N_2O$. Tin and HCl or ammonium sulphide first reduce it to benzene o azo aniline and then to aniline and o phenylene diamine. By bromination in acetic acid it yields bromo nitro-benzene [128°] or [132°] (Janovsky a Erb, *B* 19, 2157, 20, 360, *M* 8, 56)

Benzene-p-azo-nitro-benzene

$C_6H_5.N_2.C_6H_4NO_2$ [1 4] [137°] Small yellow needles (from alcohol). Formed by nitration of benzene azo benzene. By NH_4HS it is reduced

to ordinary benzene azo aniline. Alcoholic NH_4HS produces red crystals of an intermediate

nitrolic acid $\text{C}_6\text{H}_5\text{N}_2\text{C}_6\text{H}_4\text{NOH}$ (?) [134°],

which forms a blue solution in NaOH aq. K_2FeC_6 reoxidises it to benzene azo p -nitrobenzene. By complete reduction it yields aniline and p -phenylene diamine (Laurent & Gerhardt, *A* 75, 73, Janovsky, *B* 18, 1133, *M* 6, 164, 455).

Benzene-azo-tri-nitro-benzene

$\text{C}_6\text{H}_5\text{—N}_2\text{—C}_6\text{H}_2(\text{NO}_2)_3$ [142°]. By action of HgO on an alcoholic solution of the corresponding hydrazo compound (E. Fischer, *A* 190, 133). Slender red prisms (from alcohol).

Benzene-azo-nitro-iso-butane

$\text{C}_6\text{H}_5\text{—N}_2\text{—CH}(\text{NO})\text{Pr}$. From diazobenzene nitrate and potassium nitro iso butane (Zublin, *B* 10, 2088). Oil. Forms an orange solution in alkalis.

Benzene-azo-nitro-ethane $\text{C}_6\text{H}_5\text{N}_2\text{O}_2$

$\text{C}_6\text{H}_5\text{—N}_2\text{—CH}(\text{NO}_2)\text{CH}_3$ [137°]. From diazobenzene nitrate and sodium nitroethane (V Meyer & Ambuhl, *B* 8, 751, 1073). Rectangular orange crystals, v sol alcohol and ether, insol cold water, sol aqueous alkalis forming a blood red solution. Dyes silky yellow. Conc H_2SO_4 forms a violet solution. It crystallises unaltered from aqueous NH_3 (Barbieri, *B* 9, 386) but such a solution gives pps with metallic salts.

Salts — $\text{C}_6\text{H}_5\text{K.N}_2\text{O}_2$ 4aq — $\text{C}_6\text{H}_5\text{Na.N}_2\text{O}_2$ 7aq — $\text{C}_6\text{H}_5\text{Zn.N}_2\text{O}_2$ 3aq — $\text{C}_6\text{H}_5\text{Pb.N}_2\text{O}_2\text{PbO}_2$ 4aq

Benzene-az -nitro-methane

$\text{C}_6\text{H}_5\text{—N}_2\text{—CH}_2\text{NO}_2$ [153°]. From diazobenzene nitrate and sodium nitromethane in very dilute solution (Fries, *B* 8, 1078). Slender red needles (from alcohol). Conc H_2SO_4 gives a purple solution. Decomposed by HCl aq only after long boiling.

Benzene-azo-tri nitro phenol

$\text{C}_6\text{H}_5\text{—N}_2\text{—C}_6\text{H}_2(\text{NO}_2)_3\text{OH}$. Long brown prisms. Insol cold, sl sol hot water, v sol alcohol. Explodes at 70°. Dyes silk and wool orange-yellow. Prepared by the action of a salt of diazobenzene on an alcoholic solution of picric acid (Stebbins, jun., *A C J* 1, 465, 2, 236, *C N* 41, 117, *B* 13, 43).

Benzene-azo nitro propane

$\text{C}_6\text{H}_5\text{—N}_2\text{—CH}(\text{NO}_2)\text{CH}_2\text{CH}_3$ [99°]. From potassium nitropropane and diazobenzene nitrate (V Meyer, *B* 9, 386). Orangeneedles, sol alkalis.

Benzene-azo-iso-nitro-propane

$\text{C}_6\text{H}_5\text{—N}_2\text{—C}(\text{NO}_2)(\text{CH}_3)_2$. From aqueous diazobenzene nitrate and potassium nitro isopropane oil, insol alkalis (V Meyer & Ambuhl, *B* 8, 1076).

Benzene-azo-o-oxy-benzoic-acid

$\text{C}_6\text{H}_5\text{—N}_2\text{—C}_6\text{H}_3(\text{OH})\text{CO}_2\text{H}$. From diazobenzene nitrate and an alkaline solution of salicylic acid (Stebbins, jun., *A C J* 1, 465, *B* 13, 715, *C N* 41, 117). Orange red needles, insol water, v sol alcohol or ether. Dyes wool orange.

Benzene-azo-di-oxy naphthalene

$\text{C}_6\text{H}_5\text{—N}_2\text{—C}_{10}\text{H}_7(\text{OH})_2$ or $\text{C}_{10}\text{H}_7(\text{OH})_2\text{N}_2\text{C}_6\text{H}_5$ { $\text{N}_2\text{HC}_6\text{H}_5$. *Oxy-(a)-naphthoquinone phenyl-hydrazide* [230°]. Formed by the action of phenylhydrazine on oxy naphthoquinone in aqueous-alcoholic solution. Yellowish red glistening needles. V sol ether, hot alcohol, and hot acetic acid.

Salts — The alkali salts form slender orange needles, sol alcohol — $\text{A}'\text{Ba}$ 10aq yellowish-brown plates or long red needles — $\text{A}'\text{Ca}$ 4aq slender orange needles — $\text{A}'\text{Ag}$ reddish brown amorphous pp.

Acetyl derivative [179°], red needles.

Methyl ether $\text{A}'\text{Me}$ [175°], red needles.

Ethyl ether $\text{A}'\text{Et}$ [173°], yellowish red needles, v sol hot alcohol and hot acetic acid.

Bromo derivative $\text{C}_6\text{H}_5\text{N}_2\text{BrO}_2$ [198°], large red needles, sl sol alcohol (Zincke & Thelen, *B* 17, 180j).

Benzene-azo phenol $\text{C}_6\text{H}_5\text{—N}_2\text{—C}_6\text{H}_4\text{OH}$ [1 4]. *Oxy azo benzene* [154°].

Formation — 1 A product of the action of BaCO_3 on diazobenzene nitrate in the cold (Griess, *A* 137, 84) — 2 From benzene azo benzene sulphonic acid by potash fusion (Griess, *A* 154, 211) — 3 From diazo benzene nitrate and $\text{C}_6\text{H}_5\text{OK}$ (Kekulé & Heidegh, *Z* [2] 6, 384) — 4 By the action of p -nitroso phenol (20 pts) on aniline acetate (60 pts) (Kimich, *B* 8, 1499) — 5 By gently warming benzene azoxy benzene, $\text{C}_6\text{H}_5\text{—N}(\text{O})\text{—C}_6\text{H}_5$, with H_2SO_4 (Wallach, *B* 13, 525, 14, 2617).

Properties — Purple pyramidal plates. Insol cold water, sol alkalis, v sol alcohol. Bromine in acetic acid gives a compound [139°].

Salt — AgA'

Acetyl derivative — $\text{Ph.N}_2\text{C}_6\text{H}_4\text{OAc}$ [85°] (above 300°). Golden scales.

Methyl ether — $\text{Ph.N}_2\text{C}_6\text{H}_4\text{OMe}$ [54°]. Yellow scales.

Benzene-azo-phenol sulphonic acid

$\text{C}_6\text{H}_5\text{—N}_2\text{—C}_6\text{H}_4(\text{OH})(\text{SO}_3\text{H})$ [1 4 3]. From diazobenzene nitrate and an alkaline solution of phenol o sulphonic acid (Griess, *B* 11, 2194). Red needles or tables, sol water and alcohol — KA' .

Benzene-azo-phenol sulphonic acid

$\text{C}_{12}\text{H}_9\text{N}_2(\text{OH})(\text{SO}_3\text{H})$. From benzene azo phenol and fuming H_2SO_4 (Tschirvinsky, *B* 6, 560) — BaA' 2aq — CuA' 6aq — MgA' 6aq — KA' .

Benzene-azo-phenol di-sulphonic acid

$\text{C}_{12}\text{H}_9\text{N}_2(\text{OH})(\text{SO}_3\text{H})_2$. From azoxybenzene (1 pt) and fuming H_2SO_4 (10 pts) by heating for 3 hours at 150° (Lamprecht & Wilsing, *A* 215, 232, *B* 15, 1297). Orange needles, v e sol water, v sol dilute acids.

Salts — KA' 2aq red needles, sl sol cold water, not attacked by Br — BaA' aq orange crystalline pp — AgA' red crystalline pp.

Benzene-azo phenol tetra-sulphonic acid

$\text{C}_{12}\text{H}_9\text{N}_2(\text{OH})(\text{SO}_3\text{H})_4$. From azoxybenzene and fuming H_2SO_4 (L & W). Will not crystallise. Salts — $\text{C}_{12}\text{H}_9\text{N}_2(\text{OK})(\text{SO}_3\text{K})_7$ 1/2 aq, long yellow needles. Gives with bromine water a pp of tri bromo phenol [92°] — $\text{Ba}_2\text{A}'$ 7aq orange crystalline pp.

Other benzene-azo phenol sulphonic acids are described as *Oxy-benzene azo benzene sulphonic acids*, and *sulpho-benzene azo phenol sulphonic acids*.

Benzene-azo diphenylamine

$\text{C}_6\text{H}_5\text{—N}_2\text{—C}_6\text{H}_4\text{NH.C}_6\text{H}_5$ [82°] (O. N. Witt, *C J* 35, 185, *B* 12, 259). A solution of di-phenylamine (17 g) in alcohol (100 cc) is added to a solution of diazo benzene chloride (14 g) in alcohol (50 g). The brown mixture is cooled with ice, and alcoholic NMe_3 (used instead of NH_3 because NMe_3HCl is soluble in alcohol) is

added from time to time to neutralise the liquid. The oil which separates is purified by a lengthy process, and finally crystallised from benzolone.

Properties—Golden leaflets or needles. Sol benzene, alcohol, and ether. HCl turns its alcoholic solution violet, steel grey crystals of the hydrochloride separating. The base forms a green solution with H_2SO_4 , turned, by adding water, into indigo, violet, and finally red. With amyl nitrite and acetic acid it forms a nitrosamine, $Ph N(NO) C_6H_4 N_2 Ph$, [120°], forming orange needles sparingly soluble in alcohol and acetic acid, readily in benzene.

Benzene-azo-*m*-phenylene diamine

$C_6H_5-N_2-C_6H_4(NH_2)_2$, [1 2 4] *Chrysoidine* [117 5°] (W), [110°] (H). From diazobenzene salts and *m*-phenylene diamine (Witt, *B* 10, 350, 654, Hofmann, *B* 10, 213, 388, Griess, *B* 10, 390). Slender yellow needles (from water), sl sol water, v sol alcohol. Reduced by ammonium sulphide at 150° to aniline and (1, 2, 4) triamido benzene. The absorption spectrum has been examined by Hartley (*C J* 51, 178)— $B''HCl$ black octahedra or small red silky crystals, its aqueous solution is orange, but turned red by $HCl-B''H_2PbCl_2$ — $B''HNO_2$.

Di acetyl derivative

$Ph-N_2-C_6H_4(NHAc)_2$ [251°]
Benzene-azo-*m*-phenylene-diamine sulphonic acid $C_6H_5-N_2-C_6H_4(NH_2)_2(SO_3H)$ *Chrysoidine sulphonic acid*. Glistening spangles or needles. Sl sol water and alcohol. Prepared by the action of diazobenzene chloride on a salt of *m*-phenylene diamine sulphonic acid. A Na soluble golden needles— $A''Ba$ orange needles (Ruhemann, *B* 14, 2655). By the sulphonation of chrysoidine an isomeric acid is formed (*v Di amido benzene azo benzene sulphonic acid*).

Benzene azo-*di*-phenyl-methyl-pyrrol-carboxylic acid $C_6H_5O_2N_2$ *etc*
 $HO_2C \cdot C \cdot CM_6$

$HC \cdot CPh \rangle N C_6H_4 N_2 C_6H_5$, [195°] Obtained

by saponification of its ethyl ether, which is formed from an acetic acid solution of aceto phenone aceto acetic ether (1 mol) and benzene *p* azo aniline (1 mol) on standing for two days. Large red crystals. V sol alcohol, ether, and benzene, sl sol ligroin and acetic acid, insol water, and conc acids. Gives Laubenheimer's reaction.

Ethyl ether EtA' [123°], splendid red crystals, v sol benzene and ligroin, sl sol alcohol, ether, and acetic acid (Paal & Schneider, *B* 19, 3162).

Benzene-azo-phenyl-(β) naphthyl-amine

$C_{10}H_7N_2$ *etc* $C_6H_5-N_2-C_{10}H_7NHC_6H_5$ or

Benzene phenyl hydrazinido naphthalene [142°] Obtained by combining diazo benzene chloride with phenyl (β) naphthyl amine in alcoholic solution. It is also formed by the action of an acetic acid solution of aniline upon phenyl (β) naphthyl nitrosamine. Small red glistening needles.

Reactions—1 By heating with conc HCl it

yields naphthophenazine $C_{12}H_8 \begin{array}{c} \diagup N \\ | \\ \diagdown N \end{array} C_{10}H_6$ and

aniline—2 Bromine acting on the hot acetic acid solution forms tetra bromo phenyl (β) naphthylamine with evolution of nitrogen—3 It is reduced by $SnCl_2$ to aniline and phenyl-*o* naphthylene diamine $C_{10}H_6(NH_2)NHC_6H_5$ —4 By oxidation with $K_2Cr_2O_7$ in acetic acid solution the chromate of a powerful ammonium base $C_{12}H_{10}N_4OH$ is formed, the latter possibly

v Naphthalene di phenyl az ammonium hydrate (Henriques, *B* 17, 2671 Zincke & Lawson, *B* 20, 1167).

Benzene-azo-*di*-phenyl-thio-urea

$C_6H_5-N_2-C_6H_4NHCSNHPh$ [179°] Plates. Formed by combination of phenyl mustard oil with benzene azo aniline (Berjy, *B* 17, 1405).

Benzene-azo-pyrogallol

$C_6H_5-N-C_6H_3(OH)_3$. Prepared by adding an aqueous solution of diazobenzene nitrate to an alkaline solution of pyrogallol (Stebbins, *jun*, *A C J* 1, 465, 2, 236, *B* 13, 44, *C N* 41, 117). Red needles (from acetic acid). Insol water, sol alcohol. Its alcoholic solution dyes silk and wool orange.

Benzene *p* azo-resorcin

$C_6H_5-N_2-C_6H_3(OH)_2$ [1 2 4] [161°] or [170°]. From diazobenzene nitrate and resorcin (Tympke, *B* 10, 1577, Wallach, *B* 15 2819, R Meyer, *B* 16, 1329). Formed also by gently warming diazobenzene anilide with resorcin, aniline being eliminated (Heumann & Oeconomidis, *B* 20, 905). Slender orange needles [170°] or short red needles [161°], insol water, sol aqueous alkalis, v e sol alcohol.

Acetyl derivative [102°]

Mono ethyl ether [87°] Scarlet needles. *Diethyl ether* [70°] Yellowish red needles.

Benzene-*o* azo-resorcin

$C_6H_5N_2C_6H_3(OH)_2$, [1 2 6] Formed in small quantity (about 5 p c) in the preparation of the *p* isomeride. *Mono ethyl ether* $C_6H_5N_2C_6H_3(OH)(OEt)$ [150°] Long fine scarlet needles, v e sol alcohol and ether, insol water, dissolves in aqueous alkalis with a brownish red colour.

Di ethyl ether $C_6H_5N_2C_6H_3(OEt)_2$, [90°]

Large red glistening tables, v sol ether, hot alcohol and acetic acid, insol water (Fukall, *B* 20, 1145).

Benzene-azo thymol

$C_6H_5-N_2-C_6H_4MePr(OH)$ [1 2 5 4] [85°-90°]. From diazobenzene chloride, and an alkaline solution of thymol (Mazzara, *G* 15, 52, 228). Reddish yellow needles. Reduction followed by oxidation gives thymoquinone.

Benzene-azo-thymol-sulphonic acid

$C_6H_5-N_2-C_6H_4(CH_3)(HSO_3)OH$ [216°]. Small yellow prisms. Yellow colouring matter. Prepared by the action of diazobenzene chloride on a salt of thymol sulphonic acid. Salts— $A''Na$ small yellow crystals— $A''Ba$ fine hair like needles (Stebbins, *B* 14, 2793).

Benzene-*p*-azo-toluene

$C_6H_5-N_2-C_6H_4(CH_3)$, [63° corr] Formed by diazotising amido benzene *p* azo toluene $C_6H_4(CH_3)-N_2-C_6H_4(NH_2)$ dissolved in alcohol and boiling the solution (Schultz, *B* 17, 466). Orange red plates, v sol alcohol. Volatile with steam. By treatment with alcoholic $SnCl_4$ and H_2SO_4 it is converted into a base melting at [116°].

Benzene-azo-*m*-tolylene diamine

$C_6H_5-N_2-C_6H_4Me(NH_2)_2$ Yellow needles Easily soluble in alcohol, sparingly in water Prepared by the action of diazobenzene chloride on (1, 2, 4) tolylene diamine, [99°]—B'HCl orange red needles (Stebbins, jun, *A C J* 1, 465, *B* 13, 717, *C N* 41, 117)

Benzene-azo-*x*lyenol $C_6H_5-N_2-C_6H_4Me_2OH$ [1 3 5 2] [175°] Formed by combining diazo benzene chloride with *m* xylenol $C_6H_4Me_2(OH)$ [1 3 4] (Grevink, *B* 19, 148) Slender brownish red needles V sol alcohol, ether, and benzene, insol water On reduction it yields aniline and *o* amido *m* xylenol $C_6H_4Me_2(NH_2)(OH)$ [5 3 2 1]

Bromo amido-benzene-azo *p*-bromo-aniline*Diacetyl derivative*

[2 5 1] $NHAc C_6H_3Br-N_2-C_6H_3Br NHAc$ [1 5 2] [289°] Formed by warming acetyl bromo nitro aniline $C_6H_3(NHAc)Br(NO_2)$ [2 5 1] with zinc and conc NH_4Ac (C H Mattheissen a Mixer, *Am* 8, 847) Pale red substance

***p* Bromo benzene azo benzene *p* sulphonic acid** [4 1] $C_6H_4Br-N_2-C_6H_4(SO_3H)$ [1 4] Formed by sulphonation of benzene *p* azo bromo benzene or by bromination of benzene azo benzene *p* sulphonic acid Flat needles (containing 3aq)

Salts — KA' rhombic tables — NaA' yellow silky needles, sl sol water (Janovsky, *M* 5, 162, *B* 20, 358, *M* 8, 53)

***m* Bromo benzene azo benzene *p* sulphonic acid** [3 1] $C_6H_4Br-N_2-C_6H_4(SO_3H)$ [1 4] Formed by sulphonation of benzene *m* azo bromo benzene with fuming sulphuric acid Glistening golden plates (containing $1\frac{1}{2}$ aq)

Salts — KA' yellow pearly pp of microscopic needles — NaA' pp v sl sol water (Janovsky a Erb, *B* 20, 359)

***o* Bromo benzene *o* azo bromo benzene**

[2 1] $C_6H_4Br-N_2-C_6H_4Br$ [1 2] [185°] A product of the bromination of benzene azo benzene in $HOAc$ (Janovsky, *M* 8, 50, *B* 20, 337) Golden plates, sl sol alcohol On nitration it gives a tri nitro derivative [135°]

***p* Bromo benzene *p* azo bromo benzene**

[4 1] $C_6H_4Br-N_2-C_6H_4Br$ [1 4] [205°] Formed by bromination of benzene azo benzene (Werigo, *A* 135, 178, 165, 189) Formed also by reduction of *p* bromo nitro benzene with zinc dust and alcoholic KOH (Schultz, *B* 17, 465) Yellow needles By alcoholic $SnCl_2$ and H_2SO_4 it is converted into di bromo di amido diphenyl Fuming H_2SO_4 forms a sulphonic acid $C_6H_4Br-N_2SO_3H$ 3aq (W)

***m* Bromo benzene *m* azo bromo benzene**

[3 1] $C_6H_4Br-N_2-C_6H_4Br$ [1 3] [126°] From the corresponding hydrazo compound by Fe, Cl_2 (Gabriel, *B* 9, 1407)

Tribromo-benzene azo dimethyl aniline

$C_6H_2Br_3-N_2-C_6H_3(NMe_2)$ [161°] Formed by adding an alcoholic solution of dimethylaniline (2 mol) to $C_6H_2Br_3N_2NO_2$ (1 mol) Crystalline pp Bed plates (from glacial acetic acid) Insol water, hardly soluble in alcohol It combines with conc HCl (Silberstein, *J pr* [2] 27, 124)

Tribromo-benzene azo-methyl-diphenylamine $C_6H_2Br_3-N_2-C_6H_3NPhMe$ [138°] From $C_6H_2Br_3N_2NO_2$ and $NPhMe$ in alcohol Small brownish red plates (from glacial acetic acid) Insol water, sl sol alcohol Does not combine with HCl (Silberstein, *J pr* [2] 27, 125)

Bromo benzene azo (a) naphthol

[4 1] $C_6H_4Br-N_2-C_{10}H_7OH$ [1 4] [196°] From *p*-diazobromo benzene and (a) naphthol, or by bromination of benzene azo (a) naphthol (Mazzara, *G* 14, 271)

***p* Bromo benzene-azo (b) naphthol**

[4 1] $C_6H_4Br-N_2-C_{10}H_7OH$ [1 2] [161°] From *p*-diazobromo benzene and (b) naphthol, or from benzene azo (b) naphthol and bromine (Mazzara, *G* 13, 438) Orange needles

***p* Bromo-benzene azo nitro benzene**

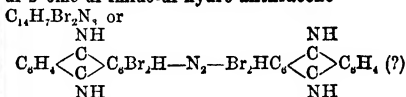

[4 1] $C_6H_4Br-N_2-C_6H_4(NO_2)$ [1 4] [109°] Formed by nitration of benzene *p* azo bromo-benzene Yellow needles V sol alcohol (Janovsky a Erb, *B* 20, 358)

Bromo benzene azo di nitro benzene (?)

[4 1] $C_6H_4Br-N_2-C_6H_3(NO_2)_2$ [1 2 4] (?) [190°] Formed by nitrating benzene *p* azo bromo benzene (Janovsky, *M* 8, 52)

***p* Bromo benzene azo nitro ethane**

[4 1] $C_6H_4Br-N_2-CH(NO_2)CH_3$ [c 137°] From *p* diazo bromo benzene nitrate and potassium nitro ethane (Wald, *B* 9, 393) Brick red crystals (from dilute alcohol), sol ether, glacial $HOAc$, and chloroform Salt — $C_6H_4KN_2O_2Br$

Di bromo di imido di hydro anthracene azo di bromo di imido di hydro-anthracene

[233°] Prepared by heating dibromo nitro anthraquinone with alcoholic NH_3 (Claus a Diernfellner, *B* 14, 1335) Red needles Sublimable Sl sol alcohol and ether, insol water or aqueous acids and alkalis

Bromo-di-oxy-benzene azo-bromo hydroquinone Tetra methyl derivative

$C_6H_4Br(OMe)_2-N_2-C_6H_4Br(OMe)_2$ [220°] Formed by bromination of the tetra methyl derivative of di oxy benzene azo hydroquinone (Baessler, *B* 17, 2125) Red crystalline solid, v sol benzene, chloroform, and CS_2 , v sl sol alcohol, insol water

Bromo sulpho-benzene azo benzene sulphonic acid

[6 3 1] $C_6H_4Br(SO_3H)-N_2-C_6H_4Br(SO_3H)$ [1 6 3] Formed by oxidation of a neutral aqueous solution of bromo amido benzene sulphonic acid $C_6H_4Br(NH_2)(SO_3H)$ [4 3 1] with $KMnO_4$ Salts — KA'' 2aq glistening red tables (Limpricht, *B* 18, 1422)

Di bromo sulpho benzene azo di bromo benzene sulphonic acid

[2 6 4 1] $C_6H_4Br_2(SO_3H)_2-N_2-C_6H_2Br_2SO_3H$ [1 2 6 4] From potassic di bromo *o*-amido benzene sulphinate and $KMnO_4$ (Rodatz, *A* 215, 222) Red plates (containing 2aq) V sol water or alcohol Reduced by $SnCl_2$ to the original $C_6H_2(NH_2)_2Br_2SO_3H$ Salts — KA'' 2aq — BaA'' 3aq — CaA'' 4aq — PbA''

Chloride — [258°–262°] Brown plates**Amide** — Violet silky needles**Di-bromo-sulpho-benzene-azo-di-bromo-benzene sulphonic acid**

[4 6 3 1] $C_6H_4Br_2(SO_3H)_2-N_2-C_6H_2Br_2SO_3H$ [1 4 6 3] From potassic di bromo amido benzene sulphinate and $KMnO_4$ (Rodatz, *A* 215, 216) Slender red needles, containing $1\frac{1}{2}$ aq (from water) V sol water, v e sol alcohol Reduced by $SnCl_2$

to the original $C_6H_5(NH_2)Br_2 SO_3H$ Salts — $K_2A''3aq - BaA''aq - CaA''4aq - PbA''2aq$

Chloride — [233°] Brick red needles

Amide — Microscopic orange needles (from alcohol) Does not melt

An acid isomeric with the above may be got by the action of $KMnO_4$ on the tetra bromo hydrazo benzene di sulphonic acid of Jordan, *A* 202, 361

Tri-bromo-sulpho-benzene-azo-tri-bromo-benzene sulphonic acid [24631]

$C_6HBr_3(SO_3H)-N_2-C_6HBr_3(SO_3H)$ [12463]

From potassic tri bromo *m* amido benzoate by $KMnO_4$ (Rodatz, *A* 215, 225) Flat orange needles Reduced by $SnCl_2$ to the original $C_6H(NH_2)Br_3 SO_3H$

$K_2A''3aq - BaA''2aq - CaA''7aq - PbA''4aq$

Chloride — [222–224°] Dark violet tables

Amide — Brown crystals that do not melt

Di-bromo-sulpho-benzene-azo-(β) naphthol
 $C_6H_2Br_2(SO_3H)-N_2-C_{10}H_7OH$ (Stebbins, *C* N 42, 44, *A* C J 2, 236) From diazo dibromo benzene sulphonic acid and an alkaline solution of (β) naphthol

Di-bromo-sulpho-benzene-azo-di-oxy-naphthalene $C_6H_2Br_2(SO_3H)-N_2-C_{10}H_6(OH)_2$ From diazo dibromo benzene sulphonic acid and an alkaline solution of dioxynaphthalene Needles (Griess, *B* 11, 2199)

Bromo-sulpho-toluene-azo-bromo-toluene sulphonic acid $N_2(C_6H_4BrMe SO_3H)_2$ [1745]

From potassic bromo *p* toluidine sulphate (of Janssen) and $KMnO_4$ (Kornatzki, *A* 221, 186) Red tables with pointed ends Salts — $K_2A''4aq - BaA''5aq - CaA''4aq - PbA''5aq$

Chloride — [226°] Groups of red prisms

Amide — [above 260°] red powder

Di bromo-sulpho toluene azo di bromo toluene sulphonic acid $N_2(C_6H_4BrMe SO_3H)_2$ [1725] From potassic dibromo *o* toluidine sulphate (of Hayduck) and $KMnO_4$ (Kornatzki, *A* 221, 188) Blood red plates Salts — $K_2A''2aq - BaA''9aq - CaA''8aq - PbA''9aq$

Chloride [243°] Red swollen tailed plates

Amide — [218°] Powder

Di butyl *p* amido benzene azo di butyl aniline $(C_4H_9)_2N C_6H_4-N_2-C_6H_4N(C_4H_9)_2$ *Di butyl-aniline azylane* [158°] Red needles Formed by passing NO through an alcoholic solution of di butyl aniline

Periodide — $B''I_2$ dark crystals with blue reflection (Lippmann a Fleissner, *B* 15, 2142 and *B* 16, 1421, *M* 3, 713)

***m* Carboxy benzene azo aceto acetic acid** $C_6H_4(CO_2H)-N_2-CHAc CO_2H$ Formed by the action of the sulphate of *m* diazo benzoic acid upon acetoacetic ether in alkaline aqueous solution (Griess, *B* 18, 962) Small yellow plates or needles Soluble in alcohol, nearly insoluble in water Bitter taste

***o* Carboxy benzene *o* azo benzoic acid** [21] $C_6H_4(CO_2H)-N_2-C_6H_4CO_2H$ [12]

***o* Azo benzoic acid** [288] Mol w 270 From *o* nitro benzoic acid and sodium amalgam (Griess, *B* 10, 1868) Dark yellow hair like needles Insol water, m sol alcohol

Salts — $BaA''7aq - BaA''9aq - AgA''$

Ethyl ether EtA'' [189°] From *o*-nitrobenzoic ether by sodium amalgam Scarlet needles (Fittica, *J* pr [2] 17, 216)

***m*-Carboxy benzene *m* azo benzoic acid**

$N_2(C_6H_4CO_2H)_2$ [13] ***m* Azo benzoic acid** From *m*-nitro benzoic acid by sodium amalgam (Strecker, *A* 129, 134) Amorphous powder, decomposed by heat, v sl sol water, alcohol, and ether Gives phenazine when distilled with lime Its copper salt gives azobenzene on distillation HgO and iodine gives an amorphous di iodo derivative, $C_{12}H_8I_2N_2O_4$ (Benedikt, *B* 8, 386) Salts — $BaA''5aq - AgA''$

Ethyl ether EtA'' [99°] By the action of EtI on AgA'' Golubeff (*B* 7, 1651) obtained two bodies isomeric with this ether, one melting at 76°, the other being a monobasic acid

***p* Carboxy benzene *p* azo benzoic acid**

$N_2(C_6H_4CO_2H)_2$ [14] From *p* nitro benzoic acid and sodium-amalgam (Beilstein a Reichenbach, *A* 129, 144, Biltinger, *A* 135, 154) Formed, together with azoxybenzoic acid, by boiling nitro benzil with alcoholic KOH (Zinn, *Z* 1868, 563) Flesh coloured amorphous powder insol water, alcohol, and ether Gives phenazine when distilled with lime Salts — $(NH_4)A''aq - NaA'' - CaA''3aq - BaA'' - AgA''$

Ethyl ether EtA'' [88°] (Fittica, *J* pr [2] 17, 216)

***m*-Carboxy benzene *o* azo malonic acid**

$C_6H_4(CO_2H)-N_2-CH(CO_2H)_2$ Formed by the action of the nitrate of *m* diazo benzoic acid on malonic ether in alkaline aqueous solution (Griess, *B* 18, 962) Microscopic orange needles or plates Easily soluble in alcohol

Carboxy benzene azo di methyl amido-benzoic acid $C_6H_4(CO_2H)N_2C_6H_4NMe_2CO_2H$ From *m* diazo benzoic acid and dimethyl *m* amido benzoic acid (Griess, *B* 10, 525) Brown pp

***m* Carboxy-benzene-azo-nitro-methane**

$C_6H_4(CO_2H)N_2CH(NO)_2$ Formed by adding the nitrate of *m* diazobenzoic acid to a dilute aqueous alkaline solution of nitromethane (Griess, *B* 18, 961) Yellowish red plates Sol hot alcohol and ether, v sl sol water

***m* Carboxy-benzene-azo-(β)-naphthol**

$C_6H_4(CO_2H)-N_2-C_{10}H_7(OH)$ [235°] Prepared by the action of *m* diazo benzoic acid on an alkaline solution of (β) naphthol (Griess, *B* 14, 2035) Reddish yellow needles or plates Sol hot alcohol, sl sol cold alcohol and ether, insol water

Salts $A''Ba3aq$ red microscopic needles $A''K2aq$ easily soluble yellow needles or plates

Ethyl ether A''Et [104°] Yellowish red needles or plates Sol ether, insol water

Amide — Slender orange needles Sl sol alcohol and ether, insol water

***m* Carboxy-benzene-azo-(β)-naphthol sulphonic acid** $C_6H_4(CO_2H)-N_2-C_{10}H_7(OH)(HSO_3)$ Prepared by the action of *m* diazo benzoic acid on an alkaline solution of (β) naphthol sulphonic acid (Griess, *B* 14, 2036) Brown needles or plates Sol hot water, sl sol cold water and alcohol, insol ether Dyes wool and silk a splendid orange — $A''H_2Ba4aq$ orange pp of slender needles

***m* Carboxy-benzene-azo-(β) naphthol di sulphonic acid** $C_6H_4(CO_2H)N_2C_{10}H_7(OH)(HSO_3)_2$ Prepared by the action of *m*-diazobenzoic acid on (β) naphthol (a) disulphonic acid in alkaline solution (Griess, *B* 14, 2037) Yellowish red microscopic needles Dyes silk and wool an orange scarlet

Salts—BaHA'''6aq red crystalline pp—Ba₂A'''12aq red microscopic needles

Carboxy benzene-azo phenol v *Oxy benzene azo-benzene acid*

Di-carboxy benzene azo phthalic acid
C₆H₃(CO₂H)₂—N₂—C₆H₃(CO₂H)₂ *Azo phthalic acid* [about 250°] Prepared by reduction of nitro phthalic acid with sodium amalgam (H Muller, Claus a May, B 14, 1330) Small yellow needles sl sol water, alcohol, and ether
Salts—A'Na, 10aq yellow monoclinic prisms, v sol water—A'K, 6aq long yellow needles—A'Mg, 18aq large orange crystals—A'Ag, yellow insoluble pp—A'Ba₂ yellow insoluble pp

Di-carboxy-benzene-azo tere phthalic acid
[5 2 1] C₆H₃(CO₂H)₂—N₂—C₆H₃(CO₂H)₂ [1 5 2] *Azo terephthalic acid*

Formation—1 By oxidation of hydrazo terephthalic acid with nitrous acid—2 By reduction of nitro terephthalic acid with sodium amalgam (Homolka a Löw, B 19, 1092)

Yellow needles Sol alcohol and ether, sl sol water Decomposes above 200°

Carboxy naphthalene azo (β) naphthoic acid
C₁₀H₆(CO₂H)—N₂—C₁₀H₆(CO₂H) From a nitro (β) naphthoic acid by ammonium sulphide (Rakowsky, B 5, 1022)

azo Carboxy-toluene-azo-phenyl-acetic acid
CO H CH C₆H₄—N₂—C₆H₄ CH CO H S (cold alcohol) 0 375, (hot alcohol) 1 57 Insol hot water, ether, and benzene Does not melt below 300° Formed by the action of sodium amalgam on nitro phenyl acetic acid [151] (Wittenberg, Bl [2] 43, 111)

Carboxy toluene-azo-toluic acid
[5 2 1] C₆H₄Me(CO₂H)—N₂—C₆H₄MeCO₂H [1 5 2] *Azo p toluic acid* [184°] From nitro p toluic acid by sodium amalgam (Fittica, B 7, 1358) Minute yellow needles, m sol boiling water, v sol alcohol

p Chloro-benzene-azo benzene p sulphonic acid [4 1] C₆H₄Cl—N₂—C₆H₄(SO₃H) [1 4] [148°] Formed by warming p chloro azo benzene with fuming sulphuric acid (10 p c SO₃) at 60°-70° Brown needles, v e sol water and alcohol It is reduced by SnCl₂ to p chloro aniline and p sulphanilic acid

Salts—A'Na large orange yellow pearly plates or small needles, sl sol cold water—A'Ba glistening flesh coloured needles—The K, Mg, Ca, Ag, Cr, and Fe, salts are white to dark yellow needles, the Cu salt forms green plates, all are sparingly soluble

Chloride C₆H₄Cl N₂ C₆H₄ SO₃Cl [130°], glistening red prisms, easily soluble in alcohol and ether

Amids C₆H₄Cl N₂ C₆H₄ SO₃NH₂ [211°], yellowish brown prisms, sol hot alcohol, sparingly in ether and cold alcohol, insol water (Mentha a Heumann, B 19, 2972)

m Chloro benzene m azo chloro benzene
[1 3] C₆H₄Cl—N₂—C₆H₄Cl [1 3] *Azo chloro benzene* [101°] Obtained by acting with Fe₂Cl₃ on m di chloro hydrazo benzene in alcoholic solution (Laubenheimer, B 8, 1025) Orange needles (from alcohol)

p Chloro benzene p azo chloro-benzene
[4 1] C₆H₄Cl—N₂—C₆H₄Cl [1 4] [184°] From p chloro-benzene - p - azo - nitro benzene and alcoholic potash (Willgerodt, B 15, 1002), or

from di chloro azoxybenzene and fuming H₂SO₄ (Heumann, B 5, 913, 918) Yellow needles

p Chloro benzene-azo-chloro benzene sulphonic acid [4 1] C₆H₄Cl N₂ C₆H₄Cl SO₃H [1 4 ?] Prepared by sulphonation of the preceding body (Calm a Heumann, B 13, 1183, 15, 2556) Slender reddish yellow needles Sol water and alcohol **Salts**—A'Na golden plates, sl sol cold water—A'K reddish yellow glistening plates, sol hot water, and alcohol—A'Ag—A'Ba yellow crystalline pp—A'Ca golden yellow plates—A'Pb orange glistening plates
Chloride C₆H₄Cl₂N₂SO₃Cl [161°] Long orange red needles

Chloro-benzene azo-chloro phenol
[3 1] Cl C₆H₃—N₂—C₆H₃Cl(OH) [1 3 ?] [115°] Formed by the action of fuming H₂SO₄ on m di chloro azoxybenzene (Schultz, B 17, 465) Brown plates

Chloro benzene azo chloro nitro benzene
[4 1] C₆H₄Cl—N₂—C₆H₄Cl(NO₂) [1 4 ?] [210°] Prepared by reducing di chloro nitro azoxy benzene with cold alcoholic NH₄HS (Calm a Heumann, B 13, 1184) Yellow needles Sl sol alcohol

m Chloro benzene azo di methyl aniline
[3 1] C₆H₄Cl—N₂—C₆H₄NMe₂ [1 4] [98°] Yellow plates Tolerably soluble in alcohol Prepared by adding sodium nitrite (1 mol) to a solution of m chloraniline (1 mol) and di methylamine (1 mol) in dilute H₂SO₄ (Staedel a Bauer, B 19, 1956)

p Chloro-benzene-p azo-nitro-benzene
[1 4] C₆H₄Cl N₂ C₆H₄(NO₂) [1 4] [153°] Formed by nitration of p chloro azo benzene with fuming HNO₃ Yellow needles, v sol acetic acid and hot alcohol, sl sol cold alcohol, insol water It is reduced by SnCl₂ to p chloro aniline and p phenylene diamine (Mentha a Heumann, B 19, 2971)

p Chloro benzene-azo phenol
C₆H₄Cl—N₂—C₆H₄(OH) [152°] Formed by gently warming p chloro diazo benzene chloro aniline with phenol, p chloraniline being eliminated Reddish yellow needles (Heumann a Oeconomidis, B 20, 906)

Cumene azo cumene PrC₆H₄—N₂—C₆H₄Pr *Azo cumene* [108°] From nitro cumene, [— 35°], by sodium amalgam (Pospekhoff, J R 1886, 49) Thin yellow leaflets, sl sol cold alcohol

ψ Cumene azo ψ cumenol
[2 4 5 1] C₆H₄(CH₃)₂ N₂ C₆H₄(CH₃)₂ OH [1 3 5 6 2] [148°] Formed by combining dia azo cumene chloride (from ψ cumidine) with ψ cumenol [70°] (Liebermann a Kostanecki, B 17, 885) Orange needles Insol alkalis Dissolves in H₂SO₄ with an orange colour No nitrogen is evolved on boiling with HCl

ψ Cumene azo ψ cumidine
[2 4 5 1] C₆H₄Me, N₂ C₆HMe, NH₂ [1 2 4 5 6] [139°] Prepared by the action of cumidine hydrochloride upon diazo cumene cumide (di azo amido cumene) dissolved in cumidine (Nöling a Baumann, B 18, 1147, Bl [2] 42, 335) Orange plates (from alcohol) V sol ether On reduction with SnCl₂ it yields cumidine and cumylene o diamine Salt —B'HCl yellow crystalline powder, readily loses its HCl, dissolves in phenol with a yellowish brown colour

Cuminic azo cuminic acid
PrC₆H₄(CO₂H)—N₂—C₆H₄Pr.CO₂H [280°] From

nitro cuminic acid and sodium amalgam (Alexeef, *Bl* [2] 88, 552, 42, 321, *J R* 1883, 198, Alexeef & Kissel, *Bl* [2] 40, 72)

Ethers—Me.A" [166°]—Et.A" [104°–108°]

Cymene azo cymene

$C_6H_5MePr-N_2-C_6H_5MePr$ [80°] From nitro cymene by sodium amalgam (Werigo, *Z* 1864, 721) Cherry coloured plates

Ethyl amido benzene azo benzene *p* sulphonic acid [4 1] $C_6H_4(SO_3H)N_2C_6H_4NH_2$ [1 4] *p* Sulpho benzene azo ethyl aniline [c 244°] Obtained by combining *p* diazo benzene sulphonic acid with ethyl aniline in acid solution. Steel blue needles. Nearly insol in alcohol and cold water, sol hot water. The sodium salt (NaA') forms orange red plates. On reduction with $(NH_4)_2S$ it yields mono ethyl *p* phenylene diamine and *p* sulphamic acid (Bernthsen & Goske, *B* 20, 929)

Di-ethyl-*p* amido-benzene-azo-di-ethyl-aniline $C_6H_4(NH_2)_2-N_2-C_6H_4(NH_2)_2$ Di ethyl aniline azylane [170°] Prepared by passing NO through an alcoholic solution of di ethyl aniline, yield 50 p.c. of the theoretical. Red monoclinic crystals, $a, b, c = 1.7108, 0.9493, \beta = 90^\circ 30'$. V sol chloroform, sl sol cold alcohol.

Reactions—1 Nitrous acid acting on the acetic solution gives *p* nitro di ethyl aniline—2 On reduction it yields *u* di ethyl *p* phenylene diamine—3 Heated with ethyl iodide at 100° it gives tetra ethyl *p* phenylene diamine—4 MeI at 100° gives di methyl di ethyl *p* phenylene diamine

Salts— $B''H_2Cl_2.PtCl_4$ small brownish red trimetric tables—Ferrocyanide $B''H_2FeC_6$ brown plates—Picrate $B''(C_6H_4(NO_2)_2OH)_2$ yellow sparingly soluble needles (Lippmann & Fleissner, *B* 15, 2136, 16, 1415, *M* 3, 286, 788)

Di-ethyl amido-benzene azo toluidine

Acetyl derivative

[4 1] $C_6H_4(NH_2)_2-N_2-C_6H_4Me(NHAc)$ [1 6 3] [159°] From diazotised acetyl tolylene diamine $C_6H_4(NH_2)_2Me(NHAc)$ [1 6 3] and di ethyl aniline (Wallach, *A* 234, 859)

***o* Ethyl-benzene *o* azo-ethyl-benzene**

[2 1] $C_6H_4(C_2H_5)_2-N_2-C_6H_4(C_2H_5)_2$ [1 2] [47°corr] Formed by reduction of *o* nitro ethyl benzene with zinc dust and alcoholic NaOH (Schultz, *B* 17, 473) Long red dimetric prisms, $a, c = 1.3455$. V sol alcohol. By treatment with $SnCl_2$ and HCl in alcoholic solution it yields a di amido di ethyl diphenyl

***p* Ethyl-benzene *p*-azo-ethyl-benzene**

[4 1] $C_6H_4(C_2H_5)_2-N_2-C_6H_4(C_2H_5)_2$ [1 4] [63°corr] (above 340°) Formed by reduction of *p* nitro ethyl benzene with zinc dust and alcoholic NaOH (Schultz, *B* 17, 475) Orange red plates or thick prisms. V sol alcohol. By treatment with $SnCl_2$ and H_2SO_4 in alcoholic solution it yields a di amido di ethyl diphenyl

***p* Ethyl phenyl amido benzene *p*-azo-ethyl di phenylamine**

[4 1] $C_6H_4NH_2Ph-N_2-C_6H_4NH_2Ph$ [1 4] [178°] From ethyl di phenyl amine and NO (Lippmann & Fleissner, *M* 4, 796) Monoclinic red crystals

Ethyl pyrrol azo (8) naphthalene

$C_8H_7N_2C_6H_5NET$ [74°] Obtained by adding (8)-diazonaphthalene chloride (1 mol) to ethyl pyrrol (1 mol) dissolved in alcohol containing sodium acetate. Thick red tables. Sparingly

soluble in dilute HCl. Dissolves in conc H_2SO_4 with a dark reddish yellow colour. The platinum chloride forms small sparingly soluble red needles (O Fischer & Hepp, *B* 19, 2258)

Ethyl pyrrol azo *p* toluene

$C_6H_4MeN_2C_6H_4NET$ probably $C_6H_4MeN_2C_6H_4NET$

[62°] Formed by adding *p* diazo toluene chloride (1 mol) to an alcoholic solution of ethyl pyrrol (1 mol) containing sodium acetate. Thick red prisms. Dissolves in conc H_2SO_4 with a yellow colour, in dilute HCl with a reddish yellow colour. The platinum chloride forms sparingly soluble red needles (O Fischer & Hepp, *B* 19, 2257)

Iodo-carboxy-benzene-azo-iodo benzoic acid $C_6H_4(CO_2H)_2-N_2-C_6H_4(CO_2H)_2$ Azo iodo benzoic acid. From *m* amide benzoic acid, iodine, and H_2O (Benedikt, *B* 8, 386)

Mesiylene-azo mesitylene

$CH(CH_3)_2-N_2-CH(CH_3)_2$ Azo mesitylene [75°corr] Prepared by oxidising an aqueous solution of mesidine hydrochloride (5 pts) with a solution of 45 pts of potassium ferricyanide and 10 pts of KOH (Schultz, *B* 17, 476) Thin red needles. Sol hot alcohol. It does not appear to yield a hexa methyl benzidine by treatment with $SnCl_2$ and HCl in alcoholic solution

Methyl-amido benzene-azo-benzene-sulphonic acid [4 1] $C_6H_4(SO_3H)N_2C_6H_4NH_2$ [1 4] *p* Sulpho benzene azo methyl aniline. Obtained by combining *p* diazo benzene sulphonic acid with methyl aniline in acid solution, yield 30 p.c. of theoretical. Also formed by the action of cold dilute acids upon *p* sulpho diazo benzene methyl anilide $C_6H_4(SO_3H)N_2NMeCH_3$. Steel blue needles, sl sol water. The sodium salt (A'Na) forms large orange red plates, v sol hot water. On reduction with $(NH_4)_2S$ it yields *p* sulphamic acid and mono methyl *p* phenylene diamine (Bernthsen & Goske, *B* 20, 929)

Di methyl-amido-benzene azo-benzene sulphonic acid [4 1] $C_6H_4(NMe)_2-N_2-C_6H_4SO_3H$ [1 4] *Helianthin*, or *Orange III*

Preparation—1 From dimethylaniline and *p* diazobenzene sulphonic acid (Griess, *B* 10, 525)—2 Dimethylamido azobenzene (1 pt) is dissolved in 20 pts cold sulphuric acid of 30 p.c anhydride value and allowed to stand for 24 hours (Mohlau, *B* 17, 1491) The absorption spectrum has been mapped by Hartley (*C J* 51, 192)

Di-methyl-amido-benzene-azo benzoic acid

[4 1] $C_6H_4NMe_2-N_2-C_6H_4CO_2H$ [1 3] From di methyl aniline and *m* diazo benzoic acid (Griess, *B* 10, 525)

Di-methyl- amido- benzene- azo-di-methyl-aniline [4 1] $C_6H_4(NMe)_2-N_2-C_6H_4NMe_2$ [1 4] [266°] *Dimethylaniline azylane*. Red needles

Formation—1 By diazotising *p* amido di methyl aniline and combining the diazo compound $C_6H_4(NMe)_2N_2Cl$ with dimethylaniline (Nolting, *B* 18, 1143)—2 By passing NO through an alcoholic solution of di methyl-aniline for several days

Reactions—1 Nitrous acid acting on the acetic acid solution gives *p*-nitro di methyl-aniline—2 On reduction it gives *u* di methyl-*p*-phenylene diamine

Salts— $B''HCl_2PtCl_4$, dichroic crystalline powder—Picrate $B''C_6H_4(NO_2)_2OH + C_6H_5OH$ glistening green needles (Lippmann & Fleissner, *B* 15, 2136, 16, 1415, *M* 3, 708)

Di-methyl-amido-benzene-azo-*p* toluene

$C_6H_5-N_2-C_6H_4-NMe_2$ [168°] Golden plates Easily soluble in alcohol and ether

Preparation—A solution of 65 pts of $NaNO_2$ (100 p.c.) and 35 pts $NaOH$ in 465 pts of water is slowly added to a cooled solution of 100 pts of *p* toluidine, 113 pts of dimethylaniline and 200 pts of HCl in 300 pts of water

On reduction it yields *p* toluidine and di methyl *p* phenylene diamine. The hydrochloride and sulphate form violet prisms, giving a red solution in alcohol (Mohlau, *B* 17, 1492)

Di methyl amido benzene azo *p* toluene sulphonic acid $C_6H_4(HSO_3)N_2C_6H_4NMe_2$. Formed by the combination of β diazo toluene sulphonic acid ($MeHSO_3N_2 = 1.34$) with dimethylaniline (Mohlau, *B* 17, 1493). Dark violet prisms. Soluble in water and alcohol with an orange colour, insoluble in ether. The sodium salt forms orange glistening plates

Di methyl amido benzene azo toluidine

[41] $C_6H_4(NMe_2)_2-N_2-C_6H_4Me(NH_2)$ [163] [145°] From its acetyl derivative [200°] which is formed by the action of diazotised acetyl toluylene diamine $C_6H_4(NH_2)Me(NHAc)$ [163] upon di methyl aniline (Wallach, *A* 234, 355)

Di methyl amido benzene azo toluidine

[41] $C_6H_4(NMe_2)_2-N_2-C_6H_4Me(NH_2)$ [143] [215°] From its acetyl derivative, [192°] which is formed by the action of diazotised acetyl toluylene diamine $C_6H_4(NH_2)Me(NHAc)$ [143] upon di methyl aniline (Wallach, *A* 234, 359)

***p* Methyl phenyl amido benzene azo methyl di phenyl amine**

[41] $C_6H_4NMePhN_2C_6H_4NMePh$ [14] [150°] Yellow crystals, got by the action of NO on methyl diphenyl amine (Lippmann & Fleissner, *M* 4, 798)

(α) Naphthalene (α) azo naphthalene

[α] $C_{10}H_7N_2C_{10}H_7$ [α] [190°] Prepared by boiling diazo naphthalene azo naphthalene with alcohol 1 pt of naphthalene azo naphthylamine is dissolved in 100 pts of 95 p.c. alcohol and 5 pts of H_2SO_4 are added, the still warm solution is then treated with a saturated solution of (1 mol of) $NaNO_2$, the fluid is heated and finally boiled for a few hours, and the azonaphthalene precipitated by water. It is recrystallised by dissolving it in hot aniline and adding alcohol (Nietzki & Goll, *B* 18, 298, 3252). Steel blue crystals. Sublimes in thin yellow plates. Soluble in aniline, sparingly in alcohol. It dissolves in cold H_2SO_4 with a blue colour, but on heating the solution to about 180° it becomes violet and exhibits a red fluorescence. By alcoholic NH_4HS , or zinc dust and alcoholic KOH , it is reduced to hydrazonaphthalene

(α) naphthalene (β) azo-naphthalene

[α] $C_{10}H_7N_2C_{10}H_7(\beta)$ [136°] Obtained by diazotisation of (β) naphthalene *p* azo (α) naphthyl amine and boiling with alcohol. Dark brown plates with steel blue reflex. Sol. alcohol, acetic acid, &c. Dissolves in conc. H_2SO_4 with a violet colour (Nietzki & Götting, *B* 20, 612). Laurent's naphthase [275°], got by heating nitro naphthalene with zinc dust, or (α) naphthylamine with PbO , has been regarded as naphtha-

lene azo naphthalene, but Witt has lately (*B* 19, 2794) shown it to be an azine $C_{10}H_7N_2$ *v* ($\alpha\beta$) NAPHTHAZINE (Laurent, *A* 109, 384, Doer, *B* 3, 291, Alexeff, *B* 3, 868, Schichuzky, *B* 5, 365, Klobulowsky, *B* 10, 570, 772, 873)

Naphthalene *p* azo (α) naphthol

$C_{10}H_7-N_2-C_{10}H_6OH$. Formed by adding di azo naphthalene chloride to a solution of (α) naphthol in $NaOHAq$, it is ppd by HCl . Crimson powder. Soluble in alkalis forming crimson solutions (P. F. Frankland, *C* *J* 37, 752)

Naphthalene-*o* azo (β) naphthol

$C_{10}H_7-N_2-C_{10}H_6OH$ [176°] Formed by diazotising (β) amido azo naphthalene and heating the diazo compound with water (Nietzki & Goll, *B* 19, 1282). Sublimes in glistening golden needles

(α) Naphthalene-(α)-azo (α)-naphthylamine

$C_{10}H_7-N_2-C_{10}H_6NH_2$ [180°] Prepared by adding KNO_2 (1 mol) to a dilute solution of (α) naphthylamine hydrochloride (2 mol) and making the mixture slightly alkaline with Na_2CO_3 (Perkin & Church, *A* 129, 108, Nietzki & Goll, *B* 18, 298). Hartley (*C* *J* 51, 190) has mapped the absorption spectrum— $B''_1HCl - B'HCl - B''_2HCl - B'_1H_2SO_4$

(β)-Naphthalene *p* azo-(α) naphthylamine

$C_{10}H_7N_2C_{10}H_6NH_2$ [152°] Formed by mixing aqueous solutions of equal mols of (β) diazo naphthalene chloride (from (β) naphthylamine) and (α) naphthylamine hydrochloride. Yellowish brown needles with green reflex (from alcohol). The base and its salts are far more soluble than the (α) azo (α) naphthalene. H_2SO_4 dissolves it with a violet colour (Nietzki & Götting, *B* 20, 612)

(β) Naphthalene-azo (β)-naphthylamine

$C_{10}H_7 \begin{matrix} \diagup NH \\ | \\ N_2H C_{10}H_7 \end{matrix}$ or $C_{10}H_7N_2C_{10}H_6NH_2$ [149°].

Reddish yellow needles. Easily soluble in benzene and acetic acid, insoluble in water. Formed by the action of amyl nitrite upon (β) naphthylamine. The absorption spectrum has been mapped by Hartley (*C* *J* 51, 191)

Reactions—1 By heating with dilute H_2SO_4 (20 p.c.) it is decomposed with evolution of nitrogen—2 On reduction with $SnCl_2$ it yields (β) naphthylamine and (1 2) naphthylenediamine—3 Treated with bromine in alcoholic or acetic acid solution it is converted into di bromo (β) naphthylamine and a brominated β naphthol 4 May be diazotised in the following manner. 15 grms of the amidoazonaphthalene are finally suspended in a mixture of 90 grms H_2SO_4 and 90 grms of water, cooled with ice and slowly treated with a concentrated solution of 5 grms sodium nitrite. The diazo compound is very unstable (Nietzki & Goll, *B* 19, 1281)

Acetyl derivative $C_{20}H_{14}N_2AO$ [218°], prisms, easily soluble in benzene, sparingly in alcohol and petroleum spirit

Benzoyl derivative $C_{20}H_{14}N_2Bz$ [177°], silky red needles, easily soluble in benzene, sparingly in alcohol and petroleum spirit (Lawson, *B* 18, 2422)

(α)-Naphthalene-azo-*peri*-naphthylene-diamine $C_{10}H_7-N_2-C_{10}H_6(NH_2)_2$. Prepared by the action of (α) diazonaphthalene chloride on *peri*-naphthylene diamine (Stebbins, jun, *B* 18,

717, *C* N 41, 117, *A* *C* *J* 1, 445) Sol alcohol, insol water— B'HCl sl sol water, m sol alcohol with a brown colour, dissolves in strong H_2SO_4 with a blue colour

(*B*) Naphthol-azo-naphthalene sulphonic acid $\text{C}_{10}\text{H}_7(\text{OH})-\text{N}_2-\text{C}_{10}\text{H}_7\text{SO}_3\text{H}$ From (*B*) naphthol and (*a*) diazo naphthalene sulphonic acid (*W* v Miller, *B* 13, 268)

(*a*) Naphthol-*p* azo diphenyl sulphonic acid $\text{C}_{10}\text{H}_7(\text{OH})-\text{N}_2-\text{C}_6\text{H}_4\text{SO}_3\text{H}$ From (*a*) naphthol and *p* diazo diphenyl sulphonic acid (Carnelley & Schlevelmann, *C* *J* 49, 383) — NaA' dyes wool brown— BaA'

(*B*)-Naphthol-*p*-azo-diphenyl sulphonic acid $\text{C}_{10}\text{H}_7(\text{OH})-\text{N}_2-\text{C}_6\text{H}_4\text{SO}_3\text{H}$ From (*B*) naphthol and *p* diazo diphenyl sulphonic acid — NaA' bright red pp, sl sol cold, v sol hot, water, dyes wool red — BaA' , (Carnelley & Schlevelmann, *C* *J* 49, 383)

o Nitro-benzene-azo aceto-acetic acid

$\text{C}_6\text{H}_4(\text{NO}_2)-\text{N}_2-\text{CH}(\text{CO CH}_3)\text{CO}_2\text{H}$ [185°] Obtained by saponification of the ethyl ether which is prepared by the action of *o* nitro diazo benzene chloride on an alkaline solution of aceto acetic ether (Bamberger, *B* 17, 2415) Glistening brown plates V sol acetic acid and hot alcohol, v sl sol ether and cold alcohol On heating it evolves CO and yields *o* nitro benzene-azo acetone $\text{C}_6\text{H}_4(\text{NO}_2)-\text{N}_2-\text{CH}(\text{CO CH}_3)\text{CO}_2\text{H}$ The same decomposition is produced by heating with alkalis

Salts — A'NH_4^+ yellow needles — A'Ag crystalline pp — A'Cu^+ green pp, sol hot water — A'Ba^+ yellow needles — A'Hg glistening plates

Ethyl ether A'Et [93°], glistening yellow plates or fine needles, sol alcohol, ether, acetic acid, and hot water

o-Nitro-benzene azo-acetone

$\text{C}_6\text{H}_4(\text{NO}_2)-\text{N}_2-\text{CH}(\text{CO CH}_3)\text{CO}_2\text{H}$ [124°] Formed by heating *o* nitro benzene azo aceto acetic acid to its melting point, or by boiling the acid or its ether with alkalis

Preparation — *o* Nitraniline dissolved in absolute alcohol is diazotised by passing into the well cooled solution a stream of N_2O_5 , the product is poured into iced water, the solution filtered and mixed without cooling with a dilute solution of acetoacetic ether (1 mol), and KOH (1 mol), after mixing the fluid must be acid, it is digested at about 40° for 40 hours, the red pp is then filtered off and purified (Bamberger, *B* 17, 2418) Long silky yellow needles Easily soluble in hot water, alcohol, ether, &c

o Nitro-benzene-azo-acetophenone

[2 1] $\text{C}_6\text{H}_4(\text{NO}_2)-\text{N}_2-\text{CH}_2\text{CO}_2\text{C}_6\text{H}_5$ [141°] Formed together with *o* nitro benzene azo benzoyl acetic ether, by adding a solution of *o* nitro diazo benzene chloride to an iced alkaline solution of benzoyl acetic ether (Bamberger & Calman, *B* 18, 2565) Glistening yellow needles Easily soluble in ordinary solvents

m Nitro-benzene-azo-aniline

[3 1] $\text{NO}_2\text{C}_6\text{H}_4\text{N}_2\text{C}_6\text{H}_5\text{NH}_2$ [14] [c 210°] From diazotised *m* nitraniline hydrochloride and aniline hydrochloride (Meldola, *C* *J* 45, 112) Orange fern like leaflets (from alcohol) Insol water and dilute acids, forms yellow solutions in alcohol, acetone, and benzene (Meldola, *C* *J* 45, 118) On reduction it gives *m* and *p* phenylene diamine Salt.—(B'HCl), PtCl_4

Nitro-benzene-azo-benzene sulphonic acid

[3 1] $\text{C}_6\text{H}_4(\text{NO}_2)-\text{N}_2-\text{C}_6\text{H}_4\text{SO}_3\text{H}$ [14] From benzene azo benzene sulphonic acid by nitration (Janovsky, *M* 3, 505, 8, 60) — KA — BaA' — PbA'

Nitro-benzene-azo-benzene sulphonic acid

[4 1] $\text{C}_6\text{H}_4(\text{NO}_2)-\text{N}_2-\text{C}_6\text{H}_4\text{SO}_3\text{H}$ [14] Formed, together with the less soluble isomeric just described, by heating benzene azo benzene *p* sulphonic acid with nitric acid (*S* *G* 141) Leaflets — KA' (Janovsky, *M* 3, 506, 5, 157, *B* 16, 1486) Ammonium sulphide reduces it to an amido benzene azo benzene sulphonic acid which is different from that formed from diazo tised sulphanic acid and *p* phenylene diamine, although on complete reduction it gives sulphamic acid and *p* phenylene diamine

Di nitro-benzene azo benzene-sulphonic acid

[3 4 1] $\text{C}_6\text{H}_4(\text{NO}_2)_2-\text{N}_2-\text{C}_6\text{H}_4\text{SO}_3\text{H}$ [14] From either of the two preceding acids or from benzene azo benzene sulphonic acid and nitric acid (*S* *G* 145) Orange leaflets — KA' — BaA' , *S* 7 at 68° (Janovsky, *M* 3, 507, 5, 157)

o Nitro benzene azo benzoyl acetic acid

[2 1] $\text{C}_6\text{H}_4(\text{NO}_2)-\text{N}_2-\text{CH}(\text{CO C}_6\text{H}_5)\text{CO}_2\text{H}$ [177°] Its ethyl ether is formed, together with *o* nitro benzene azo acetophenone, by adding a solution of *o* nitro diazo benzene chloride to an iced alkaline solution of benzoyl acetic ether (Bamberger & Calman, *B* 18, 2565) Long, yellow silky needles Sl sol alcohol and ether By long heating at its melting point it loses CO , giving *o* nitro benzene azo acetophenone

Oxim $\text{C}_6\text{H}_4(\text{NO}_2)-\text{N}_2(\text{CO}_2\text{H})\text{NOH}$ [142°], orange yellow needles

m Nitro-benzene-azo-*m*-chloro di methyl-

aniline [3 1] $\text{C}_6\text{H}_4(\text{NO}_2)-\text{N}_2\text{C}_6\text{H}_3\text{ClNMe}_2$ [124] [156°] Prepared by adding sodium nitrite (1 mol) to a solution of *m* nitraniline (1 mol) and *m* chloro di methyl aniline (1 mol) in dilute H_2SO_4 (Staedel & Bauer, *B* 19, 1956) Reddish yellow plates (from alcohol)

p Nitro benzene azo di methylaniline

[4 1] $\text{NO}_2\text{C}_6\text{H}_4\text{N}_2\text{C}_6\text{H}_4\text{NMe}_2$ [14] [230°] The hydrochloride is deposited as crystals with steel blue reflex when aqueous diazo *p* nitro benzene chloride is added to aqueous dimethylaniline hydrochloride (Meldola, *C* *J* 45, 107)

Properties — Chocolate brown powder, slightly soluble in alcohol whence it separates as brown needles Solutions are orange in benzene and in glacial acetic acid, orange in conc H_2SO_4 , red on dilution Salt —(B'HCl) PtCl_4

m Nitro benzene *p* azo dimethylaniline

[3 1] $\text{NO}_2\text{C}_6\text{H}_4\text{N}_2\text{C}_6\text{H}_4\text{NMe}_2$ [14] [159°] From $\text{NO}_2\text{C}_6\text{H}_4\text{N}_2\text{Cl}$ and $\text{C}_6\text{H}_5\text{NMe}_2\text{HCl}$ (Meldola, *C* *J* 45, 120, Staedel & Bauer, *B* 19, 1954) Orange crystalline powder Solutions in alcohol, benzene, acetone, and glacial acetic acid, are yellowish orange, in conc H_2SO_4 , pale orange, turned red by dilution After reduction by HCl and zinc dust, Fe_2Cl_6 forms a blue dye

m Nitro benzene azo (*a*) naphthol

[3 1] $\text{C}_6\text{H}_4(\text{NO}_2)-\text{N}_2-\text{C}_{10}\text{H}_7\text{OH}$ [14] From *m* diazo nitro benzene and (*a*) naphthol (Stebbins, jun, *A* *C* *J* 2, 446) Brown pp, sol water

p Nitro benzene azo-*(a)* naphthol

[4 1] $\text{C}_6\text{H}_4(\text{NO}_2)-\text{N}_2-\text{C}_{10}\text{H}_7\text{OH}$ [14] From *p*-diazo nitro-benzene chloride and an alkaline solution of (*a*) naphthol (Meldola, *C* *J* 47, 661) Dull red powder, melts above 360° V sl. sol.

boiling alcohol H_2SO_4 forms a violet solution, hot NaOH aq gives a blue colour

m-Nitro-benzene azo (β) naphthol

[3 1] $\text{C}_6\text{H}_4(\text{NO}_2)-\text{N}_2-\text{C}_{10}\text{H}_7\text{OH}$ [1 2] or

$\text{C}_{10}\text{H}_7\text{N}_2\text{O}$ [194°] From *m* diazo

nitro benzene chloride and an alkaline solution of (β) naphthol (Meldola, *C J* 47, 668) Lustrous orange scales (from toluene) Insol aqueous alkalis, sol alcoholic KOH H_2SO_4 gives a magenta red solution It is not reduced by ammonium sulphide

p Nitro benzene azo (β) naphthol

[4 1] $\text{C}_6\text{H}_4(\text{NO}_2)-\text{N}_2-\text{C}_{10}\text{H}_7\text{OH}$ (?) [1 2] [249°] From *p* diazo nitro benzene chloride and sodium (β) naphthol (Meldola, *C J* 47, 663) Orange needles Insol hot NaOH aq Conc H_2SO_4 gives a magenta red solution

m Nitro benzene azo (β) naphthol disulphonic acid [3 1] $\text{C}_6\text{H}_3(\text{NO}_2)\text{N}_2\text{C}_6\text{H}_4(\text{SO}_3\text{H})_2(\text{OH})$ (?) Prepared by acting on *d* azo *m* nitro benzene with (β) naphthol disulphonic acid in alkaline solution V sol water, dyes an old gold colour (Stebbins, jun, *A C J* 2, 446)

m Nitro benzene (α) azo (α) naphthylamine

[3 1] $\text{NO}_2\text{C}_6\text{H}_4-\text{N}_2-\text{C}_{10}\text{H}_7\text{NH}_2$ [1 4] [203°] From NO , $\text{C}_6\text{H}_5\text{N}_2\text{Cl}$ and $\text{C}_{10}\text{H}_7\text{NH}_2\text{HCl}$ (Meldola, *C J* 45, 114)

* *Properties*—Red needles Solutions in alcohol, acetone, and benzene, are orange, in acetic acid, red, in conc H_2SO_4 violet red turned red by dilution Completely decomposed by ammoniac sulphide

p-Nitro benzene azo (α) naphthylamine

[4 1] $\text{NO}_2\text{C}_6\text{H}_4\text{N}_2\text{C}_{10}\text{H}_7\text{NH}_2$ [1 4] [252°] From aqueous *p* nitro diazo benzene chloride and alcoholic (α) naphthylamine hydrochloride (Meldola, *C J* 43, 430) Brown needles (from benzene) Forms a crimson alcoholic solution (B HCl), PtCl_4 Salts hardly soluble in alcohol

Reactions—Reduces to *p* phenylene-diamine and (α,α) naphthylene diamine

m Nitro benzene azo (β) naphthylamine

[3 1] $\text{C}_6\text{H}_3(\text{NO}_2)-\text{N}_2-\text{C}_{10}\text{H}_6(\text{NH}_2)$ or

$\text{C}_6\text{H}_4(\text{NO}_2)-\text{N}_2\text{H}$ C_{10}H_6 [177°] From

NO $\text{C}_6\text{H}_5\text{N}_2\text{Cl}$ and (β) naphthylamine Splendid orange needles Solutions in toluene, chloroform, and glacial acetic acid, are orange, in alcohol and in acetone, orange but turned red by HCl , in conc H_2SO_4 , violet (Meldola, *C J* 45, 117)

p Nitro benzene azo (β) naphthylamine

[4 1] $\text{NO}_2\text{C}_6\text{H}_4-\text{N}_2-\text{C}_{10}\text{H}_7\text{NH}_2$ (?) [1 2] [180°] From aqueous *p* nitro-diazo benzene chloride and aqueous (β) naphthylamine hydrochloride (Meldola, *C J* 43, 420) Needles, with golden lustre (from alcohol) Its solutions in alcohol, acetone, and chloroform are red, in benzene and toluene, orange, in conc H_2SO_4 , violet Its salts are readily soluble in alcohol—(B HCl), PtCl_4

p Nitro-benzene-azo *p* nitro-benzene

[4 1] $\text{C}_6\text{H}_4(\text{NO}_2)-\text{N}_2-\text{C}_6\text{H}_4(\text{NO}_2)$ [1 4] *Di nitro-azo benzene* [201°] Formed by nitration of benzene azo benzene (Laurent & Gerhardt, *A* 75, 73, Janovsky, *M* 6, 159, 7, 135, *B* 18, 1134) Red crystals (from glacial HOAc) Gives, when reduced by ammonium sulphide, a nitrolic

VOL I

acid ($\text{C}_6\text{H}_4(\text{NO}_2)-\text{N}_2-\text{C}_6\text{H}_4\text{NOH}$) (?) [118°] of which the sodium salt is blue It is re oxidised by K_2FeO_4 to *p* nitro benzene azo *p* nitro-benzene.

m Nitro benzene azo *m*-nitro-benzene

[3 1] $\text{C}_6\text{H}_3(\text{NO}_2)-\text{N}_2-\text{C}_6\text{H}_4(\text{NO}_2)$ [1 8] A red oil, formed in the preparation of the preceding (Janovsky, *M* 6, 455) Ammonium sulphide and NaOH give a violet colour

o Nitro benzene *p* azo nitro-benzene

[2 1] $\text{C}_6\text{H}_4(\text{NO}_2)-\text{N}_2-\text{C}_6\text{H}_3(\text{NO}_2)$ [1 4] [208°]. From nitro benzene *o* azo - nitro benzene (Janovsky, *M* 7, 131) Orange laminae Alcoholic ammonium sulphide mixed with NaOH aq gives a permanent blue

Nitro benzene azo nitro benzene

$\text{C}_6\text{H}_4(\text{NO})-\text{N}_2-\text{C}_6\text{H}_4(\text{NO}_2)$ [1 4] [205°] A by product in the nitration of benzene azo benzene *p* sulphonic acid (Janovsky, *M* 7, 132) Orange laminae Ammonium sulphide and NaOH gives a permanent blue nitrolate

Nitro-benzene azo-nitro benzene

$\text{C}_6\text{H}_4(\text{NO}_2)-\text{N}_2-\text{C}_6\text{H}_4(\text{NO}_2)$ [180°] A product of nitration of benzene azo benzene (Janovsky, *M* 7, 134) Pale, asbestos like, needles Ammonium sulphide and NaOH give a blue nitrolate changing to brown

Nitro benzene azo di nitro benzene

[4 1] $\text{C}_6\text{H}_3(\text{NO}_2)-\text{N}_2-\text{C}_6\text{H}_3(\text{NO}_2)$ [1 2 8 or 5 or 6] or [1 3 5] [112°] Formed by nitration of benzene azo benzene (Petrie, *Z* [2] 6, 564) or benzene azo *p* nitro benzene (Janovsky, *M* 7, 125) Yellow needles Boiling with a mixture of alcoholic NaOH and aqueous ammoniac sulphide gives a green colour, changing to brown

Nitro benzene azo di nitro benzene

[3 1] $\text{C}_6\text{H}_4(\text{NO})-\text{N}_2-\text{C}_6\text{H}_3(\text{NO}_2)_2$ [1 3 4] [170°] Formed by nitration of benzene *p* azo nitro benzene or *m* nitro benzene *m* azo nitro benzene (Janovsky, *M* 7, 126) Yellow tables Alcoholic ammonium sulphide and aqueous NaOH give an olive green colour, turning brown

Nitro benzene azo di nitro benzene

[3 1] $\text{C}_6\text{H}_3(\text{NO}_2)-\text{N}_2-\text{C}_6\text{H}_3(\text{NO}_2)_2$ [1 3 2 or 5 or 6] [124°] Formed by nitrating *m* nitro benzene azo nitro benzene (*J*) Yellow prisms Nitrolic reaction emerald green changing to orange

Nitro benzene azo di nitro benzene

[4 1] $\text{C}_6\text{H}_4(\text{NO}_2)-\text{N}_2-\text{C}_6\text{H}_4(\text{NO}_2)_2$ [1 4 8 or 2] [185°] Formed by nitrating *p* nitro benzene *p* azo nitro benzene or benzene azo benzene (Janovsky, *M* 6, 461, *B* 18, 1135) Needles

Nitro benzene azo di nitro-benzene

[4 1] $\text{C}_6\text{H}_4(\text{NO}_2)-\text{N}_2-\text{C}_6\text{H}_4(\text{NO}_2)_2$ [1 4 2 or 3]. [160°] Formed in the preparation of the preceding substance (Janovsky, *M* 6, 462, 7, 125, *B* 18, 1134) Yellow needles (from alcohol) Nitrolic reaction green, turning blue This body and the preceding, both give (1, 2, 4) tri amido-benzene and *p* phenylene diamine on reduction

Nitro benzene azo nitro ethane

[3 1] $\text{C}_6\text{H}_4(\text{NO}_2)-\text{N}_2-\text{CH}(\text{NO}_2)\text{CH}_3$ From potassium nitro ethane and *m* diazo nitro benzene nitrate (Hallmann, *B* 9, 891) Yellow powder Reduced by tin and HCl to the tin salt $\text{B}^+\text{H}_3\text{SnCl}_4$ of an unstable base di amido phenyl ethyl hydrazine $\text{C}_6\text{H}_4(\text{NH}_2)-\text{N}_2\text{H}_2-\text{CH}(\text{NH}_2)\text{CH}_3$.

Nitro benzene azo nitro phenol

[3 1] $\text{C}_6\text{H}_4(\text{NO}_2)\text{N}_2\text{C}_6\text{H}_3(\text{NO}_2)(\text{OH})$ [1 3 4?] [173°]. Formed by heating the isomeria of *m* nitro-azoxy benzene $\text{C}_6\text{H}_4(\text{NO}_2)-\text{N}_2\text{O}-\text{C}_6\text{H}_4(\text{NO}_2)$

C C

with strong H_2SO_4 for some time to about 140° (Klinger & Pitschke, *B* 18, 2552) Yellowish-brown crystals Dissolves in alkalis with an orange colour — A^{Ag} red crystalline pp

p-Nitro-benzene-azo-o-oxy-benzoic acid

[4 1] $\text{C}_6\text{H}_4(\text{NO}_2) - \text{N}_2 - \text{C}_6\text{H}_4(\text{CO}_2\text{H})(\text{OH})$ [1 3 4] From diazotised *p* nitro aniline and a cooled alkaline solution of salicylic acid (Meldola, *C J* 47, 666) Brown needles (from dilute acetic acid), sol alkalis H_2SO_4 gives an orange solution Blackens at 225°

p Nitro benzene azo phenol

[4 1] $\text{C}_6\text{H}_4(\text{NO}_2) - \text{N}_2 - \text{C}_6\text{H}_4(\text{OH})$ [1 4] [184°] From diazotised *p* nitro aniline and sodium phenol (Meldola, *C J* 47, 655) Golden scales, v sol water, sol boiling dilute alkalis H_2SO_4 gives an orange solution

m Nitro-benzene *p* azo-diphenylamine

[3 1] $(\text{NO}_2)\text{C}_6\text{H}_4 - \text{N}_2 - \text{C}_6\text{H}_4(\text{NHC}_6\text{H}_5)_2$ [1 4] [137°] From $\text{NO}_2\text{C}_6\text{H}_4\text{NCl}$ and $\text{NH}(\text{C}_6\text{H}_5)_2$ (Meldola, *C J* 45, 118) Reddish brown scales (from dilute alcohol) Solutions in alcohol, acetone, glacial acetic acid, and benzene are orange On adding HCl to the alcoholic solution the liquid turns crimson, and, if concentrated, a brown gelatinous hydrochloride is ppt Conc H_2SO_4 forms a violet solution After reduction by Zn and HCl , FeCl_3 forms a blue dye Its salts are unstable

Nitroso derivative [128°]

p Nitro benzene azo di phenylamine

[4 1] $(\text{NO}_2)\text{C}_6\text{H}_4 - \text{N}_2 - \text{C}_6\text{H}_4(\text{NH C}_6\text{H}_5)_2$ [1 4] [151°] From aqueous diazotised *p* nitraniline and alcoholic diphenylamine The pp is treated with ammonium carbonate, and the base crystallised from dilute alcohol (Meldola, *C J* 43, 440) Brown leaflets Solutions are orange in alcohol, turned violet by HCl , violet in conc H_2SO_4 The hydrochloride forms needles, with violet reflex, but is very unstable

p Nitro benzene azo resorcin

[4 1] $\text{C}_6\text{H}_4(\text{NO}_2) - \text{N}_2 - \text{C}_6\text{H}_3(\text{OH})_2$ [1 2 4] From *p* diazo nitro benzene nitrate and resorcin in alkaline solution (Meldola, *C J* 47, 660) Brick red crystalline powder, KOH forms a violet, H_2SO_4 an orange, solution

p Nitro benzene azo *m* xylidine

[4 1] $(\text{NO}_2)\text{C}_6\text{H}_4 - \text{N}_2 - \text{C}_6\text{H}_3\text{Me}_2(\text{NH}_2)_2$ [1 3 5 2] [141°] From aqueous *p* nitro diazo benzene chloride and alcoholic *m*-xylidine hydrochloride (Meldola, *C J* 43, 428) There results a bulky reddish pp of $\text{NO}_2\text{C}_6\text{H}_4\text{N}_2\text{NHC}_6\text{H}_3\text{Me}_2$ which, on standing, changes to the scarlet hydrochloride of the azo compound

Properties — Brick red needles (from dilute alcohol) Forms orange solutions in alcohol, acetone, benzene, chloroform, and conc H_2SO_4

Salts — The chloride, sulphate, and nitrate form red needles with violet reflex, insoluble in alcohol — $(\text{BHCl})_2\text{PtCl}_4$

Nitro-carboxy-benzene azo-nitro benzoic acid $\text{N}_2(\text{C}_6\text{H}_3(\text{NO}_2)\text{CO}_2\text{H})_2$ (?) Formed by nitrating carboxy benzene azo benzoic acid (Golubeff, *J R.* 6, 197) — $\text{Na}_2\text{A}''$ — $\text{K}_2\text{A}''$ 3aq — BaA'' — $\text{Et}_2\text{A}''$ [104°]

Di nitro oxy-amido-benzene azo xylene

$\text{C}_6\text{H}_3(\text{NO}_2)_2(\text{NH}_2)(\text{OH}) - \text{N}_2 - \text{C}_6\text{H}_3\text{Me}_2$ From diazo xylene chloride and di nitro amido-phenol in alkaline solution (Stebbins, jun, *A C J* 2, 236) Brown powder, sl sol cold water

Nitro-oxy-benzene-azo benzene sulphonic acid [3 4 1] $\text{C}_6\text{H}_3(\text{NO}_2)(\text{OH}) - \text{N}_2 - \text{C}_6\text{H}_4\text{SO}_3\text{H}$ [1 4] From diazotised sulphanilic acid and *o* nitro-phenol (Griess, *B* 11, 2195, R Meyer & Kreis, *B* 16, 1331)

Nitro - oxy - benzene - azo - naphthalene sulphonic acid $\text{C}_6\text{H}_3(\text{NO}_2)(\text{OH}) - \text{N}_2 - \text{C}_{10}\text{H}_7\text{SO}_3\text{H}$ From diazotised (a) naphthylamine sulphonic acid and *o* nitro phenol (Stebbins, jun, *A C J* 2, 236) Red needles, v sol water

Di nitro oxy benzene azo naphthylamine sulphonic acid $\text{C}_6\text{H}_3(\text{NO}_2)_2(\text{OH}) - \text{N}_2 - \text{C}_{10}\text{H}_7(\text{NH}_2)\text{SO}_3\text{H}$ From diazo di nitro phenol and (a) naphthylamine sulphonic acid (Stebbins, jun, *A C J* 2, 446) Reddish brown dye, sol water

Nitro oxy benzene azo nitro phenol

Ethyl ether

[2 x 1] $\text{C}_6\text{H}_4(\text{OEt})(\text{NO}_2) - \text{N}_2 - \text{C}_6\text{H}_3(\text{OEt})(\text{NO}_2)$ [1 2 x] [190°] Formed by nitrating *o* oxy benzene *o* azo phenol ethyl ether, and separated from the isomeric compound by alcohol, in which it dissolves (Andreae, *J pr* [2] 21, 322) Needles (from alcohol)

Nitro-oxy benzene azo nitro phenol

Ethyl ether

[2 x 1] $\text{C}_6\text{H}_4(\text{OEt})(\text{NO}_2) - \text{N}_2 - \text{C}_6\text{H}_3(\text{OEt})(\text{NO}_2)$ [1 2 x] [285°] Formed together with the preceding (*q v*) Brownish red crystals (from chloroform) Insol alcohol Dissolves without change in conc H_2SO_4 Reduced by alcoholic ammonium sulphide to the di ethyl ether of dinitro dioxy di phenyl hydrazine

Di nitro oxy benzene azo phenol sulphonic acid $\text{C}_6\text{H}_3(\text{NO}_2)_2(\text{OH}) - \text{N}_2 - \text{C}_6\text{H}_4(\text{OH})\text{SO}_3\text{H}$ From diazotised di nitro amido phenol and an alkaline solution of phenol *o* sulphonic acid (Stebbins, jun, *A C J* 2, 236, *C N* 42, 44) Brown lustrous needles, sl sol hot water

Nitro diphenyl azo nitro diphenyl (?)

[4 1] $\text{C}_6\text{H}_4(\text{NO}_2) - \text{C}_6\text{H}_4 - \text{N}_2 - \text{C}_6\text{H}_4\text{C}_6\text{H}_3(\text{NO}_2)$ [1 4] [187°] From *p* dinitro diphenyl and sodium amalgam (Wald, *B* 10, 187) Yellow powder (from alcohol)

m Nitro toluene-azo aceto-acetic acid

[4 2 1] $\text{C}_6\text{H}_3(\text{CH}_3)(\text{NO}_2) - \text{N}_2 - \text{CH}(\text{CO CH}_3)\text{CO}_2\text{H}$ [176°] Obtained by saponification of the ethyl ether formed by the action of nitro diazo toluene chloride (from nitro *p* toluidine [114°]) on an alkaline solution of aceto acetic ether (Bamberger, *B* 17, 2421) Long yellow silky needles V sol hot alcohol and $\text{HOAc} - \text{A}_2^{\text{Ba}}$

m-Nitro-toluene-azo-acetone

[4 2 1] $\text{C}_6\text{H}_3(\text{CH}_3)(\text{NO}_2) - \text{N}_2 - \text{CH}_2\text{CO CH}_3$ [134°] Formed by the action of a dilute solution of aceto acetic ether (1 mol) and KOH (1 mol) on a solution of nitro diazo toluene nitrate (from nitro *p* toluidine [114°]) (Bamberger, *B* 17, 2421) Orange red prisms V sol alcohol and ether

m Nitro-toluene-azo-acetophenone

[4 2 1] $\text{C}_6\text{H}_3(\text{CH}_3)(\text{NO}_2) - \text{N}_2 - \text{CH}_2\text{CO C}_6\text{H}_5$ [168°] Glistening yellow needles Formed, together with nitro toluene azo benzoyl acetic ether, by adding a solution of nitro diazo toluene chloride (from *m* nitro *p* toluidine [114°]) to an iced alkaline solution of benzoyl acetic ether

Ketoxim $\text{C}_{11}\text{H}_{11}\text{N}_2(\text{NO}_2)\text{NOH}$ [174°], orange needles (Bamberger & Calman, *B* 18, 2566)

m-Nitro-*p*-toluene-azo-benzoyl-acetic acid

[4 2 1] $\text{C}_6\text{H}_3(\text{CH}_3)(\text{NO}_2) - \text{N}_2 - \text{CH}(\text{CO C}_6\text{H}_5)\text{CO}_2\text{H}$ [194°] Its ethyl ether is formed, together with

m nitro *p* toluene-azo acetophenone, by adding a solution of *m*-nitro *p* diazo toluene chloride to an acid alkaline solution of benzoyl acetic ether (Bamberger & Calman, *B* 18, 2566) Silky yellow needles *V* sol cold alcohol and acetic acid, more easily at the boiling point

p Oxy benzene azo benzene-*m* sulphonic acid [4 1] $C_6H_4(OH)-N_2-C_6H_4SO_3H$ [1 3] From diazotised amido benzene *m* sulphonic acid and an alkaline solution of phenol Leaflets, with violet reflex, insol ether, *v* sol water and alcohol —KA' long needles (Griess, *B* 11, 2194)

p Oxy benzene azo benzene *p* sulphonic acid [4 1] $C_6H_4(HSO_3)-N_2-C_6H_4(OH)$ [1 4] *Tro pœoline* *Y* Prepared by the action of an aqueous alkaline solution of phenol on *p* diazobenzene sulphonic acid (Griess, *B* 11, 2192) Yellowish red prisms *V* sol water and alcohol

Salts —BaA'' orange pp —BaA', 2aq —BaA', 5aq minute orange tables, sl sol water —KA' yellow rhombic leaflets, *S* 26 at 15° (Wilsing, *A* 215, 232)

p Oxy benzene azo benzene sulphonic acid [4 1] $C_6H_4(OH)-N_2-C_6H_4SO_3H$ From azoxy benzene (1 pt) and fuming H_2SO_4 (5 pts) at 110° (Lumprecht, *B* 15, 1295, Wilsing, *A* 215, 229), Tschirwinsky (*J R* 5, 217) considers this acid to be identical with the preceding Small lustrous reddish plates, *v* sol water, *m* sol dilute acids or alcohol *Br* does not act on the potassium salt $SnCl_2$ forms no aniline by reduction Salts —KA' aq *S* 85 at 15° —BaA', 2 —AgA' —MgA', 6aq —CuA', 6aq

Chloride [122°] Orange 6 or 8 sided plates

Amide [212°] Plates

Di oxy benzene azo benzene sulphonic acid [4 2 1] $C_6H_4(OH)_2-N_2-C_6H_4SO_3H$ [1 4] *Tro pœolin* *O* *Chrysoine* Formed by sulphonating benzene azo resorcin at 100° (Witt, *C J* 35, 183) or from diazotised amido benzene *p* sulphonic acid and resorcin dissolved in KOHAq (Griess, *B* 11, 2195) Red leaflets with steel blue reflex, *v* sl sol alcohol and cold water —KA' —BaA', 4aq

The absorption spectrum has been examined by Hartley (*C J* 51, 182)

Di oxy benzene azo benzene *m*-sulphonic acid [4 2 1] $C_6H_4(OH)_2-N_2-C_6H_4SO_3H$ [1 3] From resorcin and diazotised amido benzene *m* sulphonic acid Orange needles —KA' by grosscopic needles

Tri-oxy benzene azo benzene sulphonic acid [2 4 6 1] $C_6H_4(OH)_3-N_2-C_6H_4SO_3H$ [1 4] From diazotised amido benzene *p* sulphonic acid and an alkaline solution of phloroglucin (Stebbins, *C N* 42, 44, *A C J* 1, 465, 2, 236, *B* 13, 716) Yellow leaflets with green lustre —NaA' yellow leaflets, easily soluble in water

p Oxy-benzene-*m* azo-benzoic acid

[4 1] $C_6H_4(OH)-N_2-C_6H_4CO_2H$ [1 3] [220°]

Formation —1 From *m* diazo benzoic acid and phenol (Griess, *B* 14, 2032) —2 By gently warming *m* carboxy diazo benzene *m* carboxy anilide $C_6H_4(CO_2H)_2NH_2$ $C_6H_4(CO_2H)$ with phenol, *m* amido benzoic acid being eliminated (Heumann & Oeconomides, *B* 20, 906) Red needles or plates, sol alcohol and ether, sl sol water Dyes wool and silk yellow —BaA', 8½aq

Di oxy benzene *m* azo-benzoic acid

[4 2 1] $C_6H_4(OH)_2-N_2-C_6H_4CO_2H$ [1.5]. *Pre*

pared by the action of *m* diazobenzoic acid on an alkaline solution of resorcin (Griess, *B* 14, 2034). Brownish red needles or brownish yellow plates. Sol alcohol Dyes wool and silk yellow

Oxy-benzene-azo *p*-cresol *Ethyl ether* [4 1] $C_6H_4(OEt)-N_2-C_6H_4(CH_3)(OH)$ [1 5 2]

or $C_6H_4Me \begin{matrix} \diagup O \\ \diagdown N \end{matrix} H C_6H_4Me(OEt)$ [104°] Formed

by combining *p* diazo phenetol with *p* cresol (Liebmann & Kostanecki, *B* 17, 883) Golden plates Sol alkalis Dissolves in H_2SO_4 with a brown colour On reduction it gives *p* amido-phenetol and amido *p* cresol

o Oxy-benzene-azo-*o*-cresol *Methyl ether* $C_6H_4(OMe)-N_2-C_6H_4Me(OH)$ [68°] From diazotised *o* anisidine and *o*-cresol (Kanonnikov, *J R* 1885, 369) *Di methyl ether* [103°]

o-Oxy-benzene-azo-*m*-cresol *Methyl ether* [161°] Prepared like the preceding (K)

Di oxy benzene azo ψ cumene

[4 2 1] $C_6H_4(OH)_2-N_2-C_6H_4Me_2$ [190°] Formed, together with the disazo compound, by combining diazo cumene chloride (from amido pseudo cumene (62°)) with resorcin (Liebmann & Kostanecki, *B* 17, 131, 882) Small red needles Dissolves in alkalis with a brownish yellow colour

Di oxy-benzene azo hydroquinone

[5 2 1] $C_6H_4(OH)_2-N_2-C_6H_4(OH)_2$ [1 2 5] *Azo-hydroquinone* *Tetra methyl derivative* $C_6H_4(OMe)_2-N_2-C_6H_4(OMe)_2$ [140°] Formed by reduction of nitro di methyl hydroquinone in alkaline solution (Baessler, *B* 17, 2124, *C C* 1886, 671) Red needles *V* sol alcohol, benzene, chloroform, and CS, *v* sl sol water Dissolves in strong HCl with a blue colour

Tetra ethyl derivative [128°] From nitro di ethyl hydroquinone, powdered zinc, and alcoholic potash (Nietzki, *B* 12, 39)

Di oxy benzene azo naphthalene sulphonic acid [4 2 1] $C_6H_4(OH)_2-N_2-C_{10}H_7SO_3H$ [1 4] 110m diazotised (*a*) naphthylamine sulphonic acid and an alkaline solution of resorcin (Stebbins, *jun*, *A C J* 2, 86, *C N* 42, 44) Dark-brown needles, sol water

p Oxy-benzene-azo-(*a*) naphthylamine

[4 1] $C_6H_4(OH)-N_2-C_{10}H_7NH_2$ [1 4] [170°] Prepared by the action of *p* diazophenol nitrate on (*a*) naphthylamine (Weselsky & Benedikt, *B* 12, 229) Orange needles (containing 3aq) —B', H_2SO_4 6aq green needles, insol water

o Oxy-benzene-azo-(*B*) naphthylamine

[2 1] $C_6H_4(OH)-N_2-C_{10}H_7 \begin{matrix} \diagup NH \\ \diagdown N \end{matrix} H C_6H_4OH$

o Oxy benzene hydrazimido naphthalene [193] Formed by combining *o* diazo phenol with (*B*) naphthylamine Slender red needles (from alcohol or acetic acid), or dark red plates (from benzene) It dissolves in aqueous or alcoholic NaOH, but is insoluble in water By heating at 150° with HCl it is split up into (*B*) naphthylamine, pyrocatechin, and nitrogen Bromine in cold acetic acid solution gives di bromo (*B*) naphthylamine, a brominated pyrocatechin, and nitrogen On reduction with zinc dust and acetic acid it yields (1 2) naphthylene diamine.

Acetyl derivative [198°]

Benzoyl derivative [183°]

Methyl ether $C_6H_4(OMe)N_2C_6H_5$ [133°], dark-red monoclinic prisms, insoluble in water (Sachs, B 18, 8125)

p Oxy-benzene azo (β) naphthylamine

[4 1] $C_{12}H_9(OH)N_2C_6H_5$ or $C_{12}H_9$ 
p Oxy benzene hydrazimido naphthalene [193°] Formed by combining *p* diazo phenol with (β) naphthylamine. Flat red prisms. V sol benzene and acetic acid, insol water. By heating at 150° with HCl it is split up into (β) naphthylamine, hydroquinone, and nitrogen. Bromine in cold acetic acid solution gives di bromo (β) naphthylamine, a brominated hydroquinone, and nitrogen. On reduction with zinc dust and acetic acid it yields (1 2) naphthylene diamine (Sachs, B 18, 8125)

Mono acetyl derivative [218°]

Mono benzoyl derivative [244°]

Oxy benzene azo orein *Methyl ether* $C_6H_4(OMe)N_2C_6H_4(OH)Me$ Hair like needles (Stebbins, A C J 5, 32)

o Oxy benzene *o* azo phenol

[2 1] $C_6H_4(OH)-N_2-C_6H_3(OH)$ [1 2] *o* Azo-phenol [171°] S (alcohol) 3 at 20° Prepared by fusing *o* nitro phenol with KOH (Weselsky a. Benedikt, B 11, 398, A 196, 344) Golden leaflets, may be sublimed. Insol water

Reactions—1 Bromine added to an ethereal solution forms a tetra bromo derivative—2 Chlorine passed into an acetic acid solution forms a tri chloro derivative $C_6H_3Cl_3(OH)N_2$ [235°] (Bohn a. Heumann, B 17, 275)—3 Nitric acid forms (1, 2, 4) di nitro phenol

Ethyl ether $[C_6H_4(OEt)]_2N_2$ [131°]

o Nitro phenyl ethyl ether $C_6H_4(OEt)(NO_2)$ is dissolved in alcohol and reduced with sodium amalgam (5 per cent), the liquid being allowed to become hot. The product is poured into water, and the pp extracted by strong HCl which dissolves the azo compound. On pouring the HCl solution into water, *o* azo phenol is thrown down (R. Schmitt a. Mohlau, J pr 126, 202) *Properties*—Long red prisms (from alcohol) Melts under water, but insoluble therein and not volatile with steam. It begins to boil at 240°, but suffers decomposition at the same time. *Reactions*—1 Reduced by alcoholic ammonium sulphide to the corresponding hydrazo compound (*q v*)—2 Cold fuming HNO_3 forms a nitro-, and a di nitro-, derivative

m Oxy benzene *m* azo phenol *Ethyl ether* [3 1] $C_6H_4(OEt)-N_2-C_6H_3(OEt)$ [1 3] *m*-Azo-phenol [91°] Formed by reducing *m* nitro-phenol in alcoholic solution with sodium amalgam (M. Buchstab, J pr [2] 29, 299)

Properties—Orange prisms (from alcohol) Sol ether. Insol water and (difference from *o* compound) in conc HCl. Reduced by H_2S and alcoholic ammonia to *m* hydrazo phenol

p Oxy benzene *p* azo phenol

[4 1] $C_6H_4(OH)-N_2-C_6H_4(OH)$ [1 4] *p* Azo-phenol [204°]

Formation—1 By potash-fusion from *p* nitroso phenol (Jaeger, B 8, 1499), *p* nitro phenol (Weselsky a. Benedikt, A 196, 339), *p*-oxy benzene azo benzene *p* sulphonic acid, or *p* sulpho benzene azo benzene *p* sulphonic acid (Bohn a. Heumann, B 15, 3037)—2 From *p*-diazo phenol nitrate and phenol potassium

Properties—Slender brown needles with blue reflex (containing aq), sl sol water, v sol alcohol. Bromine gives a tetra bromo derivative. Nitric acid (1, 2, 4) di nitro phenol. Chlorine gives tri chloro phenol.

Salt— $BaCl_2 \cdot H_2N_2O_2 \cdot 4aq$

Ethyl ether $C_6H_4(OEt)-N_2-C_6H_4(OEt)$ *p* Azo phenol [160°] (S a M), [158°] (A). Formed by adding sodium amalgam (5 pc) to an alcoholic solution of *p* nitro phenyl ethyl ether, precipitating the product with water, boiling it with dilute HCl to remove amido phenyl ethyl ether, and crystallising from alcohol (Schmitt a. Mohlau, J pr 126, 199, Hepp, B 10, 1652, Andreae, J pr 129, 333) *Properties*—Glittering golden plates. M sol cold alcohol, v sol ether and chloroform. Distills with difficulty. *Reactions*—1 Fuming HNO_3 forms the ethyl ether of di nitro phenol (*q v*) and two isomeric tri nitro azoxy phenol ethyl ethers—2 HCl aq at 130° gives EtCl and *p* azo phenol $N_2(C_6H_4OH)_2$, but at 160° chloro *p* amido phenol is got (Schmitt, J pr [2] 19, 313)

p Oxy-benzene-azo-diphenyl sulphonic acid

[4 1] $C_6H_4(OH)-N_2-C_6H_4(C_6H_4SO_3H)$ From diazotised *p* amido diphenyl sulphonic acid and phenol (Carnelley a. Schlevelmann, C J 49, 380) Yellow dye— BaA' insol cold water

m Di-oxy-benzene-azo-diphenyl sulphonic acid

[4 2 1] $C_6H_3(OH)_2-N_2-C_6H_4(C_6H_4SO_3H)_2$ From diazotised *p* amido diphenyl sulphonic acid and resorcin (Carnelley a. Schlevelmann, C J 49, 382)— NaA' — BaA'_2

p Di-oxy-benzene-azo-diphenyl sulphonic acid

[5 2 1] $C_6H_3(OH)_2N_2C_6H_4(C_6H_4SO_3H)$ From diazotised *p* amido diphenyl sulphonic acid and hydroquinone (Carnelley a. Schlevelmann, C J 49, 382)

p Oxy benzene-azo phloroglucin

$C_6H_4(OH)-N_2-C_6H_2(OH)_3$ Two modifications appear to be formed by the action of *p* diazo phenol nitrate on phloroglucin (Weselsky a. Benedikt, B 12, 227) (a) Red crystalline powder (containing 3aq), sol alcohol (β) Green amorphous mass, inso¹ alcohol

p Oxy benzene azo resorcin *Ethyl ether*

[4 1] $C_6H_4(OEt)-N_2-C_6H_3(OH)_2$ [1 2 4] [167°] Formed by the action of *p* diazo phenol on resorcin (Liebermann a. Kostanecki, B 17, 883) Red plates. Sol alkalis. Dissolves in H_2SO_4 with a brownish red colour

Di-oxy benzene azo resorcin

[2 6 1] $C_6H_3(OH)_2-N_2-C_6H_3(OH)_2$ [1 2 4] Tetra-azo benzene

Di ethyl ether $C_6H_3(OEt)_2N_2C_6H_3(OH)_2$

[182°] Formed by combination of the di ethyl ether of *o* diazo resorcin $C_6H_3(OEt)_2N_2OH$ [6 2 1] with resorcin. Light reddish yellow needles. V sol alcohol and ether, insol water. Dissolves in conc alkali with a reddish yellow colour, which becomes a splendid carmine red on dilution (Pukall, B 20, 1151)

Di oxy benzene azo resorcin

[2 4 1] $C_6H_3(OH)_2N_2C_6H_3(OH)_2$ [1 4 2] Tetra-azo benzene

Di ethyl ether

$C_6H_3(OEt)_2-N_2-C_6H_3(OH)_2$ [193°] Formed by combination of the di ethyl ether of *p* diazo-resorcin $C_6H_3(OEt)_2N_2OH$ [4 2 1] with resorcin. Small brown needles or short prisms with green reflex. V sol alcohol, ether, and aqueous

alkalis, insol water Carmine red dyestuff (Pukall, *B* 20, 1144)

Oxy-benzene azo resorcin di sulphonic acid

Mono methyl ether

$C_6H_4(OMe)_2N_2C_6H_4(OH)_2(SO_3H)_2$ Yellow plates (Stebbins, *A C J* 5, 55) —BaA"aq needles

p **Oxy benzene p azo toluene**

$[4\ 1]\ C_6H_4Me-N_2-C_6H_4(OH)_2$ [151°] Formed by gently warming *p* diazo toluene *p* toluide with phenol, *p* toluidine being split off (Heumann & Oeconomidis, *B* 20, 905), or by warming *p* nitroso toluene with *p* toluidine acetate (Kimich, *B* 8, 1030) Orange prisms, with blue reflex

m-Di-oxy benzene *o* azo toluene

$[2\ 1]\ C_6H_4(CH_3)_2-N_2-C_6H_4(OH)_2$ [1 2 4] [195°] (W), [178°] (F) Formed by the action of *o* diazo toluene on resorcin Brownish red felted needles *Acetyl derivative* [75°] Orange yellow plates (Wallach, *B* 15, 2820, cf Fischer, *B* 20, 1579)

m Di oxy benzene *p* azo toluene

$[4\ 1]\ C_6H_4(CH_3)_2-N_2-C_6H_4(OH)_2$ [1 2 4] [184°] Prepared by the action of *p* diazo toluene on resorcin, or by gently warming *p* diazo toluene *p* toluidine with resorcin, *p* toluidine being split off (Heumann & Oeconomidis, *B* 20, 906) Reddish yellow needles sol alcohol, ether and aqueous alkalis *Acetyl derivative* [98°]

p **Oxy benzene azo toluidine**

$[5\ 2\ 1]\ C_6H_4(CH_3)(NH)_2-N_2-C_6H_4OH$ [1 4] [172°] Formed by saponification of the acetyl derivative Slender brown needles Sol alcohol and ether, v sl sol cold water Dissolves in aqueous acids and alkalis

Acetyl derivative

$C_6H_4(CH_3)(NHAc)_2-N_2-C_6H_4OH$ [253°] Prepared by diazotising the mono acetyl derivative of (1 2 4) tolylene diamine and combining it with phenol (Wallach, *B* 15, 2826) Yellow plates Sol acetic acid and in aqueous alkalis, sl sol alcohol

Di oxy benzene azo xylene (Wallach, *B* 15, 25) Formed by adding diazo xylene chloride to an alkaline solution of resorcin

Di oxy benzene azo xylene sulphonic acid

$[4\ 2\ 1]\ C_6H_4(OH)_2-N_2-C_6H_4Me_2SO_3H$ Prepared by the action of an alkaline solution of resorcin upon diazo xylene sulphonic acid Slender orange needles, sl sol hot water, m sol alcohol (Griess, *B* 11, 2197)

Oxy-carboxy-benzene azo naphthalene

$C_6H_4-N_2-C_6H_4(OH)(CO_2H)$ [1 4 3] From naphthylamine hydrochloride (9 g), HCl, water (500 g), and $NaNO_2$ (3.45 g) at 0°, the filtrate being poured into a solution of salicylic acid (6.9 g) and NaOH (6 g) in water (500 g) The liquid is filtered and the sodium salt ppd by NaCl (P F Frankland, *C J* 37, 747) Salt —NaA' S 07 (cold) Dyes silk pale yellow Reduced by Sn and HCl to naphthylamine and amido salicylic acid, $C_6H_4(NH_2)(OH)(CO_2H)$

Oxy carboxy benzene azo (β) naphthol

Mono-methyl derivative

$C_6H_4(OMe)(CO_2H)-N_2-C_{10}H_7(OH)$ Prepared by the action of diazo anisic acid on an alkaline solution of (β) naphthol (Griess, *B* 14, 2039) Small red needles or plates (containing 1½ aq) Sl sol alcohol A' Ba 4aq red minute needles

Oxy carboxy benzene-azo (β) naphthol sulphonic acid. Methyl derivative

$C_6H_4(OMe)(CO_2H)-N_2-C_{10}H_7(OH)(SO_3H)$ From diazo anisic acid and (β) naphthol sulphonic acid Brwn needles Dyes wool scarlet BaA", 8aq (Griess, *B* 14, 2039)

Oxy carboxy benzene azo (β)-naphthol (α) di-sulphonic acid Methyl derivative

$C_6H_4(OMe)(CO_2H)-N_2-C_{10}H_7(OH)(SO_3H)_2$ Prepared by the action of diazo anisic acid on an alkaline solution of (β) naphthol (α) di sulphonic acid (Griess, *B* 14, 2040) Small dark red needles (containing 8aq) Sol water, and alcohol, insol ether Dyes a blueish shade of scarlet A' HK₂ 6aq red crystals, sol hot water

Oxy carboxy benzene azo oxy-benzoic acid

Di-methyl derivative

$C_6H_4(OMe)(CO_2H)-N_2-C_6H_4(OMe)(CO_2H)$ Formed by the action of sodium amalgam on an alkaline solution of nitro anisic acid Insol water —BaA"aq (Alexeyeff, *C R* 55, 472)

Dioxy carboxy methyl phthalide azo dioxy-phthalide acetic acid

Tetra methyl derivative $C_6H_2N_2O_{12}$ i.e.

Azo meconic acetic acid [c 257°] Obtained by reduction of nitro di methoxy phthalide

acetic acid $C_6H(OMe)_2(NO_2)\left\langle\begin{array}{c} CO=O \\ CH_2CH_2CO_2H \end{array}\right\rangle$ with zinc dust and aqueous NH_3 Yellow crystals Insol water Dissolves in conc H_2SO_4 , with a deep blueish violet colour (Kleemann, *B* 20, 880)

Tri oxy carboxy toluene azo tri oxy toluic acid Anhydride of the tetra methyl derivative

[c 245] Formed by reduction of nitroso opianic acid $C_6H(OMe)_2(NO)(CHO)(CO_2H)$ with zinc dust and aqueous NH_3 Dissolves in alkalis with a yellow colour, in conc H_2SO_4 with an intense purple colour —AgA' microscopic needles (from hot water) —ETA' [101°], yellow needles, v sol alcohol, ether, and benzene (Kleemann, *B* 20, 878)

(β) Oxy naphthalene-azo hippuric acid

$CO_2HCH_2NHCO_2C_6H_4-N_2-C_{10}H_7(OH)$ Prepared by the action of diazo hippuric acid on an alkaline solution of (β) naphthol (Griess, *B* 14, 2040) Reddish yellow needles Sl. sol. alcohol, v sl sol water and ether

(α)-Oxy (α)-naphthalene-(α)-azo-naphthalene-(α)-sulphonic acid

$[4\ 1]\ C_{10}H_7(OH)-N_2-C_{10}H_7SO_3H$ [1 4] From diazotised (α) naphthylamine sulphonic acid and (α) naphthol The absorption spectrum has been examined by Hartley (*C J* 51, 198)

(β) Oxy-naphthalene azo naphthalene sulphonic acid $C_{10}H_7(OH)-N_2-C_{10}H_7SO_3H$ From diazotised (α) naphthylamine sulphonic acid and (β) naphthol (Caro, Griess, *B* 11, 2199) Reddish brown needles (from alcohol) Red dye —BaA'. The absorption spectrum has been examined by Hartley (*C J* 51, 197)

Oxy-propyl carboxy-benzene-azo-oxy-propyl benzoic acid

$CO_2HC_6H_4(CO_2H)Me_2-N_2-C_6H_4(CO_2H)Me_2CO_2H$ Formed by reduction of nitro oxy propyl benzoic acid with sodium amalgam and water (Widmann, *B* 15, 2550) Yellow plates V sl. sol.

most ordinary solvents, sl sol acetic acid — Na.A" 10aq thin red rectangular tables

Oxy-sulpho benzene azo benzoic acid

[3 1] $C_6H_4(CO_2H)-N_2-C_6H_4(OH)(HSO_3)$ [1 4 3] Prepared by the action of *m* diazobenzoic acid on an alkaline solution of phenol *o* sulphonic acid (Griess, *B* 14, 2033) Brownish red crystals (containing 4aq) Sol water, alcohol and ether Yellow dye Salts —A" HKaq yellow plates or needles, sl sol cold water —A" H₂Ba small yellow needles or plates —A" Ba aq yellow crystalline pp

Oxy sulpho benzene azo naphthalene sulphonic acid $C_{10}H_6(OH)(SO_3H)-N-C_{10}H_6SO_3H$ From diazotising (a) naphthylamine sulphonic acid and phenol sulphonic acid (Stebbins, *A C J* 2, 446)

Oxy toluene azo toluene sulphonic acid

[4 2 1] $C_6H_4(CH_3)(SO_3H)-N_2-C_6H_4(CH_3)(OH)$ [1 5 2] Formed by the action of *p* diazo toluenesulphonic acid (by diazotising *p* toluidine sulphonic acid) on an alkaline solution of *p* cresol (Nolting a Kohn, *B* 17, 358) Reddish brown crystals with violet reflection V sol water, sl sol alcohol Salts —A" Na soluble yellow plates —A" Ba 4aq small reddish brown needles, sl sol hot water

Diphenyl-azo-diphenyl

$C_6H_5C_6H_5-N_2-C_6H_5C_6H_5$ [250°] Orange red plates Sol ether, insol water, alcohol, and acetic acid Formed by reduction of *p* nitro diphenyl with sodium amalgam, and by the dry distillation of hydrazo diphenyl Prepared by oxidising an alcoholic solution of hydrazo diphenyl with $FeCl_3$ (Zimmermann, *B* 13, 1962)

Phenyl acetic azo phenyl acetic acid *exo* CARBOXY TOLUENE AZO PHENYL ACETIC ACID

Phenyl amido-benzene azo benzene sulphonic acid

[4 1] $C_6H_4(SO_3H)-N-C_6H_4NHPH$ [1 4] *Tropaeoline* O O Prepared by the action of *p* diazo benzene sulphonic acid on an alcoholic solution of diphenylamine (Witt, *C J* 35, 187, *B* 13, 262) Steel blue hair like needles Sl sol water Salts —A' K flat yellow needles, sl sol cold water —A' Na —A' NH₂ —A' NHMe₂ large yellow leaflets —A' Ba and A' Ca insoluble yellow pps

Phenyl glycollic azo phenyl glycollic acid $N_2(C_6H_4OCH_2CO_2H)_2$ [162°]

Preparation —*o* Nitrophenylglycollic acid (18.6 g) water (140 g) and Na_2CO_3 (5 g) are treated at 60° with sodium amalgam (215 g of 4 p.c. amalgam) The crystals which separate on cooling are dissolved in very little water and the acid is p.p.d by acetic acid The product is recrystallised several times from alcohol (A. Thate, *J pr* [2] 29, 161)

Properties —Orange silky needles, containing 2aq (from water or dilute alcohol) When dry (at 110°) it is brick red Sol ether, alkalis and strong acids Its solutions are yellow or red

Reactions —1 Aqueous solution is acid to litmus and gives with $AgNO_3$ a red gelatinous pp. and with $Pb(OAc)_2$ a flocculent yellow pp —2 Reduced by alcoholic NH_3 and H_2S to the corresponding hydrazo compound, the potassium salt of which, $N_2H_4(C_6H_4OCH_2CO_2K)_2$ 3aq, crystallises from alcohol in rhombohedra.

Salts —K.A" 8aq Orange plates Its solution gives with $BaCl_2$ a red crystalline pp, with $Pb(OAc)_2$ an orange flocculent pp, with

$AgNO_3$, a red flocculent pp, with $FeCl_3$ an orange pp, with $CuSO_4$ a brownish yellow pp, with $HgCl_2$, on boiling, a red pp, with $MgSO_4$ after some time, an orange crystalline pp — Na.A" 3aq —Ag.A" 3aq —Ba.A" 2aq —Ca.A" 8aq *Ethyl ether Et.A"* [111°] Red crystals

Phenyl glyoxylic azo phenyl glyoxylic acid $CO_2HCO_2C_6H_5-N_2-C_6H_5CO_2CO_2H$ *Azo benzoyl formic acid* Orange needles (containing 2aq and melting at [135°] When dry it melts at about 151° Prepared by reduction of *m* nitro benzoyl formic acid with $FeSO_4$ and KOH , yield, 50 p.c (Thompson, *B* 16, 1308) Sl sol ether and cold water, insol acidulated water, chloroform, or benzene Very stable body A cold saturated aqueous solution of the acid gives with $BaCl_2$ or $CaCl_2$ a micro crystalline pp with $AgNO_3$ a yellow flocculent precipitate —A" Ba orange crystalline pp, insol water —A" Ag orange yellow slightly soluble pp

Phenyl-pyrrol-azo-benzene

$C_6H_5N_2C=CH$
 $C_6H_5N_2C_6H_4NPh$ probably $NPh|$
 $HC=CH$

[117°] Prepared by adding diazobenzene chloride (1 mol) to phenyl pyrrol (1 mol) dissolved in alcohol containing $AcONa$ Brown prisms or long reddish yellow needles with bluish reflection V sol alcohol Dissolves in conc H_2SO_4 with a reddish violet colour, in alcoholic HCl with a blood red colour Reduced by zinc dust and NH_3 or $NaOH$ to aniline and (probably) amido phenyl pyrrol (O Fischer a Hepp, *B* 19, 2256)

Di-propyl-amido-benzene-azo-di-propyl aniline $C_3H_7N(C_3H_7)-N_2-C_3H_7N(C_3H_7)$ *Di-propyl aniline azylene* [90°] Formed by passing NO through an alcoholic solution of di propyl aniline (Lippmann a Fleissner, *B* 15, 2140, 16, 1417) Large trimetric crystals, $a b c = 1.629 \ 913$ Picrate $B''(C_6H_5(NO_2)_2OH)_2$ orange red insoluble crystals —Periodide $B''I_2$ violet glistening needles

Pyrrol-azo-benzene $C_6H_5-N_2-C_3H_7NH$
 $C_3H_7N_2C=CH$
probably $NH|$ [62°] Prepared by $HC=CH$

adding the calculated quantity of a moderately conc solution of diazo benzene chloride to a well cooled solution of pyrrol (2 pts) in alcohol (100 pts) with addition of sodium acetate (5 pts) (Fischer a Hepp, *B* 19, 2251) Yellow needles V sol alcohol, ether, and petroleum spirit, sl sol water It has basic properties Easily reduced (e.g. by zinc dust and alkalis) to aniline and (probably) amido pyrrol Readily combines in alkaline or neutral solution with a further quantity of diazo compound, giving disazo bodies Dissolves easily in dilute HCl with a reddish yellow colour Dissolves in conc H_2SO_4 with a yellow colour The platinum chloride forms small red sparingly soluble needles

Pyrrol-azo-di-methyl-aniline $C_6H_5(NMe_2)-N_2-C_3H_7NH$ [159°] Formed by combining *p* diazo-di-methyl-amido benzene with pyrrol in dilute alkaline solution Glistening green plates Dissolves in very dilute HCl with a grass-green colour, in conc HCl with a greenish yellow colour $PtCl_4$ gives a dark green amorphous pp (Fischer a Hepp, *B* 19, 2257)

Pyrrrol (α) azo naphthalene $C_{10}H_7N_2C_6H_4NH$
 $C_{10}H_7N_2C_6H_4NH$ probably

$\begin{array}{c} NH \\ | \\ HC=CH \end{array}$ [103°] Formed by

adding (α) diazo naphthalene chloride (1 mol) to pyrrrol (1 mol) dissolved in alcohol containing sodium acetate. Reddish yellow plates. V sol alcohol (O Fischer & Hepp, B 19, 2255)

Pyrrrol (β) azo naphthalene

$C_{10}H_7N_2C_6H_4NH$ probably $\begin{array}{c} NH \\ | \\ HC=CH \end{array}$

[101°] Prepared by adding (β) diazo naphthalene chloride to an alcoholic solution of pyrrrol containing sodium acetate. Gold bronzy plates (O Fischer & Hepp, B 19, 2255)

Pyrrrol p azo toluene $C_6H_4Me-N_2-C_6H_4NH$
 $C_6H_4N_2C_6H_4NH$ probably

$\begin{array}{c} NH \\ | \\ HC=CH \end{array}$ [82°] Prepared by

adding p diazo toluene chloride (1 mol) to pyrrrol (1 mol) dissolved in alcohol containing sodium acetate (Fischer & Hepp, B 19, 2254)

m-Sulphi-benzene-azo-benzene m sulphinic acid $C_6H_4(SO_2H)-N_2-C_6H_4(SO_2H)$

Azo benzene di sulphinic acid Obtained from $C_6H_4(SO_2SH)N_2C_6H_4(SO_2SH)$ by treatment with sodium amalgam (Limpricht, B 18, 1473, Bauer, A 229, 363) Yellowish amorphous mass, sl sol cold water, insol ether

Salts —NaA" 2aq —CaA" 1½aq —BaA" —PbA" These salts are readily oxidised (eg by $KMnO_4$ or I in KI) to the corresponding di sulphonates. Conc ammoniac sulphide converts them into the di thio di sulphonates. They are not reduced by sodium amalgam. Boiled with HCl the acid clots together, but conc HCl at 110° forms (2 p c of) an isomeric base

p Sulphi benzene azo benzene p sulphinic acid $SO_2H C_6H_4-N_2-C_6H_4 SO_2H$

Azo benzene p di sulphinic acid Prepared from $SO_2Cl C_6H_4-N_2-C_6H_4 SO_2Cl$ and $Ba(SH)_2$, or from $Na_2SO_3 C_6H_4N_2C_6H_4 SO_2$ SNa by sodium amalgam (Limpricht, B 18, 1475, Bauer, A 229, 369) The free acid is ppd by HCl from its salts as a bulky yellow mass, sparingly soluble in water or alcohol. Clots together when heated with acids. **Salts** —NaA" 4aq —BaA"

Sulpho benzene azo amido ethane v SULPHO-BENZENE AZO ETHYLAMINE

p-Sulpho-benzene azo di amido benzoic acid [4 1] $C_6H_4(SO_2H)-N_2-C_6H_4(NH_2)_2CO_2H$ [1 4 2 6] Formed by the action of p diazo benzene sulphinic acid on s di amido benzoic acid (Griess, B 15, 2199) Needles or plates. Sl sol water, cold alcohol, and ether. Very unstable. Decomposes by boiling with water. On reduction it gives sulphanilic acid and (5 3 2 1) tri amido benzoic acid

Sulpho-benzene-azo-aniline sulphinic acid [4 1] $C_6H_4(HSO_2)-N_2-C_6H_4(HSO_2)NH_2$ [1 ? 4]

Amido-azo-benzene disulphinic acid Formed by sulphonation of p amido benzene azo benzene-p sulphinic acid (Griess, B 15, 2187) Violet glistening needles. Sol hot water. Dyes silk and wool yellow. On reduction with tin and HCl it gives sulphanilic acid and p phenylenediamine sulphinic acid. **BaA" 7½aq** orange needles, sol hot water

m-Sulpho benzene azo benzene m sulphinic acid [3 1] $SO_2H C_6H_4-N_2-C_6H_4 SO_2H$ [1 3]

Formation —1 From nitro benzene m sulphinic acid by treatment with sodium amalgam (Claus & Moser, B 11, 782) or, better, with powdered zinc and KOH (Mahrenholtz & Gilbert, A 202, 332) —2 One of the acids got by sulphonating benzene-azo benzene at 150° (Janovsky, M 3, 244) —3 From potassium m-amido benzene sulphonate and $KMnO_4$

Monoclinic prisms, sl sol water and alcohol, insol ether

Salts —NaA" 8½aq monoclinic crystals — $(NH_4)_2A" 2aq$ —CaA" 4aq —BaA" 5aq —PbA" 4½aq

Amide [290°] Prisms, sl sol water

Ethyl ether EtA" [100°]

Chloride $C_6H_4(SO_2Cl)N_2C_6H_4(SO_2Cl)$

[166°] Acts upon cold conc aqueous $Ba(SH)_2$, thus $C_6H_4(SO_2Cl)N_2C_6H_4(SO_2Cl) + 2BaSH_2 = N_2(C_6H_4SO_2S)_2Ba + BaCl_2 + 2H_2S$ forming thio sulpho benzene azo benzene thio sulphonic acid, part of which then decomposes according to the following equation $N_2(C_6H_4SO_2S)_2Ba + H_2S = H_2N_2(C_6H_4SO_2S)_2Ba + S$ forming the barium salt of hydrazobenzene di thio di sulphonie acid (Bauer, A 229, 363)

m Sulpho benzene azo-benzene p sulphinic acid [4 1] $C_6H_4(HSO_2)-N_2-C_6H_4(HSO_2)$ [1 3] Formed, together with the p p acid, by heating benzene azo benzene with H_2SO_4 at 160° (Limpricht, B 14, 1356, Rodatz, A 215, 216), and by the oxidation of a mixture of m and p-potassium amido-benzene sulphonate with $KMnO_4$. Uncrystallised syrup. On heating with dilute HCl to 150° it gives p and m-amido benzene sulphinic acids (Limpricht, B 15, 1155)

Salts —K₂A" 2½aq yellow needles, v sol water —Ag₂A"

Chloride [125°] red needles

Amide [258°] slender yellow needles

p sulpho benzene azo benzene p-sulphinic acid [4 1] $SO_2H C_6H_4-N_2-C_6H_4 SO_2H$ [1 4]

Formation —1 By oxidising amido benzene-p sulphinic acid with $KMnO_4$ (Laar, B 14, 1928, Limpricht, B 18, 1414) —2 Among the products of the sulphonation of benzene azo benzene at 160° (Limpricht, B 14, 1356, 15, 1155, Janovsky, M 3, 242)

Properties —Ruby red needles containing 2 or 3 aq (J), or aq (L). Melts at about 60°, when dry, at about 150°. $HClAq$ at 150° gives sulphanilic acid and other products

Salts $K_2A" 2½aq$ sl sol water —NaA" — $(NH_4)_2A" - Ag_2A" - CaA" - PbA" aq - CuA" 6aq$

Chloride [222°] Red needles

Amide [above 300°], orange plates or needles, sl sol hot water

Di sulpho benzene azo benzene disulphinic acid [5 3 1] $C_6H_4(SO_2H)_2N_2C_6H_4(SO_2H)_2$ [1 3 5] From nitro benzene di sulphinic acid, zinc dust, and baryta (Reiche, A 203, 64) Very deliquescent crystals —K₂A" 8aq —Ba₂A" 5aq

Di sulpho benzene azo benzene di sulphinic acid [4 3 1] $C_6H_4(SO_2H)_2N_2C_6H_4(SO_2H)_2$ [1 3 4] From the corresponding nitro benzene di sulphinic acid, zinc dust, and baryta water (Reiche, A 203, 70) **Salts** —K₂A" 8aq —Ba₂A" 4aq

Chloride [58°], radiating needles.

Amide [222°], white needles

p-Sulpho benzene azo o cresol [4 1] $C_6H_4(SO_2H)-N_2-C_6H_3(CH_3)(OH)$ [1 5 4].

Formed by the action of diazo benzene *p* sulphonic acid (by diazotising sulphanilic acid) on an alkaline solution of *o* cresol (Nöling & Kohn, *B* 17, 864) Small reddish brown needles Sol hot water V sl sol alcohol On reduction with tin and HCl it gives sulphanilic acid and amido *o* cresol $C_6H_4(CH_3)(NH_2)(OH)$ [1 5 2]

Salts A^+Na^+ yellow soluble plates A_2Ba 3aq yellow tables, sl sol hot water

p Sulpho benzene azo *m* cresol

[4 1] $C_6H_4(SO_3H)-N_2-C_6H_3(CH_3)(OH)$ [1 2 4]

Formed by the action of diazobenzene *p* sulphonic acid on an alkaline solution of *m* cresol (Nöling & Kohn, *B* 17, 366) Small reddish brown crystals with violet reflex V sol water and hot alcohol Orange yellow dye stuff On reduction it gives sulphanilic acid and amido *m* cresol $C_6H_3(CH_3)(NH_2)(OH)$ [1 2 5]

Salts A^+Na^+ small yellow soluble needles A_2Ba yellow plates, v sl sol cold water

Sulpho benzene azo *p* cresol

[4 1] $C_6H_4(SO_3H)-N_2-C_6H_4(CH_3)(OH)$ [1 5 2]

or
$$C_6H_4(SO_3H)-N \begin{array}{c} \diagup \\ \diagdown \end{array} C_6H_4CH_3$$

Formation—1 By the action of *p* diazo benzene sulphonic acid on an alkaline solution of *p* cresol—2 By sulphonation of benzene-azo *p* cresol (Nöling & Kohn, *B* 17, 355) Yellowish brown plates with violet reflex V sol water and hot alcohol Dyes silk and wool orange yellow On reduction with tin and HCl it yields sulphanilic acid and amido-*p* cresol $C_6H_4(CH_3)(NH_2)(OH)$ [1 3 4]

Salts A^+Na^+ soluble yellow plates A^+K^+ 3aq— A^+Mg^{2+} 5aq— A_2Ba yellowish brown tables, sl sol hot water

p Sulpho-benzene azo- ψ cumenol

[4 1] $C_6H_4(HSO_3)-N_2-C_6H(CH_3)_2OH$ [1 3 5 6 2]

Formed by combining diazo benzene *p* sulphonic acid with ψ cumenol [70]— KA^+ 2aq orange needles (Liebermann & Kostanecki, *B* 17, 867)

Sulpho-benzene azo ethylamine Potas

sium salt $C_6H_4(SO_3K)-N_2-CH(NH_2)CH_3$ From the potassium salt of the corresponding nitro compound by reducing with ammonium sulphide (Kappeler, *B* 12, 2285) Silvery plates (from water), sl sol water, insol Na_2CO_3 4aq $NaOH$ 4aq dissolves it with crimson colour

m Sulpho benzene azo (α) naphthol

[8 1] $C_6H_4(HSO_3)-N_2-C_{10}H_7OH$ [1 4]

Prepared by the action of an alkaline solution of (α) naphthol on *m* diazobenzene sulphonic acid (Griess, *B* 11, 2197) Small greenish leaflets Sl sol cold water and cold alcohol

m-Sulpho benzene azo (β) naphthol

[3 1] $C_6H_4(HSO_3)-N_2-C_{10}H_7(OH)$ [1 2] or

$$C_6H_4(HSO_3)-HN \begin{array}{c} \diagup \\ \diagdown \end{array} C_{10}H_6$$
 Prepared by the action of an alkaline solution of (β) naphthol on *m* diazobenzene sulphonic acid (Griess, *B* 11, 2197) Slender red needles V sol alcohol and water BaA^+ 5aq yellowish red scales Sl sol water

p Sulpho benzene-azo (α) naphthol

[4 1] $C_6H_4(SO_3H)-N_2-C_{10}H_7(OH)$ [1 4] *Tropaeoline* OOO , No 1 From *p* diazobenzene sulphonic acid and an alkaline solution of (α) naphthol (Liebermann & Jacobsen, *A* 211, 61) Orange

dye Its absorption spectrum is given by Hartley (*C J* 51, 184)

p Sulpho benzene azo (β) naphthol

[4 1] $C_6H_4(SO_3H)-N_2-C_{10}H_7(OH)$ [1 2] or

$$C_6H_4(SO_3H)-HN \begin{array}{c} \diagup \\ \diagdown \end{array} C_{10}H_6$$
 Tropaeoline OOO No 2

From *p* diazo benzene sulphonic acid and (β) naphthol (W & Miller, *B* 13, 268, Hofmann, *B* 10, 1378, Griess, *B* 11, 2198) The absorption spectrum has been examined by Hartley (*C J* 51, 185)

p Sulpho-benzene azo (β) naphthol sulphonic acid [4 1] $C_6H_4(HSO_3)-N_2-C_{10}H_7(HSO_3)OH$ Prepared by the action of *p* diazobenzene sulphonic acid on an alkaline solution of (β) naphthol sulphonic acid (Griess, *B* 11, 2198, Stebbins, *A C J* 2, 236) Yellowish red crystals Excessively soluble in water BaA^+ 7aq difficultly soluble orange microscopic needles

p Sulpho-benzene azo (α) naphthylamine

[4 1] $C_6H_4(HSO_3)-N_2-C_{10}H_7NH_2$ [1 4] From diazotised sulphanilic acid and (α) naphthylamine (Griess, *B* 12 427) Brownish violet needles, v sl sol boiling water Its acid solutions have a deep magenta colour (Griess's test for nitrous acid), its alkaline solutions are orange On reduction with tin and HCl it gives sulphanilic acid and (1, 4) naphthylene diamine

Salts KA^+ 3aq brownish yellow plates, sol hot water— BaA^+ 3aq sparingly soluble brown needles (Griess, *B* 15, 2190)

p Sulpho benzene azo (β) naphthylamine

[4 1] $C_6H_4(HSO_3)-N_2-C_{10}H_7NH_2$ [1 2] or

$$C_6H_4(HSO_3)-HN \begin{array}{c} \diagup \\ \diagdown \end{array} C_{10}H_6$$
 Formed by the

action of *p* diazo benzene sulphonic acid on (β) naphthylamine hydrochloride (Griess, *B* 15, 2191) Small yellowish red needles Sl sol, water, v sol hot alcohol, insol ether On reduction with tin and HCl it gives sulphanilic acid and (1, 2) naphthylene diamine— KA^+ 7aq orange plates, sol hot water

Sulpho benzene azo (α) naphthylamine sulphonic acid $C_6H_4(SO_3H)N_2C_{10}H_7(SO_3H)NH_2$ [1 4 2]

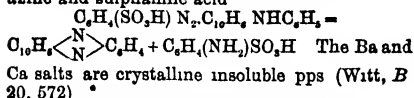

Formed by the action of *p* diazo benzene sulphonic acid on (α) naphthylamine sulphonic acid (Griess, *B* 15, 2194) Needles or plates Sol water and alcohol, insol ether, dyes silk and wool orange— BaA^+ 7aq red needles or plates, sol hot water— BaH_2A^+ 8aq sparingly soluble violet brown needles

p-Sulpho benzene azo (β) naphthyl phenyl amine $C_6H_4(SO_3H)-N_2-C_{10}H_7NHC_6H_5$ or $C_6H_4(SO_3H)HN_2C_{10}H_6$

Prepared by slowly

$$N \begin{array}{c} \diagup \\ \diagdown \end{array} C_6H_5$$
 adding dry *p* diazobenzene sulphonic acid (18 g) to a solution of phenyl (β) naphthylamine (22 g) in glacial acetic acid (100 c c) at c 50°, followed by finely powdered dry K_2CO_3 (7 g), the compound separates out in glistening red needles of the potassium salt It is a splendid scarlet dyestuff, but is very fugitive in light The potassium salt is easily soluble in water, when cold its solution solidifies to a transparent red jelly HCl precipitates the free acid By $SnCl_2$ it is reduced to phenyl α naphthylene diamine and sulphanilic acid By boiling with dilute,

mineral acids it is converted into naphthophenazine and sulphamic acid

p Sulpho benzene azo nitro isobutane $\text{C}_6\text{H}_4(\text{HSO}_3)_2\text{N}_2\text{C}_4\text{H}_9(\text{NO}_2)$ Prepared by the action of *p* diazobenzene sulphonic acid on an alkaline solution of nitro isobutane—KA' aq orange yellow needles Soluble in alkalis to a red solution Dyes silk orange (Kappeler, B 12, 2288)

p Sulpho benzene azo nitro ethane $\text{C}_6\text{H}_4(\text{HSO}_3)_2\text{N}_2\text{C}_2\text{H}_5(\text{NO}_2)$ Prepared by the action of *p* diazobenzene sulphonic acid on an alkaline solution of nitro ethane AK golden yellow leaflets, sparingly soluble in cold water, soluble in alkalis to a blood red solution (Kappeler, B 12, 2286)

p Sulpho benzene azo nitro methane $\text{C}_6\text{H}_4(\text{HSO}_3)_2\text{N}_2\text{CH}_3(\text{NO}_2)$ Prepared by the action of *p* diazobenzene sulphonic acid on an alkaline solution of nitro methane—KA' 3aq orange needles Dyes silk orange (Kappeler, B 12, 2286)

p Sulpho-benzene-azo-nitro propane $\text{C}_6\text{H}_4(\text{HSO}_3)_2\text{N}_2\text{C}_3\text{H}_7(\text{NO}_2)$ Prepared by the action of *p* diazobenzene sulphonic acid on an alkaline solution of nitro isopropane AK light yellow leaflets Has no dyeing power Insoluble in alkalis (Kappeler, B 12, 2287)

p Sulphobenzene-azo orcin [4 1] $\text{C}_6\text{H}_4(\text{HSO}_3)_2\text{N}_2\text{C}_6\text{H}_3(\text{OH})_2$ Small yellowish red needles Difficultly soluble in water Prepared by the action of an alkaline solution of orcin upon *p* diazobenzene sulphonic acid—KA' 2aq (Griess, B 11, 2196)

p Sulpho-benzene azo o oxy benzoic acid [4 1] $\text{C}_6\text{H}_4(\text{SO}_3\text{H})\text{N}_2\text{C}_6\text{H}_4(\text{OH})(\text{CO}_2\text{H})$ [1 4 5] From diazotised sulphamic acid and an alkaline solution of salicylic acid Golden needles, sl sol hot water (Griess, B 11, 2196, Stebbins, B 13, 716) —BaHA'₂

p Sulpho benzene azo-oxy-quinoline $\text{C}_6\text{H}_4(\text{HSO}_3)_2\text{N}_2\text{C}_8\text{H}_6(\text{OH}) \begin{array}{c} \text{(B 1)} \\ \text{(B 4)} \end{array} \begin{array}{c} \text{CH CH} \\ \diagup \quad \diagdown \\ \text{N} \quad \text{CH} \end{array}$ Formed

by the combination of *p* diazo benzene sulphonic acid with (B 4) oxy-quinoline (Fischer a Renouf, B 17, 1642) Small needles Orange dye

p Sulpho-benzene azo phenol disulphonic acid $\text{C}_6\text{H}_4(\text{SO}_3\text{H})_2\text{N}_2\text{C}_6\text{H}_3(\text{SO}_3\text{H})(\text{OH})$ Formed by heating azoxybenzene with fuming H_2SO_4 Small soluble flat red needles with green lustre On reduction it gives *p* amido benzene-sulphonic acid and amido phenol di sulphonic acid

Salts—A'''K₂ 3aq yellow microscopic needles, easily soluble Bromine water gives tri-bromo phenol—A'Ag unstable red pp—A'''Ba₂ 7aq brown crystalline pp—A'''Pb₂ 1 $\frac{1}{2}$ aq

Chloride red crystalline powder [220°] Amide yellow plates [260°], sparingly soluble in alcohol (Limpricht, B 15, 1297, Wilsing, A 215, 284)

p-Sulpho benzene azo xylene [4 1] $\text{C}_6\text{H}_4(\text{SO}_3\text{H})\text{N}_2\text{C}_8\text{H}_7\text{Me}_2\text{OH}$ [1 3 5-2] Formed by combining diazobenzene-*p* sulphonic acid with *m* xylene $\text{C}_6\text{H}_4\text{Me}_2(\text{OH})$ [1 3 4]

(Grevink, B 19, 148, Dyes wool and silk a brownish yellow from an acid bath On reduction it yields sulphamic acid and o-amido-*m* xylene $\text{C}_6\text{H}_4\text{Me}_2(\text{NH}_2)(\text{OH})$ [5 8 1 2]

Sulpho-*carboxy*-benzene-azo-(β)-naphthol (a) di sulphonic acid

$\text{C}_6\text{H}_4(\text{CO}_2\text{H})(\text{SO}_3\text{H})\text{N}_2\text{C}_{10}\text{H}_7(\text{OH})(\text{SO}_3\text{H})$ Prepared by the action of *m* diazo sulphobenzoic acid on an alkaline solution of (β)-naphthol (a) di sulphonic acid (Griess, B 14, 2038) Orange needles or prisms V sol water and alcohol, insol ether Salts—A'''H₂Ba₂ 3aq slightly soluble yellow needles. A'''Ba₂ 5aq nearly insoluble red crystalline pp

Sulpho carboxy benzene azo-oxy-naphthoic acid $\text{C}_6\text{H}_4(\text{SO}_3\text{H})(\text{CO}_2\text{H})\text{N}_2\text{C}_{10}\text{H}_7(\text{OH})(\text{CO}_2\text{H})$ Prepared by the action of diazotised benzoic acid on an alkaline solution of (a) oxy naphthoic acid (Griess, B 11, 2199) Brown microscopic needles or leaflets Sl sol water

Sulpho naphthalene azo (β) naphthol-disulphonic acid $\text{C}_{10}\text{H}_7(\text{SO}_3\text{H})\text{N}_2\text{C}_{10}\text{H}_7(\text{OH})(\text{SO}_3\text{H})_2$ Crumson dye (Stebbins, A C J 2, 446)

Sulpho toluene azo toluene sulphonic acid [2 4 1] $\text{C}_6\text{H}_4\text{Me}(\text{SO}_3\text{H})\text{N}_2\text{C}_6\text{H}_4\text{Me}(\text{SO}_3\text{H})$ [1 2 4] From potassium o-toluidine sulphonate (of Gerver) and KMnO_4 (Kornatzki, A 221, 183) Small red prisms, grouped in tables, very soluble in water and in alcohol K₂A'' red plates grouped in clumps—BaA''aq—CaA''3aq—PbA''aq

Chloride [218°] Red needles (from C_6H_4) Amide [250°] Tables (from aqueous NH_3)

Sulpho toluene azo toluene sulphonic acid [2 5 1] $\text{C}_6\text{H}_4\text{Me}(\text{SO}_3\text{H})\text{N}_2\text{C}_6\text{H}_4\text{Me}(\text{SO}_3\text{H})$ [1 2 5] Azo toluene disulphonic acid From o-toluene sulphonic acid, zinc dust, and KOHAq (Neale, A 203, 74), or from o-toluidine sulphonic acid of Hayduck and KMnO_4 (Kornatzki, A 221, 181) Salts—BaA''4aq—K₂A''2 $\frac{1}{2}$ aq—CaA''5aq—PbA''4aq

Chloride [220°] Red prisms Amide [300°] Red powder

Sulpho-toluene-azo-toluene sulphonic acid [4 6 1] $\text{C}_6\text{H}_4\text{Me}(\text{SO}_3\text{H})\text{N}_2\text{C}_6\text{H}_4\text{Me}(\text{SO}_3\text{H})$ [1 4 6] From potassium *p*-toluidine sulphonate and KMnO_4 (Kornatzki, A 221, 182) Salt—BaA''3aq

Sulpho toluene azo-toluene-sulphonic acid [4 5 1] $\text{C}_6\text{H}_4\text{Me}(\text{SO}_3\text{H})\text{N}_2\text{C}_6\text{H}_4\text{Me}(\text{SO}_3\text{H})$ [1 4 5] From *p* nitro toluene o sulphonic acid, KOHAq, and zinc dust (Neale, A 203, 80), or from potassium *p*-toluidine sulphonate and KMnO_4 K₂A''3aq—CaA''3aq—BaA''aq—PbA''2aq

Chloride [194°] Red crystals Amide [270°] Yellow

Exo Sulpho toluene azo-toluene azo-sulphonic acid $\text{SO}_3\text{HCH}_2\text{C}_6\text{H}_4\text{N}_2\text{C}_6\text{H}_4\text{CH}_2\text{SO}_3\text{H}$ by boiling with zinc dust and KOH or Ba(OH)₂—2 From $\text{C}_6\text{H}_4(\text{NH}_2)\text{CH}_2\text{SO}_3\text{K}$ and KMnO_4 (Mohr, A 221, 223) Salts—K₂A''3aq orange plates—BaA''1 $\frac{1}{2}$ aq—Ag₂A''aq

Chloride. [149°]

Sulpho-xylene azo di bromo naphthol $\text{C}_6\text{H}_4\text{Me}_2(\text{SO}_3\text{H})\text{N}_2\text{C}_{10}\text{H}_6\text{Br}_2(\text{OH})$ From *p*-diazoxylene sulphonic acid and di-bromo-(α)-naphthol (Stebbins, jun, A C J 2, 446) Sol. hot water, forming a scarlet solution

Sulpho-xylene azo (a) naphthol $\text{C}_6\text{H}_4\text{Me}_2(\text{SO}_3\text{H})\text{N}_2\text{C}_{10}\text{H}_7\text{OH}$ From *p* diazo-

xylene sulphonic acid and (a) naphthol (Stebbins, jun, *A C J* 2, 446) Brown dye, sol water

Sulpho-*m*-xylene-azo (8) naphthol
[1 8 6 4] $C_6H_4Me_2(SO_3H)-N_2-C_{10}H_7(OH)$

Formed by the action of diazo *m* xylene sulphonic acid (from *m* xylidine sulphonic acid) upon an alkaline solution of (8) naphthol (Nöling a Kohn, *B* 19, 139) Metallic green crystals. Sl sol cold water. Dyes wool and silk from an acid bath a yellowish shade of scarlet.

Salts— A^+Na^+ red soluble plates— A^+Ba sl sol hot water

Sulpho xylene azo (8) phenanthrol From *p* diazo xylene sulphonic acid and (8) phenanthrol (Stebbins, *A C J* 2, 446) Reddish brown dye

Sulpho-xylene-azo-resorcin v DR OXY BENZENE AZO XYLENE SULPHONIC ACID

Sulpho xylene azo xylene sulphonic acid
[2 4 5 1] $C_6H_4Me_2(SO_3H)-N-C_6H_4Me_2(SO_3H)$

[1 2 4 5] Formed by oxidising (1, 3, 6, 4) xylidine sulphonic acid with dilute $KMnO_4$ (Jacobsen a Ledderhoge, *B* 16, 194), or by reducing (6, 1, 3, 4) nitro xylene sulphonic acid with zinc-dust and $NaOH$ (Lumprecht, *B* 18, 2191) Orange plates, v sol water, sl sol acids

Salts— $K_2A^+4aq-KHA^+4aq$

Chloride [86°], red crystals

Amide [174°]

***m* Thio-sulpho-benzene azo benzene sulphonic acid** [3 1] $(HSO_3)C_6H_4N_2C_6H_4(SO_3H)$ [1 3] [below 100°] A solution of the barium thio sulpho benzene azo (or hydrazo) benzene thio sulphonate gives, on evaporation, S and the salt of the present acid. This salt forms red crusts which are sparingly soluble in water, but are converted by boiling Na_2CO_3 into the soluble Na salt, whence HCl separates the free acid as a bulky flocculent pp hardly soluble in water, but resinified by boiling with it. It is soluble in alcohol. Oxidised by $KMnO_4$ to $N_2(C_6H_4SO_3K)_2$

Salts— BaA^+ (dried at 140°)— K_2A^+ — Na_2A^+ *zaq*— PbA^+ (dried at 130°)

Isomer—Ammonia converts the acid into a brown amorphous base, isomeric with it (Lumprecht, *B* 18, 1472, Bauer, *A* 229, 360)

***m* Thio sulpho benzene-azo-benzene-*m* thio-sulphonic acid**

[3 1] $HSO_3C_6H_4N_2C_6H_4SO_3SH$ [1 3] [91°–93°] From its salts by adding *glacial* acetic acid. A voluminous yellow pp insol water or alcohol, and resinified when boiled with them (Lumprecht, *B* 18, 1471, Bauer, *A* 229, 358)

Barium salt— BaA^+ *5aq* One of the products of the action of baric sulphhydrate upon the chloride of sulpho benzene-azo benzene-sulphonic acid (v) V sol hot water, sl sol cold water, nearly insoluble in alcohol. Yellow ammoniac sulphide slowly converts it into the corresponding hydrazo compound

Na_2A^+ *zaq* Its solutions give amorphous pps with salts of Cu, Pb, Ag and Fe^{++}

***p* Thio-sulpho-benzene-azo benzene-thio-sulphonic acid**

[4 1] $C_6H_4(SO_3SH)-N_2-C_6H_4(SO_3SH)$ [1 4] Yellow amorphous solid. Sl sol water and alcohol. Formed by the action of a saturated aqueous solution of $Ba(SH)_2$ upon the chloride of sulpho benzene azo benzene sulphonic acid. Na_2A^+ *zaq* very soluble yellow warty crystals

— BaA^+ yellow warty crystals, sol hot water (Lumprecht, *B* 18, 1474, Bauer, *A* 229, 368)

***p* Toluene azo aceto acetic acid**

[4 1] $C_6H_4(CH_3)-N_2-CH(COCH_3)CO_2H$ [188°] *Ethyl ether* A^+Et [70°], yellow needles. Formed by the action of *p* diazo toluene chloride on an alcoholic solution of sodio acetacetic ether (Zablin, *B* 11, 1419, Richter a Munzer, *B* 17, 1929)

***p* Toluene azo-acetone**
[4 1] $C_6H_4(CH_3)-N_2-CH_2COCH_3$ [115°]

Formation—1 By heating *p* toluene azo aceto acetic ether with a dilute alcoholic solution of $NaOH$ —2 By heating *p* toluene azo aceto acetic acid above its melting point, CO_2 being evolved (Richter a Munzer, *B* 17, 1929) Yellow needles. Sl sol water

Toluene azo bromo toluene
 $C_6H_4Me-N_2-C_6H_4BrMe^+$ *Bromo azo toluene* [136°] (P), [138 5°] (J a E) Formed by brominating *p* toluene *p* azo toluene (Petrieff, *B* 6, 557, Janovsky a Erb, *B* 20, 363) Golden plates or needles. Reduces to a hydrazo compound [119°]

Toluene azo chloro toluene
[4 1] $C_6H_4Me-N_2-C_6H_4MeCl$ [1 5 2] [97°] Formed by the action of cuprous chloride upon diazotised *p* toluene *p* azo toluidine (from *p* toluidine), yield, 20 p c of theoretical. Brown plates. V sol alcohol, ether, and benzene (Mentha, *B* 19, 3026)

***p* Toluene azo *p* cresol**
[4 1] $C_6H_4(CH_3)-N_2-C_6H_3(CH_3)(OH)$ [1 5 2] [113°] Obtained by the action of *p* diazo toluene chloride on an alkaline solution of *p*-cresol. It is also formed by diazotising *p* toluene azo *p* toluidine $C_6H_4(CH_3)-N_2-C_6H_3(CH_3)(NH_2)$ and boiling the product with water (Nöling a Kohn, *B* 17, 354) Reddish needles or yellow tables. V sol ether, benzene, and hot alcohol. *Acetyl derivative* [91°], yellow needles. *Benzoyl derivative* [95°], small yellow needles

***o* Toluene azo ethyl (8) naphthyl amine**
[2 1] $C_6H_4(CH_3)-N_2-C_{10}H_7(NH_2)$ [1 2] [132°] Formed by heating ethyl (8) naphthyl nitros amine with an acetic acid solution of *o* toluidine (Henriques, *B* 17, 2670)

***p* Toluene azo ethyl (8) naphthyl amine**
[4 1] $C_6H_4(CH_3)-N_2-C_{10}H_7(NH_2)$ [1 2] [113°] Formed by heating ethyl (8) naphthyl nitros amine with an acetic acid solution of *p*-toluidine (Henriques, *B* 17, 2670)

***o* Toluene-*p* azo-(a)-naphthol**
[2 1] $C_6H_4Me-N_2-C_{10}H_6(OH)$ [1 4] (a) *Naphthoquinone o tolyl hydrazide* [146°]

Formation—1 From *o* diazo toluene and (a) naphthol—2 From (a) naphthoquinone and *o* tolyl hydrazine

Properties—Red glistening needles. V sol. alcohol, acetic acid, and benzene, less readily in benzoline. HNO_3 converts it into di nitro (a)-naphthol. With HCl and HBr it gives dark blue metallic glistening salts. Dissolves in dilute $NaOH$

Methylether $C_{11}H_{11}N_2(OMe)$ [93°], reddish-brown glistening needles, easily soluble in ordinary solvents

Ethyl ether $C_{11}H_{11}N_2(OEt)$ [94°], red plates or dark thick needles (Zincke a Rathgen, *B* 19, 2488)

p-Toluenes-p-azo (α)-naphthol

[4 1] $C_6H_4Me N_2 C_{10}H_7(OH)$ [1 4] (α) *Naphthoquinone p tolyl hydrazide* [208°]

Formation—1 From *p* diazo toluene and (α) naphthol—2 From (α) naphthoquinone and *p*-tolyl hydrazine

Properties—Metallic glistening dark-red spangles V sol acetone, aniline, and hot nitrobenzene, sl sol alcohol, acetic acid, and benzene Dissolves in dilute NaOH HNO_3 converts it into di nitro (α) naphthol Not attacked by bromine in acetic acid solution With mineral acids it forms salts which separate in bluish green metallic glistening plates By heating with baryta water it is rendered insoluble in alkalis— $BHCl$ — $BHBr$

Methyl ether $C_6H_4Me N_2 C_{10}H_6(OMe)$ [104°]

Ethyl ether $C_6H_4Me N_2 C_{10}H_6(OEt)$ [127°], large red crystals or red needles

Acetyl derivative $C_{11}H_{13}N(OAc)$ [102°], fine yellowish needles (from benzoline) (Zincke a Rathgen, B 19, 2486)

o-Toluene o-azo-(α)-naphthol

[2 1] $C_6H_4Me N_2 C_{10}H_7(OH)$ [2 1] or

$O \begin{array}{c} \diagup \\ \diagdown \end{array} C_{10}H_6$ (β) *Naphthoquinone o-C₆H₄Me HN₂* [156°] Formed by the action of o tolyl hydrazine upon (β) naphthoquinone

Glistening red plates Easily soluble in ordinary solvents HNO_3 converts it into di nitro (α) naphthol Bromine gives a di bromo derivative [254°] (Zincke a Rathgen, B 19, 2492)

p-Toluene-o-azo (α)-naphthol

[4 1] $C_6H_4Me N_2 C_{10}H_7(OH)$ [2 1] or

$C_6H_4Me N_2 H \begin{array}{c} \diagup \\ \diagdown \end{array} C_{10}H_6$ (β) *Naphthoquinone p tolyl hydrazide* [145°] Formed by the action of *p* tolyl hydrazine upon (β) naphthoquinone

Red slender glistening needles V sol alcohol, benzene, and acetic acid, sparingly in benzoline By $SnCl_4$ it is reduced to (β) amido (α) naphthol and *p* toluidine HNO_3 converts it into di nitro (α) naphthol Bromine gives a di bromo derivative [236°] (Zincke a Rathgen, B 19, 2491)

p-Toluene o-azo (β) naphthol

[4 1] $C_6H_4Me N_2 C_{10}H_7(OH)$ [1 2] or

$C_6H_4Me N_2 H \begin{array}{c} \diagup \\ \diagdown \end{array} C_{10}H_6$ [135°] Formed by combination of *p* diazo toluene with (β) naphthol Thick red needles or tables V sol alcohol, benzene, acetic acid, and acetone Insoluble in cold dilute NaOH With acids it forms unstable salts Bromine in acetic acid converts it into a di bromo derivative [190°] HNO_3 gives di nitro-(β) naphthol (Zincke a Rathgen, B 19, 2490)

o-Toluene-o-azo (β) naphthol

[2 1] $C_6H_4Me N_2 C_{10}H_7(OH)$ [1 2] or

$C_6H_4Me N_2 H \begin{array}{c} \diagup \\ \diagdown \end{array} C_{10}H_6$ [131°] Formed by combination of *o* diazo toluene with (β) naphthol Fine red needles or plates Insol cold dilute NaOH With acids it forms unstable salts HNO_3 converts it into di nitro (β) naphthol Bromine forms a mono bromo derivative [167°] (Zincke a Rathgen, B 19, 2491, Fischer, B 20, 1580)

p-Toluene-azo (β)-naphthol disulphonic acid $C_6H_4Me-N_2-C_{10}H_6(OH)(SO_3H)_2$ From sodium-(β) naphthol disulphonate and *p* diazo toluene

nitrate (Stebbins, A C J 2, 236, C N 42, 44) Red leaflets, v sol water Scarlet dye The corresponding o compound dyes yellower, the *m*-compound, redder

p-Toluene azo (α) naphthylamine

[4 1] $C_6H_4(CH_3)-N_2-C_{10}H_7NH_2$ [1 4] [145°]. Prepared by the action of *p*-diazo toluene sulphate on (α) naphthylamine (Weselsky a Benedikt, B 12, 229) Red leaflets, insol water.— $B_2H_2SO_3$ 3aq steel blue needles.

o-Toluene-azo-nitro-ethane

[2 1] $C_6H_4Me-N_2-CH(NO_2)CH_3$ [88°] From *o* diazo toluene nitrate and potassium nitro-ethane (Barbieri, B 9, 387) Unstable orange needles— NaA' golden spangles

p-Toluene azo nitro-ethane [133°] Prepared like the preceding (B) Orange prisms with steel blue lustre Its alkaline solutions are deep red

Toluene azo nitro-toluene

$C_6H_4Me-N_2-C_6H_4(NO_2)Me$ *Nitro azo toluene* [114°] Among the products of the nitration of toluene azo toluene dissolved in glacial acetic acid (Janowsky a Erb, B 20, 363) Orange monochlome needles (from 90 p c alcohol)

Toluene azo nitro-toluene [76°] From toluene-azo toluene and HNO_3 (S G 1 4) (Petrif, B 6, 557)

o-Toluene azo-orein

$C_6H_4Me-N_2-C_6H_4Me(OH)_2$ [203°—206°] From *o* diazo toluene and orein (Scichlone, G 12, 223) Red brown crystals

p-Toluene azo thymol sulphonic acid

$C_6H_4(CH_3)-N_2-C_6H_4(CH_3)(C_2H_5)(HSO_3)OH$ Prepared by the action of *p* diazo toluene-chloride on sodium thymol sulphionate— $A'Na$ slender yellow needles, sol alcohol and hot water, almost insoluble in cold water (Stebbins, B 14, 2795)

o-Toluene-o-azo-toluene

[2 1] $Me C_6H_4-N_2-C_6H_4Me$ [1 2] *o Azo toluene* [55°]

Preparation—1 By distilling *o* nitro toluene with alcoholic potash, or by reducing it with zinc dust and alcoholic NaOH (Schultz, B 17, 497) Cannot be prepared by reducing *o* nitro-toluene in alcoholic solution with sodium amalgam (Perkin)—2 From *o* toluidine and $KMnO_4$ (Hoogewerf a van Dorp, B 11, 1203)

Properties—Dark red trimetric prisms, $a b c = 2.225 \times 1.1708$ Volatile with steam Gives a mono nitro- derivative [$c 67^\circ$], a di-nitro-derivative, [142°], and a tri nitro-derivative that decomposes before melting (Petrif)

m-Toluene m-azo-toluene

[8 1] $Me C_6H_4-N_2-C_6H_4Me$ [1 3] *m Azo-toluene* [51°] (G), [55°] (B) From *m*-nitro toluene by boiling with alcoholic KOH (Goldschmidt, B 11, 1624), or by treatment with zinc dust and alcoholic KOH (Barsilowsky, B 10, 2097, A 207, 114) Orange red trimetric tables, $a b c = 85 \times 1.54$ V sol alcohol

p-Toluene p-azo toluene p Azo toluene

[4 1] $Me C_6H_4-N_2-C_6H_4Me$ [1 4] [144°]

Formation—From *p* toluidine and CrO_3 in glacial acetic acid, or by treating a solution of *p* toluidine in chloroform with bleaching powder (R Schmitt, J pr [2] 18, 198) Or by oxidising *p* toluidine with H_2O_2 (Leeds, B 14, 1882), or benzoyl peroxide Cannot be prepared by distilling *p* nitro toluene with alcoholic potash

(Perkin), for by such treatment a red condensation product is obtained which on further reduction gives di amido di phenyl ethylene [227°] (Bender & Schultz, *B* 19, 3237)

Preparation—*p* Nitro toluene (20g) in alcohol is treated with sodium amalgam added gradually, the mixture being frequently cooled. The brown solid that separates is crystallised from glacial acetic acid (Perkin, *C J* 37, 554, cf Jaworsky, *J pr* 94, 283, Werigo, *Z* 1864, 640, Alexejeff, *Z* 1866, 269, Melms, *B* 3, 549, Schultz, *B* 17, 472)

Properties—Red trimetric needles. *V* sol alcohol and ligroin, sl sol alcohol. Slowly reduced to hydrazo toluene by ammonium sulphide. In alcoholic solution it is reduced by SnCl_2 and HCl to toluene [91°] (*S*). Nitric acid forms a mono nitro derivative, [76°], a dinitro derivative [110°], and a tri nitro derivative [201°] (Petrieff)

o Toluene *m* azo toluene

[2 1] $\text{C}_6\text{H}_4(\text{CH}_3)-\text{N}_2-\text{C}_6\text{H}_4(\text{CH}_3)$ [1 3] Obtained by diazotising *o* toluene azo *o* toluene (from *o* toluene) and treating the diazo compound with alcohol (Schultz, *B* 17, 470) Red oil Volatile with steam. *V* sol alcohol and ether. By SnCl_2 and HCl in alcoholic solution it is converted into an unsymmetrical toluene

m Toluene *p* azo toluene

[4 1] $\text{C}_6\text{H}_4(\text{CH}_3)-\text{N}_2-\text{C}_6\text{H}_4(\text{CH}_3)$ [1 3] [58°] **Formation**—1 By the action of zinc dust and alcohol upon *o* diazo toluene azo toluene—2 By the action of Ag_2O and alcohol upon the compound $\text{C}_{10}\text{H}_{11}\text{N}_3$, the reduction product of *o* diazo toluene azo toluene (Zincke & Lawson, *B* 19, 1458) Brownish red plates. *V* sol alcohol, ether and benzene

o Toluene azo *o* toluene

[2 1] $\text{C}_6\text{H}_4(\text{CH}_3)-\text{N}_2-\text{C}_6\text{H}_4(\text{CH}_3)(\text{NH}_2)$ [1 3 4] [100°] Formed by passing nitrous acid gas into *o* toluene (Nietzki, *B* 10, 662) Trimetric crystals, $a b c = 1.0416 : 1.13268$ Heated with aniline hydrochloride and alcohol at 160° it forms a red dye resembling saffranin

Salts— B^+HCl^- orange tables— $\text{B}^+\text{H}_2\text{PtCl}_6^-$

Acetyl derivative

$\text{C}_6\text{H}_4-\text{N}_2-\text{C}_6\text{H}_4(\text{NHAc})$ [185°] Slender red needles, *v* sol alcohol (Schultz, *B* 17, 469)

m Toluene azo *m* toluene

[8 1] $\text{C}_6\text{H}_4\text{Me}-\text{N}_2-\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)$ [1 2 4] [80°] Formed by treating an alcoholic solution of *m* toluene with nitrous acid gas (Nietzki, *B* 10, 1155) Golden needles— B^+HCl^- — $\text{B}^+\text{H}_2\text{PtCl}_6^-$ Gives *p* tolylene diamine, [64°], on reduction

p-Toluene azo *o* toluene

[4 1] $\text{C}_6\text{H}_4\text{Me}-\text{N}_2-\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)$ [1 3 4] [128°] From *p*-diazotoluene toluene and *o* toluene hydrochloride (Nietzki, *B* 10, 832) Gives *p* tolylene diamine, [64°], on reduction Heated with aniline hydrochloride it forms a violet dye **Salts**— B^+HCl^- — $\text{B}^+\text{H}_2\text{PtCl}_6^-$

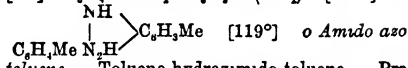

p Toluene azo *m* toluene

[4 1] $\text{C}_6\text{H}_4\text{Me}-\text{N}_2-\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)$ [1 2 4] [127°] From *p*-diazotoluene toluene and *m* toluene hydrochloride in alcoholic solution (Nietzki, *B* 10, 1156) Large yellow plates Gives *p* tolylene diamine [64°] on reduction

Salts— B^+HCl^- — $\text{B}^+\text{H}_2\text{PtCl}_6^-$

p Toluene azo *p* toluene

[4 1] $\text{C}_6\text{H}_4\text{Me}-\text{N}_2-\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)$ [1 5 2] or

Toluene hydrazimido toluene Prepared by heating *p* diazo toluene *p* toluene (diazotoluene), dissolved in 5 or 6 times its weight of melted *p* toluene, with *p* toluene hydrochloride (1 mol) at 65° for 12 hours Orange red glistening needles. *V* sol hot alcohol, acetic ether, and benzene. On reduction it gives *p* toluene and tolylene *o* diamine. CrO_3 oxidises it in acetic acid solution to toluene azimido toluene $\text{C}_6\text{H}_4-\text{N}_2-\text{C}_6\text{H}_4$ (Zincke, *B* 18, 3142) Heated with *p* toluene hydrochloride and *p* toluene at 100° it gives a body $\text{C}_{10}\text{H}_{11}\text{N}_3$ analogous to azophenine which forms flat red needles. Heated to a higher temperature dye-stuffs of the induline series are formed. It is converted into eurhodine $\text{C}_{10}\text{H}_{11}\text{N}_3$ by heating with (a) naphthylamine hydrochloride (Witt, *C J* 49, 393) The salts of *o* amido azo *p* toluene are yellow in the solid state, but dissolve to green solutions— B^+HCl^- slender light yellow needles

Acetyl derivative [157°], yellow felted needles

Benzoyl derivative [135°], orange, yellow needles (Witt & Nolting, *B* 17, 77)

Disulphonic acid $\text{C}_{10}\text{H}_8\text{N}_2(\text{SO}_3\text{H})_2$ Formed by sulphonating with fuming H_2SO_4 (*N* & *W*) Greyish white needles. Is a yellow dyestuff of redder shade than 'acid yellow'— $\text{BaA}''4\text{aq}$ brownish red crystalline powder

p Toluene-azo-tolylene-diamine

[4 1] $\text{C}_6\text{H}_4\text{Me}-\text{N}_2-\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)_2$ [1 3 4 6] [183°] From *p* diazo toluene nitrate and tolylene *m* diamine (Hofmann, *B* 10, 218) Orange needles, *v* sol alcohol, insol water— B^+HCl^- — $\text{B}^+\text{H}_2\text{PtCl}_6^-$

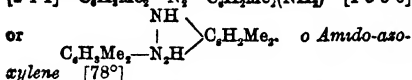

Xylene-azo-(β)-naphthol-(β) sulphonic acid. Diazo xylene does not combine with Rumpf's 'a' sulphonic acid of (β) naphthol in dilute alkaline solution, although some other diazo compounds (such as diazo benzene) do combine with it under the same conditions. If, however, the solution is very concentrated, the combination with diazo xylene takes place. The product forms red needles, dissolves in H_2SO_4 with a red colour, and dyes wool a somewhat yellower shade than the compound from Schaefer's ' β ' acid (Schultz, *B* 17, 461)

Xylene azo thymol sulphonic acid

$\text{C}_6\text{H}_4(\text{CH}_3)_2-\text{N}_2-\text{C}_6\text{H}_4(\text{CH}_3)(\text{C}_6\text{H}_4)(\text{HSO}_3\text{OH})$ Slender yellow needles. Prepared by the action of diazo xylene chloride on sodium thymol sulphonate— A^+Ba small yellow needles or plates (Stebbins, *B* 14, 2795)

Xylene azo xylene

$\text{C}_6\text{H}_4(\text{CH}_3)_2-\text{N}_2-\text{C}_6\text{H}_4(\text{CH}_3)_2$ *Azo xylene* [126° corr] Formed by reduction of nitro *m* xylene with sodium amalgam or with zinc dust and alcoholic NaOH , very small yield. A better yield is obtained by oxidation of xylidine with alkaline potassium ferricyanide (Werigo, *Z* 1864, 723, 1865, 312, Samonoff, *Bl* [2] 39, 597, *J R* 1882, 327, Schultz, *B* 17, 476) Red needles. Sol hot alcohol. It does not appear to give a dixylyl base by treatment with SnCl_2 and HCl in alcoholic solution.

***m*-Xylene *o* azo *m* xylidine**[2 4 1] $C_6H_4Me_2-N_2-C_6H_4Me_2(NH_2)$ [1 3 5 6]

Preparation—Diazo *m* xylene *m* xylide, prepared by adding a solution of 1 mol of sodium nitrite to a mixture of 1 mol of *m* xylidine $C_6H_4Me_2NH_2$ [1 3 4] and 1 mol of its hydrochloride, is dissolved in *m* xylidine and gently warmed for a long time with about 5 p.c. of *m* xylidine hydrochloride. The mixture is then acidified with dilute HCl, the precipitated hydrochloride is filtered off, washed with water, alcohol, and ether, basified, and crystallised from alcohol or benzene, the yield is 70 p.c. to 80 p.c. of theoretical. Orange plates. V sol benzene, and hot alcohol, v sol water.

Reactions—On reduction it yields *m* xylidine and *m*-xylene *o* diamine $C_6H_4Me_2(NH_2)_2$ [1 3 5 6].

Salts—B·HCl yellow crystalline powder, dissolves sparingly in alcohol with a green colour, soluble in phenol with a splendid green colour (Nörling a. Forel, B 18, 2682).

***m*-Xylene *p* azo *m* xylidine**

[2 6 1] $C_6H_4Me_2-N_2-C_6H_4Me_2(NH_2)$ [1 3 5 4] [78°] Yellow plates. Easily soluble in alcohol and benzene. Prepared from *m* xylidine $C_6H_4Me_2NH_2$ [1 3 2] by the same method as that described under *m* xylene *o* azo *m* xylidine.

Salts—B· $H_2Cl_2PtCl_4$ red crystalline powder. The hydrochloride dissolves in phenol or alcohol with a red colour (Nörling a. Forel, B 18, 2684).

***m*-Xylene *o* azo *m* xylidine**

[3 5 1] $C_6H_4Me_2-N_2-C_6H_4Me_2(NH)$ [1 2 6 4] [95°] Prepared from *m* xylidine $C_6H_4Me_2NH_2$ [1 3 5] by the same method as that described for *m* xylene *o* azo *m* xylidine. Yellow plates. On reduction it gives symmetrical *m* xylidine and *m* xylene *p* diamine $C_6H_4Me_2(NH)_2$ [1 3 2 5]. The hydrochloride dissolves in phenol with a violet red colour (Nörling a. Forel, B 18, 2684).

***o*-Xylene *p* azo *x*ylidine**

[2 3 1] $C_6H_4Me_2-N_2-C_6H_4Me_2(NH_2)$ [1 2 3 4] [111°] Prepared from *o* xylidine $C_6H_4Me_2NH_2$ [1 2 3] by the same method as that described under *m* xylene *o* azo *m* xylidine (Nörling a. Forel, B 18, 2684). Glistening yellow plates (from alcohol or benzene). On reduction it yields *o* xylidine and *o* xylene-*p* diamine $C_6H_4Me_2(NH_2)_2$ [1 2 3 6]. The hydrochloride dissolves in phenol with a red colour.

***m* Xylene *p* azo *p* xylidine**

[2 4 1] $C_6H_4Me_2-N_2-C_6H_4Me_2(NH_2)$ [1 2 5 4] [111°] Red plates.

Preparation—50 c.c. of a solution of sodium nitrite containing 227 grms. $NaNO_2$ per litre are added to a mixture of 20 grms. of *p* xylidine and 26 grms. of hydrochloride of *m* xylidine $C_6H_4Me_2(NH_2)$ [1 3 4], the diazoamide so formed is dissolved in 20 grms. of *p* xylidine and gently warmed with 4 grms. of *p* xylidine hydrochloride.

Reactions—On reduction it yields *m*-xylidine and *p* xylene *p* diamine $C_6H_4Me_2(NH_2)_2$ [1 4 2 5]. The hydrochloride dissolves in phenol with a red colour (Nietzki, B 18, 470, Nörling a. Forel, B 18, 2686).

***p* Xylene *p* azo *p* xylidine**

[2 5 1] $C_6H_4Me_2-N_2-C_6H_4Me_2(NH_2)$ [1 2 5 4].

[150°] Red plates (from alcohol). Prepared from *p*-xylidine $C_6H_4Me_2(NH_2)$ [1 4 5] by the same method as that described under *m*-xylene *o* azo *m* xylidine. On reduction it yields *p*-xylidine and *p*-xylene *p*-diamine $C_6H_4Me_2(NH_2)_2$ [1 4 2 5]. The hydrochloride is red, and dissolves in phenol with a violet red colour (Nörling a. Forel, B 18, 2685).

***o* Xylene *o* azo *o* xylidine**

[3 4 1] $C_6H_4Me_2-N_2-C_6H_4Me_2(NH_2)$ [1 3 4 6] or

plates. Sol alcohol. Prepared from *o* xylidine $C_6H_4Me_2(NH_2)$ [1 2 4] by the same method as that described under *m* xylene *o* azo *m* xylidine. On reduction it gives rise to *o* xylidine and *o*-xylene *o* diamine $C_6H_4Me_2(NH_2)_2$ [1 2 4 5]. Its hydrochloride dissolves in phenol with a green colour (Nörling a. Forel, B 18, 2685).

DIAZO-COMPOUNDS

A class of bodies formed by the action of nitrous acid upon primary amine compounds $XNH_2 + ONOH = XN_2OH + H_2O$. They contain a pair of nitrogen atoms (Fr. *azote*) which are united to only one hydrocarbon radicle, whilst in the azo compounds the N_2 group is united to two hydrocarbon radicles XN_2Y . The diazo radicles XN_2 cannot of course exist in the free state, but they occur as hydrates XN_2OH , chlorides XN_2Cl , amides XN_2NHR , &c. For the sake of convenience reactions will usually be represented in this article as taking place with the hydrates.

The diazo salts XN_2A may be regarded as derived from the salts of amines XNH_2A by the displacement of H by N . This may take place in two ways. According to Kekulé's view, which is that most generally adopted, both nitrogen atoms are trivalent XN_2NA . On the other hand, Blomstrand (*Chemie der Jetztzeit*, p 272, and B 8, 51) assumes that the nitrogen attached to the carbon is pentavalent XNA .

Strecker (B 4, 786) and Erlenmeyer (B 7, 1110) also concur in this view. The reduction of diazo compounds to hydrazines, which have the undoubted constitution $XNHNH_2$, E. Fischer (A 190, 67) regards as a proof of the correctness of Kekulé's formula, since a body of the constitution XNA would, he considers, give on

reduction XNH_2 . Crum Brown, however, has

pointed out in a private communication that this argument is fallacious, since the product of the reduction is not a hydrazine itself but a hydrazine salt, and XNA , by adding H to each

N , would give the hydrazine salt XNH_2A . He

considers the pentad N in the salts of hydrazines is most probably that connected to the hydrocarbon nucleus, in which case to explain their formation by adoption of Kekulé's formula would necessitate a shifting of the acid from one N to the other. The strongest argument against Kekulé's formula is that it represents diazo-salts, by not containing pentad nitrogen, as differently constituted to the salts of all other nitrogen bases. On the other hand, the

formula XN_2A would necessitate a rearrangement of the molecule in the formation of azo-compounds which undoubtedly have the constitution $XNNY$.

The simplest member of the series HN_2OH should be formed by the action of nitrous acid upon NH_3 , but it has not yet been obtained, probably by reason of its extreme instability. The best known diazo compounds are those derived from aromatic amines and amido compounds, some of which are tolerably stable bodies. No diazo compounds have at present been obtained from fatty amines, for, like the first member of the series, HN_2OH , they are so unstable that they are probably scarcely capable of existence, and at once break up into the alcohol and N_2 . The only known fatty diazo compounds are a few which have lately been prepared from fatty amido ethers (e.g. glycooil). In their constitution they differ from the aromatic diazo hydrates by containing a molecule of water less $(EtO.C)CH_2.N_2.OH - H.O = (EtO.C)CH.N_2$.

A Aromatic diazo compounds. The discovery of these bodies, and a large portion of our knowledge concerning them, are due to P. Griess (*A* 106, 123, 113, 201, 117, 1, 120, 125, 121, 267, 137, 39, &c.), who, in a series of classical researches, opened up a field of investigation which in a few years has produced more discoveries of scientific interest and practical utility than almost any other branch of organic chemistry.

Formation.—1 By the action of nitrous acid, or any compound readily forming nitrous acid (e.g. $NOCl$, $NOBr$, $SO_2(OH)(NO_2)$, zinc dust and HNO_3 , &c.) upon salts of primary amines—2 By oxidation of primary hydrazines (E. Fischer, *A* 190, 97).

Preparation.—The details vary very much with individual cases and the purposes for which the diazo compounds are required. The amine can be dissolved in water, alcohol, acetic acid, HCl , H_2SO_4 , &c., and can then be treated with nitrous acid gas, sodium nitrite, or a nitrous ether. When required in the solid form, a common method is to mix the nitrate of the amine with a little water, cool in a freezing mixture, and saturate with N_2O gas, the diazonitrate is then pptd by addition of alcohol and ether. Diazo compounds can also be isolated from their aqueous solutions by pptn as platinichlorides, perbromides, picrates, sulphates, &c. When the diazo compound is required for a subsequent reaction it is seldom necessary to isolate it, but the compound can be prepared under the conditions suitable to the second reaction. For instance, when the diazo-compound is to be conjugated with an amine or phenol to form an azo-compound, the amine is usually dissolved in water containing 2 mol of HCl for each NH_2 group, cooled by addition of ice, and mixed with an aqueous solution of sodium nitrite (1 mol to each NH_2). The solution of the diazo chloride thus prepared can be at once treated with a solution of the phenol or amine.

The diazotisation of simple amines, in not too dilute solutions, usually takes place quantitatively, and the reaction is tolerably rapid. For instance, the diazotisation of aniline in a 10 p.c. solution is so complete within an hour

that it forms the most accurate method of estimating nitrous acid or aniline (Green & Rideal, *C N* 49, 173, Green & Evershed, *S C I* 1886, 633). The greater the molecular weight of the amine the slower and less complete is the diazotisation. The diazotisation of heavy amido bodies is facilitated by the presence of a very large excess of mineral acid, using as little water as possible. Alcohol in many cases appears to have a contrary effect. Amido groups cannot be diazotised unless combined with an acid, thus if the ordinary hydrochloride of *p* phenylene diamine $C_6H_4(NH_2)(NH_2Cl)$ is treated with HNO_3 , only one NH group is diazotised, but if a large excess of HCl is employed so that $C_6H_4(NH_2Cl)_2$ is present, both NH groups are diazotised. The final products of the action of nitrous acid upon the mono acid salts of diamines vary with the constitution of the latter. Thus *o* phenylene diamine gives azimido benzene

m-Phenylene diamine gives tri amido azo benzene, thus $C_6H_4(NH_2)_2.N_2.OH + C_6H_4(NH_2)_2 = C_6H_4(NH_2)_2.N.C_6H_4(NH_2)_2 + H.O$. Whilst the diazo compound $C_6H_4(NH_2)(NH_2.N_2.OH)$ [14], from *p* phenylene diamine, does not undergo any further transformation. The di amido benzoic acids react with nitrous acid in an exactly similar manner according as the NH_2 groups are *o*, *m*, or *p* to each other (Griess, *B* 17, 607).

Properties.—The diazo salts are in general very unstable crystalline solids. When dry they often decompose with detonation, by heat or percussion. Their solutions slowly decompose at the ordinary temperature, more quickly on heating, with evolution of nitrogen. The hydrates are even more unstable than the salts, and have scarcely ever been isolated. The stability is increased by substitution in the nucleus, thus diazo benzene sulphonic acid is more stable than diazo benzene. The diazo derivatives of substituted phenols and of *o* and *p* sulphonic acids usually occur in the form of anhydrous compounds, e.g.

manner *o* amido diazo compounds form inner amides (e.g. azimido benzene, *v supra*).

Reactions.—The diazo-compounds are extremely prone to undergo reactions, they play a most important part in organic syntheses and the determination of the constitution of isomeric aromatic compounds, by serving as an intermediate stage by means of which NH_2 groups can be replaced by H , OH , Cl , Br , I , F , CN , SH , NO_2 , &c. Their power of combining with amines and phenols to form azo compounds renders them of great technical importance for the production of colouring-matters, for which purpose they are prepared in large quantities. The majority of their reactions consist in the evolution of N_2 , and its replacement by the atom or group (Cl , OH , &c.) previously united to it.

1 By heating the aqueous solution nitrogen is evolved, with formation of the corresponding phenol $X N_2 OH = X OH + N_2$. The best method is to dissolve the amine in a considerable excess of dilute H_2SO_4 , diazotise by adding $NaNO_2$ to the iced solution, and finally heat to boiling.

2 When heated with strong alcohol the normal reaction appears to be the replacement of the N_2 group by OEt, with formation of ethoxy compounds (Wroblewski, *Z* 6, 164, *B* 17, 2703, Haller, *B* 17, 1887, Hofmann, *B* 17, 1917, Remsen, *Am* 8, 243, *B* 18, 65, Hayduck, *A* 172, 212, Zander, *A* 198, 25, Heffter, *A* 221, 352, Paysan, *A* 221, 212, 363, Mohr, *A* 221, 222, Hesse, *A* 230, 293).

3 Under certain circumstances, at present undetermined, the reaction with alcohol takes a different course, resulting in the substitution of H for the N_2 group, with production of the corresponding hydrocarbon together with aldehyde $X N_2 OH + C_2H_5O = X H + C_2H_5O + N_2 + H_2O$

(Griess) (a) The amido-compound is treated with a solution of nitrous acid in absolute alcohol, warmed till nitrogen comes off freely, allowed to cool, resaturated with N_2O_5 , and the operation repeated until but little gas is evolved on heating (Neville a Winther, *C J* 37, 452) (b) The amido compound is dissolved in a considerable excess of conc H_2SO_4 , the solution diluted with a small quantity of water is cooled in a freezing mixture, and the necessary quantity of solid sodium nitrite added. When diazotised the solution is poured in a thin stream into two or three times its bulk of alcohol, the mixture becomes warm enough to complete the reaction without further heating (Meldola, *C J* 1885, 507).

4 Mercaptan, when heated with diazo compounds at 170° , behaves similarly to alcohol in reaction 3, causing the displacement of N_2 by hydrogen with simultaneous formation of diethyl di sulphide (Schmitt a Mittenzwey, *J pr* 126, 192).

5 The displacement of the N_2 group by H is also effected by reduction to the corresponding hydrazine (*q v*), and treatment of this with $CuSO_4$ or $Fe Cl_3$ (*B* 18, 90).

6 Reduction of a diazo chloride with excess of $SnCl_2$ also effects the displacement of N_2 by H. $X N_2 Cl + SnCl_2 + H O = X H + SnOCl_2 + HCl + N_2$. A dilute aqueous solution of the diazo chloride is treated with an excess of $SnCl_2$ at 0° , and finally heated for two hours with an inverted condenser, the yield is good (Effront, *B* 17, 2329, Gasirowski a Wayss, *B* 18, 337).

7 By treatment of a cold solution of a diazo-compound in conc HCl with (2 mols of) $SnCl_2$, the corresponding hydrazine (*q v*) is produced $X N_2 Cl + 2SnCl_2 + 8HCl = X NH NH_2 + 2SnCl_4$.

8 The reduction of the sulphates of diazo compounds with SO_2 , or with zinc dust and acetic acid, also gives rise to hydrazines.

9 By heating with dilute HNO_3 , nitrated phenols are obtained (Nolting a Wild, *B* 18, 1338).

10 The platino chlorides on distillation with dry Na_2CO_3 yield the corresponding chloro-derivatives $(X N_2 Cl)_2PtCl_2 = 2X Cl + 2N_2 + PtCl_4$.

11 The replacement of N_2 by Cl is also effected by boiling the diazo compound with fuming HCl in large excess $X N_2 Cl = X Cl + N_2$

(Griess, *B* 18, 960, Gasirowski a. Wayss, *B* 18, 1936).

12 The same replacement is most readily effected by treating the aqueous solution of the diazo chloride with cuprous chloride, which appears to act by intermediate formation of an addition product $R N_2 Cl, Cu_2Cl_2$. (a) A 10 p c solution of Cu_2Cl_2 is prepared by adding 100 pts of conc HCl and 13 pts of copper turnings to a hot solution of 25 pts. of crystallised $CuSO_4$, and 12 pts of $NaCl$, boiling till decolourised, and making up the weight to 203 pts with conc HCl . A dilute HCl solution of the diazo compound is allowed to run slowly into the above solution (about 5 times the weight of the amine used) heated nearly to boiling, the product, if volatile, is distilled with steam, or it is separated and purified by crystallisation. (b) In most cases instead of separately diazotising the amine, its solution in dilute HCl can be mixed with about 5 pts of the 10 p c Cu_2Cl_2 solution, and a solution of the calculated quantity of $NaNO_2$ run into the nearly boiling mixture (Sandmeyer, *B* 17, 1633, 2650, Lellmann, *B* 19, 810).

13 The perbromides (*q v*) of diazo compounds, on heating by themselves, or with dry Na_2CO_3 , or best by boiling with glacial acetic acid, yield bromo-derivatives $X N_2 Br = X Br + Br + N_2$ (Neville a Winther, *C J* 37, 452).

14 The replacement of N_2 by Br is also effected by boiling the diazo compound with fuming HBr in large excess $X N_2 Br = X Br + N_2$ (Griess, *B* 18, 960, Gasirowski a. Wayss, *B* 18, 1936).

15 The same replacement is most conveniently effected by means of cuprous bromide (*cf* reaction 12). A solution of 125 pts of crystallised $CuSO_4$ ($\frac{1}{3}$ mol), 360 pts of KBr (3 mols), 800 pts of water, and 110 pts of conc H_2SO_4 (1 mol), is boiled with 200 pts of copper turnings till decolourised. The amine (1 mol) is then added, and into the mixture, heated nearly to boiling, is slowly run a solution of 70 pts $NaNO_2$ (1 mol) in 400 pts of water (Sandmeyer, *B* 17, 2650, 18, 1492).

16 By boiling diazo compounds with aqueous HI the N_2 group is replaced by I forming iodo compounds $X N_2 I = XI + N_2$ (Griess, *B* 18, 960).

17 By boiling with HF the N_2 group is replaced by F giving fluoro compounds $X N_2 F = XF + N_2$. (Griess, *B* 18, 960, Paterno a Oliveri, *G* 12, 85, 13, 533, Wallach, *A* 235, 255).

18 By heating diazo salts with $Cu(CN)_2$, the N_2 group is replaced by CN (*cf* reactions 12 and 15). The nitriles so formed can be converted into carboxylic acids by saponification, so that by means of this reaction an NH_2 group can be replaced by CO_2H . 28 pts of KCN (96 p c) are added to a hot solution of 25 pts of crystallised $CuSO_4$ in 150 pts of water, into this solution, heated to about 90° , is slowly run an aqueous solution of the diazo chloride. If the nitrile is required for conversion into the acid, it is not always necessary to isolate it, but the crude product of the reaction can be at once saponified (Sandmeyer, *B* 17, 2650, 18, 1492, 1496).

19 By the action of a warm alcoholic solution of K_2S the N_2 group is replaced by SH , thus $X N_2 SH = X SH + N_2$. The mercaptans so formed can be converted into sulphonic acids by oxida-

tion with cold KMnO_4 , so that by means of this reaction an NH_2 group can be replaced by SO_3H (Klason, *B* 20, 349)

20 *Hydric sulphide* converts diazo benzene into phenyl sulphide $(\text{C}_6\text{H}_5)_2\text{S}$ (Graebe & Mann, *B* 15, 1688)

21 Diazo compounds combine with *ethyl mercaptan* to form unstable bodies $\text{X N}_2\text{SEt}$, which when boiled with alcohol yield sulphides $\text{X N}_2\text{SEt} = \text{X SEt} + \text{N}_2$ (Stadler, *B* 17, 2075)

22 By heating with *acetic anhydride*, acetylated phenols are formed $\text{X N}_2\text{OH} + \text{Ac}_2\text{O} = \text{X OAc} + \text{N}_2 + \text{AcOH}$ (Wallach, *A* 235, 231)

23 SO_2 in presence of boiling alcohol converts some diazo compounds into the corresponding sulphonic acids $\text{X N}_2\text{OH} + \text{SO}_2 = \text{X SO}_3\text{H} + \text{N}_2$ (Hubner, *B* 10, 1715)

24 *Alkalies* give insoluble pps of complex constitution (Frankland, *C J* 37, 750)

25 Action of *cyanogen compounds* (*v* Griess, *B* 9, 132, 12, 2119, Gabriel, *B* 12, 1637)

26 *Cuprous nitrite* replaces the diazo group by NO . The amine (1 mol) is dissolved in exactly 2 mols of dilute HNO_3 (or 1 mol of dilute H_2SO_4) and the acid solution treated with one half of a solution of 2 mols of NaNO , the other half being added when the diazotisation is complete. The solution of the diazo nitrite is added to a paste of 1 mol of Cu_2O (obtained by reducing CuSO_4 with glucose and NaOH) and the decomposition allowed to proceed in the cold. The yield of nitrobenzene from aniline is 42 p.c. of the theoretical, but with other bases it is smaller (Sandmeyer, *B* 20, 1494)

27 *Primary and secondary amines*, react at once with diazo compounds forming diazo amides (*q v*) $\text{X N}_2\text{OH} + \text{H N Y} = \text{X N}_2\text{NHY} + \text{H}_2\text{O}$. In these bodies the diazo radicle replaces H united to N, and on treatment with excess of acid they readily regenerate the diazo compound and amine. When diazo compounds act upon *salts of aromatic amines*, the diazo residue may replace H in the carbon nucleus, with formation of amido azo compounds $\text{X N}_2\text{OH} + \text{HY} \cdot \text{NH}_2 = \text{X N}_2\text{Y} \cdot \text{NH}_2 + \text{H}_2\text{O}$. In the case of tertiary aromatic amines the latter reaction is the only one possible, but with primary and secondary aromatic amines the replacement in the nucleus may be preceded by the formation of a diazo amide, when there is no large excess of mineral acid present. The readiness with which amido azo compounds are formed varies greatly with the amine in some cases (*e g* (a) and (8) naphthylamine, phenylene diamine, &c) the replacement in the nucleus appears to take place almost instantly, in others (*e g* aniline) the reaction, at the ordinary temperature, takes several hours for its completion, allowing the intermediate formation of the diazo amide (Friswell & Green, *C J* 1885, 917, *Proceedings* 1887, 26). In many cases the formation of an amido azo compound will take place in presence of a large excess of acid, under which conditions the formation of a diazo amide is precluded. In the formation of amido azo compounds of the benzene series the diazo residue enters in the para position to the NH_2 group, but when this place is already occupied it takes the ortho position. The ortho amido azo-compounds appear to be differently constituted to the para amido azo compounds (*v* Azo compounds). If the amine

does not contain any free para or ortho position the formation from it of an amido azo compound does not appear to be possible. When a diamine contains displaceable H atoms para to each NH_2 group, it is capable of reacting with 2 mols of a diazo-compound to form a diazo-compound

28 Diazo compounds readily react upon *phenols* and their sulphonic and carboxylic acids in alkaline solution, forming oxy azo compounds $\text{X N}_2\text{OH} + \text{H Y}''\text{OH} = \text{X N}_2\text{Y}''\text{OH} + \text{H}_2\text{O}$. Compounds of the form $\text{X N}_2\text{OY}'$ analogous to the diazo amides have never been obtained. The above remarks (*reaction* 24) with regard to the position taken by the diazo group in the benzene nucleus apply equally to oxy and to amido azo compounds. Also, the di oxy compounds, similarly to diamines, can give rise to diazo compounds $(\text{X N}_2)_2\text{Y}''(\text{OH})_2$ when they contain displaceable H atoms para to each OH group.

29 Diazo compounds readily react with *pyrrol*, with formation of azo and diazo bodies, $\text{X N}_2\text{C}_4\text{H}_7\text{NH}$ and $(\text{X N}_2)_2\text{C}_4\text{H}_7\text{NH}$, but no compounds analogous to diazo amides (O Fischer & Hepp, *B* 19, 2251)

30 *Piperidine*, on the other hand, gives rise to piperidines $\text{X N}_2\text{NC}_5\text{H}_{10}$ (O Wallach, *A* 235, 233)

31 *Amido thiophene*, unlike aniline, does not appear to form diazo amides when treated with diazo compounds, but gives at once amido azo compounds $\text{X N}_2\text{C}_4\text{H}_3\text{NH}_2$ (Stadler, *B* 18, 2318). This is no doubt due to the tendency to replacement of the hydrogen being greater in the thiophene ring than in the benzene ring.

32 Diazo compounds react with those bodies of the fatty series which contain H united to C, replaceable by sodium, *e g* nitro methane, nitro ethane, malonic ether, aceto acetic ether, other ketonic ethers, &c. The products are mixed azo compounds, those from nitro methane for instance, have the constitution $\text{X N CH}_2(\text{NO}_2)$ (Meyer, *B* 8, 751, 1073, 9, 384, Zublin, *B* 11, 1417, Kappeler, *B* 12, 2286, Richter & Munzer, *B* 17, 1926, Griess, *B* 18, 961, Bamberger, *B* 17, 2415, 18, 2563).

Salts—The diazo salts have the general formula $\text{X N}_2\text{A}$. They are mostly white crystalline solids, very easily soluble in water, but sparingly in alcohol and ether. They are usually very unstable, and in the dry state are often very explosive, especially the nitrates and picrates. By the action of K_2SO_4 upon diazo chlorides, sulphites are formed of the constitution $\text{X N}_2\text{SO}_3\text{K}$. Stannic and cuprous salts give double compounds of the formula $(\text{X N}_2\text{Cl})_2\text{SnCl}_4$, $(\text{X N}_2\text{Cl})_2\text{CuCl}_2$, $(\text{X N}_2\text{Br})_2\text{CuBr}_2$, &c (Griess, *B* 18, 965, Lellmann, *B* 19, 810). The platino chlorides $(\text{X N}_2\text{Cl})_2\text{PtCl}_4$ are sparingly soluble pps. An excess of bromine produces yellow or red pps of the per bromides $\text{X N}_2\text{Br}_2$. The diazo sulphonic and carboxylic acids form salts $\text{X}''(\text{SO}_3\text{M})\text{N}_2\text{OH}$ with bases, as well as $\text{X}''(\text{SO}_3\text{H})\text{N}_2\text{A}$ with acids.

Amides—As already mentioned (*reaction* 27), the action of primary and secondary amines upon diazo compounds gives rise to diazo-amides of the general formula $\text{X N}_2\text{NHY}$, or $\text{X N}_2\text{NY}_2$. Thus diazo benzene and aniline

yield diazo benzene-anilide (diazoamidobenzene)

$C_6H_5N_2OH + C_6H_5NH_2 = C_6H_5N_2NHC_6H_5$
 These bodies are in general yellow crystalline solids, stable below 100° when free from acid. By treatment with an excess of mineral acid they are resolved, even in the cold, into the diazo salt and amine. When the amine is aromatic the resolution products again slowly recombine, if the conditions are favourable, to produce an amido azo compound $XN_2Y'NH_2$, isomeric with the original diazo amide. The resolution and recombination take place concurrently when the diazo amide is treated with 1 mol of cold dilute HCl, or with unstable salts, such as $ZnCl_2$, $CaCl_2$, aniline chloride, &c., in alcoholic or aniline solution (Friswell & Green, *C J* 1885, 917, Wallach, *A* 235, 233). When a diazo amide is treated with a salt of a base different from that of which it is a compound, the diazo salt generated will react upon that base of the two whose nuclear hydrogen is most readily replaced. Thus diazo benzene dimethyl amide $C_6H_5N_2NMe_2$, treated with aniline chloride gives amido azo benzene and dimethyl amine, similarly, diazobenzene anilide $C_6H_5N_2NHC_6H_5$, treated with *m* phenylenediamine hydrochloride yields dimido azo benzene $C_6H_5N_2C_6H_4(NH_2)_2$, whilst aniline is set free, but diazo benzene anilide treated with *p* toluidine hydrochloride gives amido azo benzene and *p* toluidine, because the para H of the aniline is more readily replaced than the ortho H of the *p* toluidine. Even very weak acids, such as acetic acid and phenols, are capable of resolving most diazo amides. In the latter case the diazo compounds produced immediately combine with the phenol to form oxy azo compounds, for diazo residues replace the hydrogen of the nucleus more readily in phenols than in amines (Heumann & Oeconomides, *B* 20, 904).

In general it may be said that the reactions of the diazo amides towards reagents in presence of acids, are simply the reactions of the free diazo salts, thus $SnCl_4$ and HCl reduce them to hydrazines (cf. reaction 7), heating with strong halogen acids gives haloid derivatives of the hydrocarbons (cf. reactions 11, 14, 16, and 17), &c.

It appears to be proved (Griess, *B* 7, 1619, Nolting & Binder, *Bl* 42, 336, Meldola & Streatfield, *C J* 1887, 102, 434) that the diazo amides of the types XN_2NHY and YN_2NHX are identical—that is, the same body is obtained whichever of the two amines is diazotised and combined with the other. The resolution of these unsymmetrical diazo amides quite corresponds to their formation, for they yield a mixture of both diazo compounds XN_2OH and YN_2OH , and both amines XNH_2 and YNH_2 . For instance, the compound $C_6H_5N_2HC_6H_5$ is obtained by combining either diazo benzene with *p* toluidine, or *p* diazo toluene with aniline, and on treatment with HCl it splits up equally into diazo-benzene, *p*-diazo toluene, aniline, and *p*-toluidine. When only 1 mol of HCl is present these resolution products will recombine to form one or more amido azo compounds according to circumstances.

Alkalis, even in boiling aqueous or alcoholic solution, usually have no action upon diazo

amides. The H of the NH group of the primary diazo amides appears to have slightly acid properties, and by introduction of NO_2 groups into the nuclei the diazo amide becomes sufficiently acid to dissolve in aqueous alkalis and form tolerably stable salts $X''(NO_2)_2N_2NM'Y(NO_2)_2$ (Meldola & Streatfield, *C J* 1886, 624, 1887, 102, 434).

By the action of alkyl haloids upon the primary diazo amides dissolved in an alcoholic solution of (1 mol of) sodium ethylate secondary diazo amides are obtained (M & S, Friswell & Green, *B* 19, 2034, *C J* 1886, 746). When the two aromatic nuclei are the same the secondary diazo amides obtained by alkylation are identical with those got by direct combination of the diazo compounds with secondary amines. But according to Meldola and Streatfield (*C J* 1887, 434) the compound obtained by ethylating the unsymmetrical *m* nitro diazo benzene *p* nitranilide [3 1] $C_6H_4(NO_2)_2N_2HC_6H_4(NO_2)$ [1 4] (which is obtained either from *m* nitro diazo benzene and *p* nitraniline, or from *p* nitro diazo benzene and *m* nitraniline) is different from either of the two ethyl derivatives [3 1] $C_6H_4(NO_2)_2N_2NEtC_6H_4(NO_2)$ [1 4] and [4 1] $C_6H_4(NO_2)_2N_2NEtC_6H_4(NO_2)$ [1 3], obtained by combining *m* and *p* nitro diazo benzene with ethyl *p* and *m* nitranilines respectively. The two latter ethyl derivatives are split up by acids into *m* nitro diazo benzene and ethyl *p* nitraniline, and *p* nitro diazo benzene and ethyl *m* nitraniline respectively, but the former ethyl derivative (obtained by ethylation) yields both diazo compounds and both ethyl nitranilines in about equal amounts.

Constitution of diazo amides—Although a considerable amount of work has been done on this subject, the matter is still far from settled. The formula $XN-NY$ is disproved by the

$$\begin{array}{c} \text{NH} \\ \diagup \quad \diagdown \\ \text{resolution of the alkyl derivatives into diazo} \\ \text{compound and alkylated amine, since the latter} \\ \text{could not be obtained from a compound of that} \\ \text{structure (Friswell & Green, } C J \text{ 1886, 746, and} \\ \text{B 19, 2034). The formula } XN-NHY \text{ does not} \end{array}$$

appear to have much probability, since one would expect a body of the constitution $C_6H_5N_2NHC_6H_5$ to give on reduction NH_2 , and

$$\begin{array}{c} N \\ \diagup \quad \diagdown \\ \text{hydrazobenzene, these bodies, however, are not} \\ \text{formed from diazo benzene anilide, even by} \\ \text{adding sodium to its boiling alcoholic solution} \\ \text{(F & G). Neither the latter formula nor that} \\ \text{usually assumed } XN-NNH_2 \text{ is capable of ex-} \\ \text{plaining the existence of more than two isomeric} \\ \text{alkyl derivatives} \end{array}$$

For further references concerning the diazo-amides see Bayer & Jager, *B* 8, 148, 893, Sarauw, *B* 14, 2442, 15, 42, Nolting & Baumann, *B* 18, 1147, Stadel & Bauer, *B* 19, 1952, Wallach, *A* 235, 233, Bernthsen & Goske, *B* 20, 926.

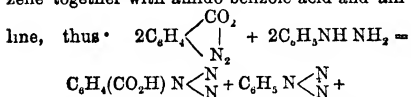

Imides—Obtained by the action of NH_3 upon the *per-bromides*

$XN_2Br_2 + NH_3 = XN \begin{array}{c} N \\ || \\ N \end{array} + 8HBr$ (Griess, *A* 187, 65, *B* 18, 963). They are also formed by

the decomposition of nitroso hydrazines

92, 96) They are usually yellowish oily liquids, insoluble in water, exploding when heated. When heated with conc HCl they are converted into chloro amido compounds $\text{HX}''\text{N}_2 + \text{HCl} = \text{X}''\text{Cl}(\text{NH}) + \text{N}_2$. Diazo benzene imide heated with H_2SO_4 diluted with an equal volume of water is converted into *p* amido phenol $\text{C}_6\text{H}_4\text{N}_2 + \text{H}_2\text{O} = \text{C}_6\text{H}_4(\text{OH})\text{NH}_2 + \text{N}_2$ (Griess, *B* 19, 313, Fischer, *A* 190, 67, 232, 236, Silberstein, *J pr* [2] 27, 116). Diazo benzoic acid reacts with phenyl hydrazine, forming the imides of diazo benzoic acid and of diazo benzene together with amido benzoic acid and amine, thus:

This equation is general (Griess, *B* 20, 1528)

Diazo-compounds derived from o amido-azo compounds—Although the so called o amido azo compounds probably do not contain an NH_2 group, but are hydrazimido

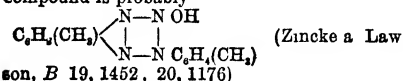

they are, nevertheless, slowly attacked by nitrous acid, with production of diazo compounds. The only member of this class of diazo compounds at present examined is that obtained by diazotising *o* amido azo toluene. In some of its reactions it behaves like an ordinary diazo compound, in others quite differently. On heating with water or alcohol it is decomposed with evolution of nitrogen. By zinc dust and alcohol it is converted into *m p* azotoluene and N_2 . It is not reduced by SnCl_2 or SO_2 to a hydrazine, but gives a stable compound $\text{C}_7\text{H}_7\text{N}_4$ which probably has the constitution

converted by bromine into the per bromide of the original diazo compound. The diazo imide loses nitrogen on heating, and yields tolyl-

identical with that obtained by oxidation of *o* amido azo toluene (tolyl hydrazimido toluene). Hence the constitution of this peculiar diazo compound is probably

B Fatty diazo-compounds $\text{X}'' \begin{array}{c} \text{N} \\ \parallel \\ \text{N} \end{array} \text{As}$

already stated, the fatty diazo-compounds contain a molecule of water less than the aromatic diazo hydrates. Their discovery is quite recent, and is due to Curtius. At present only a few members of the group are known, these are obtained by the action of NaNO_2 upon the hydrochlorides of amido fatty-ethers $\text{X}''\text{H}_2\text{CO}_2\text{R}$,

and hence have the constitution $\text{X}''(\text{N}_2)\text{CO}_2\text{R}$. They are unstable oily bodies, which exhibit the following reactions—1 By boiling with water or dilute acids, they are usually converted into oxy ethers, *e g* $\text{CH}_3(\text{OH})\text{CO}_2\text{Et}$, with evolution of nitrogen, however, diazo-

DESCRIPTION OF DIAZO COMPOUNDS

A large number of diazo compounds are mentioned under the amido compounds from which they are formed.

Pseudo diazo acetamide $\text{C}_2\text{H}_5\text{N}_3\text{O}$. Formed, together with diazoacetamide, by prolonged action of strong aqueous NH_3 in the cold upon the methyl ether of diazoacetic acid $\text{CHN}_2\text{CO}_2\text{Me}$ (Curtius, *B* 18, 1287). Fine crystalline yellow powder, consisting of microscopic quadrangular plates. Sol cold water, dilute HCl, and acetic acid. Insol alcohol, ether, and benzene. Dibasic acid. On warming with water it evolves nitrogen. Aqueous alkalis evolve nitrogen and ammonia. It gives a green colouration with Fehling's solution, on boiling a black pp is formed. Silver and mercury salts are reduced on boiling.

Salts— $\text{A}''(\text{NH}_4)_2$ small yellow tables, sol cold water [α 155°]— $\text{A}''\text{Ag}$, 1½g yellow microcrystalline pp, v sol cold water. Explodes on heating— $\text{A}''\text{Hg}$ yellow pp— $\text{A}''\text{Cu}$, sparingly soluble reddish brown pp— $\text{A}''\text{Pb}$, yellow pp.

Diazo acetic acid $\text{CHN}_2\text{CO}_2\text{H}$. The free acid and its salts have not been isolated on account of their instability. The alkaline salts are obtained in solution by treating the methyl ether with cold aqueous alkalis.

Methyl ether MeA' (129°) at 721 mm S G 21 1139

Ethyl ether EtA' [−24°] (144°) at 721 mm S G 21 1073. Formed by the action of NaNO_2 on a concentrated solution of the hydrochloride of amido acetic ether. Yellow oil. V sol water, miscible with alcohol, ether, benzene, and light petroleum. Explodes when conc.

H_2SO_4 is poured upon it **Reactions**—1 Boiling water gives glycollic ether, nitrogen, and alcohol—2 Boiling alcohol gives $\text{CH}_3(\text{OEt})\text{CO}_2\text{Et}$ and nitrogen—3 Benzoic acid gives rise to $\text{CH}_3(\text{OBz})\text{CO}_2\text{Et}$ —4 Reduces AgNO_3 in cold aqueous solution—5 Reduces hot Fehling's solution—6 Zinc dust and acetic acid form an unstable hydrazo derivative $\text{NH}_2\text{NHCH}_2\text{CO}_2\text{Et}$, which is further reduced to ammonia and $\text{NH}_2\text{CH}_2\text{CO}_2\text{Et}$ The hydrazo- derivative reduces cold Fehling's solution—7 Combines with aldehydes, thus $\text{PhCHO} + \text{CHN}_2\text{CO}_2\text{Et} = \text{PhCOCH}_2\text{CO}_2\text{Et} + \text{N}_2$ —8 Changes on standing into 'azin succinic' ether, $\text{C}_6\text{H}_4\text{N}_2\text{O}_2\text{Et}$, [245°]—9 Boiling aniline produces $\text{NPhHCH}_2\text{CO}_2\text{Et}$ —10 Conc HCl gives $\text{CH}_2\text{ClCO}_2\text{Et}$ —11 Hot conc KOH forms a crystalline pseudo diazo salt whence boiling dilute H_2SO_4 liberates hydrazine, N_2H_2 (Curtius, B 20, 332)—12 Boiling aromatic hydrocarbons produce condensation products, thus benzene gives $\text{C}_6\text{H}_5\text{CO}_2\text{Et}$ (Buchner a. Curtius, B 18, 2371)

Iso amylether $\text{C}_{11}\text{H}_{21}\text{N}$ (160°) at 720 mm

Amide $\text{CHN}_2\text{CONH}_2$ [114°], yellow tables or prisms, v sol cold water or alcohol Formed by the action of strong aqueous NH_3 upon the methyl ether The aqueous solution decomposes on boiling with evolution of nitrogen and formation of glycolamide By treatment in alcoholic solution with iodine it is converted into di iodo acetamide $\text{CHI}_2\text{CONH}_2$ with evolution of nitrogen It gives a blood red colouration with AgNO_3 , and in a few moments a reduction to metallic silver It also reduces $\text{Hg}(\text{NO}_3)_2$ and $\text{Cu}(\text{OAc})_2$ With Fehling's solution it produces a red colouration, which becomes green on boiling (Curtius, B 17, 953, 18, 1283).

Diazo amido-benzoic acid

$\text{C}_6\text{H}_4(\text{NH}_2)\text{CO}_2\text{N}(\text{N})\text{N}$ (6) . Obtained by adding

sodium nitrite to a solution of (6.31) p di amido benzoic acid containing barely sufficient HCl to dissolve it Long slender needles, or four sided plates Yellow colour Bitter taste V sol hot water, sl sol hot alcohol, insol ether Has no acid properties, but is a weak base When dry it explodes on heating It is decomposed by long boiling with water It combines with amines and phenols to form azo compounds

Salts— B_2HCl white six sided plates— $\text{B}_2\text{H}_2\text{Cl}_2\text{PtCl}_4$, sparingly soluble small yellow trimetric plates— $\text{B}_2\text{AuCl}_4\text{HCl}$ yellow insoluble needles (Griess, B 17, 603)

p Diazo aniline salts are formed by diazotising salts of p phenylene diamine (Griess, B 17, 607)— $\text{C}_6\text{H}_4(\text{NH}_2)_2\text{ClHClAuCl}_4$ is an insoluble pp

m Diazo-aniline imide $\text{C}_6\text{H}_4(\text{NH}_2)\text{N}(\text{N})\text{N}$

m Amido-diazo benzene imide Yellowish oil Volatile with steam Easily soluble in alcohol and ether

Preparation—m Amido-phenyl-oxamic acid $\text{C}_6\text{H}_4(\text{NH}_2)\text{NHCO}_2\text{OH}$ is diazotised and converted into the tribromide $\text{C}_6\text{H}_3(\text{N}_2\text{Br})\text{NHCO}_2\text{OH}$ By treatment with NH_3 this yields the imide $\text{C}_6\text{H}_4(\text{N}_2)\text{NHCO}_2\text{OH}$, which on boiling with aqueous KOH splits off the oxalyl group with

production of m diazo aniline imide On diazotisation it gives a diazo compound which combines with phenols and amines to form azo-diestuffs Decomposes explosively on heating **Salts**— B_2HCl white soluble trimetric plates— $\text{B}_2\text{H}_2\text{Cl}_2\text{PtCl}_4$ yellow needles (Griess, B 18, 963)

m Diazo aniline piperidide.

Acetyl derivative

$\text{C}_6\text{H}_4(\text{NHAc})\text{N}_2\text{NC}_6\text{H}_{11}$ [101°] From acetyl m tolylene diamine hydrochloride by diazotisation and treatment with piperidine (Wallach, A 235, 266)

(a) Diazo anthraquinone nitrate

$\text{C}_{14}\text{H}_8\text{O}_2\text{N}_2\text{NO}_3$ Formed by passing nitrous acid gas into a solution of (a) amido anthraquinone in dry ether (Böttger a Petersen, A 160, 150) Powder, m sol water, v sol alcohol, insol ether When heated with water it gives N_2 and m-oxy anthraquinone

Diazo-benzene *References* Griess, Tr 1864, m 667, A 113, 201, 137, 39

Hydroxide $\text{PhN}(\text{OH})_2$ On adding acetic acid to an aqueous solution of PhN_2OK a thick yellow oil is ppd, this may be diazo-benzene hydroxide It is very unstable

Salts— $\text{PhN}(\text{OK})$ A crystalline substance obtained by adding excess of conc aqueous KOH to a saturated solution of diazo benzene nitrate, and evaporating at 100° Detonates feebly at 130° V sol water and alcohol, insol ether— PhN_2OAg obtained as a greyish white pp on adding AgNO_3 to an aqueous solution of the preceding, explodes when heated—($\text{PhN}_2\text{O}_2\text{Hg}$ white pp got by adding HgCl_2 to the potassium salt (Griess, A 137, 57)

Nitrate— PhN_2NO_3 SG 137 HF -47,400 (Berthelot a Vieille, C R 92, 1074) Prepared by passing nitrous fumes at 0° into an aqueous solution of aniline nitrate containing undissolved aniline nitrate in suspension, ppd by adding alcohol and ether Needles, v e sol water, m sol alcohol, insol ether and benzene Stable in dry air in the dark, but decomposed in moist air Explodes at 90° forming CO , CH_4 , N , HCN , CH_3 , and C The decomposition may be roughly represented thus $\text{C}_6\text{H}_5\text{N}_2\text{NO}_3 = 3\text{CO} + 3\text{C} + 5\text{H} + 3\text{N}$

Reactions—1 Barium carbonate added to its aqueous solution produces $\text{PhN}_2\text{C}_6\text{H}_4\text{OH}$ and $\text{C}_6\text{H}_5\text{N}_2\text{O}$ [131°] This 'benzene di azo-phenol' is perhaps $\text{C}_6\text{H}_5\text{N}_2\text{C}_6\text{H}_4(\text{OH})\text{N}_2\text{C}_6\text{H}_5$ for it may be reduced by HI to di amido phenol (P F Frankland, C J 37, 751). It is soluble in NaOHaq —2 Aqueous NaOH , added to neutralisation, gives the 'benzene di azo phenol' and a brown substance, $\text{C}_{10}\text{H}_8\text{N}_4\text{O}_4$, insol NaOHaq —3 Aqueous ammonia produces diazo benzene-anilide and two amorphous brown substances, $\text{C}_{10}\text{H}_8\text{N}_4\text{O}$ and $\text{C}_{10}\text{H}_8\text{N}_4\text{O}_2$ The latter is very explosive and is decomposed by boiling HCl into phenol, aniline, and N_2 —4 Boiling dilute HNO_3 (1 mol.) forms o and p nitro phenol (Nolting a Wild, B 18, 1338)—5 Aqueous K_2FeCy_6 forms a compound $\text{C}_{10}\text{H}_8\text{N}_4\text{N}_2$ [150°] (Griess, B 9, 132). 6 Potassic ferrocyanide gives $(\text{C}_6\text{H}_5\text{N}_2)_2(\text{H}_3\text{FeCy}_6)_2$ 7 Sodium nitroprusside gives the compound $\text{C}_6\text{H}_5\text{N}_2\text{H}_3\text{FeCy}_6(\text{NO})\text{aq}$ (Griess, B 12, 2120)—8 Nitro-benzyl cyanide and alcoholic KOH give a pp of $\text{C}_{10}\text{H}_8\text{N}_4\text{O}_2$ [202°] (Perkin, C J 43, 111).

Chloride.— PhN_2Cl Formed in solution p 2

by diazotising aniline hydrochloride *Combinations*—($C_6H_5N_2Cl$), $SnCl_4$, white plates, sol water, v sl sol alcohol and ether (Griess, *B* 18, 965) —(PhN_2Cl), $PtCl_4$, yellow prisms, v sl sol water, insol alcohol and ether— $PhN_2ClAuCl_4$, golden plates, insol water, m sol warm alcohol

Bromide— PhN_2Br Formed by adding bromine to an ethereal solution of diazo benzene anilide, or by washing the perbromide for a long time with ether Pearly plates, v e sol water, insol ether

Perbromide— PhN_2Br_2 Formed by adding bromine dissolved in $HClAq$ to an aqueous solution of a diazobenzene salt Large yellow plates, insol water and ether, m sol cold alcohol Gives bromo benzene when distilled with Na_2CO_3 or when heated with alcohol

Sulphate— PhN_2SO_4H Ppd by adding alcohol (3 vols) and ether to a solution of diazobenzene nitrate mixed with an equivalent quantity of H_2SO_4 Prisms, v e sol water, v sl sol alcohol, insol ether Explodes at 100°

Dicyanide— $C_6H_5N_4$ or $C_6H_5N_2CN, HCN$ [69°] Formed by the action of a diazo benzene salt on a solution of KCN Readily decomposes (Gabriel, *B* 12, 1637)

Picrate— $PhN_2O C_6H_4(NO_2)_3$ Yellow needles, obtained by mixing solutions of diazo benzene nitrate and sodium picrate Very explosive (Baeyer & Jager, *B* 8, 984)

Sulphite—The potassium salt, $C_6H_5N_2SO_3K$, called also potassium diazobenzene sulphinate is ppd by adding KOH to a mixture of diazobenzene nitrate and K_2SO_3Aq (L Fischer, *A* 190, 73) It forms explosive yellow crystals Bromine in conc $HBrAq$ pps diazobenzene perbromide Zinc dust and acetic acid reduce it to the corresponding hydrazo compound

Nitrite—Converted by CuO into nitro benzene (Sandmeyer, *B* 20, 1407)

Benzene-sulphinat $PhN SO_2 C_6H_5$ [76°] From sodium benzene sulphinate and diazobenzene nitrate (Königs, *B* 10, 1532) Orange tables (from alcohol), insol cold water, v sol alcohol and ether

m Tetr azo benzene $C_6H_4(N.OH)_2$ [13] Formed by the action of a large excess of nitrous acid upon *m*-phenylene diamine in presence of a large excess of HCl It combines with 2 mols of an amine or phenol

Salts— $C_6H_4(N_2Cl)_2PtCl_4$, small yellow plates, nearly insoluble in cold water and alcohol, heated with dry Na_2CO_3 it yields dichloro benzene— $C_6H_4(N_2Cl)_2AuCl_4$ pp of yellow microscopic needles, explosive (Griess, *B* 19, 317)

p Tetr-azo-benzene $C_6H_4(N_2.OH)_2$ [14] Formed by the action of an excess of nitrous acid upon *p* phenylene diamine in presence of a large excess of acid— $C_6H_4(N_2Cl)_2PtCl_4$, yellow crystalline explosive pp, by heating with dry Na_2CO_3 it yields *p*-di chloro benzene (Griess, *B* 19, 319)

Diazo benzene m amido benzoic acid $C_6H_4N_2NH C_6H_4CO_2H$ Formed by mixing solutions of diazo benzene nitrate and *m* amido-benzoic acid (Griess, *A* 187, 62) Small yellow plates (from ether) Sl sol alcohol, v e sol ether— $C_6H_4N_2O_2H.PtCl_4$

Ethyl ether— EtA yellow crystals, v e sol. alcohol and ether.— $C_6H_4N_2O_2H.PtCl_4$

The above diazo benzene amido benzoic acid $C_6H_4N_2NH C_6H_4CO_2H$ is identical with diazo benzoic acid anilide, $C_6H_4NH N_2 C_6H_4CO_2H$ (Griess, *B* 7, 1619, cf Meldola, *C J* 51, 435)

Diazo-benzene-anilide PhN_2NHPh *Diazo-amidobenzene* Mol w 197 [96°]

Formation—By passing nitrous acid gas into an alcoholic solution of aniline (Griess, *A* 121, 258)

Preparation—A solution of 18 pts of sodium nitrite is added to a solution 50 pts aniline, 15 pts conc H_2SO_4 in about 1,500 pts of water, the temperature of the mixture is kept for 15 mins between 25° and 30° , the pp then filtered off, washed, and dried, the yield is 98 p.c of the theoretical (Staedel & Bauer, *B* 19, 1952)

Properties—Golden plates (from alcohol), or large flat prisms (from benzene) Explodes between 150° and 200° Insol water, and dilute acids, m sol cold alcohol, v sol hot alcohol, v sol ether and benzene

Reactions—1 Hot conc $HClAq$ splits it up into phenol, nitrogen, and aniline, cold $HClAq$ gives aniline and diazobenzene chloride, which, if an excess (more than 1 mol) of HCl is not present, recombine forming benzene azo aniline (*q v*) Unstable chlorides such as aniline hydrochloride or $ZnCl_2$ also effect the conversion into benzene azo aniline—2 Bromine in $HBrAq$ gives diazobenzene bromide and tribromo-aniline—3 The hydrogen atom of the NH group can be readily replaced by alkyl radicles by treatment with alcoholic haloids, and sodium ethylate The alkylated diazobenzene-anilides thus obtained are split up by acids into diazobenzene and the corresponding mono alkyl aniline A proof is thus afforded of the unsymmetrical structure of the anilide, and since the only other possible formula $C_6H_5N NH C_6H_5$ is

excluded by the fact that the body is not reduced by alkaline reducing agents to hydrazobenzene and NH_3 , the formula PhN_2NHPh is probably correct (Friswell & Green, *C J* 49, 746, *B* 19, 2034)—4 Phenol at 100° gives benzene *p*-azo phenol Resorcin and the naphthols act similarly (Heumann & Oeconomides, *B* 20, 372)

Salts— PhN_2NAGPh orange needles—($PhN_2NHPhHCl$), $PtCl_4$, unstable crystals

Di sulphonamide $C_6H_4(SO_2NH_2)_2N_2NH C_6H_4SO_2NH_2$ [183°] Yellow needles From $C_6H_4(SO_2NH_2)_2NH_2$, HNO_3 , and nitrous acid gas (Hybbenseth, *A* 221, 206) Conc HCl converts it into $C_6H_4ClSO_2NH_2$, $C_6H_4(NH_2)SO_2NH_2$, and N_2

Diazo-benzene-azo-benzene p sulphonic acid $C_6H_4(SO_3)_2-N_2-C_6H_4-N_2$ Small yellow needles. Nearly insoluble in most solvents Formed by long action of nitrous acid on amido benzene azo benzene sulphonic acid Boiled with water it gives oxy benzene azo benzene sulphonic acid, with alcohol it gives benzene azo benzene-sulphonic acid (Griess, *B* 15, 2186)

Diazo-benzene-benzyl-anilide $C_6H_5N_2N(C_6H_5)C_6H_5$ *Benzyl diazo-amido-benzene* [81°] Yellow needles V sol acetone, m sol alcohol, insol water

Preparation—30 g of sodium are dissolved

in 800 cc of alcohol, a hot solution of 200 g of diazo benzene anilide in 500 cc of absol alcohol added, and the mixture heated with 140 g of benzyl chloride for 1 or 2 hours, the product is precipitated by water and recrystallised from alcohol, yield, 200 g

Reactions—On heating it decomposes explosively By excess of HCl it is resolved into diazobenzene and benzyl aniline (Friswell & Green, *B* 19, 2036)

Diazo-benzene-bromo-anilide v Diazo bromo benzene anilide

Diazo benzene-*p*-chloro anilide Formed from *p* chloro diazo benzene and aniline By warming with phenol it gives oxy azo benzene and *p* chloraniline (Heumann & Oeconomides, *B* 20, 908)

Diazo - benzene - ethylamide Ph N. NH₂Et From diazo benzene nitrate and ethylamine Picrate C₆H₄N₂C₂H₅(NO₂)₂OH

Diazo benzene ethyl hydrazide Ph N. N.H₂Et From diazo benzene nitrate and ethyl hydrazine (E Fischer, *A* 190, 306) Very unstable oil Reduced in alcoholic solution by zinc dust and acetic acid to ethyl hydrazine and phenylhydrazine

Diazo benzene imide C₆H₄N₂ *Tri azo benzene*

Formation—1 Diazobenzene perbromide is treated with aqueous NH₃ and the product distilled with steam, dried over CaCl₂, and rectified under diminished pressure (Griess, *Tr* 1864, in 700)—2 By warming nitroso phenyl hydrazine with dilute KOH (Fischer, *A* 190, 92)—3 By adding Na₂CO₃ to a mixture of diazo benzene sulphate and hydroxylamine

Properties—A heavy oil, insol water, m sol alcohol and ether Detonates when distilled under atmospheric pressure Not attacked by KOH

Reactions—1 Reduced in alcoholic solution by Zn and H₂SO₄ to aniline and NH₃—2 By heating with strong HCl it is converted into a mixture of *o* and *p* chloro aniline

3 By heating with H₂SO₄ diluted with an equal volume of water it is converted into *p* amido-phenol C₆H₄N₂ + H₂O = C₆H₄NH₂ + O + N₂ = C₆H₃(OH)NH₂ + N₂ (Griess, *B* 19, 313)

Diazo-benzene dimethylamide Ph N. NMe₂ From diazobenzene nitrate and aqueous dimethylamine (Baeyer & Jager, *B* 8, 893) Yellowish oil, explodes when large quantities are heated, volatile with steam, insol water and alkalis, v e sol alcohol, ether, and acids Decomposed by acids into diazobenzene salts and dimethylamine Aniline hydrochloride forms diazo-benzene anilide and NMe₂H hydrochloride Picrate Ph N. NMe₂C₆H₂(NO₂)₂(OH) yellow needles

Diazo-benzene-methyl-anilide

C₆H₄N₂NMeC₆H₅ *Methyl diazo amido benzene* Heavy deep-yellow oil Not volatile with steam Miscible with alcohol, insol water

Preparation—30 g of sodium are dissolved in 300 cc of absolute alcohol and mixed with a hot solution of 200 g diazobenzene anilide in 500 cc of absolute alcohol, when nearly cold 170 g of methyl iodide are added, a vigorous reaction soon sets in and is completed by 1 or 2

hours' cohobation, half the alcohol is then distilled off and the residue precipitated by water, the oil separated and dried over CaCl₂, the yield is 200 grms

Reactions—On heating it decomposes explosively By excess of HCl it is resolved into diazobenzene chloride and methylamine (Friswell & Green, *C* 7 49, 748, *B* 19, 2035)

Diazo-benzene phosphonic acid nitrate (?) NO₂N₂C₆H₄PO(OH)₂3aq [188°] S 58 at 18°, 59 at 80° Formed by passing nitrous acid gas into a boiling solution of amido benzene phosphonic acid in HNO₃Aq (Michaelis & Benzinger, *A* 188, 288) Long white prisms (from HNO₃Aq) Explodes above 190° V sol alcohol, s sol ether Not affected by boiling water, even in presence of H₂SO₄, slightly decomposed by boiling NaOHaq

Salts—Na₂A" 2aq —K₂A" aq —BaA" 3aq —AgA" —PbA"

Diazo benzene piperidine PhN₂NC₄H₉ [43°] (Baeyer & Jager, *B* 8, 893, Wallach, *A* 235, 241)

Preparation—Aniline (100g) is dissolved in aqueous HCl (210 cc) and the solution at 0° is diazotised with NaNO₂ (74 g) and then poured into a dilute aqueous solution of piperidine (100 g) containing KOH (60 g) cooled with ice

Properties—Crystals (from ether or petroleum ether)

Reactions—1 HCl passed into an ethereal solution gives diazobenzene chloride and piperidine hydrochloride Aqueous HCl acts similarly—2 Warm HCl forms N₂, chlorobenzene and piperidine hydrochloride, phenol is a by product HBr and HI act similarly—3 Hot dilute H₂SO₄ forms phenol—4 An ethereal solution of picric acid gives diazo benzene picrate

***o* Diazo benzene sulphonic acid**

C₆H₄<SO₃>N₂ Yellowish tables, obtained by passing nitrous acid gas into water containing *o*-amido-benzene sulphonic acid in suspension (Berndsen & Lumprecht, *A* 177, 101)

***m* Diazo benzene sulphonic acid**

C₆H₄<SO₃>N₂ Prepared by passing nitrous acid gas into a concentrated solution of *m* amido-benzene sulphonic acid, containing the free acid in suspension (Meyer & Stuber, *A* 165, 165, Berndsen, *A* 177, 88) Small columns (from water) Very explosive when dry V sol water and decomposed by it at 60° Boiling HBr gives *m* bromo benzene sulphonic acid Boiling alcohol has no action

***m* diazo benzene sulphamide nitrate** NO₂N₂C₆H₄SO₂NH₂ From C₆H₄(NH₂)SO₂NH₂ by mixing with HNO₃ and passing in nitrous acid gas (Hybbeneth, *A* 221, 205) Minute orange needles

***p* Diazo-benzene sulphonic acid**

C₆H₄<SO₃>N₂ Formed by diazotising *p* amido-benzene sulphonic acid (Schmitt, *A* 120, 144, Fischer, *A* 190, 76) Small needles (from water). Insol cold water, v sol water at 60° Boiling water forms phenol *p* sulphonic acid An alkaline solution gives a red colour with aldehydes (Petri, *H* 8, 291, Zahn, *B* 17, Ref 290), but this is not a characteristic test for aldehydes, as

it is given also by many other bodies (E Fischer, *B* 16, 657, O Loew, *J pr* [2] 31, 136)

Reactions — 1 *Bovling alcohol* forms benzene sulphonic acid — 2 PCl_5 , at 100° has no action (Laar, *J pr* [2] 20, 263)

Ethyl mercaptide $\text{C}_6\text{H}_5(\text{SO}_2\text{H})\text{N}_2\text{Set}$ Formed by combining *p* diazo benzene sulphonic acid with an alkaline solution of ethyl mercaptan. The sodium salt ($\text{A}'\text{Na}$) forms yellow glistening needles, v sol water. It is very unstable, readily decomposing with evolution of nitrogen. When boiled with alcohol it yields ethyl phenyl sulphide. *p* sulphonic acid $\text{C}_6\text{H}_5\text{SC}_6\text{H}_4(\text{SO}_2\text{H})$ (Stadler, *B* 17, 2075)

Methyl anilide $\text{C}_6\text{H}_5(\text{SO}_2\text{H})\text{N}_2\text{NMeC}_6\text{H}_5$ Formed by combination of *p* diazo benzene sulphonic acid with mono methyl aniline in nearly neutral solution. The sodium salt (NaA') forms large colourless plates, v sol water, from which it is precipitated in white felted needles by alkali, nearly insol alcohol. Not affected by boiling with dilute caustic soda. Acids resolve it into its constituents *p* diazo benzene sulphonic acid and methyl aniline, which when the acid is dilute recombine to form methyl amido benzene azo benzene sulphonic acid $\text{C}_6\text{H}_5(\text{SO}_2\text{H})\text{N}_2\text{C}_6\text{H}_4\text{NHMe}$ (Bernthsen & Goske, *B* 20, 926)

Piperidine $\text{C}_6\text{H}_5(\text{SO}_2\text{H})\text{N}_2\text{NC}_4\text{H}_8$ (Wallich, *A* 235, 270) From sulphonic acid by diazotisation and treatment with piperidine (1 mol) and aqueous NaOH (1 mol). Salt — NaA' satiny plates — AgA' Stable in neutral or alkaline solutions

Imide $\text{C}_6\text{H}_5(\text{SO}_2\text{H})\text{N} \begin{smallmatrix} \diagup \text{N} \\ \diagdown \end{smallmatrix} \text{[1 4]}$

Triazobenzene *p* sulphonic acid Formed by the action of phenyl hydrazine upon diazobenzene *p* sulphonic acid suspended in cold water, diazobenzene imide, sulphonic acid, and aniline, are formed simultaneously

$\text{C}_6\text{H}_5(\text{N}_2)\text{SO}_3\text{H} + \text{C}_6\text{H}_5\text{N}_3 + \text{C}_6\text{H}_5(\text{NH}_2)\text{SO}_3\text{H} + \text{C}_6\text{H}_5\text{NH}_2$ White deliquescent needles v sol alcohol and water. Salts — BaA'_2 , 2aq white six sided plates, m sol hot water. **Phenyl hydrazine salt** $\text{C}_6\text{H}_5\text{N}_2\text{H}_4\text{A}'$ aq long white glistening plates, m sol hot water and alcohol, less in the cold, nearly insol ether and chloroform, decomposed by alkalis, but not by HCl even when boiling (Griess, *B* 20, 1528)

Diazo-benzene disulphonic acid

$\text{C}_6\text{H}_5(\text{SO}_2\text{H}) \begin{smallmatrix} \diagup \text{SO}_3\text{H} \\ \diagdown \end{smallmatrix}$ The salts are formed by passing nitrous acid gas at 0° into a solution of the acid salts of $\text{C}_6\text{H}_5(\text{NH})_2(\text{SO}_2\text{H})$, [1 3 4 ?] The free acid is unstable (Zander, *A* 198, 24) — KA' — BaA'_2 , 2aq

Diazo-benzene disulphonic acid

$\text{C}_6\text{H}_5(\text{SO}_2\text{H})(\text{SO}_2\text{N}_2)$ Formed by diazotising $\text{C}_6\text{H}_5(\text{NH}_2)(\text{SO}_2\text{H})$, [1 3 5] Slender needles, v sol water and alcohol. Decomposed by NaOH or BaCO_3 . The salts are formed by diazotising salts of the amido benzene disulphonic acid (Heinzelmann, *A* 188, 174, 190, 223) — KA' — BaA'_2 , 3aq — PbA'_2 , 8aq

Diazo-benzene disulphonic acid

$\text{C}_6\text{H}_5(\text{SO}_2\text{H})(\text{SO}_2\text{N}_2)$ Formed by diazotising $\text{C}_6\text{H}_5(\text{NH}_2)(\text{SO}_2\text{H})$, [1 2 4].

Salts — $\text{NH}_4\text{A}'$ — KA' — CaA'_2 , 2aq — BaA'_2 , 2aq — PbA'_2 , 8aq (Heinzelmann & Zander, *A* 198, 5)

Diazo-benzene *p*-toluide is identical with diazo toluene anilide (q v)

***o* Diazo benzoic acid**

Nitrate $\text{NO}_2\text{N}_2\text{C}_6\text{H}_4\text{CO}_2\text{H}$ By diazotisation of *o* amido benzoic acid suspended in dilute HNO_3 (Griess, *B* 9, 1653) Colourless tables or prisms v e sol water, m sol alcohol. Explodes when heated. Boiling water converts it into salicylic acid. Repeated solution in water and ppn with alcohol converts it into the so called semi-nitrate

substance is also formed by passing nitrous acid gas into an alcoholic solution of *o* amido benzoic acid (Griess, *A* 117, 39, Hand, *A* 234, 146)

Perbromide $\text{C}_6\text{H}_3\text{N}_2\text{O}_4\text{Br}_2$

Imide $\text{N}_2\text{C}_6\text{H}_4\text{CO}_2\text{H}$ **Triazo benzoic acid** [145°] From the perbromide and ammonia (Griess, *Z* [2] 3, 165) Long needles M sol boiling water

***m* Diazo-benzoic acid**

Sulphate $\text{SO}_3\text{H N}_2\text{C}_6\text{H}_4\text{CO}_2\text{H}$ Formed by passing nitrous acid gas into a thin paste of the sulphate of *m* amido benzoic acid, ppd by alcohol and ether. Long white laminae, v e sol water, detonates when heated. Treatment with dilute alcohol gives rises to a 'basic sulphate' $\text{C}_6\text{H}_3\text{N}_2\text{O}_4 \cdot 2\text{H SO}_4(?)$, or more probably $\text{N}_2(\text{C}_6\text{H}_3\text{CO}_2\text{H})_2\text{H SO}_4$

Nitrate $\text{NO}_2\text{N}_2\text{C}_6\text{H}_4\text{CO}_2\text{H}$ (Griess, *A* 120, 126) Its aqueous solution left in contact with BaCO_3 forms carboxy benzene azo oxy benzoic acid. With aqueous Na_2CO_3 it forms an acid $\text{C}_6\text{H}_3\text{N}_2\text{O}_4$

Hydride $\text{HO N}_2\text{C}_6\text{H}_4\text{CO}_2\text{H}$ Unstable yellow oil

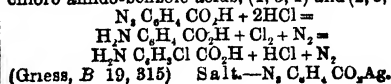

Chloride $\text{Cl N}_2\text{C}_6\text{H}_4\text{CO}_2\text{H}$ **Combinations** — $(\text{Cl N}_2\text{C}_6\text{H}_4\text{CO}_2\text{H})\text{PtCl}_4$ yellow prisms — $(\text{Cl N}_2\text{C}_6\text{H}_4\text{CO}_2\text{H})\text{AuCl}_3$ This salt suspended in alcohol and treated with H_2S gives benzoic acid, chloro benzoic acid, and sulphhydro benzoic acid, $\text{HS C}_6\text{H}_4\text{CO}_2\text{H}$ (Griess, *J pr* [2] 1, 102)

Perbromide $\text{Br}_2\text{N}_2\text{C}_6\text{H}_4\text{CO}_2\text{H}$ Only pp Converted by boiling alcohol into *m* bromo benzoic acid (Griess, *A* 135, 121, Cunze & Hubner, *A* 135, 106)

Ethylether, nitrate $\text{NO}_2\text{N}_2\text{C}_6\text{H}_4\text{CO}_2\text{Et}$ Formed by diazotising *m* amido benzoic ether dissolved in nitric acid (Griess, *A* 120, 127) — **Aurochloride** $(\text{Cl N}_2\text{C}_6\text{H}_4\text{CO}_2\text{Et})\text{AuCl}_3$ golden prisms (from alcohol)

Amide, nitrate $\text{NO}_2\text{N}_2\text{C}_6\text{H}_4\text{CONH}_2$ Formed by the action of nitrous acid gas on a solution of *m* amido benzamide in alcohol mixed with ether (Griess, *A* 120, 127) Needles. **Platinochloride** $(\text{Cl N}_2\text{C}_6\text{H}_4\text{CONH}_2)_2\text{PtCl}_4$

Imide $\text{N}_2\text{C}_6\text{H}_4\text{CO}_2\text{H}$ **Triazobenzoic acid** [160°] From the perbromide and NH_3 (Griess, *Z* 1867, 164) Thin laminae v sol alcohol and ether, m sol boiling water. By heating with HCl it is converted into two isomeric chloro amido-benzoic acids, (4, 3, 1) and (2, 3, 1)

Anilide v DIAZO BENZENE AMIDO BENZOIC ACID**Bromo-anilide v DIAZO BROMOBENZENE AMIDO BENZOIC ACID**

Nitric Nitrate $\text{NO}_2\text{N}_2\text{C}_6\text{H}_4\text{CN}$ From *m* amido benzonitrile (Griess, *B* 2, 370) Explosive, crystals, m sol cold water — **Perbromide** $\text{Br}_2\text{N}_2\text{C}_6\text{H}_4\text{CN}$ Crystals — **Imide** $\text{N}_2\text{C}_6\text{H}_4\text{CN}$ [57°] Needles, v sl sol water

***p* Diazo-benzoic acid**

Nitrate $\text{NO}_2\text{N}_2\text{C}_6\text{H}_4\text{COH}$ Explosive white prisms (Griess, *J* 1864, 353)

Amide Nitrate $\text{NO}_2\text{N}_2\text{C}_6\text{H}_4\text{CONH}_2$ (Griess, *Z* 1866, 1)

Imide $\text{N}_2\text{C}_6\text{H}_4\text{COH}$ *Triazobenzoic acid* [185°] Thin laminae (Griess, *Z* 1867, 164)

***m* Diazo-benzoic-*m*-amido benzoic acid**

[3 1] $\text{CO}_2\text{H C}_6\text{H}_4\text{N}_2\text{NH C}_6\text{H}_4\text{COH}$ [1 3]

Formed by passing nitrous acid gas into an alcoholic solution of *m* amido benzoic acid, or by mixing aqueous solutions of *m* amido benzoic acid and the nitrate of *m* diazo benzoic acid (Griess, *A* 117, 2, *Z* 1861, 353) Orange grains Explodes at 180° V sl sol water, alcohol, and ether Sol alkalis and reppd by acids Boiling HCl forms *m* amido benzoic acid and *m* chloro benzoic acid Bromine water gives bromo, and tri bromo, benzoic acid Boiling water and iodine form iodo oxy benzoic acid Nitrous acid passed into a boiling aqueous solution forms nitro oxy benzoic acid, nitrous acid passed into a boiling alcoholic solution forms benzoic acid Fuming HNO_3 gives tri nitro oxy benzoic acid

Sulphate $\text{C}_6\text{H}_3\text{BrN}_2\text{SO}_4\text{H}$ slender prisms

Imide $\text{C}_6\text{H}_3\text{BrN}_2$ *Triazo bromo-benzene* [20°] Insol water, m sol alcohol, v sol ether and benzene Reduced by Zn and H_2SO_4 to bromo aniline and NH_3

Cyanide $\text{C}_6\text{H}_3\text{BrN}_2\text{CNHCN}$ [128°] From *p* diazo bromo benzene nitrate and aqueous KCN (Gabriel, *B* 12, 1638)

Anilide $\text{C}_6\text{H}_3\text{BrN}_2\text{NH C}_6\text{H}_5$ or, alternatively $\text{C}_6\text{H}_3\text{N}_2\text{NH C}_6\text{H}_4\text{Br}$ Formed either from diazo benzene nitrate and *p* bromo aniline or from *p* diazo bromo benzene nitrate and aniline (Griess, *B* 7, 1618) Yellow plates, v e sol ether, m sol alcohol — $(\text{C}_6\text{H}_3\text{BrN}_2\text{HCl})_2\text{PtCl}_4$

***p* Bromo anilide** $\text{C}_6\text{H}_3\text{BrN}_2\text{NH C}_6\text{H}_4\text{Br}$ [145°] Obtained from *p*-bromo-aniline — $(\text{C}_{12}\text{H}_3\text{Br}_2\text{N}_2)_2\text{H}_2\text{PtCl}_4$

Diazo di-bromo benzene

Nitrate $\text{C}_6\text{H}_2\text{Br}_2\text{N}_2\text{NO}_2$ [2 4 1] Obtained by passing nitrous acid into an aqueous solution of the nitrate of di bromo aniline (Griess, *Tr* 1864, in 704) Needles or plates

Platinochloride $(\text{C}_6\text{H}_2\text{Br}_2\text{N}_2\text{Cl})_2\text{PtCl}_4$, orange plates

Perbromide $\text{C}_6\text{H}_2\text{Br}_2\text{N}_2\text{Br}_2$, slender needles

Imide $\text{C}_6\text{H}_2\text{Br}_2\text{N}_2$ [62°] needles

***Di* bromo-anilide**

$\text{C}_6\text{H}_2\text{Br}_2\text{N}_2\text{NHC}_6\text{H}_4\text{Br}_2$ [168°] From (2, 4, 1)-di bromo aniline Golden needles, v sl sol alcohol and ether

Diazo-tri bromo benzene

Nitrate $\text{C}_6\text{H}_2\text{Br}_3\text{N}_2\text{NO}_2$ [2 4 6 1] Formed when a rapid current of nitrous acid gas is passed into alcohol containing tri bromo aniline in suspension together with excess of HNO_3 . As soon as everything is dissolved, ether is added and a bright yellow crystalline pp of the diazo nitrate is formed (H Silberstein, *J pr* [2] 27, 102)

Properties — Yellow trimetric plates Explodes at 85° Sol water and HCl. V sl sol alcohol, ether, and benzene

Reactions — 1 Boiled with alcohol it gives tri bromo benzene, N_2 , HNO_3 , and aldehyde. — 2 Boiled with water, gives off no nitrogen but forms undetermined compounds — 3 Heated with glacial acetic acid gives off N_2 and nitrous fumes and leaves tri bromo benzene — 4 Heated with benzene (4 pts) it decomposes at 45° forming a diazo di bromo phenol (*q v*), tetra bromo-benzene [98°], and nitrobenzene — 5 Heated with CHCl_3 it gives diazo di bromo phenol and tetra-bromo benzene — 6 Heated with concentrated HCl it forms crystals of the perbromide of diazo-tri bromo benzene chloride, $\text{C}_6\text{H}_2\text{Br}_3\text{N}_2\text{ClBr}_2$. Probably chlorine, liberated in this reaction, turns out bromine from some of the tri bromo-compound, which bromine then unites with the diazo chloride The perbromide explodes at 100°, forming chloro tri bromo benzene — 7 With HBr it gives the bromide (*q v*) — 8 With HI it gives tri bromo iodo benzene

Sulphate $\text{C}_6\text{H}_2\text{Br}_3\text{N}_2\text{SO}_4\text{H}$

Perthes — Colourless prisms Sol. water, sl sol alcohol, insol ether and benzene

Reactions — 1 Decomposed by alcohol into tri-bromo benzene, H_2SO_4 , and N_2 — 2 Boiled with acidulated water it forms no tri bromo phenol. — 3 Heated with glacial acetic acid it forms tri-bromo benzene — 4 Not affected by boiling benzene

Bromide $\text{C}_6\text{H}_2\text{Br}_3\text{N}_2\text{Br}$ Small golden tri-

metric tablets, got by adding dilute HBr to a solution of the nitrate. Decomposed by sun light into N_2 and C_6H_5Br . Sl sol. water, insol alcohol and ether. Heated with glacial acetic acid it gives unsymmetrical $C_6H_4Br_2$.

Perbromide $C_6H_2Br_3N_2Br_3$. Formed by adding conc HBr to a solution of the nitrate, $C_6H_2Br_3N_2NO_3$, the liquid is filtered from $C_6H_2Br_3N_2Br$ and evaporated to crystallisation. It forms orange prisms and behaves very much like $C_6H_2Br_3N_2ClBr_3$ (*q v*).

Chloro perbromide $C_6H_2Br_3N_2ClBr_3$. From tri bromo diazo benzene nitrate (*q v*) and HCl. It explodes at 100° forming chloro tri bromo benzene. **Reactions** —1 With NH_3 gives tri bromo diazo benzene imide (*q v*) —2 With alcoholic dimethylaniline forms tri bromo benzene azo dimethylaniline $C_6H_2Br_3N_2 \cdot C_6H_4NMe_2$, 3 With alcoholic methyl di phenylamine it forms tri bromo benzene azo methyl di phenyl amine $C_6H_2Br_3N_2 \cdot C_6H_4NMePh$ —4 With mercuric diphenyl it forms chloro tri bromo benzene and nitrogen (Silberstein, *J pr* [2] 27, 117).

Imide $C_6H_2Br_3N_2$ [59°] Formed by adding dilute ammonia to $C_6H_2Br_3N_2ClBr_3$. Colourless needles. May be distilled with steam. Insol water, sol warm alcohol, ether, and $CHCl_3$. Unlike diazo benzene imide, it is not reduced by Zn and H_2SO_4 to NH_3 and tri bromo aniline (Silberstein, *J pr* [2] 27, 116).

Anilide $C_6H_2Br_3N_2NHPh$ [104°] From alcoholic aniline (2 mols) and $CH_2Br_3N_2NO_3$ (1 mol). The pp is crystallised from alcohol (Silberstein, *J pr* [2] 27, 121). Yellow, glittering, triclinic prisms. Insol water, sol hot alcohol, ether, and benzene. Boiled with glacial acetic acid it gives nitrogen and tri bromo aniline.

Tri bromo anilide

$C_6H_2Br_3N_2 \cdot NH \cdot C_6H_5Br_3$. Obtained by passing N_2O_5 slowly into a cold alcoholic solution of tri bromaniline. Some $C_6H_2Br_3N_2NO_3$ is formed at the same time. The product is washed with water and hot alcohol and crystallised from benzene. The yield is bad (Silberstein, *J pr* [2] 27, 120). Insol water and alcohol, v sl sol ether. V sol $CHCl_3$ and benzene. Not attacked by cold acids, but decomposed by boiling with acids with evolution of N_2 .

Diazo *p* bromo-benzene-amido-benzoic acid

$C_6H_2BrN_2 \cdot NH \cdot C_6H_4CO_2H$. **Diazo benzoic acid *p* bromo anilide**. From *p* diazo bromo benzene nitrate and *m* amido benzoic acid (Griess, *J* 1866, 453). Clusters of needles.

Diazo-bromo-benzene sulphonic acid

$C_6H_2Br \langle \begin{smallmatrix} SO_2 \\ N_2 \end{smallmatrix} \rangle$ [4 2] From the corresponding bromo amido sulphonic acid (Borns, *A* 187, 371). Small yellow needles, v sol water, m sol alcohol, explodes when struck or when heated. Heated with alcohol, it gives *m* bromo benzene sulphonic acid. Conc HBr gives $C_6H_2Br_2(SO_3H)$ [4 1 2].

Diazo-bromo-benzene disulphonic acid

From $C_6H_4(NH_2)(SO_3H)Br$ [1 4 6 3]. Minute plates, v sol water and alcohol. Does not explode when struck (Zander, *A* 198, 15) — **Ka⁸ 8aq.**

Diazo di bromo-benzene sulphonic acid

$C_6H_2Br_2 \langle \begin{smallmatrix} SO_2 \\ N_2 \end{smallmatrix} \rangle$ From $C_6H_2(NH_2)Br_2(SO_3H)$ [1 2 6 4]. Yellowish scales, explodes above 100° . V sl sol cold water, v sol hot water. Boiling water gives di bromo phenol sulphonic acid. Heated with alcohol it gives di bromo-benzene sulphonic acid.

Diazo-di-bromo-benzene sulphonic-acid di-bromo sulphanilide

$C_6H_2Br_2(SO_3H)N \cdot NH \cdot C_6H_4Br_2(SO_3H)$ [70°–80°] From $C_6H_2Br_2(NH_2)SO_3H$ [2 4 1 5] by warming with alcohol and KNO_3 . Needles (from water). Insol alcohol (Baessmann, *A* 191, 229).

Diazo di bromo benzene disulphonic acid

$C_6HBr_2(SO_3H) \langle \begin{smallmatrix} SO_2 \\ N_2 \end{smallmatrix} \rangle$ From the nitro benzene disulphonic acid [1 3 5]? whose chloride melts at 96° , by reduction, bromination, and diazotisation (Heinzelmann, *A* 188, 183).

Diazo-tri-bromo-benzene sulphonic acid

$C_6HBr_3 \langle \begin{smallmatrix} SO_2 \\ N_2 \end{smallmatrix} \rangle$ From tri bromo aniline, $C_6H_2(NH)Br_3$ [1 3 4 5] by sulphonation and diazotisation (Spiegelberg, *A* 197, 291). Minute needles.

Diazo tetra bromo benzene *p* sulphonic acid

$C_6Br_4 \langle \begin{smallmatrix} SO_2 \\ N_2 \end{smallmatrix} \rangle$ Crystalline powder not decomposed by boiling alcohol (Beckurts, *A* 131, 225).

Diazo bromo nitro toluene sulphonic acid

$C_6HMeBr(NO_2) \langle \begin{smallmatrix} N_2 \\ SO_2 \end{smallmatrix} \rangle$ Formed by projecting *m* bromo *p* amido toluene *o* sulphonic acid into fuming HNO_3 (Weckwarth, *A* 172, 203).

Diazo di bromo nitro-toluene sulphonic acid

$C_6Br_2Me(NO_2) \langle \begin{smallmatrix} N_2 \\ SO_2 \end{smallmatrix} \rangle$ Formed by projecting di bromo *o* amido toluene *p* sulphonic acid into fuming HNO_3 (Hayduck, *A* 174, 355).

Diazo di bromo phenol

$C_6H_2Br_2 \langle \begin{smallmatrix} O \\ N_2 \end{smallmatrix} \rangle$ [0 $N_2 = 1$ 2]

Preparation —Bromine water is added to an aqueous solution of *o* diazo phenol chloride and the pp is dissolved in fuming HCl, filtered through asbestos and ppd by water.

Properties —Orange crystalline powder, much less stable than the *p* compound. When heated it explodes at 128° . It is more soluble in cold water than the *p* compound, on warming the solution a resin is formed. The solution gives an amorphous grey pp with silver nitrate. It is almost insoluble in alcohol, ether and CS_2 , but readily dissolves in $CHCl_3$, hot benzene, and benzoline. It does not reduce Fehling's solution, nor form a crystalline body with $NaHSO_4$. $C_6H_2Br_2(OH)N \cdot Br \frac{1}{2} aq$ decomposed by water.

Ethyl ether, nitrate of

$C_6H_2Br_2(OEt)N_2NO_3$. Got by passing N_2O_5 into alcohol containing HNO_3 and di bromo-*o* amido phenetol in suspension, and pouring it into dry ether at 0° . **Properties** —Prisms. Explodes at 102° . If its alcoholic solution be diluted with water (10 vols) and boiled as long as N_2 escapes, it is converted into di bromo phenetol, bromine being replaced by hydrogen, not by hydroxyl (Möhlau & Oehmichen, *J pr* [2] 24, 482).

Diazo di-bromo phenol

Formation—1 Obtained by adding bromine water to an aqueous solution of any salt of *p*-diazo phenol $\text{C}_6\text{H}_4(\text{OH})\text{N}_2\text{Cl} + 2\text{Br}_2 = \text{C}_6\text{H}_3\text{Br}_2\langle\overset{\text{O}}{\text{N}_2}\rangle + \text{HCl} + 2\text{HBr}$ —2 From HBr and diazophenol nitrate (*q v*)

Properties—A flocculent yellow pp resembling sulphide of arsenic. Dissolves in boiling water, without decomposition, and crystallises in yellow prisms as the solution cools. Almost insoluble in cold water, ether, and CS_2 , somewhat more soluble in CHCl_3 . Soluble in alcohol and in amyl alcohol. May be kept for months in closed bottles in the dark, but, when exposed to air and light, it soon turns brown. Heated to 137° , it explodes.

Salts—Unstable, decomposed by water and by alcohol. $\text{C}_6\text{H}_3\text{Br}_2(\text{OH})\text{N}_2\text{Br}, \text{aq}$ — $\{\text{C}_6\text{H}_3\text{Br}_2(\text{OH})\text{N}_2\text{Br}\}_3\text{PtCl}_6$, trichloric plates, decomposed by water— $\text{C}_6\text{H}_3\text{Br}_2(\text{OH})\text{N}_2\text{SO}_3\text{H}$ (Böhmer, *J pr* 132, 458).

Reactions—1 Boiled with water of which the boiling point, by addition of calcic chloride, has been raised to 120° , it gives off nitrogen and forms di bromo hydroquinone

(Bohmer, *J pr* 132, 464)—2 Dissolves in a hot solution of NaHSO_3 , and as the solution cools, yellow needles of $\text{C}_6\text{H}_3\text{Br}_2(\text{OH})\text{N}_2\text{SO}_3\text{Na} \cdot 2\text{aq}$ are formed. These crystals dissolve in ether, benzene and CS_2 , do not explode when heated, show Liebermann's reaction, do not reduce Fehling's solution, and give with BaCl_2 golden scales of $\{\text{C}_6\text{H}_3\text{Br}_2(\text{OH})\text{N}_2\text{SO}_3\}_2\text{Ba} \cdot 5\text{aq}$ —3 Reduced by Sn and HCl to di bromo *p* amido phenol

Diazo di-bromo phenol (?) Identical with the preceding diazo di bromo phenol just described may be converted into this isomeride by first reducing it to dibromo *p* amido phenol hydrochloride and again diazotising

Properties—Explodes at 145° , has a greyish yellow colour, is insoluble in water. Crystallises from alcohol in much thinner needles than the preceding. With NaHSO_3 it forms small plates, whereas the sulphonate of its parent isomeride crystallises in needles (Böhmer, *J pr* 132, 471).

Diazo di bromo phenol

$\text{C}_6\text{H}_3\text{Br}_2\langle\overset{\text{N}_2}{\text{O}}\rangle$ [*Br Br N O* = 1.563] Formed by heating tri bromo diazo benzene nitrate with benzene at 45° (Silberstein, *J pr* [2] 27, 107).

Properties—Oblique prisms, from water. Crystallises from alcohol. Explodes at 142° . Soluble in hot alcohol. Nearly insoluble in chloroform and ether.

Salts—These are very unstable, they are formed by warming with rather strong solutions of acids, but are saponified by water.

Reactions—1 Not attacked by boiling water. 2 Heated with strong HBr forms tri bromo-phenol and N_2 —3 Reduced by Sn and HCl to di bromo amido phenol and NH_3 .

Constitution—The hydrochloride of the di bromo amido phenol obtained by reduction, gives Schmitt's reaction upon the gradual addition of dilute bleaching powder, viz a violet colour

followed by a white pp. As this reaction is characteristic of *p* amido phenols, this body must be di bromo *p* amido-phenol, and since it is formed from $\text{C}_6\text{H}_3(\text{NH}_2)\text{Br}_2$ [1.246] its constitution is as given above. It appears to be different from Böhmer's compound, exploding at 137° .

Diazo-tri-bromo phenol

Ethyl ether, nitrate of

$\text{C}_6\text{HBr}_3(\text{OEt})\text{N}_2\text{NO}_3$ [*OEt N* = 1.2] Trichloric plates, prepared by bromination of *o* diazo-phenol. Does not explode when struck. In melting point tubes it explodes at 92° . It is decomposed by boiling water into tri bromo phenol, the N_2NO_3 being displaced by H, not by OH (Mohlau & Oehmichen, *J pr* 132, 484).

**Diazo-bromo-toluene sulphonic acids**

p diazo *m* bromo toluene *o* sulphonic acid (Weekwarth, *A* 172, 196). Red crystals. Heated with alcohol under pressure it gives bromo-toluene sulphonic acid.

p diazo-bromo-toluene *m*-sulphonic acid (Pechmann, *A* 173, 211). Heated with alcohol under pressure it gives bromo toluene *m* sulphonic acid.

diazo *o* bromo toluene *m* sulphonic acid (Schafer, *A* 174, 360).

diazo-*p* bromo toluene *m*-sulphonic acid (S)

diazo *p* bromo toluene *o* sulphonic acid (S)

o-Diazo di bromo toluene *p* sulphonic acid (Hayduck, *A* 174, 352).

Diazo camphor v CAMPHOR

Diazo *p* chloro benzene [1.4] $\text{C}_6\text{H}_4\text{Cl N}_2\text{OH}$. Yellow explosive powder, ppd from its salts by HOAc . Salts— $\text{C}_6\text{H}_4\text{Cl N}_2\text{NO}_3$, white plates— $\text{C}_6\text{H}_4\text{Cl N}_2\text{Br}$, yellow prisms— $\text{C}_6\text{H}_4\text{Cl N}_2$ — $(\text{C}_6\text{H}_4\text{Cl N}_2\text{Cl})_2\text{PtCl}_6$ (Griess, *Tr* 1864, iii 705).

Anilide v Diazo benzene *p* chloro anilide *p* Chloro-anilide $\text{C}_6\text{H}_4\text{Cl N}_2\text{NH C}_6\text{H}_4\text{Cl}$ [125°]

Diazo di-chloro benzene

Salts— $\text{C}_6\text{H}_3\text{Cl}_2\text{N}_2\text{NO}_3$ — $\text{C}_6\text{H}_3\text{Cl}_2\text{N}_2\text{Br}$ — $(\text{C}_6\text{H}_3\text{Cl}_2\text{N}_2\text{Cl})_2\text{PtCl}_6$ (G)

Di-chloro anilide $\text{C}_6\text{H}_3\text{Cl}_2\text{N}_2\text{NH C}_6\text{H}_4\text{Cl}$ [127°]. Needles, v sl sol alcohol and ether.

Diazo chloro nitro phenol

$\text{C}_6\text{H}_3\text{Cl}(\text{NO}_2)\langle\overset{\text{N}_2}{\text{O}}\rangle$ From chloro nitro amido-phenol (Griess, *A* 113, 215). Brownish red columns (from alcohol).

Diazo di-chloro phenol $\text{C}_6\text{H}_3\text{Cl}_2\langle\overset{\text{N}_2}{\text{O}}\rangle$ From $\text{C}_6\text{H}_3(\text{OH})\text{Cl}_2(\text{NH}_2)$ [1.352] (Schmitt & Glutz, *B* 2, 52). Brown flocculent powder.

Diazo-tri-chloro-phenol $\text{C}_6\text{HCl}_3\langle\overset{\text{N}_2}{\text{O}}\rangle$ From tri chloro-*p*-amido phenol (Lampert, *J pr* [2] 33, 375). Golden needles, explodes at 137° . Sl sol hot alcohol or benzene, insol ether.

Reactions—1 Boiling alcohol gives a tri-chloro phenol [54°] (253°)—2 Conc $\text{Na}_2\text{SO}_3\text{aq}$ forms $\text{C}_6\text{HCl}_3(\text{ONa})\text{N}_2\text{SO}_3\text{Na}$, of which the acid $\text{C}_6\text{HCl}_3(\text{OH})\text{N}_2\text{SO}_3\text{H}$ explodes at 200° , and forms an orange crystalline barium salt.—3 HI forms $\text{C}_6\text{HCl}_3\text{I OH}$.

Diazo-chloro-thymol chloride

$\text{C}_6\text{HClMePr}(\text{OH})\text{N}_2\text{Cl}$. By the action of N_2O on

a cold alcoholic solution of hydrochloride of chloro-amido thymol (Andresen, *J* pr 181, 180) Precipitated by ether Colourless needles, often grouped in fans

o Diazo cinnamic acid From amido cinnamic acid (10 pts), HCl (9 pts of SG 1.19), water (70 pts), and NaNO_2 . The chloride separates as a yellow powder (Fischer a Kuzel, *B* 14, 478, *A* 221, 272) The nitrate $\text{C}_6\text{H}_4(\text{N}_2\text{NO}_3)\text{CH CH CO}_2\text{H}$ forms clear prisms Both salts may be boiled with potash without giving off nitrogen, but they are decomposed by boiling water, forming *o* coumaric acid With Na_2SO_3 they form $\text{C}_6\text{H}_4(\text{N}_2\text{SO}_3\text{Na})\text{CH CH CO}_2\text{H}$, whence, by reducing with zinc and HCl, $\text{C}_6\text{H}_4(\text{NH NH SO}_2\text{Na})\text{CH CH CO}_2\text{H}$ The latter forms slender needles It reduces HgO in the cold, and Fehling's solution HCl in the cold converts it into hydrazido cinnamic acid (2 v)

p Diazo cinnamic acid The chloride $\text{C}_6\text{H}_4(\text{N N Cl})\text{CH CH CO}_2\text{H}$ is prepared by the action of NaNO_2 on *p* amido cinnamic acid suspended in HCl (Gabriel, *B* 15, 2300) Long needles (containing aq) M sol water Can be dried at a gentle heat without decomposition

p-Diazo-cresol $\text{Me C}_6\text{H}_3\text{N}_2\text{O}$ Formed by diazotising $\text{C}_6\text{H}_3\text{Me}(\text{NH}_2)(\text{OH})$ [1 3 4] (Wagner, *B* 7, 1270)— $(\text{MeC}_6\text{H}_3(\text{OH})\text{N}_2\text{Cl})\cdot\text{PtCl}_4$ powder, m sol water

Diazo ψ -cumene sulphite

Salt $-\text{C}_6\text{H}_2(\text{CH}_3)_2\text{N}_2\text{SO}_3\text{Na}$ [1 3 4 6] Transparent prisms (containing $2\frac{1}{2}$ aq) Not explosive (Haller, *B* 18, 90)

Diazo- ψ -cumene cumide Diazoamidocumene [1 3 4 6] $\text{C}_6\text{H}_4\text{Me}_2\text{N N NH C}_6\text{H}_2\text{Me}_2$ [6 1 3 4] [131*] Formed by the combination of diazo cumene with cumidine (Nolting a Baumann, *B* 18, 1147) Yellow tables (from ether) V sol benzene, ether, and acetone, m sol alcohol

Diazo-cumino-amido cumenic acid

$\text{Pr C}_6\text{H}_3(\text{CO}_2\text{H})\text{N}_2\text{NH C}_6\text{H}_2\text{Pr CO}_2\text{H}$ Formed by passing nitrous acid into an alcoholic solution of amido cumenic acid at 0° Minute prisms or leaflets (Griess, *A* 117, 62)

Diazo-ethane sulphite $\text{C}_2\text{H}_5\text{N}_2\text{SO}_3\text{H}$ Diazo-ethane sulphonic acid

Salt $-\text{KA}'$ Formed by the action of HgO on the corresponding hydrazone derivative $\text{C}_2\text{H}_5\text{NH NH SO}_3\text{K}$ (Fischer, *A* 199, 802) V sol water, ppd by alcohol Explodes when heated. Decomposed by boiling acids, N_2 and SO_2 coming off Reduced by zinc dust and acetic acid to $\text{C}_2\text{H}_5\text{NH NH SO}_3\text{K}$

Diazo-ethoxane $\text{C}_2\text{H}_5\text{O}-\text{N}_2-\text{O C}_2\text{H}_5$ (?)

V D 402 (calc 4.08) Prepared by the action of silver hyponitrite, AgNO_2 , on EtI (Zorn, *B* 11, 1630) Neutral liquid Exceedingly explosive Is decomposed by water with production of aldehyde and alcohol $(\text{C}_2\text{H}_5)_2\text{O}_2\text{N}_2 + \text{H}_2\text{O} = \text{N}_2 + \text{CH}_3\text{COH} + \text{C}_2\text{H}_5\text{OH} + \text{H}_2\text{O}$ By tin and acetic acid it is reduced to nitrogen and alcohol $(\text{C}_2\text{H}_5)_2\text{O}_2\text{N}_2 + \text{H}_2 = 2\text{C}_2\text{H}_5\text{OH} + \text{N}_2$

o-Diazo hemipic acid

$\text{C}_6\text{H}(\text{OMe})_2(\text{CO}_2\text{H})\text{N}_2\text{O}$ Diazo *di*-methoxy

phthalic acid Formed by the action of nitrous acid upon *o*-amido-hempic acid Yellow micro crystalline powder Sl sol ordinary solvents Explodes on percussion or when heated to

140°–150° Converted into hemipic acid by boiling with alcohol

Hydrochloride $\text{C}_6\text{H}(\text{OMe})_2(\text{CO}_2\text{H})\text{N}_2\text{Cl}$ aq long colourless needles

The sulphate forms small prisms (Grüne, *B* 19, 2802)

Diazo hippuric acid

The nitrate $\text{C}_6\text{H CH}_2\text{NH CO C}_6\text{H}_4\text{N}_2\text{NO}_3$ is formed by diazotising the nitrate of *m*-amido hippuric acid (Griess, *Z* 1867, 165)—*Perbromide* $\text{C}_6\text{H}_3\text{NO}_3\text{N}_2\text{Br}_3$ yellow prisms *Imide* $\text{C}_6\text{H}_3\text{NO}_3\text{N}_2$ tables or needles

Diazo-leucaniline ψ Hexa azo tri phenylmethane (*infra*)

p Diazo-iodo-benzene $\text{C}_6\text{H}_4\text{I N}_2\text{OH}$ yellow pp

Salts $-(\text{C}_6\text{H}_4\text{I N}_2\text{Cl})\text{PtCl}_4$ — $\text{C}_6\text{H}_4\text{I N}_2\text{NO}_3$ — $\text{C}_6\text{H}_4\text{I N}_2\text{SO}_3\text{H}$ small plates, v sol water, sl sol alcohol— $\text{C}_6\text{H}_4\text{I N}_2\text{Br}$ —*Imide* $\text{C}_6\text{H}_4\text{I N}_2$ (Griess, *Tr* 1864, iii 706)

(a) Diazo-naphthalene (Griess, *J* 1866, 459) Nitrate $\text{C}_{10}\text{H}_7\text{N}_2\text{NO}_3$ formed by diazotising a naphthylamine nitrate—*Perbromide* $\text{C}_{10}\text{H}_7\text{N}_2\text{Br}_3$ orange crystals—*Platino chloride* $(\text{C}_{10}\text{H}_7\text{N}_2\text{Cl})\text{PtCl}_4$ —*Imide* $\text{C}_{10}\text{H}_7\text{N}_2$ yellowish oil (*cf* Fischer, *A* 232, 242)

A solution of the chloride neutralised by Na CO_3 gives a brown pp Part of this dissolves in alkalis and appears to be $\text{C}_{10}\text{H}_7\text{NO}$, the rest is ppd as minute crystals by adding alcohol to its benzene solution Analysis indicates $\text{C}_{10}\text{H}_7\text{N}_2\text{O}_2$ Both form crimson solutions in alcohol, ether, benzene, and glacial acetic acid (P F Frankland, *C J* 37, 750)

(b) Diazo-naphthalene Obtained by diazotising (d) naphthylamine (Liebmann a Palm, *A* 183, 267) The sulphate forms pale yellow needles, and the *perbromide* orange needles $(\text{C}_{10}\text{H}_7\text{N}_2\text{Cl})\text{Cu Cl}_2$ very unstable yellow pp which is formed on adding Cu Cl_2 to a cold solution of *b* diazo naphthalene chloride $(\text{C}_{10}\text{H}_7\text{N}_2\text{Br})\text{Cu Br}_2$ red pp, on boiling with water it evolves nitrogen yielding (b) bromo-naphthalene (Lellmann, *B* 19, 810)

(a) Diazo naphthalene (a) naphthylamide [100°] Formed by action of nitrous acid on (a) naphthylamine, or by ppg a solution of (a) diazo naphthalene chloride with (a) naphthylamine Brown laminae (from alcohol) Acids resolve it into naphthylamine and diazo naphthalene (Martius, *Z* [2] 2, 137)

(a) Diazo naphthalene sulphonic acid

$\text{C}_{10}\text{H}_6\text{N}_2\text{SO}_3$ [1 4] Got by passing nitrous acid gas into (a) naphthylamine sulphonic acid (formed by sulphonating (a) naphthylamine) suspended in water (Clève, *Bl* [2] 26, 241, Neville a Winther, *C J* 37, 632) Powder, nearly insoluble in cold water Boiling water converts it into a crimson dye, forming very little naphthol sulphonic acid Heated with dilute H_2SO_4 (σ) naphthol *p* sulphonic acid is formed By heat with strong H_2SO_4 , or with water at 160°, (a) naphthol is produced Dilute HNO_3 (7 to 15 p c HNO_3) forms di nitro naphthol, [188°] Conc HCl forms a chloro naphthalene sulphonic acid, whence PCl_5 forms dichloro-naphthalene [68°]

Imide $\text{C}_{10}\text{H}_6(\text{SO}_3\text{H})\text{N}_2\text{N}$ [1 4]

Triazo naphthalene *p* sulphomacine Formed by the action of phenyl hydrazine upon the

acid, diazo-benzene imide, (a) naphthylamine-*p* sulphonic acid, and aniline are formed simul-

taneously $2\text{C}_{10}\text{H}_7\text{SO}_3\text{H} + 2\text{C}_6\text{H}_5\text{NH}_2 =$

$\text{C}_{10}\text{H}_7(\text{N}_2)\text{SO}_3\text{H} + \text{C}_6\text{H}_5\text{N}_3 + \text{C}_{10}\text{H}_7(\text{NH}_2)\text{SO}_3\text{H} + \text{C}_6\text{H}_5\text{NH}_2$. White needles ∇ sol water and alcohol

Salt —BaA', white silvery plates, ∇ sol boiling water. Phenyl-hydrazine salt $\text{C}_6\text{H}_5\text{N}_3\text{H}_4\text{A}'$ long plates, ∇ sol alcohol, nearly insol ether and chloroform (Griess, *B* 20, 1530)

(a) Diazo-naphthalene sulphonic acid

$\text{C}_{10}\text{H}_7\text{SO}_3\text{H} < \text{N}_2 >$ [1 1' or 4'] Similarly prepared from the product of the reduction of (a) nitro-(a) naphthalene sulphonic acid formed by sulphonating nitro naphthalene (Clöve, *Bl* [2] 24, 512) Yellow crystalline powder Boiling water gives (a) naphthol (a) sulphonic acid

(B) Diazo-naphthalene sulphonic acid

$\text{C}_{10}\text{H}_7\text{SO}_3\text{H} < \text{N}_2 >$ Microcrystalline powder Formed by diazotising (B) naphthylamine sulphonic acid (formed by sulphonating (B) naphthylamine) By boiling with HCl, converting into the K salt and heating with PCl, it yields chloro naphthalene sulphonic chloride [129°] (Forsling, *B* 19, 1715)

(B) Diazo-naphthalene sulphonic acid

$\text{C}_{10}\text{H}_7\text{SO}_3\text{H} < \text{N}_2 >$ Formed by diazotising ($\beta\beta$) naphthylamine sulphonic acid, itself got by the action of NH_2 upon Schaffer's (B) naphthol sulphonic acid at 180° Minute crystals. Converted by treatment with cuprous chloride into (B) chloro naphthalene sulphonic acid, whose chloride melts at 110°, and, by distillation with PCl, is converted into (e) di chloro naphthalene, [136°] (Forsling, *B* 20, 80)

Tetrazo-dinaphthyl $\text{HO N}_2 \text{C}_{10}\text{H}_6 \text{C}_{10}\text{H}_6 \text{N}_2\text{OH}$ Formed by diazotising naphthidine It gives violet dye stuffs when combined with the sulphonic acids of (B) naphthol By boiling with alcohol it yields (aa) dinaphthyl

Salts — $\text{C}_{20}\text{H}_{12}\text{N}_4\text{SO}_3^x$ yellowish plates — ($\text{C}_{20}\text{H}_{12}\text{N}_4\text{Cl}_2$)PtCl₄ sparingly soluble yellow needles (Nietzki & Goll, *B* 18, 3256)

Diazo nitro benzaldoxim chloride

$\text{C}_6\text{H}_5(\text{NO}_2)(\text{N Cl})(\text{CH OH})$ [3 4 1] Formed by the action of amyl nitrite and HCl on (3 4 1) nitro amido phenyl-acetic acid (Gabriel, *B* 15, 837) Plates or needles Explodes on heating On heating with alcohol it gives *m* nitro benzaldoxim $\text{C}_6\text{H}_4(\text{NO}_2)(\text{CH OH})$

p-Diazo *o* nitro-benzaldoxim chloride

$\text{C}_6\text{H}_3(\text{NO}_2)(\text{N}_2\text{Cl})(\text{CH OH})$ [2 4 1] Formed, with evolution of CO_2 , by the action of amyl nitrite on a HCl solution of *o* nitro *p* amido phenyl-acetic acid (Gabriel & R Meyer, *B* 14, 826, *C* 1885, 516) Long red needles Explosive By the action of HBr it gives *o* nitro *p* bromo benzaldoxim By hot alcohol it gives *o* nitro-benzaldoxim $\text{C}_6\text{H}_4(\text{NO}_2)(\text{CH OH})$ On oxidation it gives *o* nitro benzaldehyde Ammonium sulphide reduces it to *o* amido benzaldoxim $\text{C}_6\text{H}_4(\text{NH}_2)(\text{CH OH})$ [133°]

m Diazo nitro benzene Formed by diazotising *m* nitro aniline

Nitrate $\text{C}_6\text{H}_4(\text{NO}_2) \text{N}_2 \text{NO}_3$ cubes —

($\text{C}_6\text{H}_4(\text{NO}_2) \text{N}_2\text{Cl}$)₂PtCl₄ — $\text{C}_6\text{H}_4(\text{NO}_2) \text{N}_2\text{Br}$, (Griess, *Tr* 1864, iii 708)

Imide $\text{C}_6\text{H}_4(\text{NO}_2) \text{N}_2$ [52°]

p Diazo nitro-benzene Formed by diazotising *p* nitro aniline

Nitrate $\text{C}_6\text{H}_4(\text{NO}_2) \text{N}_2 \text{NO}_3$ slender needles. Gives no pp with PtCl₄

Imide $\text{C}_6\text{H}_4(\text{NO}_2) \text{N}_2$ [71°]

m Diazo nitro-benzene *p* ethyl-toluide

[3 1] $\text{C}_6\text{H}_4(\text{NO}_2) \text{N}_2 \text{—NET C}_2\text{H}_5\text{Me}$ [1 4] [55°] From *m* diazo nitro benzene chloride and ethyl *p* toluidine (Gastiger, *Bl* [2] 42, 342) Resolved by dilute HCl into its generators

p Diazo-nitro-benzene-*p* ethyl-toluide

[4 1] $\text{C}_6\text{H}_4(\text{NO}_2) \text{N}_2 \text{—NET C}_2\text{H}_5\text{Me}$ [1 4] [105°] Yellow needles (Gastiger, *Bl* [2] 42, 342) Resolved by HCl into *p* diazo nitro benzene chloride and ethyl *p* toluidine

m Diazo nitro benzene *m* nitro anilide

[3 1] $\text{C}_6\text{H}_4(\text{NO}_2) \text{N}_2 \text{NH C}_6\text{H}_4(\text{NO}_2)$ [1 3] [195°] Formed by the action of nitrous acid (1 mol) on *m* nitro aniline (2 mols) Small red prisms, ∇ sol alcohol (Griess, *A* 121, 272, Meldola & Streetfield, *C* J 51, 107) Insol hot aqueous KOH, but the potassium salt separates as brown crystals from a solution in alcoholic KOH Cold HClAq gives *m* nitro aniline and *m* diazo-nitro-benzene chloride

p Diazo-nitro benzene *p* nitro anilide

[4 1] $\text{C}_6\text{H}_4(\text{NO}_2) \text{N}_2 \text{NH C}_6\text{H}_4(\text{NO}_2)$ [1 4] [223°] Formed by the action of nitrous acid (1 mol) on *p* nitro aniline (2 mols) (Griess, *A* 121, 271, Meldola & Streetfield, *C* J 49, 624) Small yellow needles, *m* sol boiling alcohol Possesses distinctly acid properties, decomposing Na_2CO_3 Cold alcoholic KOH or boiling aqueous KOH form a magenta coloured solution of the potassium salt It forms *p* nitro aniline when heated with dilute H_2SO_4 or with water in sealed tubes at 230° Conc HCl at 20° gives *p* diazo nitro benzene chloride and *p* nitro aniline

Salts — $\text{C}_6\text{H}_4(\text{NO}_2) \text{N}_2 \text{NNA C}_6\text{H}_4\text{NO}_2$ forms steel blue needles, soluble only in excess of alkali — $\{\text{C}_6\text{H}_4(\text{NO}_2) \text{N}_2 (\text{C}_6\text{H}_4\text{NO}_2)\}_2\text{Cu}$ — $\{\text{C}_6\text{H}_4(\text{NO}_2) \text{N}_2 (\text{C}_6\text{H}_4\text{NO}_2)\}_2\text{Cd}$ — $\{\text{C}_6\text{H}_4(\text{NO}_2) \text{N}_2 (\text{C}_6\text{H}_4\text{NO}_2)\}_2\text{Co}$

m Diazo nitro-benzene-*p*-nitro anilide

[3 or 4 1] $\text{C}_6\text{H}_4(\text{NO}_2) \text{N}_2 \text{NH C}_6\text{H}_4(\text{NO}_2)$ [1 4 or 3] [211°] From diazotised *m* nitro aniline hydrochloride and *p* nitro aniline, or from diazotised *p* nitro-aniline hydrochloride and *m* nitro aniline (Meldola & Streetfield, *C* J 51, 103, 439) Yellow needles (from alcohol) Dissolves in NaOH Aq, forming a red solution Cold aqueous HCl gives *m* and *p* diazo nitro benzene chlorides and *m* and *p* nitro aniline

m-Diazo nitro benzene - *m*-nitro - benzyl-anilide [3 1] $\text{C}_6\text{H}_4(\text{NO}_2) \text{N}_2 \text{NC}_6\text{H}_4 \text{C}_6\text{H}_4(\text{NO}_2)$ [1 3] [142°] From *m* diazo nitro benzene - *m*-nitro anilide, alcoholic KOH, and benzyl chloride (M & S) HClAq at 100° gives *m*-chloro nitro-benzene and *m* nitro benzyl aniline

p Diazo nitro benzene *p* nitro benzyl anilide [4 1] $\text{C}_6\text{H}_4(\text{NO}_2) \text{N}_2 \text{NC}_6\text{H}_4 \text{C}_6\text{H}_4(\text{NO}_2)$ [1 4] [190°] From *p* diazo nitro-benzene *p* nitro benzyl-anilide, alcoholic KOH, and $\text{C}_6\text{H}_5\text{Cl}$ (Meldola & Streetfield, *C* J 51, 112) Minute yellow needles Conc HCl decomposes it at 100° into *p* nitro benzyl aniline and *p* chloro-nitro-benzene

p Diazo nitro benzene *m* nitro benzyl anilide [4 1] $C_6H_4(NO_2)N_2C_6H_4C_6H_4(NO_2)$ [1 3] [180°] From *m* diazo nitro benzene *p* nitro anilide alcoholic KOH, and benzyl chloride (Meldola a Streatfeild, *C J* 51, 114)

m Diazo nitro benzene *m* nitro ethyl anilide [8 1] $C_6H_4(NO_2)N_2NEtC_6H_4(NO_2)$ [1 3] [119°] From *m* diazo nitro benzene *m* nitro anilide by treatment with KOH and EtI Also from *m* diazo *p* nitro benzene and *m* nitro ethyl aniline Needles Cold conc HCl forms *m* diazo nitro benzene chloride and *m* nitro ethyl aniline (Meldola a Streatfeild, *C J* 51, 108, 441)

p Diazo nitro benzene *p* nitro ethyl anilide [4 1] $C_6H_4(NO_2)N_2NEtC_6H_4(NO_2)$ [1 4] [192°] Formed by the action of EtI and KOH upon *p* diazo nitro-benzene *p* nitro ethyl anilide (Meldola a Streatfeild, *C J* 49, 631) Or from diazotised *p* nitro aniline and *p* nitro ethyl aniline (M a S, *C J* 51, 111, 442) Yellow needles, v sl sol alcohol, insol alkalis De composed by cold HCl into *p* diazo nitro benzene chloride and *p* nitro ethyl aniline

p Diazo nitro benzene *m* nitro ethyl anilide [4 1] $C_6H_4(NO_2)N_2NEtC_6H_4(NO_2)$ [1 3] [187°] From diazotised *p* nitro aniline and *m* nitro ethyl aniline (Meldola a Streatfeild, *C J* 51, 111, 442) Orange needles (from alcohol) V sl sol alcohol Cold conc HCl gives *m* nitro ethyl aniline and *p* diazo nitro benzene chloride *m*-Diazo-nitro-benzene *p* nitro ethyl anilide (?)

[3 1] $C_6H_4(NO_2)N_2EtC_6H_4(NO_2)$ [1 4] [148°] Prepared by digesting the potassium salt of *m* diazo nitro-benzene *p* nitro anilide dissolved in alcohol with EtI (Meldola a Streatfeild, *C J* 51, 105) Small yellow needles Heated with HCl at 100° it gives *m* and *p* nitro ethyl anilines and *m* and *p* chloro nitro benzenes By cold HCl it is resolved into *m* and *p* diazo nitro benzene chlorides and *m* and *p* nitro ethyl anilines

m-Diazo-nitro benzene *p* nitro ethyl anilide [3 1] $C_6H_4(NO_2)N_2NEtC_6H_4(NO_2)$ [1 4] [175°] From diazotised *m* nitro aniline and *p* nitro ethyl aniline (Meldola a Streatfeild, *C J* 51, 110) Yellow needles (from alcohol) V sl sol alcohol With conc HCl aq it forms *p* nitro aniline and *m* diazo nitro benzene chloride

p Diazo nitro benzene-piperidine [4 1] $C_6H_4(NO_2)N_2NC_5H_{10}$ [97°] (Wallach, *A* 235, 264)

m Diazo nitro benzene sulphonic acid $C_6H_4(NO_2)N_2SO_3H$ (1) Formed by diazotisation of *m* nitro aniline sulphonic acid (1 3 6) White microscopic tables By heating with absolute alcohol under an extra pressure of 400 mm it is converted into *p* nitro benzene sulphonic acid (Lamprich, *B* 18, 2186)

Diazo-nitro benzene disulphonic acid $C_6H_4(SO_3H)(NO_2)N_2SO_3H$ Formed by diazotising *m*-nitro aniline disulphonic acid (Lamprich, *B* 8, 289) Boiling alcohol forms *m* nitro-benzene disulphonic acid

Diazo nitro benzoic acid $C_6H_4(NO_2)N_2CO_2H$ Explosive yellow laminae (Salkowski, *A* 173, 63).

Diazo nitro di oxy quinone The salts are formed by diazotising nitro amido tetra oxy-benzene (Nietzki a Benkiser, *B* 18, 501) — $C_6(NO_2)(N_2OH)(OH)(ONa)O_4$ aq long yellow explosive needles — $C_6(NO_2)(N_2OH)(OH)(OAg)O_4$ yellow explosive plates

Diazo nitro phenol $C_6H_3(NO_2)N_2O$ From $C_6H_3(OH)(NH)(NO_2)$ [1 2 4] by diazotisation (Griess, *A* 113, 212) Brownish yellow granular mass, v sl sol hot water, v sol alcohol Explodes at 100°

Methyl ether Nitrate $C_6H_3(NO_2)(OMe)N_2NO_2$ Formed by diazotising nitro anisidine (Griess, *J* 1866, 459) Platinochloride $[C_6H_3(NO_2)(OMe)N_2Cl_2]_2PtCl_4$ Perbromide $C_6H_3(NO_2)(OMe)N_2Br_4$ Imide $C_6H_3(NO_2)(OMe)N_2$ needles Methoxy nitranilide

$C_6H_3(NO)(OMe)N NH C_6H_3(NO_2)(OMe)$ Formed by passing nitrous acid into an alcohol solution of nitro anisidine (Griess, *A* 121, 278)

Diazo di nitro-phenol $C_6H_2(NO)_2N_2O$ Formed by passing nitrous acid into an alcoholic solution of di nitro amido phenol (picramic acid (Griess, *A* 113, 205) Yellow plates (from alcohol)

Diazo-nitro- β -phenyl-propionic acid [3 4 1] $C_6H_4(NO_2)(N_2OH)C_6H_4COH$ Nitro diazo hydrocinnamic acid The nitrate is formed by the action of ethyl nitrite and HNO_3 on (3 4 1) nitro amido β phenyl propionic acid It forms short colourless needles which explode feebly on heating Heated with alcohol it gives *m* nitro hydrocinnamic acid (Gabriel, *B* 15, 845)

Diazo nitroso methyl nitro benzene v Diazo-nitro BENZALDOXIM

p Diazo nitroso oxindole chloride $C_6H_3N_2O Cl$ or $C_6H_3(N N Cl)N_2O$ Formed by dissolving

p Diazo di oxindole oxim chloride Small yellow needles Prepared by the action of amyl nitrite on a solution of amido oxindole in HCl Is only slightly attacked by boiling alcohol (Gabriel a R Meyer, *B* 14, 832, *C C* 1885, 516)

o Diazo *p* nitro toluene-piperidine $C_{12}H_{16}N_4O$ (1 4 2) $C_6H_4Me(NO_2)N_2NC_5H_{10}$ [61°] From *p* nitro *o* toluidine [107°] by diazotisation of its hydrochloride and subsequent addition of piperidine (Wallach, *A* 235, 248)

o Diazo nitro toluene *p* sulphonic acid $C_6H_4Me(NO_2)N_2SO_3H$ Formed by dissolving *o* toluidine *p* sulphonic acid in fuming HNO_3 and ppg with ice water (Hayduck, *A* 172, 117) Boiling alcohol under 1160 mm pressure does not attack it

p Diazo nitro toluene *o* sulphonic acid Formed by dissolving *p* toluidine *o* sulphonic acid in cold fuming HNO_3 (Weekwarth, *A* 172, 202) Large dark red prisms Alcohol heated with it under 1,000 mm pressure gives nitro-toluene sulphonic acid (Pagel, *A* 176, 304)

p Diazo-nitro-toluene *m* sulphonic acid $C_6H_4Me(NO_2)N_2SO_3H$ [1 2 4 5] Formed by dissolving *p* toluidine *m* sulphonic acid in fuming HNO_3 (Fechmann, *A* 173, 214), and also from $C_6H_4Me(NO_2)(NH_2)SO_3H$ [1 2 4 5] and nitrous

acid Insol cold water, on boiling with water only $\frac{1}{3}$ of the theoretical quantity of nitrogen comes off, when boiled with FeCl_3 all comes off. Boiling alcohol does not affect it, but in a sealed tube at 100° it is converted into *o*-nitro toluene *m*-sulphonic acid

p Diazo di-nitro-toluene *o*-sulphonic acid

$\text{C}_6\text{HMe}(\text{NO}_2)_2 < \text{SO}_3 >$ From *p* toluidine *o*-sulphonic acid and fuming HNO_3 (Pagel, *A* 176, 306) Yellowish needles Not affected by alcohol boiling under 1,000 mm pressure

Diazo-oxy-acrylic ether (?)

$\text{C}_6\text{H}_5\text{N}_2\text{O}$, *vs* $\text{CN}_2\text{C}(\text{OH})\text{COEt}$ (?) (142°) at 717 mm VD = 5.0 (obs) Yellow oil of strong peculiar odour Volatile with steam

Formation—Gelatine, swollen with water, is warmed with absolute alcohol whilst HCl gas is passed in, it soon dissolves and after distilling off the alcohol a thick brown syrup is left, the latter, which appears to be the hydrochloride of amido oxy acrylic ether $\text{CH}(\text{NH}_2)\text{C}(\text{OH})\text{CO}_2\text{Et}$ yields the diazo ether when its concentrated aqueous solution is treated with NaNO_2 , it is purified by distillation with steam, the yield is 150 grms from 400 grms of gelatine

Reactions—Acids eliminate its nitrogen, but it is very stable towards alkalis, with the exception of NH_3 , which even in the cold soon splits off CO_2 and alcohol By zinc dust and acetic acid it is reduced first to a hydrazine and finally to an amido acid An ethereal solution of iodine converts it into di iodo oxy acrylic ether $\text{Cl}_2\text{C}(\text{OH})\text{CO}_2\text{Et}$ which on treatment with cold aqueous NH_3 loses CO_2 and alcohol and yields di iodo vinyl amine $\text{Cl}_2\text{CH}(\text{NH}_2)$ It reduces AgNO_3 in the cold (Buchner a Curtius, *B* 19, 850)

Diazo-*o* oxy-benzoic acid

$\text{C}_6\text{H}_3(\text{CO}_2\text{H}) < \text{N}_2 > [\text{CO}_2\text{H O N} = 1.63]$

Diazo salicylic acid Formed by passing N_2O into an aqueous or alcoholic solution of hydrochloride of amido salicylic acid and concentrating Crystallised from water (Schmitt, *J* 1864, 384, Goldberg, *J pr* [2] 19, 362, P F Frankland, *C* J 37, 749) Slender needles

Reactions—1 Boiled with conc HI it gives iodo salicylic acid [196°] (*q v*)—2 **Mercaptan** at 170° gives salicylic acid (Schmitt a Mittenzwey, *J pr* [2] 18, 193)

Chloride— $\text{C}_6\text{H}_3(\text{CO}_2\text{H})(\text{OH})\text{N}_2\text{Cl}$ —**Platino chloride** [$\text{C}_6\text{H}_3(\text{CO}_2\text{H})(\text{OH})\text{N}_2\text{Cl}_2$]. PtCl_4

Diazo *o* oxy-benzoic amido-oxy-benzoic acid Dimethyl derivative

Diazo amido-amisic acid

$\text{C}_6\text{H}_3(\text{OMe})(\text{CO}_2\text{H})\text{N}_2\text{NH C}_6\text{H}_3(\text{OMe})(\text{CO}_2\text{H})$ Formed by passing nitrous acid gas into a cold alcoholic solution of amido amisic acid (Griess, *A* 113, 337, 117, 45) Amorphous powder, insol water, alcohol, and ether Warm conc HCl converts it into a red acid $\text{C}_6\text{H}_3\text{O}$,— $\text{Na}_2\text{A} \cdot 1\frac{1}{2}\text{aq}$ — $\text{K}_2\text{A} \cdot 2\text{aq}$ — Et_2A narrow leaflets

Diazo-oxy cinnamic acid Methyl derivative $\text{C}_6\text{H}_3(\text{N}_2\text{OH})(\text{OMe})\text{CH CH CO}_2\text{H}$ [5 2 1] Formed by diazotising methoxy amido cinnamic acid The chloride forms yellow crystals, which decompose at about 102° The nitrate $\text{C}_6\text{H}_3(\text{N N NO}_2)(\text{OMe})(\text{C}_6\text{H}_3\text{CO}_2\text{H})$ crystallises in yellow needles, which explode at 152° , nearly

insoluble in cold water, alcohol, and ether (Schnell, *B* 17, 1386)

***o* diazo-phenol Chloride** $\text{C}_6\text{H}_4(\text{OH})\text{N}_2\text{Cl}$

By passing N_2O into an alcoholic solution of the hydrochloride of *o* amido phenol, and then adding ether (Schmitt, *B* 1, 67, Böhmer, *J pr* 132, 460) Rhombohedra Bromine water added to its aqueous solution forms a yellow pp of diazo dibromo phenol (*q v*)

Sulphite $\text{C}_6\text{H}_4(\text{OH})\text{N}_2\text{SO}_3\text{K aq}$ Golden scales, got by adding KHSO_3 to $\text{C}_6\text{H}_4(\text{OH})\text{N}_2\text{Cl}$ (Schmitt a Glutz, *B* 2, 51, Reisenegger, *A* 221, 314)

Platinochloride ($\text{C}_6\text{H}_4(\text{OH})\text{N}_2\text{Cl}_2$). PtCl_4 , ***m* Diazo phenol Ethyl derivative** (Wagner, *J pr* [2] 32, 70)

***p* Diazo phenol Nitrate** $\text{C}_6\text{H}_4(\text{OH})\text{N}_2\text{NO}_3$ Formed by passing nitrous acid gas into a cold ethereal solution of phenol (Weselsky, *Sitz B* 1875, 9, *B* 8, 895), or of *p* nitroso phenol (Jager, *B* 8, 894)

Preparation—By passing N_2O into alcoholic solution of hydrochloride of *p* amido phenol, adding strong HNO_3 and cooling strongly (Bohmer, *J pr* 132, 450)

Reactions—1 By warming with dilute HBr (15 per cent solution) it does not give off nitrogen, as diazo benzene nitrate would do, but forms di azo di bromo benzene in accordance with the equation

Chloride $\text{C}_6\text{H}_4(\text{OH})\text{N}_2\text{Cl}$ Formed by diazotising *p* amido phenol hydrochloride Converted into hydroquinone by boiling conc HCl or dilute H_2SO_4 (Schuler, *B* 9, 1160) Heated with mercaptan it gives phenol and $(\text{C}_6\text{H}_5)_2\text{S}_2$ (Schmitt a Mittenzwey, *J pr* [2] 18, 194)— $(\text{C}_6\text{H}_4(\text{OH})\text{N}_2\text{Cl})_2\text{PtCl}_4$

Bromide $\text{C}_6\text{H}_4(\text{OH})\text{N}_2\text{Br}$ Formed by passing N_2O into an alcoholic solution of the hydrobromide of *p* amido phenol (C Bohmer, *J pr* 132, 451) Precipitated by ether

Platinobromide ($\text{C}_6\text{H}_4(\text{OH})\text{N}_2\text{Br}$). PtBr_4 Needles grouped in spherical segments Got by adding an aqueous solution of PtBr_4 (prepared like PtCl_4 by dissolving spongy platinum in HBr mixed with HNO_3 and evaporating) to one of diazo phenol hydrobromide If left for several days in contact with their mother liquor, the crystals absorb eight molecules of water of crystallisation changing to blood red twin crystals resembling gypsum These are insoluble in ether, CS_2 , and CHCl_3 , difficultly soluble in water The salt heated with 10 pts of Na_2CO_3 does not yield bromophenol

Sulphate $\text{C}_6\text{H}_4(\text{OH})\text{N}_2\text{SO}_4\text{H}$ Obtained by adding dilute H_2SO_4 to an alcoholic solution of the hydrochloride of *p* amido phenol, passing in N_2O , and adding ether Needles Does not explode when heated Converted by boiling HBr into the bromo phenyl ether of hydroquinone (*q v*)

Sulphite $\text{HO C}_6\text{H}_3\text{N}_2\text{SO}_3\text{K}$ From *p*-amido-phenol, HCl , NaNO_2 , and K_2SO_3 (Reisenegger, *A* 221, 316) Yellowish plates

Ethyl derivative $\text{C}_6\text{H}_4(\text{OEt})\text{N}_2\text{OH}$ Salts.— $\text{C}_6\text{H}_4(\text{OEt})\text{N}_2\text{Cl}$ From *p* amido-phenol hydrochloride by solution in alcohol and treatment with N_2O Precipitated by ether as an oil

Crystallises when cooled to -18° . But if H_2SO_4 be added to the alcoholic solution of the chloride, avoiding rise of temperature, crystals of the sulphate $\text{C}_6\text{H}_4(\text{OEt})\text{N}_2\text{SO}_4\text{H}$ separate. Boiled with water this forms $\text{C}_6\text{H}_4(\text{OEt})(\text{OH})$, hydroquinone mono ethylic ether (*q v*) (Hantzsch, *J pr* 130, 461).

Methyl derivative The salts are formed by diazotising *p* anisidine (Salkowski, *B* 7, 1009) $\text{C}_6\text{H}_4(\text{OMe})\text{N}_2\text{NO}_2 - \text{C}_6\text{H}_4(\text{OMe})\text{N}_2\text{SO}_4\text{H}$
Diazo phenol carbamic ether *Ethyl derivative*

Preparation—By passing N_2O_5 into a solution of the hydrochloride of ethoxy amido phenyl urethane, $\text{C}_6\text{H}_4(\text{OEt})(\text{NH})\text{NH CO}_2\text{Et}$, *HCl* (Kohler, *J pr* [2] 29, 273).

Properties—Slender, silvery white matted needles. Insol water, sol alcohol, ether, and glacial acetic acid. Decomposes below 100° .

Reactions—1 Does not explode—2 Not affected by boiling alcohol—3 Boiled with soda, it is decomposed with evolution of nitrogen.

Diazo phenol sulphonic acids

$\text{C}_6\text{H}_3(\text{N}_2\text{OH})(\text{OH})(\text{SO}_3\text{H})$ [4 3] and [3 4 1] are unstable crystalline acids obtained by diazotising the corresponding amido phenol sulphonic acids (Beunewitz, *J pr* [2] 8, 52).

Diazo phenol disulphonic acid

$\text{C}_6\text{H}_2(\text{SO}_3\text{H})_2 \begin{array}{c} \diagup \text{N}_2 \\ \diagdown \text{O} \end{array}$ From *p* amido phenol disulphonic acid (*q v*) (Wilsing, *A* 215, 238).

Salt— K_2A aq. Small sulphur yellow needles. Warmed with water it forms hydroquinone disulphonic acid.

p p Tetra-azo-diphenyl

Nitrate $\text{NO}_2\text{N}_2\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{N}_2\text{NO}_2$. Formed by passing nitrous acid gas into an alcoholic solution of nitrate of benzidine, and *ppg* with ether (Griess, *Tr* 1864, m 719). White needles, *v* sol water, *m* sol alcohol, insol ether. Explodes when heated. Boiling water forms *pp* di oxy-diphenyl.

Perbromide $\text{Br}_2\text{N}_2\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{N}_2\text{Br}_2$.

Imide $\text{N}_2\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{N}_2$ [127]. White plates.

Platinochloride

$(\text{ClN}_2\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{N}_2\text{Cl})\text{PtCl}_4$ yellow plates.

Sulphate

$(\text{HSO}_3\text{N}_2\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{N}_2\text{SO}_3\text{H})_2\text{H}_2\text{SO}_4$ white needles.

Anilide $\text{PhNH N}_2\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{N}_2\text{NHPh}$ lance shaped crystals, insol water. Explosive.

Piperidine

$\text{C}_6\text{H}_4\text{N}_2\text{N}_2\text{C}_6\text{H}_4\text{C}_6\text{H}_4\text{N}_2\text{NC}_6\text{H}_5$. From benzidine by diazotisation and treatment with piperidine. Insol. water, *sl* sol alcohol, *v* sol ether (Wallach, *A* 235, 271).

***m-m* Tetra-azo-diphenyl** (Brunner a. Witt, *B* 20, 1028).

Diazo-phenyl-carbamic ether

$\text{C}_6\text{H}_4 \begin{array}{c} \diagup \text{N}_2 \\ \diagdown \text{N} \end{array} \text{CO}_2\text{Et}$ Formed by diazotising *o*-amido phenyl carbamic ether (Rudolph, *B* 12, 1296).

Hexa-azo-tri-phenyl-carbinol

Chloride $\{\text{C}_6\text{H}_4(\text{N}_2\text{Cl})\}_3\text{COH}$ **Diazo *p* rosaniline chloride**. Formed by diazotising *p*

rosaniline hydrochloride (*E a O* Fischer, *A*, 194, 274) $-\text{C}_6\text{H}_4\text{N}_2\text{Cl}_3\text{AuCl}$.

Hexa-azo tri-phenyl carbinyl cyanide

Chloride $\{\text{C}_6\text{H}_4(\text{N}_2\text{Cl})\}_3\text{C CN}$ 2aq. From hydrocyano *p* rosaniline hydrochloride by diazotisation. Slender needles, *v* sol water. Gives, with boiling water, $(\text{C}_6\text{H}_4\text{OH})_3\text{C CN}$ (Fischer, *A* 194, 275).

Hexa-azo tri phenyl methane chloride

$(\text{C}_6\text{H}_4\text{N}_2\text{Cl})_3\text{CH}$ **Diazo *p* leucaniline**. Formed by diazotising tri amido tri phenyl methane hydrochloride (*E a O* Fischer, *A* 194, 269). Gives *p* rosolic acid (aurin) when boiled with water.

Di azo phenyl methyl ketone sulphite of sodium $\text{CH}_3\text{CO C}_6\text{H}_4\text{N}_2\text{SO}_3\text{K}$. Formed by diazotising *o* amido acetophenone and treating the product with K_2SO_3 . On reduction it gives the hydrazine salt $\text{CH}_3\text{CO C}_6\text{H}_4\text{NH NHSO}_3\text{K}$ whence *HCl* forms methyl indazol.

$\text{C}_6\text{H}_4 \begin{array}{c} \diagup \text{CMe} \\ \diagdown \text{N-NH} \end{array}$ (*v* INDAZOL). The aqueous solution of the hydrazine salt changes to

$\text{C}_6\text{H}_4 \begin{array}{c} \diagup \text{CMe} \\ \diagdown \text{N-N SO}_3\text{Na} \end{array}$ methyl indazol sulphionate of sodium (Fischer a. Tafel, *A* 227, 305).

Hexa-azo-di-phenyl-tolyl-carbinol

Chloride $(\text{C}_6\text{H}_4\text{N}_2\text{Cl})_2\text{C}(\text{OH})\text{C}_6\text{H}_4\text{MeN}_2\text{Cl}$ **Diazo rosaniline**. Formed by diazotising rosaniline hydrochloride (Caro a. Wanklyn, *Z* 1866, 511, *E a O* Fischer, *A* 194, 279). Gives rise to rosolic acid when boiled with water $-\text{C}_{20}\text{H}_{11}\text{N}_6\text{Cl}_3$ 3PtCl₄ 6aq $-\text{C}_{20}\text{H}_{11}\text{N}_6\text{Cl}_3\text{AuCl}_3$.

Hexa azo di phenyl-tolyl carbinyl cyanide

Chloride $(\text{C}_6\text{H}_4\text{N}_2\text{Cl})_2\text{C}(\text{CN})\text{C}_6\text{H}_4\text{MeN}_2\text{Cl}$ **Diazo hydrocyan - rosaniline**—Gold salt $-\text{C}_{20}\text{H}_{11}(\text{CN})\text{N}_6\text{Cl}_3\text{AuCl}_3$.

Diazo-resorcin chloride Diethyl ether

$\text{C}_6\text{H}_3(\text{OEt})_2\text{N}_2\text{Cl}$. From the amido compound (Pukall, *B* 20, 1136). Unstable crystals.

Diazo rosaniline (*v supra*)

Diazo-salicylic acid *v* DIAZO OXY BENZOIC ACID

Diazo succinamic acid

Methyl ether *A' Me* [84], long yellow prisms (from alcohol). Formed by the action of aqueous NH_3 upon methyl diazo succinate. By decomposition with cold slightly acidified water it yields methyl fumaramate and methyl malamate. Heated with benzoic acid at 140° – 150° it gives methyl benzoyl malamate. Iodine in ethereal solution converts it into methyl di iodo succinamate $-\text{CO}_2\text{Me CH}_2\text{Cl}_2\text{CONH}_2$ (Curlius a. Koch, *B* 19, 2460).

Ethyl ether $\text{C}_2\text{H}_5\text{N}_2(\text{CONH}_2)(\text{CO}_2\text{Et})$ [112], long thin yellow prisms, easily soluble in hot water and alcohol, sparingly in cold water and ether. It is not altered by boiling with pure water, but by acids and alkalis is at once decomposed with evolution of nitrogen. Reduced to aspartic ether by zinc dust and acetic acid (Curlius a. Koch, *B* 18, 1293).

Diazo-succinic acid $\text{C}_2\text{H}_4\text{N}_2(\text{CO}_2\text{H})_2$. The di-methyl and di-ethyl ethers of this acid are obtained by mixing used solutions of the hydrochlorides of the aspartic ethers $\text{OO}_2\text{R CH}(\text{NH}_2\text{Cl})\text{CH}_2\text{CO}_2\text{R}$ and sodium nitrite, and adding a few drops of dilute H_2SO_4 , after

which the product is shaken out with ether. The ethers form dark yellow oils which have not yet been obtained in a pure state. By boiling with water or aqueous acids they are decomposed with evolution of nitrogen and formation of the corresponding fumaric ether. They decompose spontaneously on keeping, evolving nitrogen and forming azinsuccinic ethers $(\text{CO}_2\text{R})_2\text{C}_2\text{H}_2\text{N}_2\text{N C}_2\text{H}_2(\text{CO}_2\text{R})_2$. Strong aqueous NH_3 converts them into diazo succinamic ethers.

p Diazo-toluene

Salts—The preparation and properties of these salts resemble those of the corresponding diazo benzene salts (Griess, *C J* 20, 86) — $\text{C}_6\text{H}_4\text{Me N}_2\text{NO}_2$, long slender white needles — $(\text{C}_6\text{H}_4\text{Me N}_2\text{Cl})_2\text{PtCl}_2$, yellow prismatic crystals $\text{C}_6\text{H}_4\text{Me N}_2\text{SO}_3\text{H}$ — $\text{C}_6\text{H}_4\text{Me N}_2\text{Br}$.

Dicyanide $\text{C}_6\text{H}_4\text{N}_4$, or $\text{C}_6\text{H}_4\text{Me N}_2\text{CN,HCN}$ [78°]. Needles or leaflets. Formed by the action of a diazo toluene salt on a solution of KCN (*B* 12, 1638).

Anilide $\text{C}_6\text{H}_4\text{Me N}_2\text{NHP}$ or, alternatively, $\text{Ph N}_2\text{NH C}_6\text{H}_4\text{Me}$. From *p* toluidine and diazobenzene nitrate or from aniline and *p* diazo toluene nitrate (Griess, *A* 137, 60, *B* 7, 1619). Narrow yellow leaflets. By warming with phenol it gives a mixture of aniline, *p* toluidine, benzene azo phenol and *p* toluene azo phenol, similarly with resorcin (Heumann & Oeconomidis, *B* 20, 907).

***p* Chloro anilide** Formed from *p* chloro diazo benzene and *p* toluidine. By heating with phenol it gives *p* toluene azo phenol and *p* chloraniline (Heumann & Oeconomidis, *B* 20, 909).

Piperidine $\text{C}_6\text{H}_4\text{N}_2$, i.e. $\text{C}_6\text{H}_4\text{N}_2\text{NC}_4\text{H}_9$ [41°]. From $\text{CH}_3\text{C}_6\text{H}_4\text{N}_2\text{Cl}$ and piperidine. Prisms (from alcohol or ether). Insol water. Dry HCl passed into its solution in petroleum ether appears to form an unstable hydrochloride, quickly decomposing into diazotoluene chloride and piperidine hydrochloride (Wallach, *A* 235, 244).

***p* Toluide** $\text{C}_6\text{H}_4\text{Me N}_2\text{NH C}_6\text{H}_4\text{Me}$ [116°]. Formed by passing nitrous acid gas into a solution of *p* toluidine in alcohol and ether (Griess, *A* 121, 277, when pure (by digestion with alcoholic $(\text{NH}_4)_2\text{S}$) it forms nearly colourless large thin prisms (Bernthsen & Goske, *B* 20, 928).

***p* Ethyl toluide** $\text{C}_6\text{H}_4\text{Me N}_2\text{NEt C}_6\text{H}_4\text{Me}$. Decomposed by acids into ethyl *p* toluidine and *p* diazo toluene chloride (Gastiger, *Bl* [2] 42, 342).

o Diazo-toluene *o* toluide

[2 1] $\text{C}_6\text{H}_4\text{Me N}_2\text{NH C}_6\text{H}_4\text{Me}$ [51°]. Orange yellow powder of microscopic needles. Prepared by adding sodium nitrite (1 mol) to an aqueous solution of *o* toluidine (2 mols) and HCl (3 mols) and then neutralising the HCl with sodium acetate, the temperature being kept below -5° during the whole reaction. It is crystallised by dissolving in cold alcohol and adding ice (Fischer & Wimmer, *B* 20, 1582).

o Diazo-toluene-azo-toluene $\text{C}_6\text{H}_4\text{N}_4\text{OH}$ i.e.

$\text{C}_6\text{H}_4\text{N}_2\text{NH C}_6\text{H}_4\text{N}_2\text{NH OH}$ (?) Obtained by diazotising

toluene azo *o* toluidine, the salts crystallise out when a stream of nitrous acid gas is passed into an alcoholic solution of toluene azo

toluidine and an excess of acid, or upon subsequent addition of a little ether. On heating with water or alcohol it decomposes, evolving nitrogen like ordinary diazo compounds. By SnCl_2 or SO_2 it is not reduced to a hydrazine but gives a stable compound $\text{C}_6\text{H}_4\text{N}_4$, which

probably has the constitution $\text{C}_6\text{H}_4\text{N}_4$ $\begin{matrix} \diagup & \text{N} & \diagdown \\ & \text{NH} & \\ \diagdown & \text{N} & \diagup \\ & \text{NC}_6\text{H}_4 & \end{matrix}$, by bromine this body is reconverted into the diazo perbromide. By zinc dust and alcohol it is converted into *m* toluene *p* azo toluene [58°] with evolution of nitrogen. The diazo imide loses nitrogen on heating and yields tolyl-

azimido toluene $\text{C}_6\text{H}_5\text{N}=\text{N C}_6\text{H}_4$, identical with

that obtained by oxidation of toluene azo *o* toluidine. *o* Diazo toluene azo toluene reacts with amines and phenols like an ordinary diazo-compound, the products, however, reduce to a diamine or amido phenol and tolyl azimido toluene. All the salts have a deep orange yellow colour and are tolerably stable — $\text{C}_6\text{H}_4\text{N}_2\text{Cl}$, red granular crystals — $(\text{C}_6\text{H}_4\text{N}_2\text{Cl})_2\text{PtCl}_2$, yellow acicular crystals — $\text{C}_6\text{H}_4\text{N}_2\text{NO}_2$, slender red pointed crystals — $\text{C}_6\text{H}_4\text{N}_2\text{SO}_3\text{H}$, red interwoven needles — $\text{C}_6\text{H}_4\text{N}_2\text{Br}$, [125°], long glistening red needles or compact crystals.

Anilide $\text{C}_6\text{H}_4\text{N}_4$, [85°], thick yellowish red crystals, formed by the action of alcoholic NH_3 upon the perbromide (Zincke & Lawson, *B* 19, 1452).

Product of Reduction $\text{C}_6\text{H}_4\text{N}_4$, probably

$\text{C}_6\text{H}_5\text{N}=\text{N C}_6\text{H}_4$ [168°]. Long colourless

needles. V sol hot alcohol, sl sol ether and chloroform, insol water. It has no basic properties. It is not affected by reducing agents. Bromine in alcoholic or acetic acid solution readily converts it into *o* diazo-toluene azo toluene perbromide. On addition of Ag_2O to its alcoholic solution nitrogen is evolved and *m* *p*-azotoluene [58°] is formed.

Acetyl derivative $\text{C}_6\text{H}_4\text{N}_4\text{Ac}$ [134°]. glistening white plates (Zincke & Lawson, *B* 19, 1457).

p Diazo toluene azo toluene

[2 1] $\text{C}_6\text{H}_4(\text{CH}_3)_2\text{N}_2\text{—N}_2\text{—C}_6\text{H}_4(\text{CH}_3)_2\text{N}_2\text{OH}$ [13 4]. Prepared by dissolving toluene azo *p* toluidine in alcohol, adding an excess of HCl , diazotising by passing N_2O_5 into the well cooled solution, and precipitating the diazo salt with ether. By reduction with SnCl_2 or zinc dust and acetic acid in cold dilute aqueous solution it is split up (without formation of a hydrazine) into *o* toluidine and tolylene *p* diamine.

Salts — $\text{C}_6\text{H}_4\text{N}_4\text{NO}_2$, slender brownish-yellow needles, m sol water and alcohol — $\text{C}_6\text{H}_4\text{N}_4\text{Br}_2$, yellow crystalline pp which changes on standing to small violet needles — $\text{C}_6\text{H}_4\text{N}_4\text{SO}_3\text{Na}$, glistening scales (from alcohol), v sol hot alcohol, sl sol water.

Anilide $\text{C}_6\text{H}_4\text{N}_4$, [60°], long plates, sol. alcohol and acetic acid (Zincke & Lawson, *B*, 20, 1181).

o Diazo toluene *m*-sulphonic acid

$\text{MeC}_6\text{H}_4\text{N}_2\text{SO}_3\text{H}$ [1 2]. Precipitated as a white powder when nitrous gas is passed into a

cold solution of *o* toluidine sulphonic acid
Explodes feebly at 100° (Neville & Winther, *C J* 37, 628)

o Diazo-toluene *p* sulphonic acid

Minute monoclinic prisms (Hayduck, *A* 172, 213, 174, 344) Boiling alcohol produces $\text{Me C}_6\text{H}_4(\text{OEt})\text{SO}_3\text{H}$ [1 2 4]

p Diazo-toluene *o* sulphonic acid Yellow or brown needles (Ascher, *A* 161, 8, Jensen, *A* 172, 235) Heated with alcohol under pressure it gives $\text{MeC}_6\text{H}_4(\text{OEt})(\text{SO}_3\text{H})$ Remsen & Palmer, *Am* 8, 243)

p-Diazo-toluene *m*-sulphonic acid

$\text{MeC}_6\text{H}_3\langle\text{N N}\rangle\text{SO}_3\text{H}$ [1 3] More soluble than the corresponding *o* compound (Neville & Winther, *C J* 37, 631) Prepared by passing nitrous acid gas into *p* toluidine sulphonic acid suspended in alcohol Hot alcohol gives toluene *m*-sulphonic acid (Petermann, *A* 173, 201)

p-Diazo-toluene *ezo* sulphonic acid

$\text{C}_6\text{H}_4\langle\text{N}_2\rangle\text{SO}_3\text{H}$ Heated with alcohol under 1,100 mm pressure it gives $\text{C}_6\text{H}_4(\text{OEt})\text{CH}_2\text{SO}_3\text{H}$ (Mohr, *A* 221, 219)

p Diazo-toluene-sulphonic-amido-toluene sulphonic acid *Amide*

[1 4 2] $\text{C}_6\text{H}_4\text{Me}(\text{SO}_2\text{NH}_2)\text{N}=\text{N}\text{C}_6\text{H}_4\text{MeSO}_2\text{NH}_2$ [2 1 4] From $\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)\text{SO}_2\text{NH}_2$ [1 2 4], alcohol, and nitrous acid gas (Paysan, *A* 221, 211) Decomposed by HCl into N_2 , $\text{C}_6\text{H}_4\text{ClMeSO}_2\text{NH}_2$, and $\text{C}_6\text{H}_4(\text{NH}_2)\text{MeSO}_2\text{NH}_2$

o Diazo-toluene disulphonic acid

$\text{C}_6\text{H}_3\text{Me}(\text{SO}_3\text{H})\langle\text{N}_2\rangle\text{SO}_3\text{H}$ [1 5 2] From N_2O , and

aqueous *o* toluidine disulphonic acid at 0° (Lumprecht, *B* 18, 2176, Hasse, *A* 230, 291) Microscopic needles Explosive Heated with alcohol under pressure it gives $\text{C}_6\text{H}_3\text{Me}(\text{OEt})(\text{SO}_3\text{H})_2$ With HI it forms $\text{C}_6\text{H}_4\text{MeI}(\text{SO}_3\text{H})_2$

Salts —KA' —BaA'2aq —PbA'.

p Diazo toluene di sulphonic acid

$\text{C}_6\text{H}_3\text{Me}(\text{SO}_3\text{H})\langle\text{N}_2\rangle\text{SO}_3\text{H}$ Formed by diazotisation

of *p*-toluidine di-sulphonic acid Yellowish crystals By heating with HI it yields *p* iodo toluene di sulphonic acid, with HBr it yields *p* bromo toluene di sulphonic acid

Salts —AK large yellow prisms —A'2Ba yellowish white needles —A'2Pb small red prisms (Lumprecht, *B* 18, 2178)

Diazo-toluene amido toluic acid

$\text{C}_6\text{H}_3\text{Me}(\text{CO}_2\text{H})\text{N}_2\text{NH C}_6\text{H}_4\text{MeCO}_2\text{H}$ From amido toluic acid and nitrous ether (Griess, *A* 117, 59) Minute yellow prisms (containing 3 aq), insol water, alcohol, and ether

o Diazo *p* toluidine bromide

Acetyl derivative

$\text{C}_6\text{H}_3\text{Me}(\text{NHAc})\text{N}_2\text{Br}$ [1 4 2]

From $\text{C}_6\text{H}_3\text{Me}(\text{NHAc})(\text{NH}_2)$ [1 4 2], conc HBr and conc NaNO_2 at 0° (Wallach, *A* 235, 249)

Reactions —1 Hot Ac_2O converts it into $\text{C}_6\text{H}_3\text{Me}(\text{NHAc})(\text{OAc})$ [182 5°] —2 Nitro ethane and NaOEt gave $\text{C}_6\text{H}_3\text{Me}(\text{NHAc})\text{N}_2\text{CHMe}(\text{NO}_2)$ [143°] —3 HNEt_2 gives $\text{C}_6\text{H}_3\text{Me}(\text{NHAc})\text{N}_2\text{NEt}_2$ [108°] —4 *Piperidine* gives the piperide $\text{C}_6\text{H}_3\text{Me}(\text{NHAc})\text{N}_2\text{NC}_4\text{H}_9$ [164°] HCl passed into an alcoholic solution of this base gives a

pp of $\text{C}_6\text{H}_3\text{Me}(\text{NHAc})\text{N}_2\text{Cl}$ Boiling HCl aq gives $\text{C}_6\text{H}_3\text{Me}(\text{NHAc})\text{Cl}$

Diazo *m* xylene-sulphonic acid

$\text{C}_6\text{H}_3\text{Me}_2\langle\text{N}_2\rangle\text{SO}_3\text{H}$ [1 3 4 6] White pp Sparingly soluble in water Decomposes at 60°–70° Combines with phenols and amines Formed by diazotisation of *m* xylydine sulphonic acid (Nöling & Kohn, *B* 19, 138)

Diazo-*p*-xylene-sulphonic acid

$\text{C}_6\text{H}_3\text{Me}_2\langle\text{N}_2\rangle\text{SO}_3\text{H}$ [1 4 5] Yellowish white plates Stable at ordinary temperature, decomposes on heating with water at 60°–70° Formed by the diazotisation of *p* xylydine sulphonic acid $\text{C}_6\text{H}_3\text{Me}_2(\text{NH}_2)(\text{SO}_3\text{H})$ [1 4 2 5] (Nöling & Kohn, *B* 19, 141)

DIAZO-COMPOUNDS *Secondary azo compounds* Compounds containing two azo groups of the form $\text{C}-\text{N}_2-\text{C}$ The general methods by which they may be prepared are given in the article on azo colouring matters (p 368) The non enclosure here used is like that used for azo compounds To find the name of a disazo compound, write down the formula, strike out everything between the two N_2 groups, remove one of the N groups, and join the remaining parts of the formula together and name the resulting azo compound as directed on p 369 Then insert after the word 'azo' the name of the central hydrocarbon, preceded by prefixes representing its substituents and followed by 'azo'

Di-amido-benzene azo benzene azo benzene sulphonic acid

[4 1] $\text{C}_6\text{H}_4(\text{SO}_3\text{H})-\text{N}_2-\text{C}_6\text{H}_4-\text{N}_2-\text{C}_6\text{H}_4(\text{NH}_2)_2$ [1 2 4] Formed by the combination of diazo benzene azo benzene *p* sulphonic acid with *m* phenylene diamine Red microscopic needles V sl sol alcohol and ether In H_2SO_4 it dissolves with a violet blue colour —KA'2aq red glistening plates, sl sol hot, v sl sol cold, water, dyes silk, wool, and cotton a brownish-red (Griess, *B* 16, 2035)

Amido sulpho naphthalene azo diphenyl azo-naphthylamine sulphonic acid

[1 4 2] $\text{C}_{10}\text{H}_7(\text{NH}_2)(\text{SO}_3\text{H})-\text{N}_2-\text{C}_6\text{H}_5$

[1 4 2] $\text{C}_{10}\text{H}_7(\text{NH}_2)(\text{SO}_3\text{H})-\text{N}_2-\text{C}_6\text{H}_5$ Formed by combining diazotised benzidine with (a) naphthylamine *p* sulphonic acid Dyes cotton from an alkaline bath scarlet, turned blue by a trace of acid The aqueous solution is readily reduced by NH_3 and zinc dust, giving benzidine and naphthylene *o* di amine sulphonic acid (Witt, *B* 19, 1719)

Benzene-azo *m* diamido benzene azo benzene

$\text{C}_6\text{H}_3-\text{N}_2-\text{C}_6\text{H}_3(\text{NH}_2)_2-\text{N}_2-\text{C}_6\text{H}_5$ [250°] Formed by the combination of diazobenzene with chrysoidine Dark red needles or six-sided plates Sol hot chloroform and benzene, v sl sol alcohol and ether, insol water Weak base Salts —B'HCl violet brown amorphous solid —B'2H₂Cl₂PtCl₄ violet brown amorphous pp (Griess, *B* 16, 2028)

Benzene-azo-*m*-diamido-benzene-azo-benzene *p* sulphonic acid

$\text{C}_6\text{H}_4(\text{SO}_3\text{H})-\text{N}_2-\text{C}_6\text{H}_3(\text{NH}_2)_2-\text{N}_2-\text{C}_6\text{H}_5$ Formed by the action of *p* diazo benzene sulphonic acid on chrysoidine Dark-brown microscopic crystals V sl sol, alcohol, insol.

ether A/K reddish brown plates, sol hot, sl sol cold, water (Griess, *B* 16, 2032)

Benzene-azo-di-amido-benzene-azo-benzoic acid $C_6H_4(CO_2H)-N_2-C_6H_4(NH_2)_2-N_2-C_6H_3$ Formed by combining *m* diazo benzoic acid with chrysoidine (Griess, *B* 16, 2032) Brownish-red powder Insoluble or nearly insoluble in all ordinary solvents Soluble in alkalis with a brownish red colour

(α)-**Benzene-azo-*m*-di-amido-benzene-azo-toluene** $C_6H_4-N_2-C_6H_4(NH_2)_2-N_2-C_6H_5$ [192°] Formed together with a small quantity of the (β) isomeride by the combination of *p* diazo benzene with *p* toluene azo phenylene diamine Dark red glistening needles Sol ether, chloroform and hot benzene, insol water and alcohol

(β) **Benzene-azo-*m*-di-amido-benzene-azo-toluene** $C_6H_4-N_2-C_6H_4(NH_2)_2-N_2-C_6H_5$ [225°] Slender yellow needles Sol alcohol and ether, v sl sol chloroform, sol in water (Griess, *B* 16, 2029)

Benzene-azo *m* di-amido benzene *p*-azo-toluene $C_6H_4-N_2-C_6H_4(NH_2)_2-N_2-C_6H_5$ [214°] Formed by the combination of *p* diazo toluene with chrysoidine (Griess, *B* 16, 2030) Dark red glistening needles Sl sol chloroform, ether, and benzene

Benzene-azo benzene-azo *p* cresol

$C_6H_4-N_2-C_6H_4-N_2-C_6H_4(CH_3)(OH)$ [160°] Obtained by the action of diazo benzene azo-benzene chloride (by diazotising benzene azo-aniline) on an alkaline solution of *p* cresol (Nolting & Kohn, *B* 17, 354) Small brown needles Sl sol alcohol, m sol chloroform, benzene, and acetic acid Dissolves in H_2SO_4 with a reddish violet colour

Benzene-azo-benzene-azo ethyl (β) naphthylamine $C_6H_4-N_2-C_6H_4-N_2-C_{10}H_7NH_2$ [142°] Small red needles Formed by heating ethyl (β) naphthyl nitrosamine with an acetic acid solution of benzene azo aniline (Henriques, *B* 17, 2670)

Benzene azo benzene azo (β) naphthol $C_6H_4-N_2-C_6H_4-N_2-C_{10}H_7OH$ From diazotised benzene azo aniline and (β) naphthol (Nietzki, *B* 13, 1838) Brick red powder

Benzene-azo-benzene-azo-resorcin

$C_6H_4-N_2-C_6H_4-N_2-C_6H_4(OH)_2$ By the action of diazotised benzene azo aniline on resorcinol two isomerides are formed which are separated by their different solubilities in aqueous alkalis

(α) **Compound** [184°] Brownish red powder consisting of microscopic tables Dissolves with a carmine red colour in aqueous NaOH and in H_2SO_4 Sol alcohol, ether, and chloroform

(β) **Compound** [215°] Brown powder Dissolves in alcoholic NaOH with a violet blue colour and in H_2SO_4 with a pure blue colour, v sl sol alcohol, ether, and chloroform, insol aqueous NaOH (Wallach, *B* 15, 2817)

Benzene-azo-methyl-pyrrol-azo-benzene

probably NMe [196°] Formed by the methylation of benzene azo pyrrol benzene Red plates (O Fischer & Hepp, *B* 19, 2253)

Vol. I.

Benzene-azo-oxy-benzene-azo-benzene

$C_6H_4-N_2-C_6H_4(OH)-N_2-C_6H_5$ **Benzene-diazo phenol** Phenol bi diazo benzene [131°] Formed, together with benzene azo phenol, by treating diazo benzene nitrate with $BaCO_3$ in the cold, or by the action of diazo benzene nitrate upon a solution of benzene azo phenol in KOH_{aq} (Griess, *A* 137, 86, *B* 9, 628) Brown lustrous needles or plates (from alcohol) V sl sol water, v sol KOH_{aq}, v sl sol NH_4 Aq, insol Na_2CO_3 Aq

Methylether $C_{10}H_{11}N_4(OMe)$ [110°], small yellow crystals, v sol ether, benzene, acetone, and hot alcohol

Acetyl derivative $C_{11}H_{11}N_4(OAc)$ [116°], small yellow needles, sol alcohol, ether, and benzene

Benzoyl derivative $C_{13}H_{13}N_4(OBz)$ [139°], small yellow needles, sl sol cold alcohol (Nolting & Kohn, *B* 17, 368)

Benzene azo di oxy benzene azo benzene

$C_6H_4-N_2-C_6H_4(OH)_2-N_2-C_6H_5$ By the action of diazo benzene chloride on an alkaline solution of benzene azo resorcin two isomerides are formed which are separated by their solubility in aqueous alkalis A third isomeride (γ) is formed, together with benzene azo resorcin, by the action of diazo benzene chloride on resorcin treated with KOH (1 mol) in dilute aqueous solution

(α) **Compound** [215°] Brown felted needles Dissolves easily with a red colour in aqueous NaOH and in H_2SO_4 Sl sol alcohol and ether, m sol chloroform Its diacetyl derivative forms brown glistening needles, [184°] (Wallach)

(β) **Compound** [220°] Microscopic needles Sl sol alcohol and chloroform, insol aqueous NaOH Dissolves in H_2SO_4 with an indigo blue colour, and in alcoholic NaOH with a red colour (Wallach, *B* 15, 2816)

(γ) **Compound** [222°] Large red needles Sol chloroform, v sl sol alcohol It dissolves in strong alkalis with a brownish yellow colour, in H_2SO_4 with the same colour By tin and HCl it is reduced to aniline and di amido resorcin

Diacetyl derivative

$C_{18}H_{12}N_4(OAc)_2$ [188°], orange needles (Liebermann & Kostanecki, *B* 17, 880)

Benzene azo trioxylbenzene azo benzene

$C_6H_4-N_2-C_6H_4(OH)_2-N_2-C_6H_5$ **Phloroglucin bi diazo benzene** Yellowish brown leaflets Prepared by the action of diazobenzene nitrate on phloroglucin (Weselsky & Benedikt, *B* 12, 226)

Benzene-azo-dioxy benzene azo naphthalene $C_6H_4-N_2-C_6H_4(OH)_2-N_2-C_{10}H_7$ [155°] From diazo benzene chloride and an alkaline solution of *m* di oxy benzene-azo naphthalene (Wallach, *B* 15, 22)

Benzene-azo-di oxy benzene azo toluene

$C_6H_4-N_2-C_6H_4(OH)_2-N_2-C_6H_4(CH_3)$ [14°] Prepared by the action of diazo benzene chloride on an alkaline solution of *m* dioxy benzene azo-toluene, or of diazo toluene chloride on an alkaline solution of benzene azo resorcin, in either case the same three isomerides are simultaneously produced and are separated by means of their different solubilities

(α) **Compound** [196°] Golden brown needles. Dissolves with a red colour in H_2SO_4 and NaOH

E E

Sol alcohol and chloroform Its di-acetyl-derivative forms yellow needles, [176°]

(*α*) *Compound* [241°] Dissolves with a red colour in H_2SO_4 and in aqueous NaOH. Its di-acetyl-derivative forms yellow needles, [196°]

(*β*) *Compound* [206°] Brownish-black microscopic crystals Insol aqueous NaOH, dissolves in H_2SO_4 to a blue solution Sl sol alcohol, m sol chloroform (Wallach, *B* 15, 2821)

Benzene azo-oxy cumene azo benzene

$C_6H_5-N_2-C_6H_4Me(OH)-N_2-C_6H_5$, *Thymol di diazo benzene* [168°] Formed, together with benzene azo thymol, by the action of diazo benzene on thymol (Mazzara, *G* 15, 52, 228) Silky needles, sol chloroform By reduction with tin and HCl, and subsequent treatment with $FeCl_3$, it is converted into oxy thymoquinone.

Benzene azo-o oxy toluene azo benzene

$C_6H_5-N_2-C_6H_4Me(OH)-N_2-C_6H_5$, [115°] Obtained by the action of (2 mols of) diazo benzene chloride on an alkaline solution of o cresol (Nöling, *B* 17, 364) Reddish-brown plates V sl sol cold alcohol Dissolves in alkalis with a yellowish red colour

Acetyl derivative [121°], yellow needles, v sol alcohol, ether, and benzene

Benzene azo-m oxy toluene azo benzene

$C_6H_5-N_2-C_6H_4Me(OH)-N_2-C_6H_5$, [149°] Obtained by the action of (2 mols of) diazo benzene chloride on an alkaline solution of m cresol Reddish brown plates Sol ether, benzene, and hot alcohol, sl sol cold alcohol

Acetyl derivative [157°], small yellowish brown needles (Nöling & Kohn, *B* 17, 367)

Benzene azo-di phenyl urea azo benzene

$C_6H_5-N_2-C_6H_4NHCO NH C_6H_5-N_2-C_6H_5$, [270°] Formed by the action of carbonyl chloride on benzene azo aniline (Berju, *B* 17, 1404, *C* 1884, 871) Small plates Sol chloroform and benzene, sl sol alcohol

Benzene-azo di phenyl thio-urea azo benzene

$C_6H_5-N_2-C_6H_4NHCS NH C_6H_5-N_2-C_6H_5$, [199°] Formed as a by product of the action of phenyl mustard oil on benzene azo aniline (Berju, *B* 17, 1405) Sl sol hot chloroform, xylene, and acetic acid, v sl sol alcohol, benzene, and CS_2

Benzene azo pyrrol azo benzene

probably $NH |$. [131°] Obtained

by combining (2 mols of) diazo benzene chloride with (1 mol of) pyrrol in alkaline solution Red crystalline solid Sublimable M sol. ether and benzene, sl sol alcohol, nearly insol. water Possesses basic properties Dissolves in dilute HCl with a reddish yellow colour, in conc H_2SO_4 with a splendid blue colour Its alcoholic solution is turned magenta red by NaOH, reddish-violet by conc HCl (O Fischer & Hepp, *B* 19, 2251)

Benzene azo pyrrol-(*β*)-azo-naphthalene

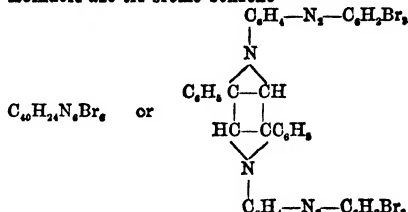

probably $NH |$. [151°]. Formed

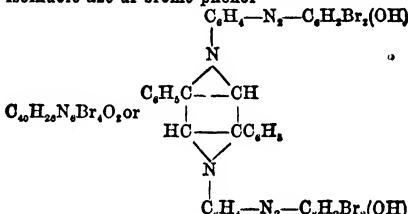

by the combination of diazo-benzene chloride with pyrrol-(*β*)-azo naphthalene or of (*β*)-diazo-naphthalene chloride with pyrrol-azo benzene, in alkaline alcoholic solution Red plates, with bluish reflection Sl sol. alcohol (O Fischer & Hepp, *B* 19, 2256)

Tri-bromo-benzene-azo-di-phenyl-di-isoindole-azo-tri-bromo benzene

[150°] Orange yellow prisms Soluble in most ordinary solvents except water Formed by the action of tri bromo diazo benzene chloride on di phenyl di iso indole - $B''H_2Cl$, slender yellowish brown needles (Möhlau, *B* 15, 2490)

Di-bromo-oxy benzene-azo di-phenyl-di-isoindole azo di bromo phenol

[198°] Yellowish green prisms Soluble in alcohol, dyes wool orange and silk yellow Formed by the action of di bromo diazo phenol on di phenyl di isoindole - $B''H_2Cl$, short metallic glistening prisms, insol water (Möhlau, *B* 15, 2492)

ψ Cumene-azo-m di-oxy-benzene azo-ψ-cumene

$C_6H_2Me_3-N_2-C_6H_2(OH)_2-N_2-C_6H_2Me_3$, Formed, together with cumene azo resorcin, by combining diazo cumene chloride (from amido pseudo cumene [62°]) with resorcin (Liebermann & Kostanecki, *B* 17, 882) Small red needles Dissolves in H_2SO_4 with a red colour Insoluble in alkalis

p Di-methyl-amido-benzene-p-azo-benzene-azo (β) naphthol

$HO C_{10}H_6-N_2-C_6H_4-N_2-C_6H_4NMe_2$, [210°] Got by pouring a diazotised solution of p amido-benzene azo-dimethylaniline hydrochloride into a solution of (β) naphthol in NaOH (Meldola, *C* J 45, 109) Bronzy green needles Sl sol. alcohol, v sol hot $C_2H_5O_2$, benzene, and chloroform Solutions in the above solvents are red, in alcoholic NaOH, red, in conc H_2SO_4 green, turned blue by dilution An alcoholic solution is turned blue by HCl

p-Di-methyl-amido-benzene-p-azo benzene-azo (α) naphthol

$HO C_{10}H_6N_2, C_6H_4N_2, C_6H_4NMe_2$, Prepared like its (β) isomeride (M) Its properties are similar, except that the solution in alcoholic KOH is violet It decomposes below 200°.

Di-methyl-amido-benzene-azo-benzene-azo-resorcin

$(HO)_2C_6H_3-N_2-C_6H_4-N_2-C_6H_3NMe_2$. Brown powder Decomposed before melting Sl sol boiling alcohol, the solution being reddish-orange and turned first violet, then blue by adding HCl Sl sol glacial acetic acid, the solution being red when hot, violet when cold Insoluble in toluene Solution in alcoholic KOH is reddish-violet Solution in conc. H_2SO_4 is violet, becoming blue on dilution (Meldola, *C J* 45, 110)

Di-methyl-amido-benzene-p-azo-benzene-azo-phenol

$HO-C_6H_4-N_2-C_6H_4-N_2-C_6H_3NMe_2$. Brown powder, forming a brown solution in aqueous KOH, and a red solution in alcoholic KOH Resembles the analogous di-methyl-amido-benzene-p-azo-benzene-azo-resorcin (*q v*) (Meldola, *C J* 45, 111)

Di-methyl-amido-benzene-azo-toluene-azo-(β)-naphthol

$C_6H_3(NMe_2)-N_2-C_6H_4Me-N_2-C_{10}H_7OH$ From diazotised di-methyl-amido-benzene-azo-p-toluidine and (β) naphthol (Wallach, *A* 234, 358) Red needles (from chloroform), insol water

Di-methyl-amido-benzene-azo-toluene-azo-phenol

$C_6H_3(NMe_2)-N_2-C_6H_4Me-N_2-C_6H_4OH$ [160°] From diazotised $C_6H_3(NMe_2)-N_2-C_6H_4MeNH_2$, and phenol (Wallach, *A* 234, 357) Orange needles

(α)-naphthalene-azo-pyrrol-(α)-azo-naphthalene

$C_{10}H_7-N_2-C_4H_2NH-N_2-C_{10}H_7$,
probably $C_{10}H_7-N_2C=CH$
 NH
 $C_{10}H_7-N_2C=CH$

Formed by adding (α) diazo naphthalene chloride (2 mols) to an alkaline solution of pyrrol (1 mol) Metallic glistening needles Sol alcohol with a dark yellowish red colour Dissolves in conc. H_2SO_4 with a blue colour (O Fischer & Hepp, *B* 19, 2255)

(β)-Naphthalene-azo-pyrrol-(β)-azo-naphthalene

$C_{10}H_7-N_2-C_4H_2NH-N_2-C_{10}H_7$,
probably $C_{10}H_7-N_2C=CH$
 NH [288°] Formed by adding (β) diazo naphthalene chloride (2 mols) to an alkaline solution of pyrrol (1 mol)

Glistening coppery plates Sl sol alcohol The alcoholic solution is turned reddish violet by conc HCl Dissolves in conc. H_2SO_4 with a blue colour (O Fischer & Hepp, *B* 19, 2255)

m-Nitro-benzene-p-azo-benzene-(α)-azo-(β)-naphthol

$NO_2-C_6H_4-N_2-C_6H_4-N_2-C_{10}H_7OH$ [c 218°] From diazotised $NO_2-C_6H_4-N_2-C_6H_4NH_2$ and (β) naphthol Small yield (Meldola, *C J* 45, 113) Orange crystals with green lustre Solutions in $C_6H_6O_2$ and in toluene are orange, in alcoholic $NaOH$ violet, in conc. H_2SO_4 green, turned blue on dilution

m-Nitro-benzene-(α)-azo-naphthalene-(α)-azo-(α)-naphthol

$NO_2-C_6H_4-N_2-C_{10}H_7-N_2-C_{10}H_7OH$ A dark amorphous powder Solution in toluene, chloroform and glacial acetic acid are red, in conc. H_2SO_4 dark indigo violet, becoming blue on dilution, in alcoholic potash, greenish blue (Meldola, *C J* 45, 116).

m-nitro-benzene-(α)-azo-naphthalene-(α)-azo-(β)-naphthol

$NO_2-C_6H_4-N_2-C_{10}H_7-N_2-C_{10}H_7OH$ From m-nitro benzene (α)-azo-(α)-naphthyl amine by diazotising and treating with (β) naphthol (Meldola, *C J* 45, 115) Minute bronzy needles (from toluene) Blackens at 245° Insol alcohol or glacial acetic acid Solutions in chloroform and in hot aniline are violet, in toluene red when hot, reddish violet when cold, in boiling alcoholic KOH, blue; in conc. H_2SO_4 , olive colour, on dilution, blue and then violet

m-nitro-benzene-(α)-azo-naphthalene-azo-resorcin

$NO_2-C_6H_4-N_2-C_{10}H_7-N_2-C_6H_3(OH)_2$ Bronzy powder, not very soluble Solutions in boiling alcohol are reddish, in glacial acetic acid, toluene and chloroform, orange, in aqueous or alcoholic KOH, blue, in conc. H_2SO_4 , green, changing to bluish green on dilution (Meldola, *C J* 45, 116)

p-Nitro-benzene-azo-m-xylene-azo-(α)-naphthol

$NO_2-C_6H_4-N_2-C_6H_4Me-N_2-C_{10}H_7OH$ Preparation and properties are similar to those of the preceding (β) compound

Sulphonic acid

$NO_2-C_6H_4-N-C_6H_4Me-N_2-C_{10}H_7(SO_3H)(OH)$ Similar to the corresponding (β) compound, but dyes reddish brown

p-Nitro-benzene-azo-m-xylene-azo- β -naphthol

$NO_2-C_6H_4-N_2-C_6H_4Me-N_2-C_{10}H_7OH$ [278°] From $NO_2-C_6H_4-N_2-C_6H_4MeNH_2$ by diazotising and treating with sodium (β) naphthol (Meldola, *C J* 43, 434) Green scales (from toluene) Scarcely soluble in alcohol or glacial acetic acid Forms a crimson solution in boiling aniline or nitrobenzene, and a green solution in conc. H_2SO_4 , turned violet by dilution

Sulphonic acid

$NO_2-C_6H_4-N_2-C_6H_4Me-N_2-C_{10}H_7(SO_3H)(OH)$ Got by using $C_{10}H_7(OH)SO_3H$ Dyes claret red

p-Nitro-benzene-azo-m-xylene-azo-phenol

$NO_2-C_6H_4-N_2-C_6H_4Me-N_2-C_6H_4OH$ Orange powder Sl sol alcohol and benzene, v sol hot aniline Solutions are orange Solution in alcoholic $NaOH$ is reddish violet Solution in conc. H_2SO_4 is blue (Meldola, *C J* 43, 436)

p-Nitro-benzene-azo-m-xylene-azo-resorcin

$NO_2-C_6H_4-N_2-C_6H_4Me-N_2-C_6H_3(OH)_2$ [231°] Brown powder Forms orange solutions in boiling alcohol, toluene, and glacial acetic acid Solution in alcoholic $NaOH$ is red, turned violet by excess of $NaOH$. Conc. H_2SO_4 forms a blue solution (Meldola, *C J* 43, 436)

p-Oxy-benzene-p-azo-benzene-(α)-azo-(α)-naphthol

$C_6H_4(OH)-N_2-C_6H_4-N_2-C_{10}H_7OH$ From diazotised p-amido benzene-azo-(α)-naphthol and an alkaline solution of phenol (Meldola, *C J* 47, 666) Dark amorphous powder Its solution in conc. H_2SO_4 is indigo-blue, in boiling toluene, orange, in alcohol, red, in KOH aq. dull red, and in alcoholic $NaOH$, deep claret colour

p-Oxy-benzene-p-azo-benzene-(α)-azo-(β)-naphthol

$HO-C_6H_4-N_2-C_6H_4-N_2-C_{10}H_7(OH)$ [225°] From p-amido-benzene-azo-(β)-naphthol by diazotising and mixing with an alkaline solution of phenol (Meldola, *C J* 47, 666) Be. l warty concretions Its solution in conc. H_2SO_4 is bluish green, and becomes violet on dilution.

Its solution in boiling toluene, or boiling alcohol, is red. Its solution in KOHAq is reddish violet.

m-Di oxy-benzene-*p*-azo-benzene (α) azo (α)-naphthol

[4 2 1] $C_6H_4(OH)_2-N_2-C_6H_4-N_2-C_{10}H_6(OH)$
Formed by mixing diazotised *p*-amido-benzene-azo (α) naphthol with a solution of resorcin in dilute NaOH (Meldola, *C J* 47, 665). Bronzy green powder, sl sol toluene and acetic acid, forming a red solution. Its solution in KOHAq is blue, its solution in NH_3 Aq is violet. It is decomposed by heat without fusion.

m-Di oxy-benzene-*p*-azo-benzene-(α) azo (β)-naphthol

[4 2 1] $C_6H_4(OH)_2-N_2-C_6H_4-N_2-C_{10}H_6(OH)$
From diazotised *p*-amido-benzene-azo (β) naphthol and an alkaline solution of resorcin (Meldola, *C J* 47, 666). Bronzy green powder. Its solution in conc H_2SO_4 is deep bluish green, in dilute aqueous alkalis, violet. Sl sol toluene forming a red solution.

m-Oxy-benzene-azo-benzene-*p*-azo-phenol

[3 1] $HO-C_6H_3-N_2-C_6H_4-N_2-C_6H_4-OH$ [1 4]
Dark powder. Easily soluble in alkalis. Formed by diazotising amido-benzene-*m*-azo-phenol ($C_6H_4(OH)-N_2-C_6H_4-NH_2$) and combining it with phenol (Wallach & Schulze, *B* 15, 3021).

p-Oxy-benzene-azo-benzene-*p*-azo-phenol

[4 1] $HO-C_6H_4-N_2-C_6H_4-N_2-C_6H_4-OH$ [1 4] [α 207°]
From diazotised amido-benzene-*p*-azo-phenol and a solution of phenol in dilute alkali (Meldola, *C J* 47, 660). Amorphous brown powder. Its solution in conc H_2SO_4 is violet, unchanged on considerable dilution, v sol NH_3 Aq and KOHAq forming a red solution, insol boiling toluene, forms an orange solution in hot phenol or aniline.

m-Di oxy-benzene-*p*-azo-benzene-azo-resorcin

[4 2 1] $C_6H_4(OH)_2-N_2-C_6H_4-N_2-C_6H_4(OH)_2$ [1 2 4]
From diazotised *p*-amido-benzene-azo-resorcin and an alkaline solution of resorcin (Meldola, *C J* 47, 661). Dull bronze like powder, v sl sol alcohol, insol toluene. Its solutions in conc H_2SO_4 and in alkalis are violet.

Oxy-carboxy-benzene-azo-benzene (α) azo-(β)-naphthol

(4) (3) (1) (4)(α) (β)
 $C_6H_3(COOH)(OH)-N_2-C_6H_4-N_2-C_{10}H_6(OH)$
[above 255°] From diazotised *p*-amido-benzene-azo-salicylic acid and an alkaline solution of (β)-naphthol (Meldola, *C J* 47, 668). Minute brown needles (from boiling aniline). V sl sol boiling toluene, sl sol alcohol and glacial HOAc. Its solution in conc H_2SO_4 is greenish blue, changing to violet on dilution. Its solution in KOHAq is reddish violet.

Oxy-cymene-azo-tri-phenyl-methane-azo-thymol

[6.3 4 1] $C_6H_4MePr(OH)-N_2-C_6H_4-N_2-C_6H_4MePr(OH)-N_2-C_6H_4MePr(OH)-N_2-C_6H_4MePr(OH)$
[170°] Formed by mixing diazotised diamido-tri-phenyl-methane hydrochloride with an alkaline solution of thymol (Mazzara, *G* 15, 44). Amorphous black powder. After reduction and oxidation it gives thymoquinone.

(α) Oxy-naphthalene-*p*-azo-benzene (α)-naphthol

(α) (α)(4) (1)(α) (α)
 $C_{10}H_6(OH)-N-N-C_6H_4-N-N-C_{10}H_6(OH)$
Formed by diazotising *p*-amido-benzene-azo-(α) naphthol and mixing the product with an

alkaline solution of (α) naphthol (Meldola, *U. J.* 47, 664). Green lustrous powder, v sl sol. glacial HOAc, alcohol, and toluene, m sol boiling aniline, forming a red solution. Its solution in NaOHAq is blue, in conc H_2SO_4 blue, turned violet on dilution. With Ac_2O and NaOAc it forms on heating a di-acetyl derivative.

(β) Oxy-naphthalene-*p*-azo-benzene (α)-azo (β) naphthol

(β) (α)(1) (4)(α) (β)
 $C_{10}H_6(OH)-N-N-C_6H_4-N-N-C_{10}H_6(OH)$
[over 275°] From diazotised *p*-amido-benzene-azo (β) naphthol and an alkaline solution of (β)-naphthol (Meldola, *C J* 47, 664). Dull bronzy powder, or green needles (from hot aniline). Insol boiling alcohol, or NaOHAq, sol cold alcoholic NaOH, forming a violet solution. Sl sol hot toluene forming a magenta solution. Conc H_2SO_4 forms a blue solution, turned violet on dilution.

(α) Oxy-naphthalene-*p*-azo-benzene-azo (β)-naphthol

(α) (α)(1) (4)(α) (β)
 $C_{10}H_6(OH)-N-N-C_6H_4-N-N-C_{10}H_6(OH)$
[236°] From diazotised *p*-amido-benzene-azo-(α) naphthol and an alkaline solution of (β) naphthol (Meldola, *C J* 47, 665). Dull bronzy powder, v sl sol boiling alcohol, m sol boiling toluene and glacial acetic acid forming violet solutions, conc H_2SO_4 forms a blue solution, becoming violet on dilution.

(α) Oxy-naphthalene-*p*-azo-benzene-azo (β)-naphthol di-sulphonic acid

(α) (α)(1) (4) (β)
 $C_{10}H_4(OH)_2-N-N-C_6H_4-N-N-C_{10}H_4(OH)_2$
From diazotised *p*-amido-benzene-azo (α) naphthol and an alkaline solution of (β) naphthol di-sulphonic acid. Its sodium salt is violet and gelatinous, it is an indigo blue dye (Meldola, *C J* 47, 665).

(β) Oxy-naphthalene-azo-benzene-azo (β)-naphthol di-sulphonic acid. Is similar to the last body, but of greater stability (M).

Oxy-di-sulpho-naphthalene-azo-benzene-azo-(β)-naphthol di-sulphonic acid

$C_{10}H_4(SO_3H)_2-N_2-C_6H_4-N_2-C_{10}H_4(SO_3H)_2(OH)$
Glistening greenish needles. Dyes wool and silk a deep indigo blue, which, however, is very unstable to light. Is prepared by diazotising the mono acetyl derivative of *p*-phenylene diamine and combining it with (β) naphthol di-sulphonic acid (modification insoluble in spirit), the product $C_{10}H_4(NHAc)-N_2-C_6H_4(OH)(SO_3H)_2$, which is a scarlet colouring matter, is saponified, diazotised, and again combined with (β) naphthol di-sulphonic acid (Nietzki, *B* 17, 344, 1350).

Phenyl-amido-benzene-*p*-azo-benzene-azo-(β)-naphthol

$HO-C_{10}H_6-N_2-C_6H_4-N_2-C_6H_4NHC_6H_5$
[204°] From *p*-amido-benzene-azo di-phenylamine by diazotising and adding sodium (β)-naphthol (Meldola, *C J* 43, 442). Warty scales with bronze lustre. Sl sol boiling alcohol, v sol benzene. The solutions are red. In glacial acetic acid the solution is red when hot, violet when cold. Solution in conc H_2SO_4 is greenish-blue, solution in alcoholic KOH is red but turned blue by HCl (characteristic).

Phenyl ethyl-amido-benzene-azo-benzene-azo (β) naphthol

$HO-C_{10}H_6-N_2-C_6H_4-N_2-C_6H_4NHC_2H_5$

From *p* diazo nitro benzene by combining with ethyl di phenyl amine, reducing with ammonium sulphide, diazotising the product and treating with (β) naphthol Bronzy powder Solutions in alcohol KOH, alcohol, and benzene are red, in conc H₂SO₄ indigo blue, turned bright blue on diluting HCl turns the alcoholic solution blue (Meldola, *C J* 45, 111)

p Sulpho benzene azo benzene azo-(β)-naphthol (β) sulphonic acid

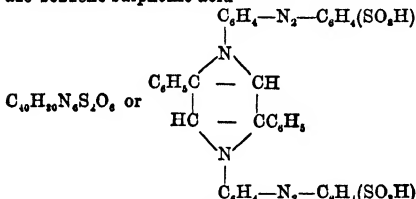

$$\text{C}_6\text{H}_4(\text{SO}_3\text{H})-\text{N}-\text{N}-\text{C}_6\text{H}_4-\text{N}-\text{N}-\text{C}_6\text{H}_3(\text{SO}_3\text{H})(\text{OH})$$

From diazotised *p* amido benzene azo benzene sulphonic acid and an ammoniacal solution of sodium (β) naphthol 'α' sulphonic acid (Bayer & Co, *B* 15, 1351) The sodium salt is a scarlet dye (crocene scarlet) Conc H₂SO₄ forms a blue solution The absorption spectrum has been studied by Hartley (*C J* 51, 195)

p Sulpho-benzene azo benzene azo tolylene diamine

$\text{C}_6\text{H}_4(\text{SO}_3\text{H})-\text{N}_2-\text{C}_6\text{H}_4-\text{N}_2-\text{C}_6\text{H}_4(\text{NH}_2)_2$ Reddish brown microscopic needles Formed by combining diazo benzene azo benzene *p* sulphonic acid with tolylene diamine (Griess, *B* 16, 2036)

Sulpho benzene azo di-phenyl di isoindole azo benzene sulphonic acid

Formed by the action of diazo benzene sulphonic acid on di phenyl di isoindole Metallic glistening brown scales Very slightly soluble in all solvents Dyes silk and wool nearly the same shade as chrysoidine On reduction it gives sulphamic acid and di amido di phenyl di isoindole

Salts—A"Na₂ aq yellow plates—A"Ag₂ red prisms (Mohlau, *B* 15, 2495)

Sulpho-benzene azo-sulpho benzene (α)-azo-(β) naphthol

$\text{C}_6\text{H}_4(\text{SO}_3\text{H})-\text{N}_2-\text{C}_6\text{H}_4(\text{SO}_3\text{H})-\text{N}_2-\text{C}_{10}\text{H}_7\text{OH}$
From diazo sulpho benzene azo benzene sulphonic acid and an alkaline solution of (β) naphthol (Nietzki, *B* 13, 800) The sodium salt is a red dye (*Biebrich scarlet*) Conc H₂SO₄ forms a green solution Its absorption spectrum has been studied by Hartley (*C J* 51, 194)

Sulpho-benzene-azo-sulpho-benzene-(β)-azo-naphthyl *p* tolyl-amine ('Wool black')

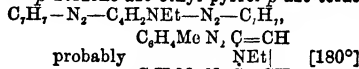

$\text{C}_6\text{H}_4(\text{SO}_3\text{H})\text{N}_2\text{C}_6\text{H}_4(\text{SO}_3\text{H})\text{N}_2\text{C}_6\text{H}_4\text{NHC}_6\text{H}_4$
The coml product is a bronzy powder V sol hot water with a violet blue colour Dissolves in conc H₂SO₄ with a deep indigo blue colour Formed by combination of diazotised amido sulpho benzene azo benzene sulphonic acid with *p* tolyl (β)-naphthylamine By boiling with moderately dilute H₂SO₄ it is decomposed into tolu (αβ) naphthazine [169°] and amidoazo benzene di sulphonic acid

The Ca and Ba salts are insoluble black pps. (Witt, *B* 20, 579)

p Toluene azo *m* diamido-benzene-azo (β)-naphthalene $\text{C}_6\text{H}_4-\text{N}_2-\text{C}_6\text{H}_4(\text{NH}_2)_2-\text{N}_2-\text{C}_{10}\text{H}_7$
Formed by the combination of *p*-diazotoluene with (β) naphthalene azo-*m*-phenylene diamine (Griess, *B* 16, 2031) Small red glistening plates V sol chloroform

p Toluene azo-ethyl-pyrrol *p* azo-toluene

Formed by ethylation of toluene azo pyrrol azo-toluene, or by combining diazo-*p* toluene chloride (2 mol) with ethyl pyrrol (1 mol) in alkaline solution Steel blue needles Sl. sol alcohol (O Fischer a Hepp, *B* 19, 2254)

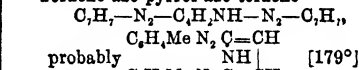

Toluene-azo-dioxy-benzene azo-toluene $\text{C}_6\text{H}_4-\text{N}_2-\text{C}_6\text{H}_2(\text{OH})_2-\text{N}_2-\text{C}_6\text{H}_4$ By the action of *p* diazotoluene chloride on an alkaline solution of *p* toluene azo resorcin two isomerides are formed which are separated by their different solubilities in alkalis

(a)-Compound [256°] Yellow felted needles, Sparingly soluble in alcohol and cold chloroform

(β) Compound [203°] Brownish black microscopic needles (Wallach, *B* 15, 2825)

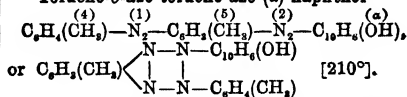

Toluene-azo-trioxybenzene azo-toluene $\text{C}_6\text{H}_4\text{Me}-\text{N}_2-\text{C}_6\text{H}_3(\text{OH})_3-\text{N}_2-\text{C}_6\text{H}_4\text{Me}$ Long red needles Prepared by the action of diazotoluene nitrate on phloroglucin (Weselsky a. Benedikt, *B* 12, 227)

Toluene-azo-pyrrol-azo-toluene

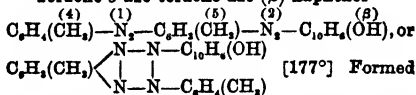

Formed by adding (2 mols) diazo *p* toluene chloride to an alkaline solution of pyrrol (1 mol) Red prisms with steel-blue reflex Sl sol alcohol Its alcoholic solution is turned reddish violet by conc HCl Dissolves in conc H₂SO₄ with a blue colour (O Fischer a Hepp, *B* 19, 2254)

Toluene-o-azo-toluene-azo-(α)-naphthol

Formed by combination of *o* diazo azo toluene with (α) naphthol Brownish red needles (from aniline) Sl sol ordinary solvents Insol aqueous NaOH, sol alcoholic NaOH with a violet red colour By SnCl₂ it is slowly reduced to amido (α) naphthol and tolyl azimido toluene $\text{C}_6\text{H}_4\text{N}_2\text{C}_6\text{H}_4$, together with small quantities of *p*-toluidine and tolylene-*o* diamine (Zincke a. Lawson, *B* 20, 1178)

Toluene-o-azo-toluene-azo-(β)-naphthol

by combination of *o* diazo azo-toluene with (β) naphthol Long dark red four sided prisms, with green reflex V sol benzene, and chloroform, sl sol alcohol, acetone, and petroleum-spirit Dissolves in alcoholic NaOH only slightly,

By SnCl_2 it is reduced to (a) amido (β) naphthol and tolyl-azimido toluene $\text{C}_6\text{H}_4\text{N}_2\text{C}_6\text{H}_4$, together with small quantities of *p*-toluidine and tolylene-o-diamine (Zincke & Lawson, *B* 20, 1179)

Toluene-*p*-azo-toluene azo- β -naphthol

$\text{C}_6\text{H}_4(\text{CH}_3)-\text{N}_2-\text{C}_6\text{H}_4(\text{CH}_3)-\text{N}_2-\text{C}_{10}\text{H}_7(\text{OH})$
 [186^c] Formed by combination of *p* diazo azo-toluene with (β) naphthol. Deep red needles. V sol. hot alcohol and benzene. By SnCl_2 it is easily reduced, giving (a) amido (β) naphthol, *o*-toluidine, and tolylene-*p*-diamine $\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)_2$, [125] (Zincke & Lawson, *B* 20, 1182)

Toluene-*o*-azo-toluene azo-(β)-naphthyl-

$\text{amine C}_6\text{H}_4(\text{CH}_3)\text{N}_2\text{C}_6\text{H}_3(\text{CH}_3)\text{N}_2\text{C}_{10}\text{H}_7(\text{NH}_2)$, or the corresponding hydrazimido formula [203^c] Formed by combination of *o* diazo toluene azo toluene with (β)-naphthylamine. Deep red glistening plates. V sol. benzene and chloroform. By SnCl_2 it is reduced to tolyl azimido toluene $\text{C}_6\text{H}_4\text{N}_2\text{C}_6\text{H}_4$, and (probably) naphthylene-o-diamine (Zincke & Lawson, *B* 20, 1180)

AZO-COMPOUNDS, TERTIARY

Oxy-benzene *p*-azo-benzene (a)-azo-naphthalene-azo-phenol

$\text{HO C}_6\text{H}_3-\text{N}_2-\text{C}_6\text{H}_4-\text{N}_2-\text{C}_{10}\text{H}_6-\text{N}_2-\text{C}_6\text{H}_4\text{OH}$
 From $\text{NH}_2\text{C}_6\text{H}_4-\text{N}_2-\text{C}_{10}\text{H}_6\text{NH}_2$ by diazotising and adding sodic phenate (Meldola, *C J* 43, 489). Dull bronzy green powder. Forms orange solutions with boiling aniline or toluene. Solution in alcoholic KOH is violet, in conc H_2SO_4 , indigo blue.

Di-oxy-benzene *p*-azo-benzene-(a) azo-naphthalene-azo-resorcin

$(\text{HO})_2\text{C}_6\text{H}_3-\text{N}_2-\text{C}_6\text{H}_4-\text{N}_2-\text{C}_{10}\text{H}_6-\text{N}_2-\text{C}_6\text{H}_3(\text{OH})_2$
 Brown powder. Its solutions are dull red in alcohol, violet in alcoholic KOH, bluish green in conc H_2SO_4 .

(β)-oxy-naphthalene-*p*-azo-benzene-(a)-azo-naphthalene-azo (β) naphthol

$\text{HO C}_6\text{H}_3-\text{N}_2-\text{C}_6\text{H}_4-\text{N}_2-\text{C}_{10}\text{H}_6-\text{N}_2-\text{C}_{10}\text{H}_6\text{CH}$
 Formed by diazotising amido benzene azo (β)-naphthylamine $\text{NH}_2\text{C}_6\text{H}_4\text{N}_2\text{C}_{10}\text{H}_6\text{NH}_2$ and treating with an alkaline solution of (β) naphthol (Meldola, *C J* 43, 437). The pp may be separated by crystallisation from hot aniline into two modifications, one remaining in solution, the other separating as needles with green lustre.

Crystalline form [α 295^c] Insoluble in boiling alcohol, acetone, or glacial acetic acid, hardly soluble in chloroform or benzene. Forms violet solutions with aniline or nitrobenzene. Solution in conc H_2SO_4 is deep inky blue. Alcoholic KOH forms, with difficulty, a blue solution.

Soluble form—Soluble in the above liquids. Its solution in boiling glacial acetic acid is violet when hot, blue when cold. Solution in conc H_2SO_4 is clear indigo blue. Alcoholic potash forms a violet solution.

Di sulphonic acid—From (β)-naphthol-sulphonic acid and diazotised $\text{NH}_2\text{C}_6\text{H}_4\text{N}_2\text{C}_{10}\text{H}_6\text{NH}_2$.

(a)-Oxy-naphthalene-*p* azo-benzene -(a)-azo-naphthalene-azo-(a) naphthol. Similar to the preceding. Bronzy powder, forming a blue solution in alcoholic KOH, and an indigo-blue solution with conc H_2SO_4 .

(β)-Oxy-naphthalene-*p*-azo-benzene-azo-mylene-azo-(β)-naphthol

$\text{HO C}_6\text{H}_3-\text{N}_2-\text{C}_6\text{H}_4-\text{N}_2-\text{C}_6\text{H}_4\text{Me}-\text{N}_2-\text{C}_{10}\text{H}_7\text{OH}$
 From $\text{NH}_2\text{C}_6\text{H}_4\text{N}_2\text{C}_6\text{H}_4\text{MeNH}_2$ by diazotising and adding sodium (β) naphthol (Meldola, *C J* 43, 439). Small green needles (from xylene). Its solution in aniline is reddish violet, in xylene, violet, in hot alcoholic KOH, bluish-violet, in conc H_2SO_4 , greenish blue, becoming blue on dilution. It is insoluble in alcohol and in glacial acetic acid. Its sulphonic acid dyes silk and wool dull violet.

Tri-oxy-tri-naphthalene-hexa-azo-tri-phenyl-carbinol $\text{HO C(C}_6\text{H}_4)_3\text{N}_2\text{C}_{10}\text{H}_7\text{OH}_2$ * From diazotised para rosaniline and (a) or (β) naphthol in alkaline solution (Meldola, *C J* 47, 668). Orange amorphous powders. Similar compounds may be got from ordinary rosaniline. They dye silk and wool orange.

AZO-COTTON DYES The azo dye stuffs obtained from benzidine and its homologues (Congo red, benzopurpurine, deltapurpurine, benzaurine, chrysamine, benzazurine, &c) have the special characteristic of dyeing cotton without a mordant. This property depends upon the constitution of the diphenyl molecule, for benzidine itself (and other diphenyl bases) readily combines with the cotton fibre. This is easily shown by allowing cotton to soak for 24 hours in a cold solution of benzidine hydrochloride, wringing, drying at the ordinary temperature, and washing thoroughly with hot and cold water, if the cotton thus mordanted with benzidine is now passed through a dilute solution of nitrous acid, and finally treated with a solution of (a) naphthylamine sulphonic acid it becomes dyed with Congo red (Möhlau, *B* 19, 2014).

Tetrazo-diphenyl (diazotised benzidine) forms red dye stuffs by combination with (a)- and (β) mono sulphonic acids of (β) naphthol or with the G di sulphonic acid. The R di sulphonic acid (Na salt insoluble in spirit) however exhibits a very peculiar reaction. One mol of tetrazo diphenyl combines with one mol of the R di sulphonate forming a dye stuff which is red. If two mols of the sulphonate are taken one mol. remains in solution unused. If now the ppd red colouring matter is heated with the mother liquor, the second mol of di sulphonate is taken up and a blue colouring matter is produced. A similar reaction has been observed with many other di-amido bodies (Schultz, *B* 17, 461).

In general, the tetrazo derivatives of diphenyl, ditolyl, &c (obtained by diazotising benzidine and its homologues) can combine with either one or two mols of a phenol, amine, or their sulphonic and carboxylic acids. The compounds with one mol, viz, $\text{R}^1\text{N}_2\text{C}_6\text{H}_4\text{N}_2\text{R}^2$, are tolerably stable, and sparingly soluble, by boiling with water or with alcohol the uncombined diazo-group is replaced by OH or by hydrogen. These half-conjugated diazo compounds readily combine with a second mol. of phenol or amine, so that mixed azo-compounds can be thus obtained. The latter bodies are colouring matters of various shades, and dye cotton direct without a mordant (Lange, *B* 19, 1817. Martius, *B* 29, 1755).

The azo compounds (Hessian yellow, Hessian purple, curcumin, &c) obtained by combining two mols of a phenol, amine or respective sulphonic acid, or one mol. of one amine or phenol and one mol of another, with the tetrazo-compound derived from di *p* amido di phenyl-ethylene or its sulphonic acids, have the property of dyeing un mordanted cotton from a soap bath. The compound from (a) naphthol sulphonic acid dyes cotton a bluish violet, (β) naphthol-R di-sulphonic acid a blue, (α) naphthylamine sulphonic acid a red salicylic acid a yellow, &c (Bender a Schultz, *B* 19, 3234). The di amido derivatives of fluorene also give colouring matters which dye cotton. To the class of cotton colours also belongs the compound which has recently been introduced under the name of 'Primuline'. This body dyes unmordanted cotton from an alkaline bath a greenish yellow. It is an amido compound and may be diazotised upon the fibre. By treatment of the cotton thus prepared with solutions of amines or phenols, fast colours (red, orange, and brown) may be produced (Green, *priv com*).

TRIAZOL A name given to the hypothetical $C_3H_3N_3$ or $HC \begin{array}{c} \text{HN} \text{---} \text{N} \\ \text{CH} \\ \text{N} \end{array}$

(Šladin, *B* 19, 2598) (*v* PHENYL METHYL TRIAZOL and CYANO PHENYL METHYL TRIAZOL).

AZO-MECONIC-ACETIC ACID *v* Di-oxy-carboxy-methyl-phthalide azo-di-oxy-phthalide acetic acid

AZO DI-METHYL-HYDROQUINONE *v* Di-oxy benzene azo hydroquinone

AZO-NAPHTHALENE *v* Naphthalene azo-naphthalene

TETRAZONES Compounds of the form $R_1N_4N_4N_4R_2$ obtained by oxidising unsymmetrical di alkylated hydrazines (*q v*).

AZONIUM BASES Compounds of the form $NH_2NRR'(OH)$ (Fischer). The name has been also applied by Witt (*B* 20, 1183) to compounds

of the form $X \begin{array}{c} \text{NR}'(OH) \\ \text{N} \end{array} > Y$

AZO-OPIANIC ACID is amido hemipic anhydride, *v* HEMIPIC ACID

AZOPHENINE $C_{10}H_7N_3$, [237°] Is formed by the action of a variety of azo and nitroso compounds (*eg* benzene azo aniline, toluene azo toluidine, phenyl amido benzene azo benzene, chrysoidine, diphenyl nitrosamine, nitroso di methyl aniline, &c) upon aniline (Kimich, *B* 8, 1026). The best method of preparation consists in warming an acetic acid solution of aniline with a nitroso-compound (*eg* nitroso di-methyl aniline) filtering off the crystals of azo-phenine, washing them with alcohol and re-crystallising from aniline or nitro benzene. If the aniline is replaced by its homologues, the homologues of azophenine are obtained. It forms unstable salts of violet colour. It cannot be acetylated. Conc H_2SO_4 at 100° yields a sulphonic acid crystallising in violet needles, which form brown crystalline salts. By heating with aniline hydrochloride it is converted into induline (*q v*). By heating alone at 860° it is converted into aniline, a violet inter-

mediate body, and fluorindine. The latter is a splendid blue crystalline colouring matter, the solutions of which have a beautiful red fluorescence and a characteristic absorption spectrum. By reduction with $SnCl_4$ azophenine yields aniline and a sparingly soluble hydrochloride of an unstable base. The latter, when set free by alkalis, rapidly absorbs oxygen from the air, and changes into a new colouring matter, the salts of which are indigo blue (Witt, *B* 20, 1538, Witt a Thomas, *C J* 43, 112).

AZO-PHENYL ACETIC ACID *v* Exo-carboxy toluene azo phenyl-acetic acid

AZO-DIPHENYL BLUE *v* INDULINE

AZO-PHENYLENE, now called PHENAZINE (*q v*)

AZO-PHTHALIC ACID *v* Di-carboxy-benzene azo phthalic acid

AZO-PYROMELLITIC ACID $C_{10}H_4(CO_2H)_4$, Tetra ethylether A^+Et_4 , [184°], glistering red trimetric tables, easily soluble in alcohol, ether, and acetic acid, insoluble in water, sublimable. Formed by reduction of di nitro mellitic ether with zinc dust and acetic acid. It forms an unstable colourless hydrochloride (Nef, *B* 18, 2805).

AZO-RESORCIN *v* RESORCIN

AZO-RESORUFIN *v* RESORCIN

AZO-TOLUENE *v* Toluene azo toluene

AZO-TOLUIDINE *v* Amido toluene azo-toluidine

AZOXIMS Amidoxims, $R_2C(OH)NH_2$, are produced by the union of hydroxylamine with nitriles, these react with acid chlorides, $R'COCl$, or anhydrides, $(R'CO)_2O$, with formation of alkoyl derivatives, $R_2C(NO CO R')NH_2$, which under suitable conditions (application of heat, or boiling with water) split off water and change

into azoxims $R_2C \begin{array}{c} \text{N} \text{O} \\ \text{N} \end{array} > CR'$. The azoxims are very volatile in the vapour of other liquids or in air, many of those boiling above 200° are volatile even in vapour of ether. They sublime at the ordinary temperature of the air (Tiemann, *B* 18, 1060, 19, 1475).

Chloroformic ether acting upon benzamidoxim produces an azoxim which has the character of a lactam, $C_6H_5 \begin{array}{c} \text{N} \text{O} \\ \text{NH} \end{array} > CO$.

Phenyl acet amidoxim,

$Ph \begin{array}{c} \text{CH}_2 \text{C}(\text{NOH}) \text{NH}_2 \\ \text{N} \end{array}$, does not produce azoxims so readily as benz-amidoxim, $Ph \begin{array}{c} \text{C}(\text{NOH}) \text{NH}_2 \\ \text{N} \end{array}$, but phenyl acryl amidoxim (cinnamidoxim), $Ph \begin{array}{c} \text{CH} \text{CH} \text{C}(\text{NOH}) \text{NH}_2 \\ \text{N} \end{array}$, produces them with great ease.

m Amido-benzenyl-azoxim-benzenyl

$C_6H_5(NH_2) \begin{array}{c} \text{N} \text{O} \\ \text{N} \end{array} > C_6H_5$, [143°] Formed by reduction of *m* nitro benzenyl azoxim benzenyl with alcoholic ammonium sulphide. Crystallises from alcohol or sublimates in long needles. V sol alcohol, ether, benzene, and chloroform, insol ligroin and water. By nitrous acid it is diazotised.

Salts— B^+HCl^- very sparingly soluble— $B^+H_2Cl_2PtCl_6^-$, sparingly soluble pp.

Benzenoyl derivative $C_6H_5ON_2(NHBz)$: [213°], needles, sol boiling alcohol, ether, and benzene, insol water and ligroin (Schöpf, *B* 18, 2475).

Benzoyl-azoxim-benzoyl $C_{11}H_{10}N_2O$ *tc*

$C_6H_5C \begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix} \begin{smallmatrix} O \\ \diagup \end{smallmatrix} C_6H_5$ [108°] (290°) Volatile with steam Sublimes in long white needles V D (H=1) 1183 V sol alcohol, ether, and benzene, v sl sol water

Formation—1 By heating the benzoyl derivative of benz amidoxim— $C_6H_5C(NH_2)NObz$ 2 By heating benz amidoxim with benzoic acid, or with benzotrichloride

Reactions—It is an extremely stable substance, being unattacked even by strong HNO_3 or H_2SO_4 . Long boiling with tin and HCl reduces it to benzonitrile (Tiemann & Kruger, B 17, 1694)

Benzoyl-azoxim-benzoyl-o-carboxylic acid

$C_6H_5C \begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix} \begin{smallmatrix} O \\ \diagup \end{smallmatrix} C_6H_5CO_2H$ [151°] Formed by melting together benz amidoxim and phthalic anhydride White glistening needles V sol alcohol, ether, and benzene, v sl sol water and ligroin

Salts—A'Ag white crystalline pp—A'Ba 4aq plates or microscopic needles—A'Cu bluish green pp—A'PbOH white granular pp

Ethyl ether—A'Et heavy yellow oil

Amide— $C_{11}H_{10}ON_2CONH_2$ [160°], microscopic needles (Schulz, B 18, 2463)

Benzoyl-azoxim-benzoyl m-carboxylic acid

$C_6H_5C \begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix} \begin{smallmatrix} O \\ \diagup \end{smallmatrix} C_6H_5CO_2H$ [218°] Formed by heating benzamidoxim m carboxylic acid with $BzCl$ (G Muller, B 19, 1497) White crystalline powder, sol alcohol, insol water

Benzoyl-azoxim-butenyl

$C_6H_5C \begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix} \begin{smallmatrix} O \\ \diagup \end{smallmatrix} C_6H_5$ (265°) Oily fluid Volatile with steam Formed by the action of butyric anhydride upon benz amidoxim, or by eliminating H_2O from the butyric derivative of the latter (Schulz, B 18, 1083)

Benzoyl-imidoxim carbonyl

$C_6H_5N_2O_2$ *tc* $C_6H_5C \begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix} \begin{smallmatrix} O \\ \diagup \end{smallmatrix} CO$ and

$C_6H_5C \begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix} \begin{smallmatrix} O \\ \diagup \end{smallmatrix} C(OH)$ **Benzoyl-azoxim carbonyl** [198°] Carbonises at about 300° Soluble in alcohol, ether, chloroform, benzene, and hot water, sparingly in cold water The aqueous solution reacts strongly acid to litmus It decomposes carbonates Not attacked by PCl_5 or by HCl Formed by elimination of alcohol from benzoyl amidoxim carbonyl ether or, directly, by heating benzoyl amidoxim with chloroformic ether

Salts—A'Ag white pp—A'Cu green pp

Ethyl derivative $C_6H_5EtN_2O_2$ [36°], soluble in alcohol, ether, &c, nearly insoluble in water, indifferent body (Falck, B 18, 2468, 19, 1481)

Benzoyl-azoxim-ethenyl $C_6H_5N_2O$ *tc*

$C_6H_5C \begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix} \begin{smallmatrix} O \\ \diagup \end{smallmatrix} CH_2$ [41°] (244°) Formed by boiling benzoyl amidoxim with acetic anhydride (Tiemann & Kruger, B 17, 1696, 18, 1059, Schulz, B 18, 1084) Flat prisms Easily volatile with steam Sublimes at the ordinary temperature in white needles V sol alcohol, ether, and benzene, sl sol water.

Benzoyl-azoxim-propenyl

$C_6H_5C \begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix} \begin{smallmatrix} O \\ \diagup \end{smallmatrix} C_6H_5$ (255°) Colourless oil Volatile with steam Formed by the action of propionic anhydride upon benz-amidoxim (Schulz, B 18, 1085)

Benzoyl azoxim-propenyl ω -carboxylic acid

$C_6H_5C \begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix} \begin{smallmatrix} O \\ \diagup \end{smallmatrix} CCH_2CH_2CO_2H$ [120°] Formed by fusing benz amidoxim with succinic anhydride White trimetric plates or prisms V sol alcohol, ether, hot water and benzene, insol ligroin It is not decomposed by warming with H_2SO_4 .

Salts—A'Ag white crystalline pp—A'Ca 3½aq long glistening soluble needles—A'Ba 4aq short prisms, or monoclinic crystals—A'Cu bluish green granular powder—A'PbOH granular pp

Ethyl ether A'Et (255°), yellowish oil

Amide $C_{10}H_8ON_2CONH_2$ [168°], slender needles (Schulz, B 18, 2459)

m Carboxy benzoyl azoxim benzenyl

$C_6H_5(CO_2H)C \begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix} \begin{smallmatrix} O \\ \diagup \end{smallmatrix} C_6H_5$ [218°] Formed by heating benzamidoxim m carboxylic acid with benzoyl chloride White crystalline powder Soluble in acetic acid, alcohol, and ether, insoluble in water and benzene The aqueous solution of the ammonium salt gives pps with $AgNO_3$ and $CuSO_4$ (Muller, B 19, 1497)

m Carboxy-benzenyl azoxim ethenyl

$C_6H_5(CO_2H)C \begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix} \begin{smallmatrix} O \\ \diagup \end{smallmatrix} CH_2$ [217°] Formed by heating benzamidoxim m carboxylic acid with acetic anhydride White crystalline powder Sol alcohol and ether, sl sol water and benzene The aqueous solution of the ammonium salt gives pps with $AgNO_3$, $CuSO_4$, $Pb(OAc)_2$, and $ZnSO_4$ (Muller, B 19, 1496)

p Carboxy benzoyl azoxim ethenyl

$C_{10}H_8N_2O_2$ *tc* $C_6H_5(CO_2H)C \begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix} \begin{smallmatrix} O \\ \diagup \end{smallmatrix} CH_2$ [218°] Formed by boiling benzamidoxim p carboxylic acid with acetic anhydride Crystalline solid Soluble in hot water and alcohol, more sparingly in ether and chloroform The dilute solution of the ammonium salt gives pps with $AgNO_3$, $Pb(OAc)_2$, and $CuSO_4$ (Muller, B 19, 1492)

m Carboxy-benzenyl azoxim propenyl ω -carboxylic acid

$C_6H_5(CO_2H)C \begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix} \begin{smallmatrix} O \\ \diagup \end{smallmatrix} CCH_2CH_2CO_2H$ [218°] Formed by heating benzamidoxim m carboxylic acid with succinic anhydride Needles Sol. hot water, v sol alcohol and ether, sl sol. chloroform, insol benzene The aqueous solution of the ammonium salt gives sparingly soluble pps with $AgNO_3$, $CuSO_4$, and $Pb(OAc)_2$ (Muller, B 19, 1496)

p Carboxy-benzenyl-azoxim-propenyl ω -carboxylic acid

$C_6H_5(CO_2H)C \begin{smallmatrix} \diagup N \\ \diagdown \end{smallmatrix} \begin{smallmatrix} O \\ \diagup \end{smallmatrix} CCH_2CH_2CO_2H$ Formed by heating benzamidoxim p carboxylic acid with an excess of succinic anhydride Sol alcohol, sl sol water, v sl sol ether, insol benzene and chloroform Carbonises at a high temperature without melting The dilute aqueous

solution of the ammonium salt gives insoluble pps with CuSO_4 and $\text{Pb}(\text{OAc})_2$, pps soluble in hot water with ZnSO_4 and AgNO_3 (Muller, *B* 19, 1498)

Ethenyl-azoxim-benzenyl

$\text{CH}_2\text{C} \begin{smallmatrix} \text{N} \\ \text{O} \end{smallmatrix} \text{C} \text{C}_6\text{H}_5$, [57°] Long white needles Begins to sublime at 70°–80° Easily volatile with steam V sol alcohol, ether, and benzene, sl sol hot water, insol cold water and ligroin Formed by heating ethenyl amidoxim hydrochloride with benzoyl chloride (Nordmann, *B* 17, 2754)

m-Nitro benzenyl-azoxim benzenyl

$\text{C}_6\text{H}_4(\text{NO}_2)\text{C} \begin{smallmatrix} \text{N} \\ \text{O} \end{smallmatrix} \text{C} \text{C}_6\text{H}_5$, [160°] Formed by the action of benzoyl chloride upon *m*-nitro benz amidoxim $\text{C}_6\text{H}_4(\text{NO}_2)\text{C}(\text{NH}_2)\text{NOH}$ (Schöpf, *B* 18, 1067) White needles Sublimable Sol alcohol, ether, and benzene, insol water and ligroin

m-Nitro benzenyl azoxim-ethenyl

$\text{C}_6\text{H}_4(\text{NO}_2)\text{C} \begin{smallmatrix} \text{N} \\ \text{O} \end{smallmatrix} \text{C} \text{CH}_2$, [109°] White needles Sublimable Formed by the action of acetic anhydride upon *m*-nitro benz amidoxim $\text{C}_6\text{H}_4(\text{NO}_2)\text{C}(\text{NH}_2)\text{NOH}$ (Schöpf, *B* 18, 1066)

m-Oxy benzenyl azoxim benzenyl

$\text{C}_6\text{H}_4(\text{OH})\text{C} \begin{smallmatrix} \text{N} \\ \text{O} \end{smallmatrix} \text{C} \text{C}_6\text{H}_5$, [163°] Formed by diazotising *m*-amido benzenyl azoxim benzenyl and heating the aqueous solution Yellow needles Sublimable Sol alcohol, ether, and benzene, scarcely sol water, insol ligroin

Ethyl ether $\text{C}_6\text{H}_4\text{ON}_2(\text{OEt})$ [71°], fine felted crystals, soluble in alcohol (Schöpf, *B* 18, 2475)

Phenyl allenyl azoxim benzenyl

$\text{C}_6\text{H}_5\text{CHCHC} \begin{smallmatrix} \text{N} \\ \text{O} \end{smallmatrix} \text{C} \text{C}_6\text{H}_5$, [102°] *Cinnamenyl-azoxim benzenyl* Formed by elimination of H_2O from the benzoyl derivative of phenyl-acryl amidoxim by heating it above its melting point or by boiling it with water (Wolff, *B* 19, 1509) Very slender white needles V sol alcohol, ether, chloroform, and benzene, v sl sol cold water Sparingly volatile with steam

Phenyl allenyl azoxim-ethenyl

$\text{C}_6\text{H}_5\text{CHCHC} \begin{smallmatrix} \text{N} \\ \text{O} \end{smallmatrix} \text{C} \text{CH}_2$, [78°] Sublimable Colourless crystals Formed by heating phenyl-acryl amidoxim with acetic anhydride (Wolff, *B* 19, 1509)

Phenyl-allenyl-azoxim-propenyl- α -carboxylic acid

$\text{C}_6\text{H}_5\text{CHCHC} \begin{smallmatrix} \text{N} \\ \text{O} \end{smallmatrix} \text{C} \text{CH}_2\text{CH}_2\text{CO}_2\text{H}$, [114°] Formed by heating phenyl acryl amidoxim with succinic anhydride (Wolff, *B* 19, 1511) Long white glistening prisms Sol alcohol, ether, benzene, and hot water, sl sol ligroin—A'Ag white powder

Phenyl ethenyl-azoxim-benzenyl

$\text{C}_6\text{H}_5\text{CH}_2\text{C} \begin{smallmatrix} \text{N} \\ \text{O} \end{smallmatrix} \text{C} \text{C}_6\text{H}_5$, [82°] Formed by boiling the benzoyl derivative of phenyl acet amidoxim with water for a long time (Knudsen, *B* 18, 1070) White needles. Volatile with steam V sol. alcohol, ether, and benzene, insol water.

Phenyl-ethenyl-azoxim-ethenyl

$\text{C}_6\text{H}_5\text{CH}_2\text{C} \begin{smallmatrix} \text{N} \\ \text{O} \end{smallmatrix} \text{C} \text{CH}_2$, (262°) Oil. Volatile with steam Formed by boiling the acetyl derivative of phenyl acet-amidoxim with water for a long time (Knudsen, *B* 18, 1070)

Phenyl-ethenyl-azoxim-propenyl- α -carboxylic acid

$\text{C}_6\text{H}_5\text{CH}_2\text{C} \begin{smallmatrix} \text{N} \\ \text{O} \end{smallmatrix} \text{C} \text{CH}_2\text{CH}_2\text{CO}_2\text{H}$, [60°]

Formed by fusing together phenyl acet amidoxim $\text{C}_6\text{H}_5\text{CH}_2\text{C}(\text{NH}_2)\text{NOH}$ and succinic anhydride Prismatic plates V sol alcohol and ether, sl sol cold water, m sol hot It is a strong acid Salts—A'Ag white pp—A'Cu bluish green pp (Knudsen, *B* 18, 2483)

Phenyl oxy ethenyl azoxim-ethenyl

$\text{C}_6\text{H}_5\text{CH}(\text{OH})\text{C} \begin{smallmatrix} \text{N} \\ \text{O} \end{smallmatrix} \text{C} \text{CH}_2$, [65°] Formed by heating the acetyl derivative of phenyl-oxy-acet amidoxim $\text{C}_6\text{H}_5\text{CH}(\text{OH})\text{C}(\text{NH}_2)\text{NOAc}$ with water for some time Transparent needles Distils undecomposed, and is volatile with steam V sol alcohol, ether, and benzene, sl sol cold water

Acetyl derivative

$\text{C}_6\text{H}_5\text{CH}(\text{OAc})\text{C} \begin{smallmatrix} \text{N} \\ \text{O} \end{smallmatrix} \text{C} \text{CH}_2$, [52°], fine white needles, volatile with steam, sol alcohol, ether, and hot water, nearly insol cold water (Gross, *B* 18, 1076)

p-Toluenyl azoxim benzenyl $\text{C}_6\text{H}_4\text{CH}_3\text{N}_2\text{O}$ is

$\text{C}_6\text{H}_4\text{MeC} \begin{smallmatrix} \text{N} \\ \text{O} \end{smallmatrix} \text{C} \text{C}_6\text{H}_5$, [103°] Formed by heating the benzoyl derivative of *p*-tolu-amidoxim, H_2O being split off (Schubart, *B* 19, 1490) Long slender white needles V sol ether, benzene, and chloroform, sl sol hot water, insol cold

AZOXYNES—Compounds whose molecular formulæ may be written $\text{X} \begin{smallmatrix} \text{NH} \\ \text{O} \end{smallmatrix} \text{Y}$, such as

Phenazoxine $\text{C}_6\text{H}_5 \begin{smallmatrix} \text{NH} \\ \text{O} \end{smallmatrix} \text{C}_6\text{H}_5$, and

Naphthazoxine $\text{C}_{10}\text{H}_7 \begin{smallmatrix} \text{NH} \\ \text{O} \end{smallmatrix} \text{C}_{10}\text{H}_7$

They may be formed—(1) By heating aromatic imido sulphides with copper oxide:

(2) By heating *o*-amido phenols with *o*-di-oxy-compounds $\text{C}_6\text{H}_3 \begin{smallmatrix} \text{NH}_2 & \text{OH} \\ \text{OH} & \text{OH} \end{smallmatrix} \text{C}_6\text{H}_3 =$

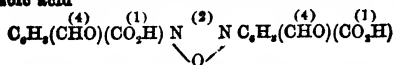

(Bernthsen, *B* 20, 942)

AZOXY-COMPOUNDS, compounds whose molecular formula may be represented by

$\text{X} \begin{smallmatrix} \text{O} \\ \text{N} \end{smallmatrix} \text{N} \text{X}$ They are formed by treating nitro-compounds with alcoholic potash or sodium amalgam They may be reduced to hydrazo compounds, $\text{X}-\text{NH}-\text{NH}-\text{X}$, and finally to two molecules of an amine, $\text{X}-\text{NH}_2$. The products of nitration of azoxy compounds

are often unsymmetrical, $\text{X}-\text{N} \begin{smallmatrix} \text{O} \\ \text{N} \end{smallmatrix} \text{N}-\text{Y}$.

p Aldehyde-benzene azoxy-p-aldehyde-benzene acid

Formed by reduction of nitro-p-aldehyde benzoic acid with aqueous KCN. Colourless needles. V sol ether, alcohol, and chloroform, sl sol ligroin, nearly insol water. Decomposes at about 280°. It gives the ordinary reactions of an aldehyde.

Phenyl hydrazide small golden yellow prisms (Homolka & Löw, *B* 19, 1090).

o-Amido-benzene-o-azoxy-aniline

Di-benzoyl derivative

(C₆H₄NHBz)₂N₂O [195°] Prepared by acting on benzoyl-o-nitranilide dissolved in alcohol with zinc dust and adding ammonia and platinum chloride. Bright yellow mass, insol water, sl sol boiling alcohol (Mixer, *Am* 6, 26).

m-Amido-benzene-m-azoxy-aniline [c 272°]

Di-benzoyl derivative—Prepared by dissolving m-nitro benzanilide in boiling alcohol and adding alcoholic ammonia and powdered zinc together with a trace of platinum. Very light powder with pale yellow colour. Insol alcohol, ether, and benzene (Mixer, *Am* 5, 5).

p-Amido-benzene-p-azoxy-aniline

(C₆H₄NH₂)₂N₂O [182°–184°] Prepared by the action of potassic ethylate on its diacetyl derivative. Sol alcohol, giving a red solution. Sl sol boiling water, from which it separates on cooling as a fibrous yellow mass (Mixer, *Am* 5, 4).

Di-acetyl derivative (C₆H₄NHAc)₂N₂O [275°–278°] Prepared by the action of powdered zinc and ammonia on p-nitro acetanilide in alcoholic solution. Hair like particles with light golden-yellow colour. Sl sol boiling alcohol.

Di-benzoyl derivative

(C₆H₄NHBz)₂N₂O [310°] Prepared by the action of zinc and ammonia on p-nitro benzanilide. Light yellow colour. Insol alcohol and water (Mixer, *Am* 5, 284).

o-Amido-toluene-azoxy-o-toluidine

[1 2 4] C₆H₄Me(NH₂)₂N₂O C₆H₄Me(NH₂) [4 1 2] *Azoxy-o-toluidine* [168°] From nitro-o-toluidine in alcoholic solution by sodium amalgam (Lamprecht, *B* 18, 1405, Graeff, *A* 229, 344). Long orange silky needles (from alcohol), or yellow needles (from water). V sol alcohol, sl sol water. Converted by conc H₂SO₄ by molecular change, into amido-toluidene azo amido cresol.

Salts—B⁺H₂SO₄ aq needles—B⁺2HCl—B⁺H₂Cl₂PtCl₆—B⁺2HBr.

p-Amido-toluene azoxy p-toluidine

[1 4 2] C₆H₄Me(NH₂)₂N₂O C₆H₄Me(NH₂) [2 1 4] [148°] Yellow needles. Sol alcohol and hot water. Prepared by the action of sodium amalgam on an alcoholic solution of nitro-p-toluidine—B⁺(HCl)₂ sl. sol. water—B⁺H₂Cl₂PtCl₆ (Buckney, *B* 11, 1451).

Benzoyl derivative

C₆H₄Me(NHBz)₂N₂O C₆H₄Me(NHBz) [290°] From C₆H₄Me(NHBz)(NO₂) [1 4 2] by treatment with zinc and ammonia (Mixer, *Am* 5, 285). Light yellow substance, insol water and alcohol.

Benzene p-azoxy-aniline

C₆H₄(NH₂)₂N₂O C₆H₅ [139°] S 4 27 at 21°. Formed, together with benzene azo-aniline, by

the action of ammonium sulphide on an alcoholic solution of benzene azoxy nitro benzene (G Schmidt, *A* 122, 174, *Z* [2] 5, 419). Large pale yellow tables (from dilute alcohol). Sl sol hot water, v sol alcohol and ether. Reduced by tin and HCl to aniline and p-phenylene diamine.

Salts—B⁺HCl silvery laminae, saponified by water—B⁺H₂FtCl₆.

Benzene azoxy-benzene C₆H₅₂N₂O C₆H₅ Mol. w 198 [36°] S (alcohol) 17 5 at 16°.

Formation—1 From nitro benzene by the action of alcoholic KOH (Zinin, *J* pr 36, 93, Rasenack, *B* 5, 364, Schmidt & Schultz, *A* 207, 328, Wilsing, *A* 215, 228), or sodium amalgam (Alexejeff, *J* 1864, 525, Moltchanoffsky, *J* R 1882, 350)—2 From aniline by oxidising with KMnO₄ (Glaser, *Z* [2] 2, 308)—3 From benzene azo benzene by oxidising with CrO₃ (Petruff, *B* 6, 577).

Preparation—1 By reducing nitro benzene in alcoholic solution by means of sodium amalgam. The yield is 87 pc of the theoretical (Moltchanoffsky, *J* R 1882, 224, *Bl* [2] 38, 551)—2 By boiling nitro benzene with sodium methylate, prepared from methyl alcohol (250 g) and sodium (10 g), the reaction being as follows

(Klinger, *B* 15, 865).

Properties—Pale yellow trimetric needles, insol water, sol alcohol, and ether. Small quantities may be volatilised with steam.

Reactions—1 When mixed with neutral substances (e.g. NaCl) and distilled it gives aniline, azo benzene, and other products—2 *Ammonium sulphide* has hardly any action upon it in the cold, but on warming it reduces it to hydrazo benzene—3 SnCl₂ and HCl reduce it to aniline, very little benzidine being formed (Schmidt & Schultz, *B* 12, 484)—4 Warm conc H₂SO₄ converts it into benzene p-azophenol (Wallach & Belli, *B* 13, 525)—5 *Aniline hydrochloride* at 230° gives violaniline (v Dechend & Wichelhaus, *B* 8, 1614)—6 *Diphenyl amine hydrochloride* heated with it gives triphenyl violaniline (Girard & Caventou, *B* 12, 290)—7 Conc HBr at 250° gives di-bromo aniline (Sendzink, *Z* [2] 6, 266), HI gives benzidine—8 PBr₃ gives yellow crystals of C₁₂H₁₁N₂Br, which are converted by aqueous AgNO₃ into benzene azo benzene (Werigo, *Z* [2] 6, 387)—9 PCl₅ added to an ethereal solution gives benzene azo benzene (Werigo, *A* 165, 202).

10 *Sodium amalgam* gives hydrazo benzene—11 *Sulphurous acid* forms benzidine sulphate—12 *Nitric acid* forms three benzene-azoxy nitro-benzenes (q v) and also a tri nitro derivative C₁₂H₇(NO₂)₃N₂O [152°] (G Schmidt, *Z* [2] 5, 421). This is converted by CrO₃ mixed with conc HNO₃ at 200° into C₁₂H₇(NO₂)₃N₂O [102°], and C₁₂H₇(NO₂)₃N₂O₃ [52°] (Petruff, *B* 6, 558).

Benzene azoxy-benzene m-sulphonic acid C₆H₄N₂O C₆H₄(SO₃H) [60°–70°] Very deliquescent reddish brown tables. Formed as a by-product in the oxidation of m-amido benzene-sulphonic acid by KMnO₄—KA⁺ aq long soluble tables (Lamprecht, *B* 18, 1420).

Benzene azoxy-benzene p-sulphonic acid C₆H₄N₂O C₆H₄(SO₃H) [below 100°] Red scales. V sol water. Formed as a by product in the

oxidation of sulphanilic acid by KMnO_4 , the yield is about 2 p.c.— $\text{KA}'2\text{aq}$ small yellow crystals (Lumprecht, *B* 18, 1420)

Benzene-azoxy-bromo-benzene sulphonic acid
 $\text{C}_6\text{H}_5\text{N}_2\text{O C}_6\text{H}_4\text{Br}(\text{SO}_3\text{H})$ Formed as a by-product of the oxidation of bromo amido benzene sulphonic acid $\text{C}_6\text{H}_4\text{Br}(\text{NH}_2)(\text{SO}_3\text{H})$ [4 3 1] with KMnO_4 — $\text{KA}'2\text{aq}$ small red six-sided tables (Lumprecht, *B* 18, 1423) V sol. water and alcohol

Benzene *p*-azoxy-nitro-benzene

$\text{C}_6\text{H}_5\text{N}_2\text{O C}_6\text{H}_4\text{NO}_2$ [1 4] [153°] Formed together with the following body by the action of HNO_3 (*S G* 1 45) on benzene azoxy benzene (Zinin, *A* 114, 218) Hair like yellow needles Reduced by alcoholic ammonium sulphide to benzene *p*-azoxy aniline

Benzene-azoxy-nitro-benzene

$\text{C}_6\text{H}_5\text{N}_2\text{O C}_6\text{H}_4\text{NO}_2$ [49°] Needles or prisms, prepared as above Alcoholic ammonium sulphide forms a compound $\text{C}_{12}\text{H}_{10}\text{N}_4\text{O}$ (?) [85°]

Benzene-azoxy-nitro-benzene

$\text{C}_6\text{H}_5\text{N}_2\text{O C}_6\text{H}_4(\text{NO}_2)$ [1 2] [127°] Formed by adding fuming HNO_3 (25–30 cc) to a solution of benzene azo benzene (20 g) in glacial acetic acid (100 cc) at 75° Red rhombic plates Sol. alcohol, ether, and acetone Alcoholic KOH gives an emerald green colouration, by long boiling or by treatment with sodium amalgam it is reduced to a compound $\text{C}_{12}\text{H}_{10}\text{N}_2\text{O}$ (Janovsky a Erb, *B* 20, 361)

Benzoic *o*-azoxy-benzoic acid

[2 1] $\text{C}_6\text{H}_4(\text{CO}_2\text{H})-\text{N}_2\text{O}-\text{C}_6\text{H}_4(\text{CO}_2\text{H})$ [1 2] Mol w 286 [237°–242°]

Formation—1 By the action of KCN on *o*-nitro benzaldehyde (Homolka, *B* 17, 1902) — 2 From *o* nitro benzoic acid by treatment with sodium amalgam or alcoholic KOH (Griess, *B* 7, 1611) — 3 Together with *o* nitro toluene by boiling *o* nitro benzyl alcohol with aqueous KOH (Jaffé, *H* 2, 57)

Properties—Small colourless prisms, m sol hot alcohol, sl sol ether and boiling water Reduced by sodium amalgam to carboxy benzene azo benzoic acid, and finally to hydrazo benzoic acid

Salt— $\text{BA}''4\text{aq}$

Benzoic *m*-azoxy-benzoic acid

[3 1] $\text{C}_6\text{H}_4(\text{CO}_2\text{H})\text{N}_2\text{O C}_6\text{H}_4(\text{CO}_2\text{H})$ [1 3] Formed by boiling *m*-nitro benzoic acid with alcoholic KOH (Griess, *A* 131, 92) Minute needles or plates Insol. water, sl sol alcohol and ether Reduced by tin and HCl to di amido-diphenic acid

Diazoxy-benzoic acid

Formed by reducing di nitro benzoic acid dissolved in NaOHAq with sodium amalgam (*V Meyer* a Michler, *B* 6, 746, Michler, *B* 7, 420, *A* 175, 150) An amorphous black powder, insol. alcohol, ether, benzene, chloroform, and glacial acetic acid Reduced by tin and HCl to diamido benzoic acid. HNO_3 gives an amorphous nitro-derivative

Salts.— AgA' black pp sol NH_4Aq — BA'' , black pp— ZnA' , brownish black pp

An isomeric acid, resembling the above, is formed from (1, 2, 4)-di nitro benzoic acid It is not attacked by tin and HCl.

***m*-Bromo-benzene-*m*-azoxy-bromo-benzene**

[3 1] $\text{C}_6\text{H}_4\text{Br N}_2\text{O C}_6\text{H}_4\text{Br}$ [1 3] [119°] From *m*-bromo-nitro-benzene and alcoholic KOH (Gabriel, *B* 9, 1405) Bright yellow prisms, v . sl sol alcohol

***p*-Bromo-benzene-*p*-azoxy-bromo-benzene**

[4 1] $\text{C}_6\text{H}_4\text{Br N}_2\text{O C}_6\text{H}_4\text{Br}$ [1 4]. [172°] (Hofmann a Geyger, *B* 5, 919), [175°] (Wergo, *A* 165, 198) From *p* bromo-nitro benzene by treatment with alcoholic KOH or sodium amalgam Yellow leaflets, v sol hot alcohol. Nitric acid forms a tri nitro-derivative [174°]

Bromo-benzene-azoxy-bromo-benzene sulphonic acid

$\text{C}_6\text{H}_4\text{Br N}_2\text{O C}_6\text{H}_4\text{Br}(\text{SO}_3\text{H})$ Formed as a by-product of the oxidation of di bromo-amido-benzene sulphonic acid $\text{C}_6\text{H}_4\text{Br}(\text{NH}_2)(\text{SO}_3\text{H})$ [1 3 6 4] by KMnO_4 — $\text{KA}'2\text{aq}$ very small yellow scales (Lumprecht, *B* 18, 1425)

***m* Chloro benzene *m* azoxy chloro benzene**

[3 1] $\text{C}_6\text{H}_4\text{Cl N}_2\text{O C}_6\text{H}_4\text{Cl}$ [1 3] [97°] Formed by boiling *m*-chloro nitro benzene with alcoholic KOH (Laubenheimer a Winther, *B* 8, 1623) Yellowish brown flat needles V sl sol alcohol Treated with fuming H_2SO_4 it is chiefly converted into *m* chloro benzene azo chloro phenol, only a very small quantity of *m* chloro benzene-azo chloro benzene being formed (Schultz, *B* 17, 464)

***p* Chloro benzene azoxy chloro benzene**

[4 1] $\text{C}_6\text{H}_4\text{Cl N}_2\text{O C}_6\text{H}_4\text{Cl}$ [1 4] [155°] From *p* chloro nitro benzene by treatment with alcoholic KOH (Heumann, *B* 5, 910, cf Willgerodt, *B* 15, 1002), sodium amalgam (Alexeeff, *Z* 1866, 269), or (in ethereal solution) with sodium (Hofmann a Geyger, *B* 5, 916) Pale yellow needles, sl sol cold alcohol Treated with fuming H_2SO_4 it is chiefly converted into *p* chloro-benzene azo chloro benzene only forming traces of a chlorinated benzene azo phenol (Schultz, *B* 17, 464)

Di-chloro benzene azoxy di chloro benzene

[3 5 1] $\text{C}_6\text{H}_3\text{Cl}_2\text{N}_2\text{O C}_6\text{H}_3\text{Cl}_2$ [1 3 5] [172°] From (3,5,1) di chloro nitro benzene and alcoholic KHS (Beilstein a Kurbatow, *A* 197, 84)

Di chloro benzene azoxy di chloro benzene

[2 5 1] $\text{C}_6\text{H}_3\text{Cl}_2\text{N}_2\text{O C}_6\text{H}_3\text{Cl}_2$ [1 2 5] [112°] From *p* di chloro nitro benzene and alcoholic KOH (Laubenheimer, *B* 7, 1600, 8, 1623) Small bright yellow needles

***p*-Chloro-benzene azoxy chloro nitro-benzene**

[4 1] $\text{C}_6\text{H}_4\text{Cl N}_2\text{O C}_6\text{H}_4\text{Cl}(\text{NO}_2)$ [1 4 ?] [134°] From *p* chloro benzene *p* azoxy chloro benzene and HNO_3 (Heumann, *B* 5, 912, 13, 1185) Bright yellow flocculent substance V sl sol boiling alcohol, reduced by alcoholic ammonium sulphide to *p* chloro-benzene azo chloro-nitro benzene

Chloro toluene azoxy-chloro toluene

[6 3 1] $\text{C}_6\text{H}_4\text{MeCl N}_2\text{O C}_6\text{H}_4\text{MeCl}$ [1 6 3] [128°] Formed by the action of Na on an ethereal solution of chloro-nitro toluene (Hofmann a Geyger, *B* 5, 919) Small needles

***m*-Iodo-benzene-*m*-azoxy-iodo-benzene**

[3 1] $\text{C}_6\text{H}_4\text{I N}_2\text{O C}_6\text{H}_4\text{I}$ [1 3] From *m*-iodo-nitro-benzene and alcoholic KOH (Gabriel, *B* 9, 1408) Flat yellow needles, sl sol cold alcohol

***p*-Iodo-benzene-*p*-azoxy-iodo benzene**

[4 1] $\text{C}_6\text{H}_4\text{I N}_2\text{O C}_6\text{H}_4\text{I}$ [1 4] [200°] From *p*-iodo-nitro-benzene and alcoholic KOH (*G*). Light yellow plates or scales Sl . sol. hot alcohol.

Di methyl amido benzene-azoxy di methyl aniline [4 1] $C_6H_4NMe_2 \cdot N_2O \cdot C_6H_4NMe_2$ [1 4] From *p* nitroso di methyl aniline and alcoholic KOH (Schraube, *B* 8, 619) Glittering brown crystals, sl sol water, m sol hot alcohol and benzene The salts are decomposed by water — $B''H \cdot PtCl_6 \cdot aq$

***m* Nitro benzene *m* azoxy nitro benzene**

[8 1] $C_6H_4(NO_2) \cdot N_2O \cdot C_6H_4(NO_2)$ [1 3] [142°]

Preparation—A solution of 2 or 3 pts of *m* di nitrobenzene in about 15 pts of methyl alcohol is mixed with a solution of sodium methylate prepared by dissolving 1 pt of sodium in 20 pts of methyl alcohol A vigorous reaction sets in, which is completed by 48 hrs cohabitation, large yield Long needles V sol benzene, m sol ether and CS_2 , v sl sol cold alcohol By heating to about 140° with strong H_2SO_4 , it is converted into the isomeric di nitro oxy-azo benzene $C_6H_4(NO_2)_2 \cdot N_2O \cdot C_6H_4(NO_2)_2(OH)$ (Klinger a Pitschke, *B* 18, 2551)

***p* Nitro diphenyl *p* azoxy nitro diphenyl**

$C_6H_4(NO_2) \cdot C_6H_4 \cdot N_2O \cdot C_6H_4 \cdot C_6H_4(NO_2)$ [225°] From *p* di nitro diphenyl by acting on its alcoholic solution with sodium amalgam (Wald, *B* 10, 137) Brick red crystalline powder, forms a red solution in conc H_2SO_4 , Insol most solvents Reduced by alcoholic ammonium sulphide to benzidine

Nitro-oxy-benzene-azoxy-di-nitro-phenol

Diethyl ether

$C_6H_4(NO_2)_2(OEt) \cdot N_2O \cdot C_6H_4(NO_2)_2(OEt)$ [168°] From HNO_3 and the diethyl ether of *p* oxy benzene *p* azo phenol the product is exhausted with water, and then treated with alcohol On cooling, the alcohol deposits the body in long yellow needles grouped in stars Sol ether, $CHCl_3$, C_6H_6 and glacial acetic acid (Andreae, *J* pr 129, 337)

An isomeric body [187°] This forms the greater part of the product of the nitration, and is left undissolved when the former body is extracted with alcohol It is crystallised from acetic ether, in which it is very soluble

***o*-Oxy-benzene-*o*-azoxy-phenol**

Ethyl ether $\{C_6H_4(OEt)\}_2 \cdot N_2O$ **Azoxy phenetol** [102°] By reducing a cold (0°) solution of *o* nitro phenetol (1 pt) in alcohol (7 pts) by adding sodium amalgam, on adding water a pp is got, this is freed from *o* azo phenetol by washing with strong HCl as long as the latter is coloured (Schmitt a Mohlau, *J* pr 126, 201)

Properties—Colourless triclinic plates Insoluble in water, but melts in boiling water Slightly soluble in cold alcohol, insoluble in hot alcohol Not volatile with steam

Diphenyl-azoxy-diphenyl

$C_6H_5 \cdot C_6H_4 \cdot N_2O \cdot C_6H_4 \cdot C_6H_5$ [205°] Small yellow plates Insol water and alcohol, sl sol acetic acid Prepared by the action of alcoholic KOH on *p* nitro di-phenyl (Zimmermann, *B* 13, 1961)

Phenyl-glycollic-*o*-azoxy-phenyl-glycollic acid $ON_2(C_6H_4OCH_2CO_2H)_2$ [187°]

Preparation—*o* Nitro phenyl glycollic acid (186 g), water (140 g) and Na_2CO_3 (5 g) are treated at 55° with sodium amalgam (165 g) of 4 per cent sodium, added in small portions On cooling, crystals separate These are dissolved in water and decomposed by HCl

The precipitated acids are recrystallised from alcohol If the mixed acids now melt above 162°, they are etherified by alcohol and HCl The ether of the azoxy acid is less soluble in alcohol than that of the azo acid, it is crystallised from alcohol and then saponified (A Thate, *J* pr [2] 29, 152)

Properties—Crystallises, from aqueous or dilute alcoholic solutions, with aq as short prisms or as scalenohedra, but if left in contact with the mother liquor these change to rhombohedra, taking up aq Both these forms are sulphur yellow At 130° they become white and anhydrous Dissolves in alkalis, HCl and glacial acetic acid The solutions are yellow Forms red solutions with HNO_3 and H_2SO_4 , Insoluble in ether and in benzene

Reactions—1 **Lead acetate**, a yellowish-white flocculent pp—2 $AgNO_3$ and $BaCl_2$, no pp in hot solutions, on cooling a crystalline pp

Salts— $(NH_4)_2A''$ obtained, as a yellow micro crystalline pp, by passing NH_3 into a solution of the acid in absolute alcohol Its aqueous solution gives yellowish white pps with $BaCl_2$ and $Pb(OAc)_2$, yellow pps with $AgNO_3$ and $FeCl_3$, and a green pp with $CuSO_4$ — AgA'' — $AgHA''$ more soluble than the neutral salt BaA'' 2aq

Ethyl ether— Et_2A'' , [114°] White silky needles

***m* Sulpho-benzene-*m*-azoxy benzene sulphonic acid** [3 1] $C_6H_4(HSO_3) \cdot N_2O \cdot C_6H_4(HSO_3)$ [13] [125°] Prepared by the reduction of *m* nitro benzene sulphonic acid with alcoholic KOH (Brunnemann, *B* 11, 1048, *A* 202, 240) Yellow needles V sol water and spirit $A''K$, 4aq needles $A''(NH_4)_2$, 2aq rhombic pillars— $A''Ba$ aq difficultly soluble prisms $A''Ca$ 3½aq difficultly soluble needles— $A''Pb$ aq

Chloride [138°] Yellowish red pillars

Amide [273°] sl sol hot water

Sulpho-naphthalene-azoxy-naphthalene sulphonic acid $C_{10}H_6(SO_3H) \cdot N_2O \cdot C_{10}H_6(SO_3H)$ From (a) nitro naphthalene (a) sulphonic acid and alcoholic KOH (Alen, *B* [2] 45, 184) V sol water, conc H_2SO_4 forms a violet solution

Salts— K_2A'' aq trimetric tabular crystals Na_2A'' 2aq tables— BaA'' aq— CaA'' 2aq— PbA'' 2aq

Terephthalic-azoxy terephthalic acid

[6 3 1] $C_6H_4(CO_2H) \cdot N_2O \cdot C_6H_4(CO_2H)_2$ [1 6 3]. Yellowish plates Sol hot, sl sol cold, water, v sl alcohol and ether Decomposes between 250° and 280° Obtained by oxidation of aldehyde benzoic azoxy aldehyde benzoic acid $N_2O(C_6H_4(CHO)CO_2H)_2$ with alkaline $KMnO_4$

Salts— $A''(NH_4)_2$, long yellowish prisms $A''Ag$, yellow pp (Homolka a Löw, *B* 19, 1091)

Toluene azoxy bromo toluene

$C_6H_4Me \cdot N_2O \cdot C_6H_4BrMe$ [74°] From *p* toluene-*p* azoxy toluene and bromine Bright yellow tables, v sol alcohol and ether (Melms, *B* 3, 551)

Toluene azoxy nitro toluene

$C_6H_4Me \cdot N_2O \cdot C_6H_4(NO_2)Me$ [84°] Formed by nitration of *p* toluene-*p* azoxy toluene (Petrineff, *B* 6, 557) Yellow needles

Toluene-*o* azoxy-toluene

$C_6H_4(CH_3) \cdot N_2O \cdot C_6H_4(CH_3)_2$ [60°] Formed by passing Cl_2O into an ethereal solution of *o*-hydrozo-toluene (Petrineff, *B* 6, 557)

Preparation—10 pts of *o*-nitro toluene are

added gradually to a solution of 5 pts of sodium in 50 pts by volume of methyl alcohol, the mixture being finally cohobated on the water-bath for 8 or 4 hours

Properties—Large yellow needles or plates, the crystals belong to the dimetric system, $a:b = 84:101$

Reactions—By distillation with iron powder it yields *o* azotoluene and a little toluidine. It also yields *o* azotoluene by heating with H_2SO_4 (Klinger & Pitschke, *B* 18, 2553)

***p* Toluene *p* azoxy-toluene**

$C_6H_5Me.N_2O.C_6H_5Me$ [70°] (M), [59°] (P) From *p* nitro toluene by reducing it in alcoholic solution with sodium amalgam (Melms, *B* 3, 551, Petreiff, *Z* [2] 5, 264, [2] 6, 30, *B* 6, 557) V sol alcohol and ether

Bromine gives a bromo derivative, [74°], and a di-bromo-derivative [138°]

Nitric acid gives a nitro derivative [84°], a di nitro derivative [145°], and a tri nitro-derivative [201°]

AZOXYLENE *v* Xylene azo xylene

AZOXY NAPHTHALENE *v* Naphthalene

azoxy naphthalene

AZOXY PHENOL *v* Oxy benzene azoxy-phenol

AZOXY DIPHENYL *v* Diphenyl azoxy diphenyl

AZOXY TOLUENE *v* Toluene azoxy toluene

AZULENE or Azulin Blue colouring matter present in essential oils of chamomile, worm wood, and millefolium. Causes these and other oils to give an absorption spectrum, viz, three bands in red and orange (Hock, *Ar Ph* [3] 21, 17).

AZULMIC ACID $C_8H_7N_3O$ Flocculent brown pp formed together with oxamide and oxamic acid by passing cyanogen into aqueous ammonia. Sl sol pure water, with violet fluorescence, acid or alkaline solutions fluoresce green. Boiling water slowly converts it into mycomelic acid $C_8H_7N_3O_2$. Nitric acid or $KMnO_4$ oxidises it to azulmoxin $C_8H_7N_3O_4$, an orange powder, insol water, sol conc H_2SO_4 , the solution having a deep green fluorescence

Hydrazulinia $C_8H_7N_3$ is formed by mixing dry cyanogen with dry NH_3 . It forms black leaflets, converted by water at once into NH_3 and azulmic acid (Emmerling & Jacobsen, *B* 4, 927). By the spontaneous decomposition of an aqueous solution of HCN containing a little NH_3 , a brown pp is produced which, according to Gautier (*A Ch* [4] 17, 158), contains an azulmic acid of the formula $C_8H_7N_3O$

AZURIN $C_{10}H_7N_3O_4$ [250 5°] Small colourless tables forming solutions which have a splendid blue fluorescence. Prepared by heating salicylic aldehyde with *o* tolylene diamine (Ladenburg, *B* 11, 596)

AZYLINES Azo compounds of the form $R_2N.C_6H_4.N.N.C_6H_4.NR_2$, prepared by passing nitric oxide into alcoholic solutions of tertiary aromatic amines, thus, di-methyl aniline azyl-ine is described as di methyl amido benzene azo di methyl aniline, di amyl aniline azyl-ine is described as di amyl amido benzene azo-di amyl-aniline, and di ethyl aniline azyl-ine as di ethyl-amido benzene azo di ethyl aniline (Lippmann & Fleissner, *M* 3, 705, 4, 284, 788, *B* 15, 2136, 16, 1421, Nolting, *B* 18, 1143)

B

BABLAH The fruit of several species of *Acacia*. The seeds and husks are rich in tannin

BACCARINE An alkaloid in *Baccharis cordifolia* or 'Mio Mio'. Needles, sl sol water, sol alcohol, amyl alcohol, and ether. Its aqueous solution is neutral to litmus (Arata, *Ph* [3] 10, 6)

BACTERIA—The name given originally to a common rod like form which is assumed in the course of growth by the minute plants to which Nageli (6) in 1857 applied the term Schizomycetes; hence the term 'Bacteria' is very frequently used to designate the whole of this group of organisms

The Bacteria, Bacteriaceae, or Schizomycetes are a group of plants of extreme simplicity of structure and very minute in size. Like larger fungi, they are destitute of chlorophyll, and accordingly are unable to decompose carbonic acid in the presence of sunlight, as a consequence their nutrition resembles in some respects that of animals, since they are dependant on the complex chemical substances produced by other organisms. The variety of substances containing either C or N, or both, which they can attack and make contributory to their sus-

tenance is very great, whilst the chemical changes which they bring about in these substances are no less varied and remarkable. The exact nature of these changes and the relation of the Bacteria themselves to the substances upon which they feed form an enormous field of inquiry which has only recently been looked at by chemists, and that, as yet, very cursorily. The study of the forms presented by different kinds of Bacteria in the course of their growth is also as yet in an incomplete state, and whilst it is certain that there are kinds of Bacteria characterised each by its particular forms, its particular pabulum or chemical food, and by its particular chemical operations resulting in the formation of definite chemical products from the breaking up of the appropriate pabulum, we do not yet know in any large number of cases whether a particular form is constantly associated with particular chemical conditions and results, or whether it is possible under modified conditions for a given form to change its chemical and physiological activities. In a certain number of cases we do know that modified chemical and physical conditions will cause a given form in the course of its growth to acquire a very marked modification of form. Hence it is at present im-

possible to discriminate with assurance different 'species' of Bacteria, although botanists use particular names to designate those which, so far as our information yet goes, are characterised by the constancy of a certain range of form, or in addition to this, by the constancy of chemical and physiological activity. By 'species' the naturalist understands a group of organic forms the members of which may present very little or very great differences of form and even of activities as compared one with another, but of which it is true, either that they actually are connected with one another by natural processes of reproduction which have occurred within human experience and observation, or that there is good reason to suppose that they might be so connected within human experience. Forms which are separated from one another by an interval the passage of which has not been witnessed and recorded by observers in the past, or defies experiment at the present day, are distinct species. We have not by experimental breeding produced a horse from an ass or an ass from a horse, or both from a third form, and we have no record of observations leading to the inference that such a passage has occurred *within human experience*, hence the horse and the ass are distinct species. On the other hand, we have traditional and experimental evidence of the production of the varieties of fancy pigeons from the Rock Pigeon, and conversely we know that from the most fantastic of fancy pigeons the Rock Pigeon can be produced in the course of a few generations—hence the Rock Pigeon and the Tumbler, Pouter, Fantail, Carrier, &c., are all variously modified members of one species.

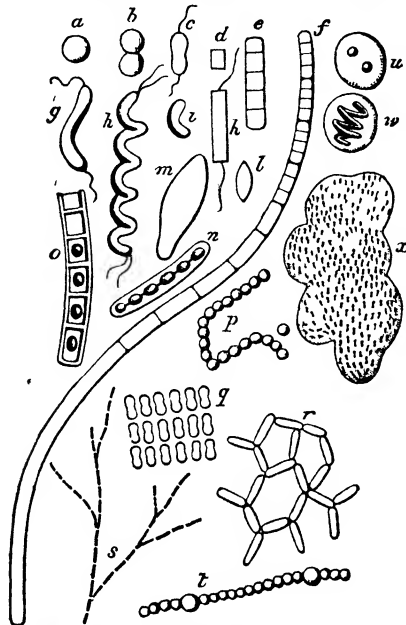

It is necessary to allude to the question of species here because the progress of our knowledge of Bacteria in the immediate past has consisted in an important degree in the recognition of the fact that a great variety of microscopic forms may belong to one and the same species of Bacterium, and because we have to expect the most important advances in the future from the endeavours of bacteriologists experimentally to breed by change of conditions one kind of Bacterium from another, and even to create experimentally new kinds, and this in spite of the fact that it has been unjustifiably assumed that the forms of Bacteria at present recognised are of the nature of species and immutable.

Classificatory position of Bacteria.—The nearest allies of the Bacteria among chlorophyll-bearing plants are the Oscillatoria and certain green coloured organisms (the so called *B. chloinum*, *B. virens*, *B. viride*) which, whilst identical in form with some of the Bacteria, differ physiologically from them in possessing chlorophyll. The distinction between these plants and the Bacteria is not by any means a wide one, and there can be no doubt of the close genetic relationship of the green and the greenless Schizophyta, the Bacteria having, as is the case in other groups of plants, lost their chlorophyll and acquired parasitic or saprophytic (refuse-eating) habits *pari passu*.

Forms of Bacteria.—The Bacteria present themselves either as swarming accumulations of detached cells or as linear aggregates (filaments or chains) of cells. Frequently the cells or plastids are loosely packed side by side and

embedded in a jelly so as to form sheets or massive aggregations. The individual cells are usually extremely minute, being only 0.01 mm. or even less in diameter, though they may be larger. The cells consist of a homogeneous protoplasm in which no nucleus can be detected, a cell wall, sometimes extremely delicate, bounds the surface of the cell, consisting of 'mycoprotein,' rarely of cellulose. When the cell wall swells up, imbibing water, a jelly is formed in which the cells are set at intervals ('zoogloea' condition). The ultimate shape of the cells of the Bacteria varies—it may be spherical (coccus-form or micrococcus), biscuit shaped or keyhole-shaped, like two spheres partially fused (clithridium form or bacterium *sensu stricto*), cuboid, varying from a cube to a short prism (microbacillus form), rod-shaped (bacillus form), curved like a bent rod (comma form), twisted like a fission of a corkscrew (spirillum form, if the spiral is not strongly marked, vibrio form). The most characteristic feature of these cells is their power of rapid growth and multiplication by fission into two equal portions. Brefeld has observed a Bacterium, formed by fission, grow to the size of the parent cell and itself divide into two in the course of half an hour, each of the daughter cells repeating the process in half an hour. In the course of 24 hours there are thus produced from a single Bacterium more than a billion individuals like itself. The constant and rapid process of binary fission is what has led to the use of the names Schizophyta and Schizomycetes. All the forms of cells which we have enumerated as being assumed by Bacteria exhibit this phenomenon. But it is not necessary that the results of the fission should separate entirely from one another. Frequently such separation occurs, and in the forms known as *clithridium* (or bacterium *sensu stricto*) *bacillus*, *vibrio*, and *spirillum*, a filament of naked protoplasm is frequently observed hanging from each end of the fission-product, and by its lashing movements causes an active 'swarming' movement, or darting progression of the separate cells. Contrasted with this locomotive swarming phase we have to note the phase of aggregation or continuous growth. As the result of variation in their pabulum, Bacteria which were at one hour separating from one another after fission—may remain in the next hour of growth in contact—held by their unruptured cell walls. Thus are produced, in place of motile swarming individual cells, aggregates or colonies which may be (1) linear, (2) tessellate, (3) branched, (4) reticulate, (5) massive. Any of these forms of aggregation may be exhibited by any of the different forms of cells. Linear aggregates of micrococci are called rosary chains or streptococcus, linear aggregates of micro bacilli form longer bacilli and so-called leptothrix filaments, linear aggregates of comma shaped segments form spirilla, and small spirilla and vibrios when aggregated end to end form larger spirilla. Branched aggregation is seen in the so-called *Cladothrix dichotoma*, where a leptothrix filament breaks so as to allow a new line of growth to start at the broken surface, but without separation of the original continuation of the filament, which takes up a lateral position as a 'false'

branch (fig s) Similarly mesh works (resembling those of the green hydrodictyon) are produced (fig r), and very regular tessellate aggregates (fig q) In the latter, bacillus or clithridium forms may be arranged with absolute symmetry forming little plates of twenty or more cells, in rows of five or more (merismopodia form) In the sarcina form the grouping is cuboid, 'packets' being produced instead of

FORMS OF BACTERIA. a Micrococcus, b Diplococcus, c Clithridium or bacillus (with flagella), d Micro-bacillus, e Bacillus (built up of microbacilli), f Leptothrix or filamentous form, homogeneous at one end divided into bacilli in the middle and into micro bacilli at the other end, g Spirillum (vibrio), h Spirillum (close spiral) with flagella, i Comma (segment of spirillum), k Homogeneous bacillus with flagella, l Uvoid or double-cone form, m Large irregular form these may occur of great size and various shapes, as flat discs (macroplasts) in *Bact. rubescens* — *Lant*, n Bacillus with moniliform protoplasm *not* spores (*B. tuberculosis*), o Sporobacillus with endospores, p Rosary-chain, linear aggregate of micrococci, q Merismopodia-form or tablet, tessellate aggregate of clithridia, r Hydrodictyon form retiform aggregate of bacilli, s Cladotrix form false branching linear aggregate of bacilli, t Nostocoid linear aggregate, larger cocci occur at intervals in a chain of smaller cocci (observed in cultivations of *B. anthracis*), u Two micrococci embedded in jelly like envelope, v Leuconostoc form a spirillum with jelly like envelope, x Zoogloea of clithridia clithridia embedded in jelly like matrix

'plates' Lastly, where the cell-wall swells up and forms a jelly, we may have the bacterian cells of any one shape adhering by the jelly to one another (fig x), and forming spherical or irregular masses of jelly (zoogloea). These masses often are as large as the hand of a man, and are found on putrefying liquids and solids.

There is no doubt that all the forms of cell and of cell aggregates which have been above

described, and others to boot, may be exhibited by one and the same species of Bacterium. The *Bacterium rubescens* of Lankester [1] forms portwine coloured pellicles on decaying organic matter in fresh water ponds and in salt marshes, the protoplasm of the cells being coloured by a peculiar insoluble pigment 'bacterio purpurin'. Lankester found all the varieties of aggregation and of cell form (except spirilla, since observed by Warming [2] and by Giard [3]), in a small tank in which this organism was flourishing, their connection with one another was proved by their all containing the peculiar colouring matter and by transition forms of growth. The accuracy of these observations has been confirmed by Zopf [4], and Lankester's conclusions adopted by him as well as by De Bary [5]. The species of Bacteria are said to be 'pleomorphic' or in Lankester's phraseology 'protean'. Nevertheless it is exceedingly probable that not all bacterian species exhibit so wide a range of form as does *B. rubescens*. Some seem to be limited to the micrococcus and clithridium cell forms, and to exist either as free swarming cells of those shapes, or as linear aggregates of the same. Others again are possibly limited to the micrococcus form, though it is necessarily extremely difficult to be sure that under appropriate conditions of cultivation the cell form and aggregation form will not change altogether, and, until experiments have been very carefully made in each case with the object of breaking down the limitation of form usual to this or that species of Bacterium, it will not be justifiable to dogmatically characterise a species of Bacterium by reference to its shape.

Spore formation The Bacteria reproduce with enormous rapidity by fission, but some few are known to produce special reproductive bodies which have the property of resisting the injurious effects of desiccation and heat.

In one sense of the word 'spore', every segment into which a previously unbroken plastid or cell of a Bacterium divides is a spore. A more special justification of the use of the term is found when occasionally one of the products of division is larger or more refringent than its fellows. Such 'spores' are recognised in the cultivations of *Bacterium (Bacillus) tuberculosis*. None of these are sufficiently specialised as reproductive particles to justify thoroughly the use of the term 'spore' in regard to them. In certain species, however, e.g. *Bacterium subtilis*, *Bacterium anthracis*, and *B. megaterium* — the formation of well defined endospores is characteristic. The protoplasm within each member of a linear aggregate of bacillus forms separates centrally from itself an ovoid mass (fig o), on the surface of which a coat of dense mycoprotein is produced. The bacilli themselves die away and decompose, but the ovoid spores remain, and have the power when dried of resisting an exposure to boiling water for as much as fifteen minutes. This property in the spores of *B. subtilis*, which are common in old hay, has led to erroneous inferences as to the 'spontaneous generation,' or 'abiogenesis,' of Bacteria. It is possible, as suggested by De Bary [5], that the Bacteria which produce endospores are widely separate (as to their origin from green algae) from the other Bacteria which have no special-

ised spores He divides the Bacteria into Endosporea and Arthrosporea.

Classification and nomenclature of Bacteria.

For the present De Bary's division of the Bacteria into Endosporea and Arthrosporea may be accepted The various generic names in use, such as Streptococcus, Ascococcus, Cladotrix, Beggiatoa, Myconostoc, Leuconostoc, have no logical basis, and produce a good deal of confusion by a false appearance of order It is probably sufficient at present to limit generic distinctions to the three terms Micrococcus, Bacterium, and Sporobacterium The genus Micrococcus comprises those Bacteriaceæ which are not at present known to exhibit any form of plastid or cell other than that of minute spheres, the genus Bacterium contains only those Bacteriaceæ which are known to exhibit in the course of growth rod like forms of plastids, as well as in many cases micrococcus forms and spiral and straight filamentous forms, the genus Sporobacterium includes only those forms which produce endospores, the so called Bacterium (Bacillus) anthracis, B subtilis, and B megaterium Adhering to this nomenclature, we still make use of the terms vibrio, spirillum, bacillus, clithridium, ascococcus, zoogloea, &c, &c, to describe conditions of growth or varieties of cell form

With regard to the use of specific names, it is well that every form or group of forms of Bacteriaceæ which definitely recurs in certain conditions, and seems to be, so far as observation has gone, distinct from other known forms or groups of forms, should receive a name Seeing that many of these names are probably but of temporary significance, it would be well that they should be as definitely descriptive of some feature of the supposed species as possible The Bacteriaceæ should be named according to their chief properties, place of occurrence, or character of growth, and not after persons

The following is a list of some of the chief supposed species of Bacteriaceæ which have been described, with an indication of the mode of occurrence It is by no means an exhaustive list, and it is quite certain that some of the few supposed species here enumerated will, on further inquiry, be found to be phases of growth of other species

Section A Endosporea

Genus SPOROBACTERIUM

Species *S subtilis*, common in hay, *S anthracis*, in the blood of cattle, sheep, and man, causes the disease known as splenic fever, *S megaterium*, observed on boiled cabbage, *S butyrum*, the butyric ferment, occurs in cheese making, and has been confused with *S subtilis*

Section B Arthrosporea.

Genus BACTERIUM

Species *B termo*, the commonest form in putrefying vegetable infusions, but not yet isolated and characterised, *B linceola*, a larger form occurring in foul ponds and sewage, *B rubescens*, the protoplasm is wine red in colour, the plastids and aggregates are of the most varied forms, occurs in ponds on vegetable refuse, *B dichotoma*, forming branched aggregates (cladotrix) and straight and spiral filaments, common in river water on dead leaves, *B Kuhmana*, in wells and drain pipes (Crenothrix), *B mesenteroides*, forming masses like

frog spawn on the beet-root juice of sugar refineries, *B tuberculosis* (fig n), in the diseased growths of men and animals suffering from tubercular consumption or phthisis, *B lepra*, in the diseased skin of persons suffering from leprosy, *B mallei*, in men and horses affected with glanders, *B typhosum*, in the spleen and intestinal glands in fatal cases of typhoid fever, *B acidilactici*, in sour milk, the manufacturer of lactic acid, *B cyanogenum*, in milk, causing it to turn deep blue, *B pyocyaneum*, in pus in badly dressed wounds, producing an emerald green colouring matter, *B alvei*, causing a disease in bee larvae known as foul brood, *B ureæ*, in urinals, causing the ammoniacal fermentation of urea, *B aceti*, the vinegar ferment, causing the conversion of ethylic alcohol into acetic acid, occurs in vinegar factories, *B prodigiosum*, causing blood red staining of bread, milk, &c, leading to public alarm, and regarded as a portent, *B ovatum*, causing the silk worm disease known as 'pebrine,' *B cuniculicidum*, causing a specific septicæmia in mice and birds, *B cholera gallinarum*, in the blood and in the intestines of fowls suffering from chicken cholera, *B pneumoniae crouposa*, in the exudation in croupous pneumonia of man, *B Kochii*, Koch's comma bacillus, found in the intestines of persons dead of Asiatic cholera (this is a spirillum form which breaks into comma shaped segments, it is not proved to have any causal relation to cholera), *B Finkleri*, similar to the last but larger, occurs in ordinary diarrhoea, *B buccale* and *B Lewisii*, spiral and filamentous forms breaking into commas which occur in the healthy human mouth

Genus Micrococcus

Species *M pyogenes*, in acute abscesses, *M erysipelatosus*, the cause of erysipelas in man, *M variolæ*, in the pustules of small pox, *M gonorrhææ*, probably the cause of gonorrhœa, *M bombycis*, causing the disease in silk worms known as flaccidezza, *M ventriculi*, in the human stomach, observed in vomit, the 'sarcina ventriculi' of Goodsir, *M scarlatina*, probably the cause of scarlet fever in man, and of a disease of the udder in cows, *M rabdorum*, the cause of rabies, not satisfactorily isolated as yet, besides a list of twenty or thirty more causing special kinds of pyæmia in such animals as rabbits and mice, or producing well-marked colouring matters in colourless vegetable or animal infusions, green, blue, red, yellow, purple

For a complete enumeration of the supposed 'species' of Bacteriaceæ which have been described, together with a description of each species and many illustrative figures, the reader is referred to the extremely useful and trustworthy treatise by Dr Edgar Crookshank, entitled *A Manual of Bacteriology*, published by H K Lewis, London, 1887 Dr Crookshank gives complete references to the original description of every known species and to the subsequent literature

Chemical relations of the Bacteriaceæ—The above incomplete list gives some idea of the importance attaching to these minute organisms It is an importance entirely depending on the variety and peculiarity of the chemical decompositions and reconstructions which they execute in the organic compounds forming either the

living or dead bodies of higher plants and animals. Without Bacteria there would be no such thing as putrefaction, and therefore no circulation of the organic elements from their more stable compounds to the condition of albumens, fats, and sugars, and back again to the stable results of putrescence. The earth's surface would be cumbered with the dead bodies of former generations in which the carbon and nitrogen now serving as the food of plants would be permanently locked up. All the evil smells which are not directly due to the chemist, are, with few exceptions, due to the action of Bacteria. Many valuable commercial products, such as acetic acid, lactic acid, and flavouring compounds such as butyric acid, are obtained through their agency. The pungent fumes of stable refuse are caused by their action on urea. It is almost certain that they too are the agents of nitrification in the soil—one species of Bacterium (or Micrococcus?) converting the ammonia produced by another, into nitrates and nitrites. Some Bacteria produce highly poisonous bodies by their action on the albumens of dead animals and plants, amongst these poisons are the ptomaines, which have recently excited the attention of chemists [6]. Other Bacteria make their way into living animals and plants and there produce poisonous decomposition products from the albuminous constituents of the organism, which are recognised in their effects under such names as splenic fever, scarlet fever, phthisis, rabies, &c. It appears that there are many kinds of Bacteria which are parasitic in and on the bodies of men and of other animals, the results of whose chemical activity is not injurious, whilst other kinds (or possibly the same kinds under changed conditions) produce deadly results. Other kinds again, it now seems certain, are not merely innocuous but actually necessary to the healthy life of the animal they inhabit. The digestion of food in the alimentary canal of man and other animals is largely aided by the Bacteria which are present in the intestine in countless myriads, and it appears that the products of digestion owe their chemical characteristics in no small degree to the Bacteria. In the absence of the normal parasitic Bacteria the products of digestion in the human intestine would, it appears highly probable, be of such a nature as to act poisonously when absorbed into the blood. When to these considerations we add the fact that the Bacteria are ubiquitous, abounding in the dust of the air, in all natural waters, and upon all surfaces whether of animate or inanimate objects which have not been chemically cleansed within a few seconds of their examination, some idea may be formed of the immense importance which belongs to the study of the Bacteria in the immediate future.

Methods of Study.—At present the state of knowledge of the chemical relations of the Bacteria is extremely fragmentary. They were originally discovered by Leeuwenhoek [7], the Dutch naturalist, in the fluids of the mouth, and various forms were subsequently seen with the microscope in natural waters, ponds, &c., and described by Ehrenberg [8] and others. It was Theodore Schwann [9], however, who, in 1838, demonstrated by a simple experiment that

the Bacteria cause the putrefaction of organic substances, and that without them there is no putrefaction. Later, Pasteur [10], in opposition to Liebig, extended Schwann's observations and conclusions, and established the doctrine of organised ferments, which has proved of immense practical importance, and is as yet only at the commencement of its history. The foundation of the experimental demonstrations of Schwann and of Pasteur lies in the fact that the living protoplasm of the Bacteria is destroyed—that is to say, undergoes an irrevocable chemical change—when subjected to a temperature below or about that of boiling water. Consequently it is possible, by the action of heat, to destroy the Bacteria present in an experimental vessel and its contents, and to protect the contents from the further accession of Bacteria. By this method, and by this method alone, it has been possible to prepare organic infusions, as well as solid gelatine, albumen, &c., which, whilst capable of supporting the life of Bacteria, are yet free from their presence for the time being. Such substances are said to be 'sterilised'. They can be inoculated at pleasure with Bacteria and the effects of the inoculation studied. In order to procure the Bacteria for inoculation in a state of purity, special methods have been devised. So abundant and varied are the kinds of Bacteria present in nearly all natural organic material, that any rough process of inoculation will introduce many kinds of Bacteria simultaneously into a sterilised medium. To separate the various kinds of Bacteria for the purpose of study of each in its isolated condition, three principal methods are employed. The first applies, as far as is known, to but one kind, the *Sporobacterium (Bacillus) subtilis*. The dry spores of this Bacterium resist the destructive effect of boiling water for as much as fifteen minutes, whilst all other known Bacteria are destroyed by it. Hence we have only to boil old hay in water for a few minutes in order to obtain a pure cultivation of *B. subtilis*. The second method (due to Nageli [11]) is that of fractional dilution. Given a liquid swarming with a mixture of various Bacteria, of which it is estimated by inspection that one individual in twenty is of the kind it is desired to cultivate. Dilute the liquid to such an extent that one drop of it should contain but a single bacterium. Then it is probable that every twentieth drop will contain a single isolated individual of the desired Bacterium. Fifty tubes of sterilised nutrient material are prepared, and into each a single drop of the diluted Bacterium-holding fluid is introduced. One, or possibly more, of the tubes will thus be inoculated with an isolated example of the desired Bacterium, which will multiply in the sterilised nutrient material and thus yield a pure cultivation, and can be recognised by the microscope. The third method is due to Brefeld, of Berlin. By streaking with a needle point a minute drop of fluid containing various Bacteria, over a surface of solid sterilised gelatine, the various Bacteria will be locally isolated along the course of the streak. They will remain thus separated from one another and commence to multiply *in situ*. With a low power of the microscope and a fine needle samples can be now removed from the various

patches of growth and placed in the pure condition in tubes of sterilised nutrient material for further cultivation and study. Similar isolation is effected by mixing liquid gelatine with a dilute infected liquid, when the gelatine solidifies, the various bacteria are embedded apart from one another, and grow in isolated patches, which can then be removed and separately studied by further cultivation.

Conditions of life required by Bacteria.— General results (a)

1 The first general result of these methods of study has been to determine the ubiquity of a large number of different kinds of Bacteria, and the comparative rarity of others. More will be said below as to the study of the distribution of Bacteria in air and water.

2 The Bacteria are found to differ from one another in their relation to free oxygen, the aerobic (Pasteur) will only multiply in the presence of free oxygen, the anaerobic will not flourish except in the absence of free oxygen, or at any rate are indifferent to its presence. Thus *B. anthracis* is eminently aerobic, whilst the *Bacterium* of malignant oedema is anaerobic. The hay bacillus (*B. subtilis*) is aerobic, the butyric bacillus of cheese (very similar to the former in appearance) is anaerobic.

3 The source of nitrogen required by Bacteria for building up their protoplasm is various. Very many can take it in as low a form of combination as ammonia. Others require it in higher combination, and some either require it in the form of albumen or at any rate can take it from albumens. It is from albumens that some of the most remarkable products formed by Bacteria result. There can be little doubt that the first steps in this process are comparable to the digestion of albumen by animal cells. It is not ascertained that all and any Bacteria can attack albumens. The exact range of the chemical quality of the nitrogenous food possible to each species of *Bacterium* has yet to be determined.

4 The carbon required by Bacteria may be taken in as low a form as acetic acid by certain species, others can take it from tartaric acid, others can do with nothing lower than a sugar, others again require glycerin or a similar body, and others apparently require their carbon as well as their nitrogen to be presented in the form of a proteid. Thus it results that many Bacteria can be nourished by solutions of ammonium tartrate alone, whilst the limits of complexity of necessary food compounds has various ranges in other species, all of which require accurate determination by the chemist. Little has as yet been ascertained in this direction, but recently Dr Roux [12] of the Pasteur Institute, has made an extremely important observation showing the necessity for extended research of the kind. It was found by Koch extremely difficult to cultivate the *Bacterium tuberculosis*, even upon blood serum kept at the normal temperature of the body. Roux found that the addition of a minute quantity of glycerin to the serum led to the rapid and abundant growth of the *B. tuberculosis* supplied with that mixture, and further, that an ordinary meat broth which alone cannot serve as pabulum for the *B. tuberculosis*, when mixed with a

minute quantity of glycerin acts as a most efficient nutrient medium for this species. It is highly probable that other such special requirements in regard to the chemical nature of their food, exist in respect of other species of Bacteria, whilst others again are more catholic in their nutrition.

5 Water is necessary for the growth of Bacteria as of all living things. Most Bacteria will flourish in the presence of that small amount of water in proportion to solid matter which suffices to constitute mere dampness or moistness. Bacteria are not killed by partial desiccation, but none resist thorough desiccation. In this respect important variations have been determined in different kinds. The spores of the Endosporea have a special power of resisting desiccation.

6 There is an optimum temperature favouring the growth of Bacteria, which ranges in various species from 10° to blood heat. Experiments have been made proving that certain species of Bacteria are killed by extreme cold, whilst all are arrested in growth during exposure to the freezing temperature of water. The most careful observations have been made in regard to the effects of exposure to high temperature. Exposure to a temperature of 100° for five minutes kills all Bacteria except those belonging to the Endosporea, the spores of which can resist the effects of this exposure for half an hour, and possibly longer. Many Bacteria are killed at lower temperatures (e.g. 80°), but careful experiments are wanting.

7 Experiments as to the effects of diminution and increase of atmospheric pressure upon the life of Bacteria have been made, but without reference to particular species. Diminution of pressure is not known to have any influence, whilst experiments made by the writer show that a pressure of thirty atmospheres does not hinder the development of putrefactive Bacteria appreciably, though modifying the chemical results of their life processes. Extremely high pressures are stated to be destructive of Bacteria.

8 The influence of light is, according to the experiments of Downes [13], inhibitory to the growth of certain Bacteria, but the species so affected have not been determined. This is in accordance with the absence of protective pigment in most species, and the general fact of their growth within turbid liquids and beneath the surface of solid bodies away from the light.

9 Like the yeast plant which creates a poison (alcohol) in the nutrient fluids in which it grows, which after reaching a certain percentage causes the arrest of growth and the subsidence of the yeast cells—so the Bacteria are limited in their growth by the existence of products of their own formation. These products have not been investigated by chemists. But it appears to be established that putrefactive Bacteria growing in a nutrient medium flourish for a time abundantly, then suddenly cease their growth and sink to the bottom of the vessel in which they have been growing, *although the nourishing material is not exhausted*. A further and exact investigation of this phenomenon by the chemist in regard to various species of Bacteria must lead to results of the

greatest value in relation to the practice of preventive inoculation for disease

10 A condition of the life of a given species of Bacterium is found in the presence of other species of Bacteria. Frequently one species of Bacterium is the indispensable friend and associate of a second—preparing by its chemical activity the pabulum on which alone the second can thrive. An association of the kind is seen in what is called the vinegar plant, where *Mycoderma* prepares from starch the alcohol which the Bacterium *aceti* converts into acetic acid. So, too, the Bacterium of ammoniacal fermentation is the antecedent of the Bacterium which converts ammonia into nitrites and nitrates. Equally important is the inhibition and possibly the destruction of one species of Bacterium by another. Very little has been ascertained on this important matter, but it appears that the presence of certain putrefactive Bacteria in a nourishing medium will actually prevent the development and growth of certain pathogenic species of Bacteria, although these are present in small numbers. Apart from the question of possible specific incompatibility of two Bacteria, it appears that the question of quantity (*v. Cheyne* [14]) is important. A species of Bacterium which is at the commencement of an inoculation experiment one hundred times more numerous than a second species, may by its rapid development and numbers prevent altogether the growth of the second species.

11 The question of the conditions of life of the Bacteria involves the very important one of their tolerance of the presence of various chemical substances in the liquids in which they grow, those substances the presence of which is not tolerated by the Bacterium being called 'germicides' or 'antiseptics'. On account of the practical importance of destroying or inhibiting the development of putrefactive and pathogenic Bacteria, a good deal of attention has been given to this subject by chemists, but unfortunately it is only recently in the laboratory of Koch [15] that experiments to determine the germicidal action of chemical substances have been made with the necessary discrimination of the species of Bacteria which were the subject of experiment. The fact is now definitely established that some species of Bacteria are killed by chemical substances which do not injuriously affect others, and that the amount of such substances which is effective varies in the case of different species. The inquiry has only as yet been commenced, but it is of immense practical importance, since it may be possible to discover 'germicides' of a generally innocuous character which are specific poisons for certain disease-producing Bacteria, whilst harmless to other Bacteria and harmless to the higher animals in whose tissues the pathogenic Bacteria flourish. Thus weak solutions of quinine sulphate are poisonous to the Bacterium *ureæ*, whilst not injurious to putrefactive Bacteria. Such a solution can be injected into the human bladder without causing irritation, and thus the inflammation resulting from the ammoniacal decomposition of the urine in the bladder by Bacterium *ureæ*, which sometimes gains access thereto, can be entirely arrested. In this inquiry the difference between actual destruc-

tion of the life of the Bacteria, and mere arrest or inhibition of growth due to the presence of the antiseptic chemical, have to be distinguished. It is also needful to inquire how far such 'antiseptics,' without killing or inhibiting Bacteria, may modify the physiological processes and chemical results brought about by the latter. The most powerful and generally effective poison for Bacteria appears to be corrosive sublimate. The presence of as little as 1 in 10,000 of this salt in a nutrient fluid has been found to kill Bacteria present. Phenol is also a general and powerful germicide. Boracic acid also and common salt in large quantities are effective. The nature of their action and their effectiveness in regard to different species of Bacteria have yet to be accurately determined. Antiseptic surgery, the future treatment of zymotic disease, and the preservation of perishable articles of food, depend upon the further discoveries of chemists in regard to this matter. It is not improbable that the most effective and useful germicides will be found in chemical substances which, like quinine, resemble those inhibitory products which are produced by the Bacteria themselves and act as the natural obstacles to their excessive multiplication. The more general question of the tolerance of or necessity for the presence on the one hand of free acid, on the other of free alkali in the nutrient fluids suited to different Bacteria, belongs here. It has been studied in regard to many Bacteria in a rough and ready way. Some Bacteria will not flourish in acid media, others will, but accurate quantitative investigations are still wanting.

The products of the activity of Bacteria.—When a species of Bacterium grows in a nutrient fluid of known chemical composition with access to a definite and limited volume of atmospheric oxygen—under given conditions of temperature, pressure, and illumination—certain chemical interchanges occur in the materials contained in the apparatus. These can be accurately determined in certain instances, and the variation of the quantity of change in relation to time can be stated. Various factors of the process, such as temperature, presence or absence of initial chemical substances, &c., can be varied, and the results stated and compared. In no case has such an experiment as yet been accurately made by a chemist. Nevertheless, we know roughly that, in the supposed experimental apparatus above indicated, there will be after a certain time an increase in the weight of mycoprotein and albumens existing in the form of Bacteria, and a corresponding diminution in the C, H, N, and O of the other material in the apparatus. Not only this, but we find certain new chemical compounds present outside the actual substance of the multiplied Bacteria which result from and accompany the growth and life of the particular species experimented upon. The same general statement is true of any higher organism in relation to its necessary pabulum, but whereas in large multicellular organisms the resulting products of the life of the organism are temporarily or permanently held within the mass of the body, in the minute unicellular Bacteria there is no taking in or envelopment of the materials to be acted upon by the living thing, but the organism gets into its food instead of

the food getting into it consequently processes comparable to the digestive and even to the more deep seated metabolic processes of higher organisms take place in the nutrient liquid in which the Bacterium lives, being initiated at the surface of the swarming cells constituting the colonies of these minute plants, and serving their economy equally as well as though they occurred in an alimentary canal or in a series of blood-vessels and tissue spaces. The chemical changes induced by Bacteria should be studied from the same point of view as that taken by the physiologist in regard to the activities of the various cells of the tissues with their diverse and specific functions. We are not yet in a position to treat the subject from this standpoint but we can distinguish with more or less certainty results traceable to respiration, digestion assimilation secretion and excretion, the chemical correlates of these processes are changes described as de oxidation, oxidation, specific fermentations, specific syntheses.

The obvious results of the activity of Bacteria (setting aside the probably universal evolution of CO₂ and consumption of free O common to the Bacteria and all living protoplasm) though by no means necessarily the most important in regard to their own physiology, are the production in the liquids in which they grow of (1) substances having distinctive smells and flavours, (2) substances having brilliant colours, (3) substances having eminently poisonous properties, to these may be added such remarkable results of oxidation as the manufacture of nitrates in soil, of acetic acid in vinegar factories, and the manifestation of light—the phosphorescence—of decaying fish, bones, and other organic refuse.

The chemical nature of the substances which are thus produced, the by products which accompany them, and the nature of the processes by which they are originated, have not yet formed the subject of chemical investigation to any large extent. Such knowledge as we have is due to Pasteur [16], to Fitz [17], and one or two others.

It seems probable that we may distinguish amongst these results those which are due to synthesis, by the Bacterium acting on lower compounds taken into its substance, and those which are due to analysis resulting from the action of ferments and other agents secreted by the Bacteria and acting on surrounding material of a high degree of chemical complexity. Of the nature of these ferments we know nothing, their existence is hypothetical but highly probable. To the first category belong certainly many of the brilliant pigments which the Bacteria produce, in most cases these pigments are soluble and pass out from the protoplasm into the surrounding water. In *Bacterium rubescens* the wine red pigment is not soluble, and remains where it is manufactured in the cells of the plant. The remarkable smelling substances formed by putrescent Bacteria also belong to this group of built up products, and it is probable that the poisonous products of some pathogenous Bacteria, though not of all, are thus elaborated. The chief experimental reason which we have for concluding that these bodies are built up by the Bacterium from lower com-

pounds is this that they are formed when the Bacterium is cultivated in a pure solution of ammonium tartrate (with traces of mineral salts) often called Pasteur's or Cohn's solution. Thus the Bacterium of blue milk can be grown and made to produce its blue colour from ammonium tartrate, the Bacterium of green pus similarly, and many of the chromogenic Micrococci, whilst some of the specially active putrefactive Bacteria manufacture foul smelling products from the same salt when experimentally nourished with it.

In regard to the second group, that of substances resulting from a breaking down of higher chemical bodies brought into relation with the Bacterium (and that probably by the action of a secreted ferment which may be minute in amount and possibly never separated from the surface of the Bacterium cell), we have to note first of all that the ferment itself belongs to the previous group. Secondly, that various species of Bacteria have been shown to produce ethylic and other alcohols in this way—from sugar and similar bodies—as does the yeast plant (*Saccharomyces*). Fitz [17] has shown that a certain Bacterium converts glycerin into ethyl alcohol, whilst another converts it into butyl alcohol. Other Bacteria have been shown to convert sugar into gum or into mannite, producing the so called 'ropy fermentation' of syrups, wine, and beer. Urea is converted into carbonate of ammonia, hippuric acid into benzoic acid and glycocholic. Albumens are broken down into bodies which have not been determined in many cases, but include the ptomaines, neuridine, and trimethylvinyl ammonium hydrate. Various Bacteria as well as the specific *B. lactici*, produce small quantities of lactic acid from various substances, such as grape sugar, milk sugar, and glycerin, whilst possessing other ferment producing action also. Butyric acid is frequently produced in these processes by other Bacteria as well as by the *B. butyricum* of cheese factories. Exact knowledge is, however, sadly deficient in these matters, owing to the fact that hitherto chemists have not been careful to ascertain what species of Bacterium is present in the fermentations studied by them. Owing to this we do not yet know whether in different nourishing fluids and under different conditions of access of oxygen and of temperature, the same Bacterium can produce different fermentations. Such knowledge as we have tends to a positive answer to the above question. One of the best researches with a known species of Bacterium is that of Vandevelde [18], on the hay bacillus (*B. subtilis*). Since it is probable that there is this change of chemical activity under changed conditions, it is also probable that a Bacterium which is harmless under ordinary conditions of growth may, when specially cultivated in albuminous media, acquire the property of living in the animal body as a parasite, and there cause deadly disease by its fermentative action, or by the secretion of poisonous products. Buchner [19], starting from this theoretical consideration, has endeavoured to produce the deadly *B. anthracis* of splenic fever from the hay bacillus (*B. subtilis*), and conversely to restore the parasitic form by cultivation to the primitive state. His experi-

ments, though of extreme interest, are not conclusive

It is difficult to hazard a guess as to whether the poisonous effects of any given Bacterium proved to be concerned in the production of disease, are due to the secretion of a poison by the Bacterium or to the production of one by its fermentative action upon the constituents of the blood, tissues, or intestinal contents. The chemical theory of the antidotal action of inoculation with various 'vaccine' cultivations, which is that favoured by their chief discoverer and investigator, M. Pasteur, would seem to involve the hypothesis that whilst the effective poison is a secretion of the Bacterium, the antidotal material is a chemical compound resulting from the fermentative action of the Bacterium, quite distinct from the poison. This fermentation product by its accumulation inhibits the development of the Bacterium as alcohol inhibits the further growth of the yeast plant by the fermentative action of which it has been formed. The phagocyte theory of Metschnikow [20] in relation to preventive inoculation does not involve this distinction (see below)

The oxidising action of Bacteria must be considered merely as a special form of their fermentative action. By the latter they produce intermediate chemical substances which are readily oxidised by the free atmospheric oxygen. It is probably thus that acetification proceeds when *B. aceti* converts ethylic alcohol into vinegar or when organic nitrogenous bodies and ammonia in the soil are converted into nitrites and nitrates. There is no evidence of a specific oxidising action on the part of the Bacterium. The phosphorescent substance produced in stale fish, old bones, meat, &c., under certain conditions by certain Bacteria (as yet not precisely determined) may be regarded as an example of one of these intermediate oxidisable substances. The oxidation in this case is accompanied by the evolution of light.

Special Study of the Occurrence and Distribution of Bacteria in the Atmosphere and in Potable Waters.—The ubiquity of Bacteria has been demonstrated by the use of sterilised nutrient fluids. If such a fluid be touched by a glass rod or by the finger or by any surface not chemically cleansed, Bacteria are conveyed into the fluid and multiply there with enormous rapidity. Gelatin has been used as a means of studying the number of Bacteria present in the atmosphere or in a sample of water (*v.* Percy Frankland's researches [21]). However modified, the process is essentially this: a given volume of air is passed through a liquid so as to arrest all Bacteria previously floating in the air. The liquid is then mixed with gelatin, warmed to liquefy the gelatin, and rapidly cooled as a thin layer on a plate. The Bacteria develop at various separate points in the gelatin, giving rise to spherical growths or nests. These are then counted, and the species present may be discriminated by further cultivation. Where water is the subject of investigation the gelatin is directly mixed with a given volume of the water. The results thus obtained have only a subordinate value from the point of view of the hygienist. The majority of Bacteria are perfectly innocuous, and their presence is not—as has been too readily as-

sumed—an indication of the probable presence of pathogenic Bacteria. No such natural association of pathogenic and innocuous Bacteria in definite proportions has been ascertained, and its assumption is not warranted. It is necessary in all cases, if the results are to have hygienic value, to distinguish the kinds or species of Bacteria present and to ascertain their properties. Further, it is quite certain that all species of Bacteria will not flourish in gelatin even when mixed with peptone or such bodies. For instance, one of the most important pathogenic Bacteria—that concerned in tubercular consumption—will not do so. A special pabulum is needed for this Bacterium, and its presence would not be indicated by the ordinary gelatin cultivation of the contents of a given volume of air. Hence it seems necessary that in addition to careful discrimination of the Bacteria obtained by such experiments on atmospheric and aquatic distribution, there should be a systematic use of various cultivating media for the purpose of demonstrating the presence of various kinds of Bacteria. No doubt many kinds can be secured by the peptonised gelatin method, but if the results of such studies are to have any qualitative hygienic significance, other cultivating media must be simultaneously made use of. All the work at present done on this subject requires doing afresh from this point of view.

Special Study of Pathogenic Bacteria.—A large number of most important observations have been made of late years by pathologists—especially by Lister, Pasteur, Koch, Klein, and their pupils—demonstrating not only the presence of Bacteria in the blood and tissues of man and other animals when in a state of disease, but also proving in a certain number of cases that the Bacteria are the cause of specific disease. The proof, which is sufficient, and has been furnished in a limited number of instances, consists in—1 The constant presence of a definite form of Bacterium in the diseased animal and in the specially-diseased parts of it. 2 Its successful removal from the diseased animal, and its pure cultivation on media free from all contamination by particles of the diseased animal. 3 The experimental introduction of the cultivated Bacterium into the body of a healthy animal liable to the disease in question but free from it. 4 The subsequent development of the disease in the inoculated animal. This proof has been furnished in regard to the connection of *B. anthracis* with splenic fever in cattle and sheep, and malignant pustule in man, in regard to *B. tuberculosis* and consumption or phthisis in man and animals, in regard to *B. cholerae* *gallinae* and the cholera of fowls, in regard to *Micrococcus erysipalatosus* and erysipelas of man, in regard to certain Bacteria and septicæmic and pyæmic conditions in rats, mice, rabbits, and birds, and in regard to some other diseases of animals. Such a connection is strongly suspected, but not yet proved in the complete manner formulated above in regard to certain observed Bacteria or Micrococci, and the following diseases, viz small pox, scarlatina, diphtheria, typhoid fever, cholera asiatica, malaria, yellow fever, gonorrhœa, &c. The first definite researches in this direction, which were immediately accompanied by practical results of enor-

mous value, were those of Sir Joseph Lister, who showed that the blood poisoning so frequent in crowded hospitals after surgical operations was due to the access of Bacteria to the wounds where they multiplied and manufactured poisonous products (sepsine, ptomaines?) which were absorbed into the blood. Lister adopted measures for preventing the access of these Bacteria, chiefly by the use of phenol and great cleanliness in instruments, dressings, &c., and thus established the antiseptic system of surgery.

It is remarkable that the researches which have been made on the relation of Bacteria to disease have been mostly of a purely empirical character. Almost the only investigator who has carried the matter further (and with the most brilliant results) is the French chemist Pasteur. The fact is that the question as to what the Bacteria do after entering an animal body is, like the question of their action on substances external to the body, essentially a chemical one. Following up the observations of Toussaint, Pasteur [22] was led to the discovery that the *Bacterium anthracis* when cultivated in broth could be made to assume a condition in which its virulence was greatly diminished. Nevertheless when introduced into the tissues of a sheep, the cultivated *Bacterium* multiplied, and as a consequence of its growth rendered the sheep so treated resistant to the attacks of the virulent *Bacterium anthracis* taken from another animal's blood.

It was known that an animal which had survived an attack of the virulent *B. anthracis* was thereby rendered 'immune' to subsequent attacks, just as one attack of small pox renders its survivor 'immune' in regard to that disease. Pasteur conceived the theory that the *Bacterium* causing the disease in all such cases produces as a by-product—independent of its specific poison—a chemical substance which inhibits its further growth (as in the case of the alcohol produced by the yeast plant) and that this substance remaining in the animal body protects it from being the seat of further growth of the pathogenic *Bacterium*. The modified cultivated variety of *B. anthracis* equally produces this substance, and consequently acts as a protective against the incursions of the virulent form. Similarly cow pox is to be regarded as the result of the growth of a modified small pox *Micrococcus*, and thus the protective effects of inoculation with cow pox are to be explained. Applying this conception Pasteur has successfully protected fowls against fowl cholera, and has been led to his greatest triumph, the protection by inoculation against rabies and the successful treatment of persons bitten by rabid dogs.

It is extremely interesting and important to observe that the discoveries which have been made in this subject are due to chemical conceptions. Nevertheless there is much probability in the view put forward by Metschnikow (a distinguished zoologist, now director of the Bacteriological Institute of Odessa) to the effect that protective inoculation does not depend upon the development within the inoculated animal of a germinal poison, resulting from the growth of the very germ which is killed or inhibited by that poison, but is rather due to the education

of the living tissues, and especially of the white corpuscles of the blood, which, he has proved, attack and feed upon Bacteria which are multiplying in the blood and tissues. This property of the white corpuscles leads Metschnikow to term them 'phagocytes,' and, according to him, preventive inoculation depends for its efficacy on the fact that, having learnt to resist and destroy a weaker modification of a pathogenic *Bacterium*, they are able to deal subsequently with the more virulent variety, whilst it has been suggested that in the struggle between the phagocytes and the inoculated modified Bacteria, there must be a survival of the fittest and a consequent strengthening of the later generations of phagocytes in the protected animal.

However this may be, it is obvious that both the direct study of the chemical history of pathogenic Bacteria and the indirect suggestions derived from further knowledge of the chemical history of Bacteria of all kinds, are of an importance to human life and health which cannot be over estimated.

In connection with the study of the pathogenic Bacteria which attack man, it is necessary to insist that at present no one has attempted to determine the various kinds of Bacteria which are normally present on the surface of the human body, in the mouth, stomach, and intestines. There appear to be twelve or more present in the healthy human mouth (v. Vignal, [23]). So strangely has this matter been neglected that Koch of Berlin was ignorant when he discovered the so called 'comma bacillus' in the intestines of choleraic subjects in India, that an identical form occurs in the healthy human mouth, as shown by Lewis [24].

Spontaneous generation or abiogenesis.—Twenty years ago experiments and observations were brought forward by various more or less competent observers [25] which were interpreted as proving the sudden formation of Bacteria as living things in fluids containing the elements of protoplasm where no germ or living thing previously existed. It is sufficient to say here that these views had a valuable effect in stimulating the investigation of the life conditions and activities of the Bacteria, but have been definitely proved to be erroneous and to have arisen from the imperfect state of knowledge as to the ubiquity of Bacteria and the power to resist the destructive effect of boiling water possessed by the spores of *Bacterium subtilis*—the hay bacillus.

Conclusion.—An endless field of investigation is open in connection with the Bacteria. It seems certain that in the near future we shall be able to control the disease producing forms, whilst the suggestion presses itself that it may be possible to cultivate and intensify the activities of those which act as scavengers and even to lead some by appropriate methods to the acquirement of new powers, or to the development of activities at present scarcely recognised. There is no reason, from the point of view of the biologist, why these lowest plants should not be cultivated and specialised as breeds and varieties for the service of mankind, as the peach and the strawberry, the wheat and the cabbage have been.

BALANCE v ANALYSIS

BALATA. A substance resembling caoutchouc and gutta percha, obtained from the dried milky juice of the Bully tree (*Sapota Muellert*) (Sperling, Z [2] 5, 480)

BALSAM. This term was originally confined to a single substance called Balm of Gilead or Balsam of Judea, but is now employed generally to denote any liquid resin with aromatic odour. They are composed of solid resins mixed with essential oils. Balsams of Peru, Tolu, Liquidambar, and Storax, contain cinna-mic acid, Copaiba balsam, Mecca balsam, and turpentine, do not

PARABANIC ACID v. PARABANIC ACID.

BAPHIIN ($C_{11}H_{10}O_2$). Extracted by ether from barwood (*Baphia nitida*). Plates or needles (from ether), insol water, v sl sol benzene. Its alcoholic solution is turned red by air. Boiling aqueous KOH converts it into baphic acid $C_{10}H_8O_2$ (?), baphnium (C_8H_6O), and baphnition, $C_{10}H_8O_2$. The latter gives a tri bromo derivative $C_8H_3Br_3O_2$.

BAPTISIA TINCTORIA. The root of this plant contains a crystalline alkaloid (Greene, Ph [3] 10, 584)

BARBALOIN v ALORN, p 140

BARBATIC ACID $C_{10}H_8O_4$, [186°] Occurs, together with usnic acid, in a lichen, *Usnea barbata* (Stenhouse & Groves, C J 87, 405, A 203, 302). Needles or plates (from benzene). Decomposed by boiling milk of lime into CO_2 and (β) orcin

BARBITURIC ACID

Malonyl urea. Formed by heating malonic acid with urea and $POCl_3$ at 100° (Griffaux, C R 88, 85, A Ch [5] 17, 276), or by reducing di bromo barbituric acid with sodium amalgam or HI. Prepared by heating alloxantin (1 pt) with H_2SO_4 (3 or 4 pts) at 100° as long as SO_2 comes off. The product is poured into water.

Properties.—Trimetric prisms (containing 2aq) from water. Sl. sol cold, v sol hot, water.

Reactions.—1 Boiling aqueous potash forms malonic acid and urea (CO_2 and NH_3) — 2 HNO_3 forms nitro barbituric (dilituric) acid — 3 KNO_3 forms nitroso barbituric (violuric) acid — 4 Br forms di bromo barbituric acid — 5 Heated with glycerin it forms dibarbituric acid, urea, and ammonium malobisulphate — 6 Cyanogen forms a compound $C_4H_4N_4O_3(CN)_2$ aq, whence potash forms 'cyanuromalic acid'

Salts.— NH_4HA needles, v sl sol cold water — Na_2A 2aq — KHA — BaH_2A 2aq — PbA — CuH_2A , 3aq — $AgHA$ — Ag_2A

Acetyl derivative $C_4H_4AN_2O_3$. A by product in the preparation of barbituric acid from urea, malonic acid, and $POCl_3$. Powder, sol hot water

Di methyl derivatives.—I **Malonyl-dimethyl urea** $CO \begin{matrix} < NMe CO \\ < NMe CO \end{matrix} > CH_2$, [123°].

From malonic acid, di methyl urea and PCl_5 , or from di methyl urea and cyano-acetyl chloride, $CNCH_2COCl$ (Mulder, B 12, 466). Flat needles, v sol water. Forms a di bromo-derivative [175°-180°]

II Di-methyl malonyl urea

$CO \begin{matrix} < NH CO \\ < NH CO \end{matrix} > CMe_2$, [265°] From silver barbiturate and MeI (Conrad & Guthzeit, B 14, 1643) or from di methyl malonic acid, urea, and $POCl_3$ (Thorne, C J 89, 545). Plates (from water). V sl sol. cold water. Boiling KOH forms di methyl malonic acid

Salt — Ag_2A 3aq

Ethyl derivative $CO \begin{matrix} < NH CO \\ < NH CO \end{matrix} > CH_2Et$.

[190°] From ethyl malonic acid, $POCl_3$, and urea. Gives a bromo derivative

Di ethyl derivative $CO \begin{matrix} < NH CO \\ < NH CO \end{matrix} > CMe_2$, [182°]. From silver barbiturate and EtI

Benzyl derivative

benzyl malonic acid, POCl_3 , and urea

Additional References—Finck, *A* 132, 304, Baeyer, *A* 130, 136, Conrad & Guthzeit, *B* 14, 1843, 15, 2844

Di-barbituric acid $\text{C}_6\text{H}_8\text{N}_4\text{O}_6$. The ammonium salt is formed by heating barbituric acid with glycerin at 150° . The acid is an insoluble powder, it gives a di bromo derivative

Salts $-\text{NH}_4\text{HA}'' - \text{Na}_2\text{A}'' 2\text{aq} - \text{KHA}'' \text{ xaq}$ (Baeyer, *A* 130, 145)

BARIUM Ba At w 136.8 Mol. w un known, as V D not determined. Very little known of properties, doubtful if approximately pure Ba has yet been obtained. SG abt 3.5-4 (sinks in H_2SO_4). SVS abt 36.5. Chief lines in spectrum are 5850, 5538, 4934, 4553, 8140 (Huggins, *T* 154, 139)

Occurrence—Not as metal, chiefly as sulphate (*heavy spar*), and carbonate (*witherte*), also as silicate in combination with silicates of Sr, K, or Al, and as oxide in combination with oxide of Mn. Ba compounds occur in many mineral waters, in the ashes of certain plants (Eckart, *A* 100, 294), and in small quantities in sea water (Dieulauf, *A Ch* [5] 15, 540)

Formation—An amalgam of Ba and Hg is prepared in several ways—(a) by electrolysis BaCl_2 mixed with a little very dilute HClAq , using an amalgamated Pt wire as negative electrode (Bunsen, *A* 92, 248), (b) by electrolysis moist BaO using Hg and Pt as electrodes (Davy, *T* 1808 303), (c) by bringing hot BaO or BaCl_2 into contact with vapour of K, and treating the product with Hg, or by heating BaO with Na and treating with Hg (Kern, *C N* 31, 244), (d) by the action of Na amalgam on conc waim BaCl_2Aq (Crookes, *C N* 6, 194). By heating Ba amalgam in an atmosphere of H, or of hydrocarbon vapours, metallic Ba was supposed to be obtained, but Donath (*B* 12, 745) asserts that it is impossible to remove all the Hg even at a white heat, and that the residue contains as much as 62 to 77 p c Hg.

Preparation—By electrolysis of fused BaCl_2 mixed with NH_4Cl in a porcelain crucible in an atmosphere of H, the positive electrode consisting of a cylinder of coke, the negative of an iron wire (Matthiessen, *C J* 8, 294)

Properties and Reactions—It is very doubtful whether the properties enumerated by different chemists as characteristic of Ba were determined by experiments made on even approximately pure metal. Davy described Ba as silver white, Bunsen and Matthiessen as a golden yellow, slightly lustrous, somewhat malleable, metal, which melts at a red heat, but cannot be distilled. It is very easily oxidised, decomposes cold H_2O readily, and burns in the oxyhydrogen flame. As no gaseous compounds of Ba have as yet been obtained, and as the spec heat of the metal has not been determined, the value to be given to its atomic weight, the combining weight or equivalent having been determined, is arrived at chiefly by considering the analogies between the compounds of Ba and those of other allied elements, chiefly Ca, Sr, Mg, Zn, and Cd. These analogies lead to the formulae BaX and BaY_2 for the compounds of

Ba, where $\text{X} = \text{O, S, SO}_3, \text{CO}_3, \&c.$ and $\text{Y} = \text{Cl, NO}_3, \text{ClO}_3, \&c.$, these compounds belong to one series. The valency of the atom of Ba in gaseous molecules is unknown. That the atomic weight of Ba is represented by a number the most probable value of which is about 136.8, provided the composition of the Ba compounds is expressed by the general formula BaX_n , where $\text{X} =$ a monovalent atom or group of atoms, was established chiefly by analyses of barium chloride conducted by Mangnac (*A* 68, 215, 106, 165) and Dumas (*A Ch* [3] 55, 187). Ba reacts as a strongly positive metal, the salts obtained by replacing H of acids by Ba are stable and well marked, BaO and BaO_2H_2 , BaS and BaS_2H_2 , exhibit no acidic characters, BaO_2H_2 is distinctly alkaline, its heat of neutralisation is the same as that of soda and potash (*Th* 1, 332) $(\text{BaO} \text{ H Aq} \text{ H SO}^+\text{Aq}) = 31,150$, $(\text{BaO}^+\text{H}^+\text{Aq}, 2\text{HClAq}) = 27,640$. Ba combines with O and the halogens with production of much heat and formation of very stable compounds— $[\text{Ba}_2\text{O}] = \text{abt } 124,000$, $[\text{Ba}_2\text{Cl}] = 194,700$, $[\text{Ba}_2\text{Br}] = 170,000$ (*Th* 3, 266), these numbers are approximate only, they were determined indirectly, except that for BaO , but the Ba used was not free from Hg. Barium is very closely related to Ca and Sr, and less closely to Mg (v art ALKALINE EARTHS, METALS OF THE).

Baryta was obtained by Scheele in 1774 from heavy spar, Davy in 1808 decomposed baryta by electrolysis, the metal was obtained approximately pure in 1855 by Bunsen and Matthiessen.

Combinations—Very few compounds of Ba have been formed directly from the metal. It forms alloys with a few metals, that with mercury (v *supra*, *Formation*) is a silver white body which rapidly decomposes water and cannot be separated into Ba and Hg by heat alone. Beketoff (*A* 110, 375) obtained an alloy with aluminium, as a greyish solid with a tinge of yellow, by heating Al with BaO_2H_2 and a little BaCl_2 , it decomposed H_2O rapidly, but the water did not acquire an alkaline reaction. Caron described alloys of Ba with lead, bismuth, antimony, &c., obtained by the action of alloys of these metals with Na on molten BaCl_2 (*A* 111, 114).

Detection—Many salts of Ba are soluble in water, some are insoluble, aqueous solutions of Ba salts are ppd by conc HClAq or conc HNO_3Aq . Insoluble Ba salts are decomposed by fusion with alkaline carbonates, giving BaCO_3 , which dissolves in dilute acids. Fusible salts of Ba impart a pale yellowish green colour to the non-luminous flame, the colour appears blue green through a green glass. The emission spectrum of Ba is characteristic, it contains very many lines in the green, about $\frac{1}{1000}$ mgm Ba may be detected by the spectroscope. Dilute sulphuric acid, or a dilute aqueous solution of sulphates, ppt white BaSO_4 , insoluble in alkalis and dilute acids, 1 part Ba_2NO_3 in 100,000 parts of water gives an immediate pp, one part in 400,000 gives a cloudiness on standing. By this reaction Ba salts are distinguished from Ca salts, and to some extent from salts of Sr.

Estimation—1. Ba is usually determined as BaSO_4 , which is ppd from fairly conc solutions, containing a little HCl or HNO_3 , by dilute $\text{H}_2\text{SO}_4\text{Aq}$, the pp is collected, well washed,

and strongly heated, before weighing. If salts of Ca are present, CaSO_4 may be removed from the pp by long washing with very dilute HClAq , or by digesting with $\text{Na}_2\text{S}_2\text{O}_4\text{Aq}$ (Diehl, *J pr* 79, 80) which dissolves CaSO_4 , but not BaSO_4 , PbSO_4 , if present, may be removed from the pp by washing with solution of potash, or of ammonium tartrate.—2 In presence of salts of Ca and Sr, Ba is best estimated as BaSiF_6 , which is ppd by freshly prepared $\text{H}_2\text{SiF}_6\text{Aq}$, followed by alcohol, after standing 12 hours, the pp is collected, washed with a mixture of equal volumes of alcohol and water dried at 100° , and weighed (*v* also Rose, *P* 95, 286, 299, 427).

Barium, alloys of, *v* BARIUM, Combinations

Barium, antimonates of, *v* ANTIMONATES, under ANTIMONY, ACIDS OF

Barium, bromide of BaBr_2 Mol w unknown, as compound has not been gasified [abt 812°] (Carnelley, *C J* 33, 280) SG 4.23 (Schiff, *A* 108, 21) HF [Ba, Br]=169,960, [$\text{Ba}, \text{Br}, \text{Aq}$]=174,940 (*Th* 3, 266)

Formation—1 By acting on BaO_2H_2 or BaS , with HBrAq —2 By adding BaS to an aqueous solution of Br—3 Along with BaBrO_3 , by the action of Br on $\text{BaO}_2\text{H}_2\text{Aq}$

Preparation—Aqueous HBr is neutralised by pure BaCO_3 , the liquid is boiled down and allowed to crystallise, and the crystals of $\text{BaBr}_2 \cdot 2\text{H}_2\text{O}$ are heated in a stream of dry air to 100°

Properties and Reactions—Crystallises with $2\text{H}_2\text{O}$ in white trimetric plates (Rammelsberg, *P* 55, 237), according to Hauser (*J pr* 80, 230) and Werther (*ibid* 91, 167) the crystals are monoclinic, the hydrated salt is perhaps dimorphous HF [$\text{BaBr}_2 \cdot 2\text{H}_2\text{O}$]=9,110 [$\text{Ba}, \text{Br}_2 \cdot 2\text{H}_2\text{O}$]=179,070 (*Th* 3, 266) Heated to 75° $\text{BaBr}_2 \cdot \text{H}_2\text{O}$ remains, and at 100° BaBr_2 is obtained The hydrate $\text{BaBr}_2 \cdot 2\text{H}_2\text{O}$ is soluble in water S (0°) 98, (20°) 104, (40°) 114, (60°) 123, (80°) 135, (100°) 149 It is also easily soluble in alcohol SG 3.69 (Schiff, *A* 108, 21) BaBr_2 is completely decomposed by heating to redness in dry O (*Schulze, J pr* [2] 21, 407) When conc aqueous solutions of BaBr_2 and BaO are mixed so that the salts are present in the ratio $\text{BaBr}_2, \text{BaO}$, crystals of $\text{BaBr}_2 \cdot \text{BaO} \cdot 5\text{H}_2\text{O}$ (= $\text{BaBrOH} \cdot 2\text{H}_2\text{O}$) separate out (Bechmann, *J pr* [2] 26, 388 and 474)

Barium bromide, hydrated, *v* BARIUM, BROMIDE OF, Preparation

Barium, chloride of BaCl_2 Mol w unknown, as compound has not been gasified [abt 860° , Carnelley] SG 3.75–3.89 (Schröder, *P* 107, 118) SH (16° – 47°) 0902 (Kopp, *T* 155, 71), (14° – 98°) 0896 (Regnault, *A Ch* [3] 1, 129) S (5°) 32.2, (30°) 38.2, (50°) 43.6, (80°) 52.4, (100°) 58.8 (Mulder, *v* Michaelis' *Lehrbuch der Anorgan. Chem* 3, 660) S (alcohol 99 p.c. 14°) 01, (alcohol at B.P.) 06 (Fresenius, *A* 59, 127) HF [Ba, Cl]=194,740, [$\text{Ba}, \text{Cl}_2, \text{Aq}$]=198,810 (Thomson) The following data apply to the hydrate $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$ SG 3.052 (Schiff, *A* 108, 21) SH (18° – 46°)

171 (Kopp, *T* 155, 71) S (15°) 43.5, (105°) 75 HF [$\text{Ba}, \text{Cl}_2 \cdot 2\text{H}_2\text{O}$]=201,740, [$\text{Ba}, \text{Cl}_2 \cdot 2\text{H}_2\text{O}$]=7,000 (*Th* 3, 266) CE (oub abt 15° – 200°) 0000548 (Playfair *a* Joule, *C J* 1, 121)

Formation—1 By the action of Cl on hot BaO (Weber, *P* 112, 619)—2 By passing HCl over hot BaO , light is evolved as well as heat or by adding conc HClAq to BaO , boiling down, and drying at 100° —3 By dissolving BaS in conc HClAq , boiling down, and drying at 100°

Preparation—1 Powdered *witherrite* (BaCO_3) is added little by little to HClAq , the solution is digested in absence of air with more BaCO_3 (to remove iron, &c), and is then poured off, evaporated to dryness, and the residue heated to 100° for some time—2 Two parts of finely powdered heavy spar (BaSO_4) are heated in a crucible to redness with 1 part dry CaCl_2 and 2 parts iron filings, the fused mass is digested for a short time with 6–8 parts boiling water (by long digestion BaSO_4 and CaCl_2 are reformed), the liquid is filtered from FeS , CaS , and undecomposed BaSO_4 , made slightly acid by HClAq , and evaporated to dryness at 100° —3 The solution of MnCl_2 which is obtained in making Cl from MnO_2 is neutralised by BaCO_3 or CaCO_3 , and evaporated to dryness, the residue is heated with heavy spar and coal, the mass is lixiviated (MnS , FeS , and some BaSO_4 remain), the liquid is treated with a little MnCl_2Aq to decompose any BaS present, HClAq is added, and the whole is evaporated to dryness (Kuhlmann, *C R* 47, 403, 464, 674)

Properties—White salt, easily soluble in water, [BaCl_2, Aq]=2,070 (*Th* 3, 266), slightly soluble in alcohol (*v supra*), solution has a bitter taste and is poisonous Melts at red heat and cools to an opaque mass

Reactions—1 Heated in steam, HCl is evolved, and residue has an alkaline reaction—2 Partly oxidised by fusion with *potassium chlorate*, but unchanged by heating in dry oxygen (*Schulze, J pr* [2] 21, 407)—3 Completely decomposed by fusion with *silicates*

Combinations—1 Conc solution of BaCl_2 , mixed with conc BaOaq pps thin transparent plates of $\text{BaCl}_2 \cdot \text{BaO} \cdot 5\text{H}_2\text{O}$ (= $\text{BaClOH} \cdot 2\text{H}_2\text{O}$) (Bechmann, *J pr* [2] 26, 388, 474)—2 Combines with water with production of heat, [$\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$]=7,000, to form the hydrate $\text{BaCl}_2 \cdot 2\text{H}_2\text{O}$ This hydrate crystallises in white flat trimetric plates, which are not efflorescent, they lose $2\text{H}_2\text{O}$ at 100° , but take it up again in moist air A conc solution is decomposed to Ba_2NO_3 and NaCl by heating with NaNO_3

Barium chloride, hydrated, *v* BARIUM, CHLORIDE OF, Combinations, No 2

Barium, cyanide of Ba(CN)_2 Obtained by action of HCNAq on BaO_2H_2 (*v* CYANIDES)

Barium, fluochloride of BaFCl (*v* BARIUM, FLUORIDE OF)

Barium, fluoride of BaF_2 Mol w unknown, as compound has not been gasified [abt 908°] (Carnelley, *C J* 33, 280) SG 4.58 (Böcker)

Preparation—1 By ppg $\text{Ba}_2\text{NO}_3\text{Aq}$ by NaFAq —2 By the action of HFAq on BaOaq , or on freshly ppd BaCO_3 , and evaporating The former action is attended with the production of much heat, Guntz (*A Ch* [6] 8, 5) gives the values [$\text{BaOaq}, 2\text{HFAq}$]=84,800, and

[BaO·H⁺, 2HF] = 71,400 (solid BaF₂ is produced by action of gaseous HF on solid BaO₂H₂.)

Properties and Reactions—White, finely granular, crystals, scarcely soluble in water, but easily in HNO₃Aq, HClAq, and HFAq. Not decomposed by heat alone.

Combinations—1 With BaCl₂ to form BaF₂·BaCl₂ (= BaFCl), obtained by adding NH₄Aq to a solution of BaF₂ in HClAq, also by fusing 1 part NaF with 6–8 parts BaCl₂, and digesting with water, also by adding KFAq to BaCl₂Aq and evaporating. Forms white granular crystals, more soluble in water than BaF₂, partly decomposed, with loss of BaCl₂, by long-continued washing with water—2 With BF₃ to form BaF₂·2BF₃·2H₂O (= Ba(BF₃)₂·2H₂O), obtained by acting on BaCO₃ with HBF₃Aq, and evaporating, boric acid separates, and afterwards the double salt (*v* BOROFLOURIDES under Boron, FLUORIDE or)—3 With SiF₄ to form BaF₂·SiF₄ (= BaSiF₆), obtained by adding H₂SiF₆Aq to a solution of a Ba salt. White solid, very slightly soluble in cold water—S (17°) 03—and only slightly soluble in HClAq. S G 428. Leaves BaF₂, when heated, heated with NH₄Cl gives residue of BaCl₂ (Stolba, *J pr* 96, 22) (*v* AMICOFLOURIDES, under SILICON, FLUORIDE or).

Barium, hydroxide of BaO·H₂ (Caustic baryta). Mol w unknown, as compound has not been gasified. S G 4495 (Filhol, *A Ch* [3] 21, 415). S (0°) 15, (5°) 175, (10°) 222, (15°) 289, (20°) 348, (25°) 419, (30°) 50, (35°) 617, (40°) 736, (45°) 912, (50°) 1175, (55°) 1471, (60°) 1876, (65°) 2467, (70°) 319, (75°) 5685, (80°) 9077 (Rosensthiel, a Ruhlmann, *J* 1870 814). H F [Ba, O, H⁺O] = 146,500, value only approximate, [BaO, H⁺O] = 22,260 (*Th* 3, 266).

Formation—1 By heating heavy spar with carbon, dissolving BaS formed in hot water, filtering, adding CuO or ZnO to decompose the BaS, filtering, evaporating to dryness, and heating to redness (Müller, *J pr* 82, 52, Stahlschmidt, *D P J* 182, 30, Nickles, *W J* 1869 274)—2 By heating Fe with Ba 2NO₃ to redness, dissolving in water, filtering, evaporating, and heating the residue—3 By the action of steam on BaCO₃ (Lenoir, *W J* 1867 256).

Preparation—1 Water is added little by little to BaO (*q v*), the product is heated to dull redness in a silver dish—2 Aqueous solution of pure NaOH, S G about 11 to 115, the quantity of NaOH in which is accurately known, is heated to boiling, a quantity of powdered Ba 2NO₃ is added equivalent to the NaOH used, the liquid is boiled for a little, if solution is not complete water is added, the hot liquid is filtered quickly and allowed to cool in a closed vessel when crystals of BaO·H₂·8H₂O are deposited, these crystals are separated, recrystallised from boiling water, and heated gradually to redness in a silver dish (Mohr, *Ar Ph* [2] 68, 88).

Properties and Reactions—A white powder, dissolving in water (*v supra*) to form an alkaline, caustic, liquid, melts at a full red heat and crystallises on cooling, not decomposed by heat alone, but by heating in a stream of air BaO and H₂O are produced. Aqueous solution is markedly alkaline, and neutralises acids with

production of same quantity of heat as KOHAq and NaOHAq (*Th* 1, 832). Does not absorb Cl, except in presence of H₂O, action is then probably 6BaO·Aq + 6Cl₂ = 5BaCl₂·Aq + Ba(ClO₃)₂·Aq (Weisberg, *B* 12, 846). Is not acted on by CO₂ (Scheibler, *B* 19, 1973).

Combinations—With water with production of heat [BaO·H⁺·8H⁺O] = 27,470 (*Th* 3, 266) to form crystals of BaO·H₂·8H₂O (Beckmann, *J pr* [2] 26, 888, and 474, Filhol found 7H₂O, Noad and others 9H₂O) (For preparation of these crystals *v supra*). These crystals lose 7H₂O over H₂SO₄ *in vacuo*, or by heating to 75°, and the eighth H₂O at a red heat, they dissolve in about 3 parts boiling water, and 20 parts water at 15°. The solution is attended with disappearance of heat [BaO·H⁺·8H⁺O·Aq] = -15,207 (*Th* 3, 263). Crystals of BaO·H₂·H₂O melt at 83°–85° (Veley, *C J* 49, 371). According to Beckmann (*J pr* [2] 26, 888 and 474) pure BaO is obtained by heating BaO₂·H₂·8H₂O in a stream of O.

Barium, iodide of BaI₂. Mol w unknown, as compound has not been gasified. S G 492 (Filhol, *A Ch* [3] 21, 415). H F [Ba, I⁺·Aq] = 144,520 (*Th* 3, 266).

Formation and Preparation—Similar to methods for BaBr₂ (*q v*) also by action of gaseous HI on BaO.

Properties and Reactions—A white, non deliquescent, solid, easily soluble in water or alcohol, not decomposed by heat in absence of air, in presence of air BaO is formed and I evolved, wholly decomposed by heating in O (Schulze, *J pr* [2] 21, 407), aqueous solution absorbs CO₂ from air.

Combinations—1 With water to form BaI₂·7H₂O (Croft, *J pr* 68, 402, Thomsen, *B* 10, 1343, Werther, *J pr* 91, 331, says the crystals are BaI₂·2H₂O). This hydrate forms needle shaped crystals which deliquesce, with partial separation of I, in moist air, and melt on heating, heated in absence of air BaI₂ remains, one H₂O is lost at 100°, 5H₂O at 125° and the seventh H₂O at 150°. Thomsen gives these data [Ba, I⁺·7H⁺O] = 151,370, [BaI⁺·7H⁺O·Aq] = -6,850—2 With baryta to form BaO·BaI₂·5H₂O (= BaIOH 2H₂O) (Beckmann, *J pr* [2] 26, 888 and 474), this salt crystallises from a mixture of conc solutions of its constituents, in the ratio BaO·BaI₂.

Barium iodide, hydrated, *v* BARIUM, IODIDE or, **Combinations**, No 1.

Barium, oxides of Ba forms two oxides, BaO and BaO₂, the former is produced by the action of dry air, or O, on Ba, BaO heated to about 450° combines with O and forms BaO₂, which is again reduced to BaO at a higher temperature, or by reducing the pressure at 450°. Dry BaO₂ is stable, but the presence of water brings about slow decomposition to BaO·H₂ + O, Berthelot (*A Ch* [5] 14, 438, comp *C R* 85, 880) gives these data [BaO, O] = -6,050, [BaO₂·H⁺O] = 2,760 (giving BaO·H₂ + O). BaO is a strongly basic oxide, BaO₂ evolves O (or H₂O₂) and forms the same salts as BaO when acted on by acids.

I BARIUM MONOXIDE (*Baryta*) BaO. Mol w unknown as compound has not been gasified. S G 465 (Playfair a Joule, *C S Mem* 8, 84), S G crystals 5722 (Brügelmann, *W* 2, 466;

4, 277), 5 456 (Filhol, *A Ch* [8] 21, 415) H.F. [BaO] = 124, 240, [BaO.Aq] = 158, 760 (*Th* 8, 266, values approximate only, as Ba used was not pure)

Scheele distinguished baryta from lime in 1774, Gahn recognised the presence of this earth in heavy spar, Bergmann called the earth *terra ponderosa*, Kirwan gave the name *baryta*, Davy, in 1808, proved it to be a metallic oxide

Formation—1 By the action of dry air on Ba—2 By strongly heating BaCO₃, best with $\frac{1}{10}$ – $\frac{1}{15}$ of carbon whereby CO is formed which does not again combine with the BaO—3 By strongly heating Ba 2NO₃, Rammelsberg (*B* 7, 512) says that an oxide with the composition Ba₂O₃ (= 2BaO BaO₂) is thus produced, Bruggemann (*W* 2, 466, 4, 277) obtained hexagonal crystals of BaO by this method—3 By strongly heating BaCl₂, or BaSO₄, to white heat, in a current of steam

Preparation—1 By strongly heating Ba(IO₃)₂ in a porcelain crucible until all I is removed—2 By heating dry Ba 2NO₃ in a capacious porcelain vessel (best a retort), gradually raising the temperature when the salt melts, again raising the temperature to full redness when the residue in the vessel re-solidifies, the heating must be continued until all nitrate is decomposed, but no longer, as on long continued heating CO₂ is absorbed, the portions in contact with the porcelain take up a little SiO₂ and Al₂O₃

Properties—A grey white powder, very poisonous, melts at white heat, takes up H₂O and CO₂ from the air, dissolves in water to form a caustic alkaline solution (v BARIUM HYDROXIDE OF)

Reactions—1 Reduced by heating with potassium—2 Decomposed to Ba + O by electrolysis—3 Heated in chlorine, BaCl₂ and O are formed—4 Heated with sulphur, BaS and BaSO₄ are produced—5 Heated in carbon disulphide vapour, the products are BaS along with BaCO₃—6 Heated in phosphorus vapour, in presence of H, barium phosphide BaP₂ (*q v*) and Ba₃P₂O₆ are formed (Dumas, *A Ch* [2] 32, 364)—7 Heated with arsenic vapour barium arsenite (*q v* under ARSENITES) is said to be produced

Combinations—1 Combines with water to form BaO.H₂O (*q v*) with production of much heat, and increase of volume [BaO, H₂O] = 22, 260, [BaO, 9H₂O] = 49, 730 (*Th* 3, 266)—2 With carbonic anhydride, to form BaCO₃, (dry BaO has no action on CO₂, Scheibler, *B* 19, 1973), with sulphuric anhydride to form BaSO₄, [BaO, CO₂] = 62, 220, [BaO, SO₃] = 110, 590 (*Th* 3, 266)—3 Heated in air or oxygen to about 450°, forms BaO₂ (*q v*)—4 With methylic or ethylic alcohol, forms BaO 2CH₃O or BaO 2C₂H₅O

II BARIUM DIOXIDE BaO₂ Mol w unknown SG 4 96 (Playfair a Joule, *C S Mem.* 3, 84) Discovered by Thenard (*A Ch* 8, 308)

Formation—1 BaO, or a mixture of BaO₂H₂ and CaO or MgO, is heated in nearly dry air, or O, to dull redness in a glass or porcelain tube

Preparation—A mixture of 4 parts finely powdered KClO₃ and 1 part BaO is thrown little by little into a porcelain crucible heated

just to redness, the KCl formed is dissolved out by cold water (Liebig a. Wöhler, *P* 26, 172), the impure hydrated BaO, containing BaO (Berthelot, *A Ch* [5] 6, 207, says the residue is nearly BaO.BaO₂) is rubbed in a mortar with water, and added little by little to very dilute HClAq, but not in quantity sufficient to neutralise the acid, the solution (which contains H₂O) is filtered, made slightly alkaline by addition of dilute BaOAq, whereby alumina and iron oxide are ppd, the liquid is again filtered through linen, and an excess of BaOAq is added, lustrous plates of BaO.8H₂O are ppd. (the filtrate must contain H₂O₂, proved by the production of a blue colour in ether when shaken with ether after acidifying and adding dilute K₂Cr₂O₇Aq, the pp is washed with cold water, pressed between filter paper, and placed over H₂SO₄ until all water is removed and BaO remains (Berthelot, *A Ch* [2] 6, 207) Or, H₂O₂Aq is added to BaOAq, the pp of BaO.8H₂O is washed with cold water, pressed between filter paper, and heated in dry air free from CO₂ to 100°–120° (Schöne, *B* 6, 1172)—2 Pure BaO is heated to low redness in a stream of O (Brodie, *T* 1850 775)

Properties—A white powder, resembling MgO, insoluble in, and combines with, water, melts at full red heat with evolution of O

Reactions—1 Decomposed by heat to BaO and O, at slightly reduced pressures (750 to 730 mm) decomposition begins at about 450°, at ordinary pressure at a higher temperature than this, if the BaO produced is allowed to cool to 450° in presence of O under reduced pressure BaO₂ is re formed (Boussingault, *A Ch* [5] 19, 464)—2 Decomposed very slowly by cold, quickly by hot, water, forming BaO.H₂O + O [BaO, H₂O] = 2,760 (giving BaO.H₂ + O, Berthelot, *A Ch* [5] 14, 433)—3 Conc sulphuric acid forms BaSO₄, and evolves O at temperatures above 60°–70°, but O mixed with ozone at lower temperatures (Houzeau, *C R* 40, 949)—4 Heated in dry carbonic anhydride, BaCO₃, and O are produced—5 Heated with carbon monoxide, or sulphurous anhydride, light and heat are produced, and BaCO₃, or BaSO₄, is formed (Wöhler, *A* 78, 125)—6 Acts as a powerful oxidiser towards carbon, phosphorus, &c, &c. (comp Slater, *J pr* 65, 253, and Brodie, *T* 1862 837)—7 With dilute acids forms salts of Ba, and H₂O₂ or O

Combinations—1 With water, combines to form BaO.8H₂O (produced also by action of BaOAq on H₂O₂Aq, v Preparation), prismatic dimetric crystals, which lose 8H₂O *in vacuo*, or by heating in absence of CO₂ to 100°–120° Berthelot gives the formula BaO₂.10H₂O to the hydrate (*A Ch* [5] 21, 157), he also describes another hydrate with 7H₂O (*l c* [5] 6, 207), he gives the data [BaO₂, 10H₂O] = 9,100 (*l c* [5] 14, 433)—2. With hydrogen peroxide forms very unstable, monoclinic, crystals, BaO₂.H₂O₂, produced by adding excess of H₂O₂Aq to BaOAq, or by adding NH₄Aq to the solution of a Ba salt mixed with H₂O₂ (Schöne, *A* 192, 257)

Barium, oxysulphides of, v BARIUM, SULPHIDES OF, MONOSULPHIDE, Reactions.

Barium, phosphide of. Described as a grey mass, having the composition BaP₂, produced by passing H charged with P vapour

over hot BaO , decomposed by H_2O , giving PH_3 and BaHPO_3 (Dumas, *A Ch.* 32, 864)

Barium, salts of Salts produced by replacing H of acids by Ba, they form one series belonging to the form BaX_2 where $\text{X} = \text{Cl}, \&c$, $\text{O}, \text{SO}_4, \text{CO}_3$, $\frac{2}{2}, \frac{2}{2}, \frac{2}{2}$, &c. As none of these salts has been gasified we do not know the molecular weight of any of them, the spec heat of Ba is undetermined, the formulæ are, therefore, based on analogies between these salts and those of similar metals which form gasifiable compounds, especially Zn and Cd, and also on analogies between the salts of Ba and Ca, the atomic weight of the latter metal having been settled by the spec heat method. Barium forms salts with most, if not all, the acids, very few basic salts are known, and those which have been prepared are generally salts of the weaker acids, e.g. boric, tungstic, molybdic, &c. The haloid salts are very stable, the carbonate, nitrate, iodate, chlorate, &c., are decomposed by heat, Ba salts of the oxyacids are reduced by heating with C, H, or CS_2 . Most Ba salts are isomorphous with the corresponding salts of Ca and Sr, many with the corresponding salts of Pb. A few Ba salts are soluble in water, the greater number are slightly soluble only, or insoluble (v. BORATES, CARBONATES, PHOSPHATES, SULPHATES, &c., &c.)

Barium, selenide of BaSe Mol w unknown. White solid, changing in air, obtained by heating BaSeO_3 in H to dull redness (Fabre, *C R* 102, 1469)

Barium, selenocyanide of $\text{BaSe}(\text{CN})_2$ (?) Prepared by Crookes (*J pr* 53, 161). Data very meagre

Barium, silicofluoride of BaSiF_6 , v. BARIUM FLUORIDE OF, *Combinations*, No 3

Barium, sulphides and hydrosulphide (or sulphhydrate) of Three sulphides of Ba are known, a fourth probably exists in solution. The monosulphide BaS is obtained by heating BaO in a stream of H_2S , by heating $\text{BaS} + 2\text{S}$ to 360° , the trisulphide Ba_3S_3 is formed, by boiling BaSAq with $\frac{3}{2}\text{S}$ and crystallising, BaS may be prepared, and if BaSAq is boiled with considerable excess of S the solution reacts as if it contained a pentasulphide Ba_5S_5 . Only one hydrosulphide or sulphhydrate, $\text{Ba}_2\text{S}_2\text{H}_2$, is known. The sulphides and the hydrosulphide are fairly stable compounds, they are soluble in, and partly decomposed by, water, they resemble the sulphides of the alkali metals in their reactions, e.g. $\text{Ba}_2\text{S}_2\text{H}_2\text{Aq}$ reacts with As_2S_3 to form barium thioarsenite $\text{Ba}_2\text{As}_2\text{S}_3$ (*q v*) Sabatier (*A Ch.*) [5] 22, 1 gives the thermal data — $[\text{BaO}, \text{H}_2\text{S}] = 22,100$, $[\text{BaS}, \text{O}] = 236,500$, $[\text{BaS}, \text{Aq}] = 7,000$

I MONOSULPHIDE BaS

Formation — 1 BaO is heated in a stream of H_2S — 2 BaSO_4 is reduced by heating in H or coal gas

Preparation — 1 A stream of CO_2 is passed through CS_2 and then over red hot BaCO_3 , CS_2 must be in excess as BaS is decomposed by CO_2 , the product is freed from higher sulphides by heating in H (Schöne, *P* 112, 193) — 2 $\text{BaO}, \text{H}_2\text{S}, \text{H}_2\text{O}$ (prepared by heating $\text{BaO}, \text{H}_2\text{S}, \text{H}_2\text{O}$ to 80° in H) is acted on by dry H_2S , the products are BaS and H_2O (Veley, *C J.*

49, 869) — 3 Crude BaS (which is the starting-point in the preparation of many Ba compounds) is prepared by mixing 8 parts heavy spar with 2 parts wood charcoal and 1 part rye meal, all in fine powder, making into a stiff paste with water, rolling into small cylinders, drying, packing in a crucible in alternate layers with charcoal, and gradually heating to full redness (Liebig, *A* 35, 115, v also Gruneberg, *J pr* 60, 168, Buchholz, *Ar Ph* 36, 275, Kuczinsky, *D P J* 135, 455)

Properties — A white amorphous solid, soluble in water, exposed to sunlight and then placed in the dark, it gives off light, oxidised in moist air

Reactions — 1 In moist air decomposes to BaCO_3 and BaSO_4 , with evolution of H_2S — 2 Heated in air is slowly oxidised — 3 Heated in steam, BaSO_4 is formed and H evolved (Lauth, *C C* 1863 880) — 4 Chlorine, bromine, and iodine, decompose BaS , forming BaX_2 ($\text{X} = \text{Cl}, \text{Br}$, or I) and S — 5 Dilute acids form Ba salts and evolve H_2S — 6 Water brings about partial decomposition into BaSH , BaO, H_2 , polysulphides and oxysulphides of Ba (v Veley, *C J* 49, 369) The action of water on crude BaS has been examined in detail by H. Rose (*P* 55, 415). If hot water is added in quantity just sufficient for solution, the liquid gives a pp of MnS , without evolution of H_2S , on addition of an aqueous solution of a neutral manganous salt, the solution, therefore, contains either BaS or hydroxide and hydrosulphide in the ratio $\text{BaO}, \text{H}, \text{BaS}, \text{H}_2$,

($2\text{BaO}, \text{H}, \text{Aq} + \text{BaS}, \text{H}_2\text{Aq} + 2\text{MnCl}_2\text{Aq} = 2\text{MnS} + 2\text{BaCl}_2\text{Aq} + 2\text{H}_2\text{O}$) If cold water is added to crude BaS in an open vessel, in quantity rather less than sufficient for complete solution, and the liquid is evaporated, BaO, H_2 separates out, then various oxysulphides (v *infra*), then, on evaporating the mother liquor in a retort, crystals of $\text{BaS}, 6\text{H}_2\text{O}$ (v *infra*, *Combinations*) separate, and finally on evaporating to dryness BaS, H_2 remains

The oxysulphides prepared as above described, or by cooling the solution obtained by acting on crude BaS with boiling water in a closed vessel, seem to be three $\text{Ba}_2\text{O}_2\text{S}_2, 58\text{H}_2\text{O} [= 4(\text{BaO}, \text{H}_2, 9\text{H}_2\text{O}) 3(\text{BaS}, 6\text{H}_2\text{O})]$, $\text{Ba}_2\text{OS}, 10\text{H}_2\text{O} [= (\text{BaO}, \text{H}_2, 6\text{H}_2\text{O})(\text{BaS}, \text{H})]$, and $\text{Ba}_2\text{S}_2\text{O}, 28\text{H}_2\text{O} [= (\text{BaO}, \text{H}_2, 9\text{H}_2\text{O}) 3(\text{BaS}, 6\text{H}_2\text{O})]$ The compositions of these bodies are, however, far from settled, the compounds are very unstable and are separated by recrystallisation into BaO, H_2 and BaS, H_2 . If successive quantities of cold water, each less than sufficient for complete solution, are shaken with crude BaS in a closed vessel for some hours, the first solution contains BaS, H_2 along with a little of the higher sulphides of Ba (the solution gives MnS and also H_2S on addition of MnCl_2Aq), the next solution contains either BaS or BaO, H_2 and BaS, H_2 in the ratio $\text{BaO}, \text{H}_2, \text{BaS}, \text{H}_2$ (with MnCl_2 it gives MnS without evolving H_2S), the following solutions contain BaO, H_2 , as they give more and more MnO, H_2 on addition of MnCl_2Aq and less and less MnS

Combinations — With water BaS forms $\text{BaS}, 6\text{H}_2\text{O}$, prepared as above described, also by evaporating *in vacuo* a solution of BaS after addition of a little S (Schöne, *P* 112, 193), or

by evaporating BaS, Aq (*q v*) *in vacuo* $\text{BaS} \cdot 6\text{H}_2\text{O}$ crystallises in white six sided plates, slightly soluble in cold, easily in hot, water, insoluble in alcohol, loses $6\text{H}_2\text{O}$ between 100° and 350° with partial decomposition

II TRISULPHIDE BaS_3 . Prepared by heating 2 parts BaS with 1 part S , and removing excess of S by distilling it off at 360° (Schöne, *P* 112, 193). Forms a yellowish green mass, soluble in hot water, heated to redness in absence of air gives $\text{BaS} + 2\text{S}$. A solution of BaS_3 in much boiling water evaporated *in vacuo* deposits (1) $\text{BaS} \cdot 6\text{H}_2\text{O}$ (*v supra*), then (2) a mixture of $\text{BaS}, \text{H}_2\text{O}$ (*v infra*) and orange dichroic monoclinic prisms of $8(\text{BaS} \cdot 6\text{H}_2\text{O}) (\text{BaS}, \text{H}_2\text{O}) \cdot 6\text{H}_2\text{O}$ (Schöne, *lc*)

III TETRASULPHIDE. Known only in combination with H_2O as $\text{BaS}_4 \cdot \text{H}_2\text{O}$. By evaporating a solution of BaS , in hot water *in vacuo*, or by evaporating BaSAq with 8S , trimetric, dichroic, needles separate, yellow by transmitted, red by reflected, light, soluble in water, may be recrystallised from hot water, insoluble in alcohol, at 300° lose H_2O with decomposition into H_2S , S , and BaS , (Schöne, *lc*). A more hydrated salt, probably $\text{BaS}_4 \cdot 2\text{H}_2\text{O}$, was obtained by Veley by dissolving S in $\text{BaS}_3 \cdot \text{H}_2\text{Aq}$ (*C J* 49, 378)

IV PENTASULPHIDE BaS_5 . Not known in definite form. BaSAq or $\text{BaS}_3 \cdot \text{H}_2\text{Aq}$ boiled with excess of S , yields a yellow alkaline solution, from which on cooling S and BaS separate out, the mother liquor contains Ba and S in ratio BaS_5 , on evaporation crystals of S separate out, and BaS remains in solution (Schöne, *lc* confirming older observations of Berzelius)

V HYDROSULPHIDE or SULPHYDRATE $\text{BaS}_2 \cdot \text{H}_2$. Formation — By action of H_2O on BaS (*v MONOSULPHIDE, Reactions, No 6*)

Preparation — BaOAq (saturated at 100°) is saturated with H_2S at 60° – 70° , the liquid is decanted in absence of air, and is cooled to about 10° , the crystals of $\text{BaS}_2 \cdot 4\text{H}_2\text{O}$ which separate are dried between paper out of contact with air, and then heated in a stream of H (*v Veley, C J* 49, 369)

Properties and Reactions — With $4\text{H}_2\text{O}$ forms white acicular crystals, which effloresce in air, and gradually absorb O , forming $\text{BaS}_3 \cdot \text{O}$, and BaSO_4 , these crystals are soluble in water but insoluble in alcohol, aqueous solution evolves H_2S when boiled, heated to redness out of contact with air, H_2S is removed and BaS remains (for details, *v Veley, lc*). $\text{BaS}_2 \cdot \text{H}_2$ is strongly basic in its reactions, *eg* with As_2S_3 , it forms Ba thio arsenite

Barium, sulphocyanide of $\text{Ba}(\text{SCN})_2$. Obtained by decomposing NH_4SCNAq by BaOAq (*v SULPHOCYANIDES, under CYANIDES*)

Barium, thio-antimonate of $\text{Ba}_3(\text{SbS}_4)_2$. Obtained by the action of $\text{BaCl}_2 \text{Aq}$ on Na_3SbSAq (compare THIO ANTIMONATES under ANTIMONY, THIO ACIDS OF)

Barium, thio-arsenite of $\text{Ba}_3\text{As}_2\text{S}_5$. Obtained by digesting $\text{BaS}_3 \cdot \text{H}_2 \text{Aq}$ with As_2S_3 , and Barium thio-arsenates $\text{Ba}_3(\text{AsS}_4)_2$, and $\text{Ba}(\text{AsS}_3)_2$, obtained by the action of H_2S on $\text{BaHAsO}_4 \text{Aq}$ (*v THIO ARSENITES and THIO ARSENATES under ARSENIO, THIO ACIDS OF*)

M M P M

BARYTA Oxide of Barium, *v* BARIUM, OXIDE OF

BASE — The characteristic reaction of an acid is that the whole, or a portion, of the hydrogen of an acid can be displaced by a metal, with production of a new body, called a salt, composed of the metal and the elements of the acid, excepting the displaced hydrogen (*v ACIDS*). If the oxide of a metal reacts with an acid to form a salt, the hydrogen displaced from the acid combines with the oxygen of the oxide to form water, the products of the reaction are a salt and water. The salt is not characterised by the properties either of the acid, the metal, or the metallic oxide, it has been built upon the metal or metallic oxide by combining this with the acid. The name base was given by Rouelle in 1744 to those bodies which reacted with acids to form salts. The name has sometimes been applied to metals, as well as to oxides and hydroxides of metals, at other times it has been confined to compounds of metals with H and O , at all times the conception underlying the name has been that of a substance which, while chemically very unlike an acid, reacts with acids to form salts. The dual origin of a salt is implied in the statement that for its production there is required the interaction of an acid and a base. A definition of any one of the terms, *acid, base, salt*, implies a definition of the other two. The chemical reaction characteristic of bases, as the term is now used, is the production of salts by the mutual reaction of a base and an acid, in some cases water is also formed, in other cases the salt is the sole product. Typical reactions are as follows

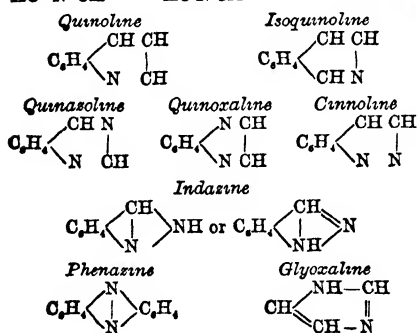

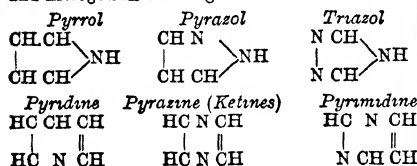

A base may then be (i) a metallic oxide, (ii) a metallic hydroxide or an allied compound such as NEt , OH , PMe , OH , SEt , OH , &c., (iii) ammonia or a derivative thereof, *eg* NH_4Et , NMe_3 , &c. The terms *strong* and *weak* may be applied to bases with meanings similar to those given to the terms when applied to acids, a strong base, in this sense, is one which, when it reacts in aqueous solution with another base and an acid—all being present in equivalent quantities, and all possible products being soluble in water—combines with a large proportion of the acid and leaves only a small proportion for the other base to combine with. The hydroxides MOH , where M = an alkali metal or Ti , are strong bases, NH_3 is a weak base, NH_4Et and NH_4Me are stronger bases than NH_3 , NMe_3OH and SEt_3OH are nearly as strong bases as the alkalis (*v AFFINITY*). By the term a *strong base* is sometimes meant a base which reacts with various acids to form very stable salts, *eg* salts which are not changed by water, hot or cold. In this meaning of the term BaO, H_2 is a strong base, but BiO, H_2 or SnO, H_2 is a weak base. The oxides and hydroxides of polyvalent metals appear to be weaker bases than the corresponding compounds of the monovalent metals. The more positive a metal is, the more basic are its oxides and hydroxides. Sometimes a metallic oxide, or hydrated oxide, may react towards strong acids as a base, and towards strong bases as an acidic oxide, thus

$Al_2O_3 \cdot xH_2O$ reacts with H_2SO_4 aq to form $Al_2O_3 \cdot 8SO_4 (= Al_2 \cdot 8SO_4)$, but $Al_2O_3 \cdot xH_2O$ reacts with much KOH aq to form $K_2O \cdot Al_2O_3 (= K_2 \cdot Al_2O_3)$. In some cases the basic and acidic functions of a compound may be nearly equal, thus amido acetic acid ($? CH_2 \cdot NH_2 \cdot COOH$) forms salts by its reactions with bases as other acids do, but it also combines with acids, as NH_3 , does, to form salts. The hydroxides of certain metals which in some of their reactions behave as non metals react as bases towards most acids, but if oxygen is added to these hydroxides compounds are formed which react as bases only towards the stronger acids and at the same time react as acids towards the stronger bases, such compounds are $SnO_2 \cdot H_2$, and $SnO \cdot O_2 \cdot H_2$, respectively. Bases are sometimes divided into *mono-acid*, *di-acid*, *tri acid*, &c, according as one reacting weight interacts with one, two, three, &c, reacting weights, of a monobasic acid, to form a salt. The poly acid bases are weaker than the mono acid bases. As examples of mono acid bases may be given KOH , NH_3 , NH_4Et , &c, of di acid bases, $CaO_2 \cdot H_2$, $BaO_2 \cdot H_2$, $ZnO \cdot H_2$, $NH_4C_2H_3$, &c, of tri acid bases, $FeO_2 \cdot H_2$, $C_2H_5(NH_2) \cdot OH$, &c, of tetra acid bases, $ZrO_2 \cdot H_2$, &c (comp ACIDS and SALTS) M M P M

BASES, ORGANIC, v ALKALOIDS, AMINES, AMIDES, AZINES, PYRIDINE, QUINOLINE, &c

The nomenclature of bases containing carbon and nitrogen in one ring is as follows

BASIC OXIDES Oxides which react with acids to produce salts. The greater number of the metallic oxides are basic, oxides of well marked non metals are never basic. The correlative term is *acidic oxides* (v BASES, ACIDS, SALTS) M M P M

BASICITY OF ACIDS v ACIDS, BASICITY OF BASILICUM, OIL OF The essential oil obtained by distilling the leaves of *Ocimum basilicum* with water contains $C_{17}H_{33}O$ which crystallises in prisms (Dumas & Peligot, A 14, 76)

BASSIA LATIFOLIA. The seeds of this Himalayan plant yield by pressure a buttery

substance, $[27^\circ - 80^\circ]$, containing olefin and stearin (Hardwick, C J 2, 231)

BASSORIN The insoluble gum acid, probably meta-arabic acid, or at least a meta acid allied thereto (v ARABIN) of gummy bassores, G Tortionense, or G Kutera. These gums consist of a part (the meta acid) that swells up to a jelly when they are treated with water, and of a soluble part, the alkaline or earthy salt of the acid. C O'S

BASTOSE v CELLULOSE

BASYLOUS A name sometimes applied to the more positive, usually oxygen containing, radicles, or groups of atoms, which combine with more negative, or *chlorous*, groups to form salts, e.g. $K^+ O \bar{S} O_3^-$, $K^+ O \bar{C} r O_3^-$, $Cr^+ O_3 \bar{S} O_3^-$, &c. The name is sometimes also applied to the elements which displace H from acids with formation of salts. The correlative term is *chlorous* M M P M

BDELLIUM A gum-resin (Johnston, J pr 26, 145)

BEBERERINE $C_{17}H_{21}NO_2$, *Beberine* $[180^\circ]$ Occurs, together with a resin (sepirin) and an acid (beberic acid) in the bark of the bebeeru tree of Demerara (Rodie, MacLagan, A 48, 106, MacLagan & Tilley, P M 27, 186, v Planta, A 77, 333). It is an amorphous powder, v sl sol water, v e sol alcohol, v sol ether — $B \cdot H_2PtCl_4$, orange amorphous pp. Buxine has been considered to be identical with bebeerine (Walz, N J P 14, 15)

BEE'S WAX v WAX

BEHENIC ACID $C_{22}H_{44}O_2$, *Behenic acid* $[76^\circ]$ Occurs as glyceride in oil of ben and in the fatty oil of black mustard seed. Needles, resembling stearic acid — $NaA' - BaA'$, — $PbA' - EtA'$ $[49^\circ]$ (Voelcker, Strecker, A 64, 346)

BEHENOLIC ACID $C_{22}H_{44}O_2$, *Behenolic acid*. $[57.5^\circ]$ Formed by the action of alcoholic potash on di bromo behenic acid (Haussknecht, A 143, 41). White needles (from alcohol), v sol alcohol and ether, insol water. Not reduced by sodium amalgam, but combines with Br_2 , forming $C_{22}H_{40}Br_2O_2$ $[47^\circ]$, and with Br_2 , forming $C_{22}H_{38}Br_4O_2$ $[78^\circ]$

Salts — MgA' , $3aq$ — AgA' — BaA' .

BELLADONNINE. An alkaloid occurring in the mother liquor from which sulphate of atropine (*q v*) has been crystallised (Hübschmann, Schweiz Z Pharm 1858, 128, Kraut, A 148, 236, B 13, 165, Ladenburg & Routh, B 17, 152, Merling, B 17, 381). Amorphous, v sl sol water, v sol alcohol, ether, and chloroform. It is but slightly attacked by boiling baryta-water, but is split up by alkalis into tropic acid and oxy tropine $C_8H_{11}NO_2$. Thus would indicate that belladonnine is oxy atropine $C_{17}H_{23}NO_2$ (L). According to Merling, belladonnine is $C_{17}H_{21}NO_2$, and gives tropine, atropine acid, and iso atropine acid when boiled with baryta water. Salts $B \cdot H_2PtCl_4$, — $B \cdot H_2AuCl_4$.

BEN, OIL OF A fatty oil expressed from the fruits of *Moringa nuxa behen*. It contains glyceryl palmitate, stearate, oleate, and behenate (v BEHENIC ACID)

BENIC ACID v BEHENIC ACID

BENYLENE $C_{10}H_8$, $(228^\circ - 228^\circ)$ SG 2-911 Formed by the action of alcoholic potash on

tri-amylen bromide $C_{11}H_{22}Br_2$, (Bauer a. Verson, *A* 147, 252)

BENZACIN $C_{10}H_{11}N_2O$ [150°] A neutral crystalline substance obtained by extracting with alcohol the product of the action of $ZnEt_2$ on phenyl acetonitrile (Frankland a. Tompkins, *C J* 37, 589)

BENZAL- v BENZYLIDENE

BENZALDEHYDE v **BENZOIC ALDEHYDE**

BENZALDOXIM $C_6H_5CH_2NOH$ *Oxim of benzoic aldehyde* (c 220° with decomposition) Colourless oil, formed by the action of hydroxylamine on benzoic aldehyde (Petracek, *B* 15, 2735) Formed also by reducing benzamidoxim with sodium amalgam (Tiemann a. Kruger, *B* 17, 1692) By heating with HCl it is split up into hydroxylamine and benzaldehyde Ac_2O converts it into benzonitrile (Lach, *B* 17, 1571)

Sodium salt $C_6H_5N(ONa)aq$ white easily soluble plates, formed by the action of sodium ethylate on benzaldoxim in alcoholic solution, gives characteristic pps with the salts of the heavy metals

Hydrochloride $C_6H_5N(OH)HCl$ white glistening scales, rotates on water

Methyl ether $C_6H_5N(OMe)$ (191° uncorr.), colourless oil, lighter than water and slightly soluble, formed by the action of methyl iodide and sodium ethylate on benzaldoxim, by $ZnCl_2$ it is split up into benzaldehyde and methyl hydroxylamine

Ethylether $C_6H_5N(OEt)$ (208° uncorr.), colourless oil, split up by HCl into ethylhydroxylamine and benzaldehyde

Propyl ether $C_6H_5N(OC_2H_5)$ (225° uncorr.), colourless oil

Iso butyl ether $C_6H_5N(OC_2H_5)$ (238° uncorr.), colourless oil

Amyl ether $C_6H_5N(OC_4H_9)$ (161° uncorr.), colourless oil (Petracek, *B* 16, 823)

BENZAMIDE C_6H_5NO v $C_6H_5CO.NH_2$ *Amide of benzoic acid* Mol w 121 [130°] (Amiciana a. Magnaghi, *B* 18, 1828) SG ± 1.34 (Schröder, *B* 12, 1612)

Formation—1 From $BzCl$ and NH_3 —2 Together with NH_4OBz , by the action of Bz_2O on NH_3 —3 From $EtOBz$ and NH_3 —4 By boiling hippuric acid with water and PbO_2 , or by heating hippuric acid in a current of dry HCl

Properties—Monoclinic tables $abc = 228.1 \times 1.068$, $\beta = 89^\circ 22'$ (Klein, *A* 166, 184), v sl sol cold water, m sol hot water, especially if it contain NH_3 , v sol alcohol and ether

Reactions—1 It splits up into water and benzonitrile when heated with *dehydrating agents* (P_2O_5 , P_2S_5 , or H_2SO_4) and to some extent when heated alone at 290°—2 *Boiling aqueous potash* forms $KOBz$ —3 *Boiling acids* form benzoic acid—4 $BzCl$ or Bz_2O form benzonitrile and benzoic acid—5 Reduced in acid solution by *sodium amalgam* to benzyl alcohol—6 Boiling *phenol* gives benzoyl phenol ($PhOBz$) and NH_3 —7 PCl_5 forms an unstable substance which rapidly splits up into HCl and benzonitrile (Wallach, *A* 184, 19)—8 $COCl_2$ gives benzonitrile, cyaphenine, and di benzoyl urea (Schmidt, *J pr* [2] 5, 35)—9 CS_2Cl_2 gives benzonitrile, CO_2S , and HCl (Rathke a. Schafer, *A* 169, 107)—10 With *chloral* it combines forming $C_6H_5Cl_2NO$ [151°] (Wallach, *B* 5, 251)—11 With *ethyl nitrite* it forms N_2 , benzoic ether, and H_2O

(Meyer a. Stüber, *B* 4, 962)—12 Converted by *bromine in alkaline solution* into aniline (Hofmann, *B* 18, 2737)—13 A solution of benzamide in *bromine* deposits crystals of unstable $BzNH_2Br_2$.

Combinations— $BzNH_2HCl$ long prisms, formed by saturating a mixture of benzamide and $HClAq$ with HCl (Dessaigues, *A Ch* [8] 34, 146, Pinner a. Klein, *B* 10, 1897) When exposed to the air it gives off all its HCl— $BzNH_2\frac{3}{2}HCl$ [178°] (E v Meyer, *J pr* [2] 30, 122)

Salts— $(BzNH_2)_2Hg$ [224°] Formed by boiling benzamide with water and HgO Laminar (from alcohol), v sol alcohol and ether— $BzNHTl$ slender needles (Church a. Crookes, *C J* 17, 151)

Additional References—Liebig a. Wöhler, *A* 3, 268, Fehling, *A* 28, 48, Schwarz, *A* 75, 195, Laurent, *Revue Scient* 16, 391, Henry, *Z* [2] 5, 446, Brauns, *Ar Ph* [2] 126, 214, Oppenheim a. Czarnomsky, *B* 6, 1392, Guareschi, *G* 4, 465, *A* 171, 141, Kekulé, *B* 6, 113, Schiff a. Tassinari, *B* 10, 1785, Friedburg, *A* 158, 26

Benz chloro amide $C_6H_5CO.NHCl$ Prepared by gradually adding a conc solution of chloride of lime to a cold conc solution of benzamide acidified with $AcOH$, the product being shaken out by ether as it is formed Long colourless prisms (from water) (Bender, *B* 19, 2274)

Dibenzamide $C_{12}H_{11}NO_2$ v $NHBz$, [148°] S 12 at 15° Formed, together with benzamide, by the action of KNH_2 on $BzCl$ dissolved in ether (Baumert a. Landolt, *A* 111, 1), and from benzonitrile (10 g) and fuming H_2SO_4 (7 g) (Barth a. Senhofer, *B* 9, 975, Gumpert, *J pr* [2] 30, 87) Trimetric crystals, $abc = 931.1 \times 1.069$ Sl sol boiling water, v sol alcohol, ether, and benzene

Salts— $NaNBz_2\frac{1}{2}aq$ small prisms, sol ether— $AgNBz_2$.

BENZAMIDINE C_6H_5N , v $C_6H_5C(NH)NH_2$ [75°-80°]

Preparation—Benzonitrile is converted by treatment with isobutyl alcohol and HCl into the hydrochloride of $C_6H_5C(NH)OC_2H_5$, whence ammonia produces benzamidine (Pinner a. Klein, *B* 10, 1880, 11, 4)

Properties—M sol water, sl sol ether, v a. sol alcohol, deliquescent, very volatile Decomposed by heat into NH_3 and cyaphenine

Salts— B^+HCl^- flat needles— $B^+H_2PtCl_6^-$ — AgC_6H_5N .

BENZAMIDO- v Benzoyl AMIDO-

BENZAMIDO-ACETIC ACID v **HIPPURIC ACID**

BENZ-AMIDOXIM $C_6H_5N_2O$ v $PhC(NH_2)NOH$ *Benzoyl oxamidine Benzoyl-amidoxim Isonitroso benzylamine* [80°].

Formation—1 By the action of hydroxylamine on an alcoholic solution of benzonitrile (Tiemann, *B* 17, 128)—2 By the action of hydroxylamine on the hydrochloride of benzamidine—3 As a by product in the action of hydroxylamine hydrochloride upon benzimidoethyl ether—4 By digesting thio-benzamide with an alcoholic solution of hydroxylamine (Tiemann, *B* 19, 1668) Long flat monoclinic prisms $abc = 2.502.1.1.077$. Volatilises

undecomposed ∇ sol. alcohol, ether, benzene, and hot water, sl. sol. cold water. It is poisonous. It dissolves both in acids and alkalis. Fe_2Cl_6 gives a red coloration. The ammoniacal solution gives white crystalline pps with BaCl_2 , AgNO_3 , $\text{Pb}(\text{OAc})_2$, and ZnSO_4 . The silver pp on heating in the solution in which it is formed gives a splendid silver mirror.

Reactions—1 Gives the carbamine reaction with *chloroform* and *alcoholic potash*.—2 *Nitrous acid* forms benzamide.—3 *Sodium amalgam* reduces it to benzaldoxim and NH_3 (Tiemann & Nageli, *B* 18, 1086).—4 When quickly heated at 170° it splits up into benzonitrile and NH_3 .—5 By heating with *acetic anhydride* it yields benzenyl azoxim-ethenyl $\text{C}_6\text{H}_5\text{C} \begin{smallmatrix} \text{NO} \\ \text{N} \end{smallmatrix} > \text{CCH}_3$.

Salts—A'Na white crystalline solid, decomposed by water.—A'K crystals.—A'Ag unstable white crystalline pp.—A'(CuOH) amorphous dark green pp.—A'H, HCl large flat plates or concentric needles.—A'H, H_2SO_4 large prisms.—A'(H), H_2SO_4 amorphous solid.

Methyl ether—A'Me [57°], (230° uncorr), prisms, ∇ sol. alcohol, ether, and benzene, sl. sol. water. By HCl and NaNO_2 it is converted into benzenyl methoxim chloride $\text{C}_6\text{H}_5\text{CCl}(\text{NOMe})$.

Ethyl ether—A'Et [67°], trimetric plates. By dilute H_2SO_4 and sodium nitrite it is converted into benzhydroximic-ethyl ether (*benzoyl hydroxylamine ethyl ether*) $\text{C}_6\text{H}_5\text{C}(\text{OH})\text{NOEt}$. With HCl and NaNO_2 it yields benzenyl ethoxim chloride.

Benzyl ether—A'C $_6\text{H}_5$, [91°], scales.

Benzoyl derivative—

$\text{C}_6\text{H}_5\text{C}(\text{NH}_2)\text{NOBz}$ [140°], slender white needles, ∇ sol. alcohol, ether, and aqueous acids, insol. water. On heating it readily splits off H_2O , giving rise to benzenyl azoxim benzenyl $\text{C}_6\text{H}_5\text{C} \begin{smallmatrix} \text{NO} \\ \text{N} \end{smallmatrix} > \text{CCH}_3$.

Acetyl derivative $\text{C}_6\text{H}_5\text{C}(\text{NH}_2)\text{NOAc}$ [96°], thin plates or flat prisms, sol. alcohol, sl. sol. ether, ∇ sl. sol. water. By boiling with water it loses H_2O and is converted into benzenyl azoxim ethenyl.

Butyryl derivative

$\text{C}_6\text{H}_5\text{C}(\text{NH}_2)\text{NOCOCH}_2\text{CH}_3$ [94°] fine needles.

Ethylene ether ($\text{PhC}(\text{NH}_2)\text{NO}$) C_2H_4 [156°] White plates. Sol. alcohol, ether, benzene, and ligroin, insol. water. Formed by heating an alcoholic solution of benzamidoxim (2 mols) and sodium ethylate (2 mols) with ethylene bromide (1 mol).

Compound with chloral $\text{C}_6\text{H}_5\text{N}_2\text{Cl}_2\text{O}_2$ [135°] Obtained by mixing the constituents. White crystalline powder. ∇ sol. alcohol and ether, insol. water. By treatment with H_2SO_4 or by long boiling with water it is resolved into its components (Falck, *B* 19, 1485).

References—Pinner, *B* 17, 184; Tiemann & Krüger, *B* 17, 1685, 18, 731, 1053; Tiemann, *B* 19, 1479, 1668; Schulz, *B* 18, 1080; Falck, *B* 19, 1484 (*v* also Azoxims).

Benz amidoxim carbonic ether

$\text{C}_6\text{H}_5\text{C}(\text{NH}_2)\text{NOCO}_2\text{Et}$ [127°] Formed by the action of chloroformic ether upon benzamidoxim (Falck, *B* 18, 2467). Long glistening needles. ∇ sol. alcohol, ether and

benzene, less in ligroin. On heating it splits off alcohol, forming benzenyl azoxim carbinol $\text{C}_6\text{H}_5\text{C} \begin{smallmatrix} \text{NO} \\ \text{N} \end{smallmatrix} > \text{C}(\text{OH})$.

Carbonyl-di benz amidoxim $\text{C}_{12}\text{H}_{10}\text{O}_4\text{N}_4$, $\pm e$ $\text{C}_6\text{H}_5\text{C}(\text{NH}_2)\text{NO} > \text{CO}$ [129°] Formed by the action of carbonyl chloride upon benzamidoxim dissolved in benzene (Falck, *B* 18, 2470). White plates. Sol. alcohol and ether, ∇ sl. sol. benzene, insol. water.

BENZ-AMIDOXIM-*m*-CARBOXYLIC ACID

$\text{C}_6\text{H}_4\text{N}_2\text{O}_4$, $\pm e$ [31°] $\text{C}_6\text{H}_4(\text{CO}_2\text{H})\text{C}(\text{NOH})\text{NH}$ [200°] Crystalline solid. Sol. hot water and alcohol, sl. sol. ether, nearly insol. chloroform and benzene.

Formation—1 By saponification of the ethyl ether which is obtained by combination of *m* cyano benzoic ether with hydroxylamine.—2 By digesting a mixture of equivalent quantities of *m* cyano benzoic acid, hydroxylamine hydrochloride, and sodium carbonate, in dilute alcoholic solution for 12 hours at 80° – 100° .

Reactions—The aqueous solution of the ammonium salt gives sparingly pps with CuSO_4 , $\text{Pb}(\text{OAc})_2$, AgNO_3 , and ZnSO_4 . Heated with acetic anhydride it is converted into *m* carboxy benzenyl azoxim ethenyl.

$\text{C}_6\text{H}_4(\text{CO}_2\text{H})\text{C} \begin{smallmatrix} \text{NO} \\ \text{N} \end{smallmatrix} > \text{CCH}_3$.

Ethyl ether A'Et [118°], needles, ∇ sol. alcohol, sl. sol. water (Müller, *B* 19, 1495).

Benz-amidoxim-*p*-carboxylic acid

[41°] $\text{C}_6\text{H}_4(\text{CO}_2\text{H})\text{C}(\text{NOH})\text{NH}_2$ [above 330°] Formed by digesting *p* cyanobenzoic acid (1 mol) hydroxylamine hydrochloride (1 mol), and sodium carbonate (1 mol) in dilute alcoholic solution for 18 hours. Sol. dilute alcohol, sl. sol. water, nearly insol. abs. alcohol, ether, and benzene. A dilute aqueous solution of the ammonium salt gives pps with CuSO_4 and with AgNO_3 . By boiling with acetic anhydride it is converted into *p* carboxy benzenyl azoxim ethenyl $\text{C}_6\text{H}_4(\text{CO}_2\text{H})\text{C} \begin{smallmatrix} \text{NO} \\ \text{N} \end{smallmatrix} > \text{CCH}_3$ (Müller, *B* 19, 1491).

Ethyl ether A'Et [135°], obtained by heating the ethyl ether of *p* cyanobenzoic acid with hydroxylamine in alcoholic solution (Müller, *B* 18, 2485). Colourless crystals, sol. boiling water.

BENZ-CREATIN**Benz-(a) methyl glycoeyamine**

$\text{NH}_2\text{C}(\text{NH})\text{NMeC}_6\text{H}_4\text{CO}_2\text{H}$ From benzglycoeyamine, conc KOH, methyl alcohol, and MeI (Griess, *B* 8, 324) Narrow laminae (containing 13 aq), sl sol water and alcohol. Decomposed by baryta into urea and methyl amido benzoic acid— $\text{B}'\text{HCl aq}$ — $\text{B}''\text{H}_2\text{PtCl}_4$, 2aq

Benz-(β) methyl-glycoeyamine

$\text{NHMeC}(\text{NH})\text{NH C}_6\text{H}_4\text{CO}_2\text{H}$ From 'ethoxy carbimidamido benzoic acid' and cold conc NMeH_2 solution. Laminae, v sl sol cold water. Boiling baryta forms methyl urea and amido benzoic acid— $\text{B}'\text{HCl}$ — $\text{B}''\text{H}_2\text{PtCl}_4$, 2aq

BENZCREATININE

o Benz (a)-methyl-glycoeyamidine $\text{C}_6\text{H}_4\text{N}_2\text{O}$

$\text{HN}=\text{C} \begin{array}{c} \text{N}(\text{CH}_3)-\text{C}_6\text{H}_4 \\ \text{NH}-\text{CO} \end{array}$ Prepared by the

action of MeI on o benzglycoeyamidine (Griess, *B* 13, 978) White needles. Sol alcohol, sl sol ether and hot water. Insol caustic alkalis.

Salts— $\text{B}'\text{HCl aq}$ soluble plates. $(\text{B}'\text{HCl})_2\text{PtCl}_4$

o Benz-(β)-methyl-glycoeyamidine

$\text{C}_6\text{H}_4\text{N}_2\text{O} : \text{HN}=\text{C} \begin{array}{c} \text{NH}-\text{C}_6\text{H}_4 \\ \text{N}(\text{CH}_3)-\text{CO} \end{array}$

Prepared by the action of methylamine on 'ethoxy cyan amido benzoyl' ($\text{C}_{10}\text{H}_{10}\text{N}_2\text{O}$) (Griess, *B* 13, 978) White needles. Sol caustic alkalis. Weak base.

Salts— $\text{B}'\text{HCl}$ small tables or prisms, decomposed by water— $(\text{B}'\text{HCl})_2\text{PtCl}_4$, sparingly soluble yellow plates.

BENZCYANIDINE v BENZOYL CYANIDE

BENZEINS These bodies, which much resemble the phthaleneis, are hydroxylated aromatic carbinols, such as di-oxo tri phenyl carbinol $\text{C}_6\text{H}_5\text{C}(\text{C}_6\text{H}_4\text{OH})_2\text{OH}$. Prepared by heating phenols with benzotrichloride. The compound from resorcin is yellow, those from cresols, pyrocatechin, hydroquinone, orcin, and (β) naphthol are yellow or yellowish red, pyrogallol gives a blue, and (α) naphthol a green dye. On reduction they give the corresponding derivatives of methane (Doebner, *B* 13, 610, *A* 217, 227).

Formation—1 By heating benzoic acid with lime (Mitscherlich, *A* 9, 39, Peligot, *A* 9, 48, 257, 11, 277, 12, 389), or by passing the vapour of benzoic acid over red hot iron (Darcet, *A* Ch [2] 66, 99)—2 By heating phthalic acid with lime (Marignac, *A* 42, 217)—3 By dry distillation of quinic acid (Wöhler, *A* 51, 146)—

VOL I

4 By passing oil of bergamot over red-hot lime (Ohme, *A* 31, 318)—5 Together with naphthalene, styrene, retene, &c, by heating acetylene to a red heat (Berthelot, *A* Ch [4] 9, 469) Benzene is among the products obtained by passing toluene, xylene, ψ -cumene, or styrene through a red hot tube—6 Metallic succinates give on dry distillation a liquid (hydroquinone dihydride?) which yields benzene when distilled with zinc dust (v Richter, *J* pr [2] 20, 206)—7 From benzene sulphonic acid by passing steam through its solution in diluted H_2SO_4 at 175° (Armstrong a Miller, *C* J 45, 148)—8 From phenol (70 g) by distilling with P_2S_5 . The yield is small (16 g) $80\text{C}_6\text{H}_5\text{OH} + \text{P}_2\text{S}_5 = 2(\text{C}_6\text{H}_5)_2\text{PO} + 3\text{H}_2\text{S} + 2\text{C}_6\text{H}_6$ (A. Geuther, *A* 221, 55)—9 The homologues of benzene when treated at their boiling points with a current of HCl gas in presence of AlCl_3 evolve MeCl and yield lower homologues, but at the same time part of the MeCl attacks other portions of the hydrocarbon with production of higher homologues. Thus if HCl is passed into boiling *m*-xylene containing AlCl_3 , benzene, toluene, pseudocumene, mesitylene, and durene are obtained (Jacobsen, *B* 18, 338, Anschütz a Immendorff, *B* 18, 657)—10 Benzene is produced when benzyldene chloride, PhCHCl_2 , or benzotrichloride, PhCCl_3 , is heated with soda lime (Limpricht, *A* 159, 303)—11 From diazo benzene nitrate or sulphate by heating with alcohol or alcoholic KOH.

Preparation—1 Coal tar is distilled and the fraction boiling below 150° is freed from phenols by shaking with NaOHAq and from bases by shaking with H_2SO_4 . It is then rectified. It is convenient to keep the still head at 100° toluene is then condensed while benzene passes over (Faraday, *T* 1825, 440, Hofmann a Mansfield, *C* J 1, 244) On the large scale the distillation is performed in an iron boiler, to which is attached a tall vertical column divided into compartments, the fire is regulated so that pure benzene passes over, while its homologues condense and run back to the boiler. Benzene is completely freed from its homologues by cooling with ice and salt, when it solidifies and the homologues which remain fluid may be pressed out. It is freed from thiophene by shaking with conc H_2SO_4 —2 A mixture of benzoic acid (1 pt) and slaked lime (3 pts) is distilled from an iron tube. The product is shaken with KOH aq , distilled with steam, dried with CaCl_2 and Na and rectified. Diphenyl and benzophenone are by products. The benzoic acid used must not be prepared from toluene, otherwise it will contain thiophenic acid, and the benzene will contain thiophene.

Properties—Colourless, mobile, strongly refracting liquid. Volatile with steam. Scarcely soluble in water, v e sol alcohol, ether, glacial acetic acid, acetone, and chloroform. Crystallises in trimetric pyramids, $a:b:c = 891:1:779$ (Groth, *Z* [2] 6, 553). It dissolves S, P, I, fats, resins, oils, and many alkaloids. It burns with a luminous flame, 1 g burnt with excess of hydrogen giving out a light equal to 58 g of spermaceti. When burnt with CO and CH_4 , the light equals that of 61 g, and 78 g, of spermaceti respectively (Frankland a Thorne, *C* J 33, 93). There are four bands in the

G G

ultra violet absorption spectrum of benzene (Hartley, *C J* 39, 162, 47, 694)

Detection—Benzene is converted by fuming HNO_3 into nitro benzene, this is washed with water and reduced by tin and HCl to aniline, caustic soda is added and the aniline extracted with ether, the ether is evaporated and the aniline dissolved in much water, the aqueous solution gives a violet colour with bleaching powder. A mixture of HNO_3 and H_2SO_4 forms di nitro benzene, which, after crystallising from dilute alcohol, melts at 89°

Detection of Thiophene in Benzene—Thiophene, which is usually present in small quantities in commercial benzene, is indicated by the blue colour produced by shaking with conc H_2SO_4 and isatin (V Meyer, *B* 16, 1465, Baeyer, *B* 12, 1309)

Impurities—Crude benzene may contain traces of toluene, xylene, thiophene, CS_2 , amylene, crotonylene, alcohol, and acetonitrile

Reactions—1 Benzene when passed through a red hot tube forms hydrogen, a little acetylene, diphenyl, benzerythrene $\text{C}_{12}\text{H}_{10}$, *p* di phenyl benzene, *iso* di phenyl benzene, and triphenylene (Berthelot, *Bl* [2] 6, 272, 279, G Schultz, *A* 174, 201, H Schmidt & G Schultz, *A* 203, 118)—2 A mixture of benzene vapour and ethylene passed through a red hot tube gives diphenyl and small quantities of anthracene, styrene, and phenanthrene (Berthelot, *Bl* [2] 7, 113, 274, Ferkö, *B* 20, 660)—3 A mixture of equivalents of benzene and toluene dropped at the rate of 80 g per hour from a tap funnel into the turned up end of an iron tube kept at low red heat is converted, to the extent of about 10 per cent, into gases, naphthalene, diphenyl, *p* tolyl di phenyl, *o* *p* di tolyl, (γ) and (δ) di phenylene methane, phenanthrene, anthracene, *p* di phenyl benzene, a hydrocarbon $\text{C}_{12}\text{H}_{10}$, a hydrocarbon [13°] (293° – 316°) and two liquid hydrocarbons (359° – 383°) and (404° – 427°) (Carnelley, *C J* 37, 701)—4 Induction sparks passing through liquid benzene produce a gas that contains 42 p.c. acetylene and 57 p.c. hydrogen (Destrem, *Bl* [2] 42, 267)—5 Aluminium chloride (*v p* 147) acting upon a mixture of benzene and an alkyl chloride causes HCl to escape with the resulting formation of an alkyl benzene (Friedel & Crafts, *C R* 84, 1392, 1450, 85, 74, *A Ch* [6] 1, 449) (a) Thus methyl chloride passed into a mixture of benzene and Al_2Cl_3 gives toluene, *o*, *m*, and *p* xylene, ψ cumene, mesitylene, durenene, isodurenene, penta methyl benzene, and hexa methyl benzene (Ador & Ralliet, *B* 12, 329, Jacobsen, *B* 14, 2624) (b) Chloral is converted by benzene in presence of Al_2Cl_3 into CPhCl_2 , $\text{CH}(\text{OH})\text{Cl}$, the hydrochloride of α -di chloro phenyl acetic aldehyde (Combes, *C R* 98, 678, *Bl* [2] 41, 382) (c) Methylene chloride in presence of Al_2Cl_3 gives di phenyl methane, anthracene, and toluene (Friedel & Crafts, *Bl* [2] 41, 322) (d) Chloroacetylene, Al_2Cl_3 , and benzene form CHPh_2 and Ph_2COH (Elbs, *B* 16, 1274) (e) Allyl chloride, Al_2Cl_3 , and benzene give di phenyl propane and *n* propyl benzene (Wispek & Zuber, *A* 218, 874) (f) Vinyl bromide, Al_2Cl_3 , and benzene give ethyl benzene, *u*-di phenyl ethane, and di methyl anthracene dihydride (Angeblis & Anschütz, *B* 17, 167) Vinyl tribromide,

$\text{CH}_2\text{Br CHBr}_2$, gives di benzyl (g) Oxygen passed into boiling benzene containing Al_2Cl_3 forms phenol (Friedel & Crafts, *C R* 86, 884, of Senff, *A* 220, 282) (h) Sulphur mixed with boiling benzene and Al_2Cl_3 forms phenyl mercaptan, di phenyl sulphide and 'diphenylene disulphide' (C_6H_5) $_2\text{S}_2$ (Friedel & Crafts, *C R* 86, 884) (i) Sulphurous acid, Al_2Cl_3 , and benzene give di phenyl sulphoxide, Ph_2SO (Colby & McLoughlin, *B* 20, 195) (j) Acetylene in presence of Al_2Cl_3 forms styrene, di phenyl ethane, and di tolyls (Varet & Vienne, *Bl* [2] 47, 917)—6 Heated with Al_2Cl_3 (2 pts) at 200° in sealed tubes benzene gives toluene, ethyl benzene, and diphenyl (Friedel & Crafts, *C R* 100, 692)—7 Phenol is among the products of oxidation of benzene by H_2O_2 (Leeds, *Ph* [3] 11, 1068, cf Kingzett, *C N* 44, 229) Phenol is also formed when benzene is digested for some days at 40° with cuprous chloride and dilute HCl , atmospheric oxygen attacking benzene and Cu_2Cl_2 simultaneously (Nencki & Sieber, *J pr* [2] 26, 25) In the animal body it is oxidised to hydroquinone and pyrocatechin (Nencki & Giacomini, *H* 4, 325, cf Schultzen & Naunyn, *C C* 1867, 705) Oxidation with MnO_2 and dilute H_2SO_4 produces formic, benzoic, and phthalic acids (Carius, *Z* 4, 505, *A* 148, 50) The formation of benzoic acid is perhaps preceded by that of diphenyl (Kekulé), PbO , and H_2SO_4 give benzoic acid, PbO_2 and boiling dilute HNO_3 give only oxalic acid, CrO_3 gives only CO (Holder, *Am* 7, 114)—8 PCl_5 at a red heat forms PhPCl_2 , diphenyl, and P (Michaelis, *A* 181, 265, Kohler, *B* 13, 1623)—9 S_2Cl_2 at 250° forms chloro benzene, HCl , and S (Schmidt, *B* 11, 1168)—10 Iodic acid and H_2SO_4 on heating slowly form iodo benzene (Peltzer, *A* 136, 194)—11 SO_2Cl_2 at 150° gives chloro benzene (Dubois, *Z* [2] 2, 705)—12 ClSO_2OH forms PhSO_2Ph , PhSO_2Cl , and PhSO_3H (Knapp, *Z* [2] 5, 41)—13 HClO forms $\text{C}_6\text{H}_4(\text{OH})_2\text{Cl}$, the trichlor hydrin of phenose (Carius, *A* 136, 323)—14 Aqueous HClO_4 forms trichloro phenomaleic acid, chloro benzene, and dichloro quinone (Carius, *A* 142, 129)—15 CrO_2Cl_2 acting upon benzene diluted with HOAc (1 vol) gives trichloro quinone (Carstanjen, *J pr* 107, 331) When benzene is heated with CrO_2Cl_2 there is formed a brown pp of $\text{C}_6\text{H}_4(\text{CrO}_2\text{Cl})_2$ which is converted into quinone by water (Etard, *A Ch* [5] 22, 269)—16 CHCl_3 condenses with sulphuric acid and aldehydes, XCHO to XCHPh_2 . Thus chloral forms $\text{CCl}_2\text{CHPh}_2$, bromal forms $\text{CBr}_2\text{CHPh}_2$, chloro-aldehyde forms CHClCHPh_2 , formic aldehyde forms CH_2Ph_2 (Goldschmidt, *B* 6, 985, Hepp, *B* 6, 1439)—17 Benzene is not attacked by HIAq and P at 250° , but at 280° it gives hexahydro benzene (Wreden & Znatowicz, *A* 187, 163, cf Berthelot, *A Ch* [3] 15, 150)—18 When chlorine is passed into benzene containing thiophene HCl is evolved and the benzene then no longer gives the indophenine reaction (Willgerodt, *J pr* [2] 33, 480) Pure benzene is not attacked by chlorine in the cold and in the dark, but at 80° or in sunlight benzene hexachloride is formed. In presence of carriers, *i.e.* substances capable of combining with chlorine in more than one proportion, chloro benzenes are produced—19. Nitric acid forms nitro and di nitro benzenes.

Combinations— $(C_6H_5)_2AlCl$, [8°] Decomposed by water into benzene and alumina, with Br it gives C_6H_4Br , (Gustavson, *B* 11, 2151) — $(C_6H_5)_2AlBr$, — $(C_6H_5)_2SbCl$, monoclinic tables, formed by warming $SbCl_3$ with benzene (Watson Smith & Davis, *C* 7 41, 411)

Potassium-benzene C_6H_5K mixed with C_6H_4K . Formed by heating benzene with K at 250° (Abelanz, *B* 5, 1027, 9, 10). Blue black crystalline mass, insol benzene. Takes fire in air. Converted by water into di phenyl benzene, hydrogen, and di phenyl

Constitution of Benzene—That the molecular formula of benzene is C_6H_6 , and not any multiple or submultiple of this, is settled, not only by its vapour density, but also by the existence of the following series C_6H_5Cl , $C_6H_4Cl_2$, $C_6H_3Cl_3$, $C_6H_2Cl_4$, C_6HCl_5 , C_6Cl_6 . We may call the six atoms of hydrogen in the molecule of benzene, *a*, *b*, *c*, *d*, *e*, *f*. The first question is are these six atoms of equal value, or could we, by displacing *a* by an element or radicle R, get a product different from that which would be produced by displacing *b* by R?

PROPOSITION I—Four, at least, of the hydrogen atoms are of equal value

Ordinary phenol contains hydroxyl in place of one hydrogen call this hydrogen *a*. Bromine and phosphorus convert phenol into C_6H_4Br . Sodium and carbonic acid convert this bromo phenol into sodic benzoate, $C_6H_5CO Na$. Hence the carboxyl of benzoic acid has taken the place of the hydrogen atom *a*. Now, there exist three oxy benzoic acids, $C_6H_4(OH)(CO_2H)$, and since in these the carboxyl is in position *a*, the three hydroxyls must have displaced three other atoms of hydrogen, say *b*, *c*, and *d*. When distilled with lime, these three acids, instead of giving three phenols, the hydroxyl being in places *b*, *c*, *d*, give the same phenol which is identical with the original phenol. Hence, the four hydrogen atoms which we have called *a*, *b*, *c*, and *d*, are of equal value (Ladenburg, *B* 7, 1684)

PROPOSITION II—To every hydrogen atom in the molecule of benzene there are two pairs of hydrogen atoms similarly related. Benzoic acid,

$C_6H_5(CO_2H)$ gives bromo benzoic acid, which we may call $C_6H_4Br(CO_2H)$. This, when acted upon by nitric acid, produces two isomeric nitrobenzoic acids. We may call these

But by reduction these lose their bromine, and give rise to amido-benzoic acids

$C_6H_4(NH_2)(CO_2H)$, $C_6H_4(NH_2)(CO_2H)$. These are found to be identical, being anthranilic acid. Hence, *b* and *f* are symmetrically related with regard to *a* (Hübner & Petermann, *A* 149, 129). Again, ordinary nitro benzoic acid may be converted into the above bromo benzoic acid by the

diazo reaction, hence it is $C_6H_4(NO_2)(CO_2H)$. On nitration it gives a di nitro benzoic acid which we may call $C_6H_3(NO_2)(NO_2)(CO_2H)$, which may be reduced to $C_6H_4(NO_2)(NH_2)(CO_2H)$,

whence we may successively prepare

$C_6H_4(NO_2)Cl(CO_2H)$, $C_6H_4(NH_2)Cl(CO_2H)$, and $C_6H_5Cl(CO_2H)$. The last acid is found to be identical with the chloro benzoic acid

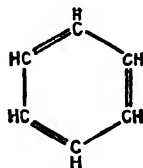

$C_6H_5Cl(CO_2H)$ obtained by the diazo reaction from $C_6H_4(NO_2)(CO_2H)$. Hence *c* and *e* are similarly related with regard to *a*. Therefore we have a second pair of hydrogen atoms similarly related with regard to *a* (Hübner, *A* 222, 94, cf Wroblewski, *A* 192, 206)

PROPOSITION III—The six atoms of hydrogen in the molecule of benzene are of equal value. Since *a*, *b*, *c*, and *d* are of equal value, and the situations of *f* and *e* are similar to those of *b* and *c* respectively, all six atoms of hydrogen are similarly placed and of equal value. This conclusion might also be deduced from the fact that no instance of isomerism among the mono substitution products of benzene has been proved

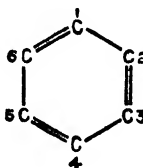

Isomerism among di substitution products Since two pairs of hydrogen atoms are symmetrical to any fifth, it follows, that only three di derivatives of benzene can exist with a given formula. Using our former notation, these are — *ab* = *af*, *ac* = *ae*, and *ad*

This is confirmed by experiment

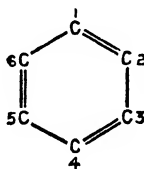

Structural formula—Since the atom of carbon is assumed to be tetravalent, all the hydrogen atoms of benzene cannot be attached to the same atom of carbon, and symmetry requires that they must be either each attached to one carbon, or else three must be attached to one, and three to another, or, finally two must be attached to one carbon, two to another, and the remaining two to a third. The two latter hypotheses do not account for more than two di substitution products, hence the former is established. The carbon atoms must be united amongst themselves in a symmetrical fashion. Each atom of carbon must be united with at least two other atoms, or the group would not hold together, but it may be united with three other atoms. The former hypothesis results in the formula

This is the ring formula of Kekulé, which is one of the two formulas originally put forward by him (*A* 137, 160). If we number the positions occupied by the atoms of hydrogen thus,

we see that the formula shows the possible existence of four di substitution products—viz 1 4, 1 3, 1 2 and 1 6. To get over this difficulty, Kekulé resorts to a peculiar mechanical hypothesis. He supposes that what we represent by straight lines in a formula really indicates that two atoms vibrate with reference to each other so that the above formula would mean that, in a given unit of time, 1 approaches 6 twice as often as it approaches 2, and so for the other atoms. Now, if this were the case, the di substitution product 1 2 would differ from 1 6, but he assumes that the motions of 1 are as follows: first, it approaches 6 twice, then it approaches 2 once, next it approaches 6 once, then it approaches 2 twice, then 6 twice, 2 once, and so on. This is equivalent to saying that the above formula for benzene is true for one instant, after which it changes to

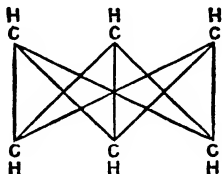

and the next instant it changes back again, and so on. This assumption leads to the deduction that only three di derivatives can exist, and, if we could devise no other formula for benzene, we should be obliged to accept it. As a matter of fact, it is now almost universally adopted, not so much on its intrinsic merits, as on account of the enormous service which it has rendered to chemistry.

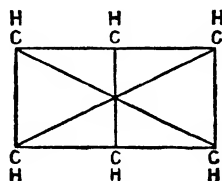

There remains, however, a second hypothesis possible, which is that every atom of carbon is united to three other atoms. The following mechanical construction may help to elucidate this hypothesis.

Let three rods be driven into the ground at the angles of an equilateral triangle, and let the top of each rod be joined by elastic string with the bottom of each of the two adjacent rods. A figure somewhat resembling a coronet is obtained, and we may suppose the six atoms of carbon in the benzene molecule situated at the two extremities of each of the three rods. At first sight it might appear that this representation of the benzene molecule would indicate the existence of three di derivatives—namely, (1) when the substituted hydrogens are attached to two carbon atoms at opposite ends of one rod, (2) when they are attached to carbon atoms which are both on the upper or both on the lower ends of two different rods, (3) when one carbon atom is on the upper end of one rod and the other is on the lower end of another rod. But if we assume that formulae and other mechanical symbols represent not actual position in space, but merely modes of combination of atoms, especially showing which atoms are directly and which indirectly united, (3) is identical with (1), for it can be converted into (1) by simply holding the string, at the opposite ends of which the carbon atoms have been placed, up right, and doing the same with the two corre-

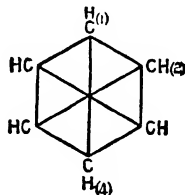

sponding strings. The rods will now take positions formerly occupied by the strings now held upright, and the figure will be the same as before. Hence this figure for benzene gives only two di-derivations, and accordingly it must be discarded. When the figure we have just considered is projected on a plane it assumes the form

This figure, by simply twisting the central rod, is converted into

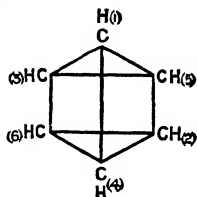

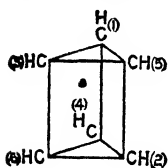

and if the central rod be now elongated we get

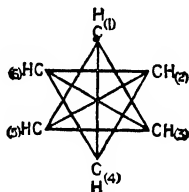

This symbol, which has been a favourite with some chemists, must, of course, be abandoned along with the solid figure from which it is derived, but it is also very easy to see that 1 2 and 1 4 di derivatives, are identical, since if we pick up the carbon atom (4) and place it upon (2), and then take up (2) and place it where (4) was, supposing all the while that the connections, which we may imagine to be elastic, are not broken, the figure will be wholly unaltered.

There remains one other benzene formula. It is obtained by joining the ends of the three rods placed vertically by six strings as before, but with this difference, that whereas in the previous formula the top of one rod is joined to the bottom of the others, in this formula the top of each rod is joined with the top of each of the others, and the bottom of each rod is joined with the bottom of each of the others. We thus obtain a right angled prism on a triangular base. This formula, defended by Ladenburg (*Theorie der aromatischen Verbindungen*, Brunswick, 1876), is capable of explaining most of the reactions of benzene, and the objections that have been brought against it are chiefly the

result of misconception of its nature Projected
upon a plane this formula becomes

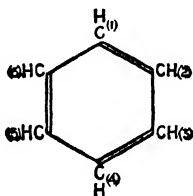

If the upper triangle be rotated through 180° , and then the figure be projected upon a horizontal plane, we obtain a figure which resembles a star

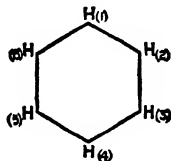

The two former figures are not symmetrical, but the latter is clearly so, and it has this advantage over the prism formula, that, if the atoms of carbon are numbered consecutively, they correspond to the atoms of carbon in Kekulé's formula, also numbered consecutively, whereas this would not be the case with the second of the three formulae here given, which is that used by Ladenburg

For most purposes it will not be necessary to decide which formula we adopt, for both the star formula and the formula of Kekulé

may be represented by the simple hexagon

The numbering of the carbon atoms here given is used throughout this dictionary. Thus, the expression C_6H_4Br , [1 5] must be taken to mean that one bromine atom has displaced the hydrogen atom numbered (1) and the other the hydrogen atom numbered (5).

Physicists have tried to decide between the formulae of Kekulé and Ladenburg. Thomsen

(*Th* iv 272, A 205, 138) considers that thermochemical data favour Ladenburg's formula, but the assumptions he makes in the course of his argument lead him in other cases to impossible conclusions. The specific volume of benzene is 96, whereas that calculated on the assumption that the S.V. of C=11, and that of H=5 is 99 this would merely show that the relation between the carbon atoms in the benzene molecule is different from that in saturated paraffins. If we compare the specific volumes of hexane, diallyl, and benzene, we find that

Hexane, C_6H_{14} has a S V 140 0

Diallyl, C_4H_6	" "	125.7
-------------------	-----	-------

Benzene, C_6H_6	"	"	95.9
-------------------	---	---	------

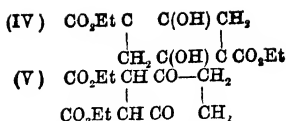

We see that the difference between the first and second (14.3) is less than that between the second and third (29.8) and that when hexane is converted into benzene by the removal of 8H the SV is lowered by 8×5.5 , while the removal of 4H, in converting hexane into diallyl, lowers SV by only 4×8.6 . That is to say the want of saturation of diallyl is accompanied by an unusually large specific volume, whereas this is not observed in the case of benzene. This would indicate that benzene is not unsaturated in the ordinary sense, and can be used as an argument in favour of Ladenburg's formula for benzene (Lossen, *A* 214, 129, R Schiff, *A* 220, 303).

On the other hand, the SV of hexahydro-toluene (141.8) differs from that of toluene (118) by 23.8. This is about three times the difference (7.2) between the SV of pentane (117.2) and amylene (110). Hence it would appear that the change in the state of saturation in passing from hexahydro toluene to toluene is of a similar character to the change in passing from pentane to amylene, the removal of H_2 in both cases producing a diminution of between 7 and 8 units in the SV. This supports Kekulé's formula for benzene (Lossen, *A* 225, 119, Horstmann, *B* 20, 766).

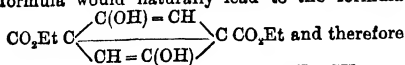

The refractive power of benzene is about equal to that calculated on the assumption that Kekulé's formula is correct, provided that certain assumptions are made regarding the connection between the refractive powers of compound molecules and the refractive powers of the constituent atoms (Bruhl, *A* 200, 228, Kanonnikoff, *J R* 15, 473).

Passing from physical to chemical considerations, we note first that the behaviour of benzene towards halogens is, on the whole, more like that of a saturated than an unsaturated compound. The following special arguments have also been employed. Sodium acting upon succinic ether gives succinyl succinic ether, which loses H_2 on oxidation, changing to di-oxyterephthalic ether. The formula of succinylsuccinic ether may be written in one of the following ways

If the first correctly represents succinyl succinic ether, it must be supposed to change into (II), (III), or (IV) during the oxidation. The third formula would naturally lead to the formula

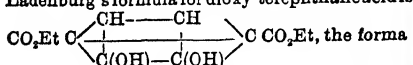

to the benzene formula $\text{HC} \begin{array}{c} \text{CH} = \text{CH} \\ \text{CH} = \text{CH} \end{array} \text{CH}$

proposed by Wislicenus, a formula which would indicate the existence of two chloro benzenes. The second formula

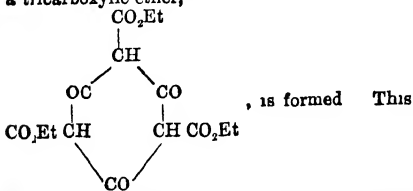

$\text{CO}_2\text{Et} \cdot \text{C} \begin{array}{c} \text{C(OH)} = \text{CH} \\ \text{CH} - \text{C(OH)} \end{array} \cdot \text{C} \cdot \text{CO}_2\text{Et}$ on oxidation, a formula based upon Kekulé's ring. The fourth formula, like the third, leads to the benzene ring of Wislicenus. The fifth formula would lead to Kekulé's or Wislicenus' ring, but with the carboxyls in the *ortho* position, whereas in terephthalic acid they are in the *para* position. Ladenburg's formula for dioxy terephthalic acid is

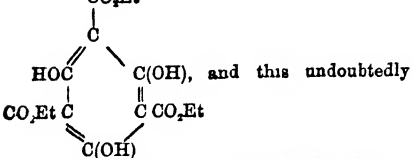

of which from formulæ I, II, III or IV requires the improbable assumption of a wandering of hydroxyl such as takes place when salicylic acid changes to *ortho* benzoic acid. Ladenburg's formula can be derived from V, but only by assuming a rearrangement of the unsaturated unions.

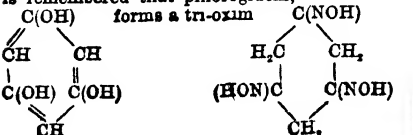

By the action of sodium upon malonic ether a tricarboxylic ether,

is found to be phloroglucin tri carboxylic ether,

favours Kekulé's hypothesis, especially when it is remembered that phloroglucin,

It will thus be seen that, in spite of the great number of researches carried out on the benzene derivatives, the constitution of benzene itself still remains unsettled.

Recent discussions on the Benzene formula — Ladenburg, *B* 19, 971, 20, 62, Baeyer, *B* 19, 1797, A K Miller, *C* 51, 208, Thomson, *B* 19, 2944, Claus, *B* 20, 1422

Orientation

Benzene gives rise to only one mono substitution product. It gives three di substitution products, and these, assuming either Kekulé's or Ladenburg's formula, are named as follows

- 1, 2 = 1, 6 is called *ortho*
 1, 3 = 1, 5 " " *meta*
 1, 4 " " *para*

When we come to tri substitution products we must distinguish several cases — 1 Compounds of the formula $\text{C}_6\text{H}_3\text{A}_3$, that is to say, where the three substituting elements or radicles are all alike. There are three such compounds

- 1, 2, 3 is called *consecutive*
 1, 3, 5 " " *symmetrical*
 1, 2, 4 " " *irregular*

2 Compounds of the formula $\text{C}_6\text{H}_2\text{A}_2\text{B}$. There are six such compounds — 3 There are ten compounds of the formula $\text{C}_6\text{H}_2\text{ABC}$

In the case of tetra- derivatives of benzene 1 There are three compounds of the formula $\text{C}_6\text{H}_2\text{A}_4$

- 1, 2, 3, 4 is called *consecutive*
 1, 2, 4, 5 " " *symmetrical*
 1, 2, 3, 5 " " *irregular*

2 There are seven compounds of the formula $\text{C}_6\text{H}_2\text{A}_3\text{B}$ — 3 There are thirteen compounds of the formula $\text{C}_6\text{H}_2\text{A}_2\text{B}_2$ — 4 There are sixteen compounds of the formula $\text{C}_6\text{H}_2\text{ABC}_2$ — 5 There are thirty compounds of the formula $\text{C}_6\text{H}_2\text{ABCD}$

There is only one penta derivative of the formula $\text{C}_6\text{H}_2\text{A}_5$, and only one compound of the formula C_6A_6 .

The next question is how to determine, in a given case, the position of substituting radicles in the benzene ring. In isolated cases it is frequently found that this may be settled by special considerations, but the only general method known is that which was thoroughly worked out, by Kekulé's pupil Körner, in a most laborious research, in the course of which he discovered no less than 126 new compounds (*G* 4, 305). This research has done more than anything else towards establishing the ring formula for benzene.

Suppose we convert $\text{C}_6\text{H}_5\text{Br}$ into $\text{C}_6\text{H}_2\text{Br}_2$, by reference to a figure it will be found that we can introduce a bromine atom in place of an atom of hydrogen in *ortho* dibromobenzene in such a way as to produce either a consecutive or an irregular tribromobenzene, but not so as to produce a symmetrical product.

Meta dibromobenzene can give rise to consecutive, irregular, or symmetrical, tribromobenzene, while *para*-dibromobenzene can only give rise to an irregular tribromobenzene.

An unknown dibromobenzene is therefore *para*, *ortho* or *meta*, according as we can get one, two, or three tribromobenzenes by treating it with bromine. Thus the dibromobenzenes from dibromoniline gives rise to three tribrome

benzenes, therefore it is a meta compound. Again, the chief product of the action of two molecules of bromine upon benzene gives rise to only one tribromobenzene on further treatment with bromine, hence this product is para dibromobenzene. On the other hand, the minor product of the dibromination of benzene gives rise to two, and only two, tribromobenzenes, therefore it is ortho dibromobenzene.

In order to investigate the constitution of a given tribromobenzene, two methods may be followed either introduce another atom of bromine in place of hydrogen and see how many tetrabromobenzenes result, or displace an atom of bromine by hydrogen and carefully examine how many dibromobenzenes are formed. It can easily be seen by reference to the formula that consecutive tribromobenzene produces two di bromobenzenes and also two tetrabromobenzenes, while symmetrical tribromobenzene produces one dibromo and one tetrabromo benzene, and irregular tribromobenzene gives rise to all three dibromobenzenes and all three tetrabromobenzenes.

The following are the melting and boiling points of the bodies described

<i>Dibromobenzenes</i>	
Ortho	[-1°] (224°)
• Meta	liquid (220°)
Para	[89°] (219°)
<i>Tribromobenzenes</i>	
Consecutive	[87°]
Symmetrical	[120°] (278°)
Irregular	[44°] (276°)
<i>Tetrabromobenzenes</i>	
Consecutive (1, 2, 3, 4)	[160°]
Symmetrical (1, 2, 4, 5)	[137°-140°]
Irregular (1, 2, 3, 5) am	[99°] (329)

It will be observed that the isomerides differ widely in melting points, but very slightly in boiling points, and this is usually the case where isomerism is due to difference of position of substituents in the benzene nucleus.

The orientation of any given benzene derivative must be determined either by preparing it from one of the three bromobenzenes, or else by preparing a bromobenzene from it.

Examples

Para dibromobenzene when treated with sodium and methyl iodide gives a dimethyl benzene or xylene $C_6H_4Br_2 + 2CH_3I + 4Na = 2NaI + 2NaBr + C_6H_4(CH_3)_2$. By oxidation this is converted first into toluic acid, $C_6H_4(CH_3)CO_2H$, and next into terephthalic acid, $C_6H_4(CO_2H)_2$. It is therefore evident that the xylene, the toluic acid, and terephthalic acid, are all *para* compounds. Also since a certain bromotoluene, $C_6H_4Br(CH_3)$, when treated with sodium and methyl iodide gives the above *para* xylene, it must be the *para*-bromotoluene, and the bromo benzoic acid derived from it by oxidation— $C_6H_4BrCH_2 + O_2 = C_6H_4BrCO_2H + H_2O$ —must be *para*-bromobenzoic acid.

As another example we may take the ortho series. A certain bromoaniline, $C_6H_4BrNH_2$, is known to be *ortho*- because when the amidogen is displaced by bromine the product is ortho-dibromobenzene. Now, this *ortho* bromoaniline

may be got by reducing a bromonitrobenzene $C_6H_4Br(NO_2)$, which may be formed by diazo-reaction from a nitroaniline $C_6H_4(NH_2)(NO_2)$, and this may be got by acting on a nitroanisole $C_6H_4(OCH_3)(NO_2)$ by ammonia, and this nitro-anisole may be obtained from a nitrophenol $C_6H_4(OH)(NO_2)$, and this nitrophenol may be itself reduced to an amidophenol $C_6H_4(OH)(NH_2)$, and this amidophenol may be converted by diazo reaction into a chlorophenol $C_6H_4(OH)Cl$, and this chlorophenol may be converted by cautious fusion with potash into a dioxybenzene $C_6H_4(OH)_2$. All the compounds here enumerated are clearly *ortho* compounds, and as the dioxybenzene is found to be pyrocatechin, we have proved that *pyrocatechin* is *ortho* dioxybenzene.

In the *para* series we may trace, in the same way, the connection between *p* dibromobenzene and *p* nitroanisole $C_6H_4(OCH_3)NO_2$. Thence we proceed by the following steps reduce to $C_6H_4(OCH_3)(NH_2)$, convert this into $C_6H_4(OCH_3)(OH)$ by nitrous acid, and treat with hydric iodide. In this way we get a second dioxybenzene, which is found to be *hydroquinone*, and this body is therefore a *para* compound. The remaining dioxybenzene is *resorcin*, which must be the *meta* compound.

The rules governing substitution in the benzene molecule are discussed in the article AROMATIC SERIES. Derivatives of benzene are described, as ANILINE, PHENOL, BROMO, BROMONITRO, CHLORO, CHLORO NITRO, IODO, METHYL, NITRO, OXY BENZENE, etc.

BENZENE HEXABROMIDE $C_6H_2Br_6$. Bromine is dropped into boiling benzene exposed to direct sunlight, the hexabromide crystallises out on cooling, it is separated from tri bromo benzene by sublimation, and finally crystallised from a mixture of alcohol and benzene (Mitscherlich, *P* 35, 374, Meunier, *C R*, 101, 378, *A Ch* [6] 10, 269). Prisms, isomorphous with the (a) hexachloride, not attacked by HNO_3 or H_2SO_4 . Alcoholic KOH splits it up into HBr and *u* tri bromo benzene. If the product of the action of $ZnEt_2$ upon benzene hexabromide dissolved in benzene be oxidised with chromic mixture, benzoic, isophthalic, terephthalic, and di bromobenzoic acids are formed (Ador & Rulliet, *Bl* [2] 24, 485).

BENZENE CARBOXYLIC ACIDS *v* BENZOIC, PHTHALIC, *Tri* MELLITIC, *Tri* MESIC, *Hemi* MELLITIC, PREHNITIC, PYROMELLITIC, MELLOPHANIC, and MFLITIC ACIDS.

Benzene penta carboxylic acid $C_{11}H_6O_5$, *s.s.* $C_6H(CO_2H)_5$. Formed by oxidation of penta-methyl benzene (Friedel & Crafts, *A Ch* [6] 1, 474). Amorphous (containing 6a_q). The K salt forms small deliquescent prisms, the salts of Ag, Pb, Ba, Fe, Cu, and Al form insoluble pps.

BENZENE (a) HEXACHLORIDE $C_6H_2Cl_6$. Mol w 291 [157°] SG 1.87. Prepared by chlorinating benzene in direct sunlight (Faraday, *A Ch* [2] 30, 275, Mitscherlich, *P* 35, 870, Lesmple, *Bl* [2] 6, 161). 350 g may be got from 600 g benzene (Leeds & Everhart, *A C J* 2, 205). It may be freed from $C_6H_2Cl_4$ and $C_6H_2Cl_2$ by treatment with H_2SO_4 or HNO_3 (Meunier, *A Ch* [6] 10, 223). Monoclinic crystals, may be sublimed. At 288° it boils, splitting up into HCl and (1, 2, 4) tri chloro-

benzene The same decomposition is effected by heating with alcoholic KOH

Reactions —1 Zinc reduces it, in alcoholic solution, to benzene (Zinn, Z 1871, 284) —2 Fuming nitric acid has no action —3 Silver acetate forms crystalline $C_6H_5Cl_3(OAc)_3$ $C_6H_5Cl_3$

Benzene (β) hexachloride $C_6H_5Cl_6$ [310°] VD 9 28 Formed at the same time as the (α) compound, when the mixture is sublimed, the (β) compound sublimes last. If the mixture (4 pts) be boiled with KCN (3 pts) and alcohol, the (β) compound is left while the (α) compound is decomposed. Regular octahedra, cubes, tetrahedra, or tetrakis tetrahedra. Alcoholic potash splits it up into HCl and (1, 2, 4) tri chloro benzene, but more slowly than the (α) compound (J Meunier, C R 98, 436, 100, 358)

BENZENE HYDRAZIMIDO v pp 369, 370

BENZENE PHENYL HYDRAZIMIDO

NAPHTHALENE v Benzene azo phenyl (β) naphthylamine

BENZENE PYROGALLOL PHTHALEIN v Tri - OXY - TRI - PHENYL CARBINOL CARBOXYLIC ANHYDRIDE

BENZENE TRI QUINONE C_6O_4 4aq So called 'oxy carboxylic acid' of Lerch [c 95°]

Formation —1 By the action of HNO_3 upon the hydrochloride of tetra oxy di amido benzene, the yield is 65 p.c. —2 By the action of HNO_3 upon di imido di oxy quinone $C_6(NH_2)(OH)_2O_2$ —3 By oxidation of hexa oxy benzene $C_6(OH)_6$

Properties —Colourless microscopic needles. Nearly insoluble in cold water, alcohol, and ether

Reactions —By reducing agents it is converted successively into di oxy benzene di quinone $C_6(OH)_2O_2$, tetra oxy benzene quinone $C_6(OH)_4O_2$, and finally hexa oxy benzene $C_6(OH)_6$. On heating to 100° or on boiling with water it evolves CO_2 and yields croconic acid $C_6H_2O_6$ (Nietzki a Benckiser, B 18, 504)

BENZENE RESORCIN PHTHALEIN v Di - OXY TRIPHENYL - CARBINOL CARBOXYLIC ANHYDRIDE

BENZENE - SULPH - AMIDO - ANILIDE v BENZENE SULPHONIC ACID

BENZENE SULPH - AMIDO - TOLUIDE v BENZENE SULPHONIC ACID

BENZENE SULPHINIC ACID $C_6H_5SO_2$ 2e $C_6H_5SO_3H$ [84°]

Formation —1 By adding zinc dust to a cooled alcoholic solution of the chloride of benzene sulphonic acid, the resulting zinc salt is very slightly soluble in water, it is treated with Na_2CO_3 , the filtrate is concentrated and the acid p.p.d by HCl (Schiller a Otto, B 9, 1584) —2 From the phenyl hydrazide of benzene sulphonic acid $PhSO_2N_2H_2Ph$, called also di phenyl sulphazide, by boiling with baryta water (Limpricht, B 20, 1239) —3 By passing SO_2 into a warm mixture of benzene and $AlCl_3$ (Friedel a Crafts, C R 86, 1368, Adrianowsky, B 12, 853) —4 By the action of $ZnEt_2$ on $C_6H_5SO_2Cl$ (Kalle, A 119, 156) —5 From $C_6H_5SO_2Cl$ and $Pb(SeEt)_2$, thus

$2PhSO_2Cl + 2Pb(SeEt)_2 = (PhSO_2)_2Pb + PbCl_2 + S_2Et_2$ (Schiller a Otto, B 9, 1636) —6 From diphenyl disulphide and alcohol potash $2Ph_2S_2 + 4KOH = PhSO_2K + 8PhSK + 2H_2O$ (S a O)

Properties —Long radiating prisms. Sl sol cold, v sol hot, water, v sol alcohol and

ether, acid to test paper. Above 100° it decomposes

Reactions —1 Water at 130° gives benzene sulphonic acid and phenyl benzene-thiosulphonate (Otto, A 145, 317), the same reaction takes place slowly in the cold, especially in presence of HCl (Pauly a Otto, B 10, 2181) —2 Ethyl mercaptan at 100° gives di ethyl di sulphide and phenyl ethyl di sulphide (Otto a Rossing, B 19, 3136) —3 Phosphorus pentachloride reacts thus $PhSO_3H + PCl_5 = PCl_3 + HCl + PhSO_2Cl$ —4 Potash fusion gives benzene and K_2SO_3 —5 Sodium chloroacetate gives phenyl sulphonyl acetic acid, $PhSO_2CH_2CO_2H$ —6 Sodium di chloroacetate gives phenyl chloro methyl sulphone $PhSO_2CH_2Cl$ —7 Methylene iodide reacts thus $CH_2I_2 + PhSO_3Na = NaI + PhSO_2CH_2I$ —8 Sodium azo di chloro propionate acting upon sodium benzene sulphinate gives di phenyl ethylene di sulphone, $PhSO_2C_2H_4SO_2Ph$ —9 Phenyl hydrazine in presence of conc HClAq forms phenyl benzene thiosulphonate and the phenyl hydrazide of benzene sulphonic acid (q v) —10 When H_2SO_4 is added to a solution of $PhSO_3Na$ and NO_2Na a pp is got which may be crystallised from alcohol. It is perhaps $(PhSO_2)_2NOH$. It is sl sol cold water, CS_2 , or ligroin, but v sol alcohol and ether. At 100° it evolves nitrous acid gas. Boiling water, alkalis, or acids, decompose it into $PhSO_3H$ and nitrous acid (Konigs, B 11, 615) —11 Fuming nitric acid forms $C_6H_5NS_2O_3$, which may be $(PhSO_2)_2NO$. It forms crystals, [98.5°], insol alkalis, sl alcohol, m sol benzene (Otto a Gruber, A 141, 370, Konigs, B 11, 615, 1590)

Salts — BaA' , clumps — ZnA' , tablets, sl sol alcohol and ether, sl sol water (Kalle) — ZnA' , 2aq insol cold water (S a O) — AgA'

Ethyl ether EtA' —Formed by means of $EtOH$ and HCl, or, together with CO_2 , by heating $PhSO_3Na$ with $ClCO_2Et$. Non volatile oil. $KMnO_4$ in acetic acid solution oxidises it to $PhSO_3Et$ (Otto a Rossing, B 18, 2495, 19, 1225)

Benzene di-sulphonic acid $C_6H_4(SO_3H)_2$ [13] From [13] $C_6H_4(SO_2Cl)_2$, and zinc dust (Pauly, B 9, 1595). Oil — BaA'

BENZENE-SULPH NITR-ANILIDE v BENZENE SULPHONIC ACID

BENZENE SULPHONE v Di PHENYL SULPHONE

BENZENE SULPHONIC ACID $C_6H_5SO_3$ 2e $C_6H_5SO_3H$ Phenyl sulphurous acid Sulphobenzolic acid [42°]

Formation —1 From benzene and fuming H_2SO_4 (Mitscherlich, P 31, 283, 634, Stenhouse, Pr 14, 361, Wurtz, C R 64, 749) —2 By the oxidation of benzene sulphonic acid (Otto a Ostrop, A 141, 369) —3 By the oxidation of phenyl mercaptan $PhSH + O_2 = PhSO_3H$ (Vogt, A 119, 151) —4 By boiling p diazobenzene sulphonic acid with alcohol under pressure (R Schmitt, A 120, 129) —5 Together with phenyl benzene thiosulphonate by heating benzene sulphonic acid with water at 130° (Otto, A 145, 317)

$8PhSO_3H = PhSO_3H + PhSO_2SPh + H_2O$

Preparation —Benzene (2 pts) is shaken with fuming H_2SO_4 (3 pts) with gentle warm,

ing The acid is separated from undissolved benzene, diluted, and neutralised with BaCO₃ or lead carbonate In the filtrate the Ba, or Pb, salt is decomposed by H₂SO₄ or H₂S respectively

Properties—Small, four sided, deliquescent plates (containing 13aq)

Reactions—1 By fusion with *potash, soda*, or a mixture of the two, it is converted into phenol The percentage of phenol obtained increases with the amount of alkali and with the temperature of the fusion The percentage of phenol is given in this table, one equivalent of acid being used

KOH	NaOH	Temperature	Phenol
2	—	253°	23
3	—	210°	7
3	—	267°	79
—	3	209°	1
—	3	280°	26
3	3	211°	2
3	3	277°	39
3	3	360°	64
7	—	252°	96

(P Degener, *J pr* 125, 401) —2 The potassium salt distilled with KCN or K₂FeCy₄ gives benzonitrile (Merz, *Z* [2] 5, 33) —3 *Dry distillation* gives H₂SO₄, benzene, SO₂, and di phenyl sulphide —4 *Dry distillation of the ammonium salt* gives benzene and small quantities of benzene sulphamide, diphenyl, di phenyl sulphone, phenyl mercaptan, and (traces of) quinoline (Egli, *B* 18, 575) —5 The potassium salt distilled with NaNH₂ gives aniline (Jackson a Wing, *Am* 9, 75) —6 Distillation of the Na salt gives di phenyl sulphide, di phenyl di sulphide, phenyl mercaptan, CO₂ and SO₂ (Stenhouse) —7 A mixture of H₂SO₄ and water boiling at 175° converts it into benzene and H₂SO₄ (Armstrong, *C J* 45, 151) —8 Fusion with *potassium formate* gives potassium benzoate

Propyl ether PrA^a SG 11 179 (H)

Phenyl ether PhA^a [35°] Formed by acting upon Ph SO₂Cl dissolved in benzene with sodium phenol Formed also by action of zinc dust on a mixture of phenol and PhSO₂Cl Trimetric crystals, *a* *b* *c* = 6847 1 8576 V sol benzene, ether, and alcohol, insol water Slowly saponified by boiling aqueous KOH, alcoholic NH₃ even at 200° does not affect it On nitration it gives the nitro phenyl ether, and also a tri nitro- derivative [116°] (Schiaparelli, *G* 11, 66, R Otto, *B* 19, 1832)

p-Nitro phenylether C₆H₄SO₂C₆H₄(NO₂) [82°] Formed by nitrating the preceding, or from *p* nitro phenol, ZnCl₂, and PhSO₂Cl (Schiaparelli, *G* 11, 70) Sl sol cold alcohol

Chloride Ph SO₂Cl—*Benzene sulphochlo-*

ride (247°) SG 11 1378 Formed by the action of PCl₅ on a salt of benzene sulphonic acid (Gerhardt a Chancel, *C R* 35, 690), or by passing chlorine into an aqueous solution of PhSO₂H (Otto a Ostrop) Oil, v sol alcohol and ether Slowly solidifies at 0° forming large rhombic crystals May be distilled in vacuo, but is much decomposed on boiling under atmospheric pressure Hardly attacked by water

Reactions —1 *Tin* and HCl form phenyl mercaptan —2 *Sodium amalgam* or ZnEt₂ forms a benzene sulphinate —3 PCl₅ at 210° gives C₆H₄Cl₂, phosphorus oxychloride, and SO₂Cl₂ (Kekulé a Barbaglia, *B* 5, 876) —4 PbO₂ gives at 180° PbSO₄ and C₆H₄Cl₂ (Wallach, *A* 214, 219) —5 *Phenol* (1 mol) and zinc dust gives Ph SO₂Ph, phenol (½ mol) and ZnCl₂ gives Ph SO₂C₆H₄O SO₂Ph (?) [123°] (Schiaparelli, *G* 11, 66)

Bromide Ph SO₂Br From PhSO₂H and Br (Otto, *A* 141, 372) Oil

Amide Ph SO₂NH₂ *Benzene sulphamide* *Benzene sulphonamide* [156°] (Hybbeneth, *A* 221, 206) S 43 at 16° Formed by the action of NH₃ on the chloride or bromide (Otto a Ostrop, *A* 141, 365), or, in small quantities, by heating the ammonium salt at 200° (Stenhouse, *Pr* 14, 351) Needles (from water) or plates (from alcohol) V sl sol water, sol hot NH₄Aq, v sol alcohol and ether Ammoniacal AgNO₃ gives a pp of Ph SO₂NHAg With PCl₅ the amide gives Ph SO₂NH PCl₂ [181°] (Wichelhaus, *B* 2, 502) Succinyl chloride gives rise to PhSO₂N(CO₂)C₂H₄ [160°], whence conc NH₄Aq produces Ph SO₂N CO C₂H₄ CO NH₄ [165°] (Gerhardt a Chancel, *C R* 35, 690, Gerhardt a Chiozza, *A Ch* [3] 47, 129)

Benzoyl derivative Ph SO₂NHBz [147°] From benzene sulphonamide and BzCl at 145° (Gerhardt, *A* 108, 214, Wallach, *A* 214, 210) Prisms (from alcohol) Salt —PhSO₂NNaBz Silky needles (from alcohol) *Reactions* —1 PCl₅ gives the imido chloride Ph SO₂N CCl₂Ph [80°] This forms triclinic plates (from benzoline) *a* *b* *c* = 862 1 2, *α* = 87° 59', *β* = 94° 31', *γ* = 69° 24' When this imido chloride is heated it splits up into benzonitrile and benzene sulpho chloride (Wallach a Gossmann, *A* 214, 210) Aniline converts the imido chloride into phenyl sulphonyl phenyl benzamidide (PhSO₂N) C(NHPh) Ph —2 The Pb and Ag derivatives are converted by EtI at 100° into the original amide (Remsen a Palmer, *Am* 8, 235)

Di benzoyl derivative PhSO₂NBz₂ [105°] *Methylamide* Ph SO₂NHMe An oil, formed by treating the chloride with aqueous methylamine (Romburgh, *R* 3, 16)

Methyl nitro amide Ph SO₂NMe(NO₂) [44°] From the preceding and HNO₃ (SG 148) *Ethylamide* Ph SO₂NEtH [58°] From the chloride and NEtH₃ (Romburgh, *R* 3, 13)

Ethyl-nitro-amide Ph SO₂NEt(NO₂) [44°] Formed by the action of HNO₃ on the preceding or on the succeeding compound. Needles (from alcohol), volatile with steam

Di-methylamide C₆H₄SO₂NMe₂ [48°]

Di-ethylamide Ph SO₂NEt₂ [42°]

Anilide Ph SO₂NHPh. [102°] (Wallach, *A* 214, 221) S 43 at 16° From the chloride and aniline (Biffi, *A* 91, 107, Gericke, *A* 100, 217, Meyer a Ascher, *B* 4, 326).

p-Chloro-anilide $\text{PhSO}_2\text{NH C}_6\text{H}_4\text{Cl}$ [122°] From the preceding and PCl_5 , or from PhSO_2Cl and *p*-chloro aniline (Wallach *B* 9, 425)

o-Nitro-anilide $\text{PhSO}_2\text{NH C}_6\text{H}_4(\text{NO}_2)$ [12] [104°] From *o* nitro-aniline and PhSO_2Cl (Lellman, *A* 221, 16, *B* 16, 594) Yellow plates, sol alcohol, glacial HOAc, and CHCl_3

m Nitro anilide $\text{PhSO}_2\text{NH C}_6\text{H}_4(\text{NO}_2)$ [13] [132°] From *m* nitro-aniline and PhSO_2Cl Flat yellow needles (*L*)

p Nitro anilide $\text{PhSO}_2\text{NH C}_6\text{H}_4(\text{NO}_2)$ [14] [139°] From *p* nitro aniline and PhSO_2Cl Yellow crystals

o Amido-anilide $\text{PhSO}_2\text{NH C}_6\text{H}_4(\text{NH}_2)$ [12] [168°] From the *o* nitro anilide by tin and HCl (*L*) Needles (from 60 p c alcohol) V sol. alcohol, sl sol ligroin — B^*HCl

p Toluide $\text{PhSO}_2\text{NH C}_6\text{H}_4\text{Me}$ [14] [120°] From the chloride and *p* toluidine (Wallach *a* Huth, *B* 9, 427)

m-Nitro *p*-toluide $\text{PhSO}_2\text{NH C}_6\text{H}_3\text{Me}(\text{NO}_2)$ [143] [99°] From the preceding by nitration, or from PhSO_2Cl and nitro *p* toluidine (Lellmann, *A* 221, 18) Cubes (from alcohol) Not attacked by alcoholic KOH

Di nitro *p* toluides $\text{PhSO}_2\text{NH C}_6\text{H}_3\text{Me}(\text{NO}_2)_2$ [178°] Formed by nitration of the *p* toluides Yellow prisms, sl sol cold alcohol (Lellmann, *B* 16, 595) Not attacked by alcoholic KOH

m-Amido-*p* toluides $\text{PhSO}_2\text{NH C}_6\text{H}_3\text{Me}(\text{NH}_2)$ [143] [146.5°] From the nitro compound by tin and HCl Colourless needles (from dilute alcohol), sl sol water

di-phenyl amide PhSO_2NPh . [124°] From PhSO_2Cl and NPh_3 at 200° (Wallach, *A* 214, 220) Silk like needles (from alcohol) Sol alcohol, ether, or benzene, insol water Conc H_2SO_4 forms a blue solution Insol HClAq .

Phenyl hydrazide $\text{C}_6\text{H}_5\text{N}_2\text{O}_2\text{S}$ *ie* $\text{PhSO}_2\text{N}_2\text{HPh}$ Phenyl benzene sulphazide

Di-phenyl sulphazide [148°–150°] Formation — 1 By the action of SO_2 upon diazo benzene (Königs, *B* 10, 1531, Wiesinger, *B* 10, 1715) — 2 From benzene sulphonic chloride and phenyl hydrazine (Fischer, *A* 190, 132) — 3

From benzene sulphonic acid (*q* v) and phenylhydrazine hydrochloride (Escales, *B* 18, 893) — 4 By reduction of $\text{C}_6\text{H}_5\text{N}_2\text{SO}_2\text{C}_6\text{H}_5$ with zinc dust and acetic acid Preparation — Aniline is dissolved in alcohol saturated with SO_2 , the solution is cooled below 0° and a conc solution of about double the theoretical quantity of KNO_2 is slowly added, after standing for 24–36 hours it is precipitated by water, the yield is 80 p c

Properties — White felted needles (from alcohol) With NaOEt it gives a very unstable crystalline sodium compound $\text{C}_{12}\text{H}_{11}\text{NaN}_2\text{SO}_2$ Reaction — By boiling with aqueous alkalis (*ie* baryta water) it is decomposed into benzene sulphimic acid, benzene, and N_2 , $\text{PhN}_2\text{H} \cdot \text{SO}_2\text{Ph} = \text{PhH} + \text{PhSO}_2\text{H} + \text{N}_2$ (*E*, *B* 18, 893, Lamprecht, *B* 20, 1258)

BENZENE-*o*-DISULPHONIC ACID $\text{C}_6\text{H}_4(\text{SO}_3\text{H})_2$ *ie* $\text{C}_6\text{H}_4(\text{SO}_3\text{H})_2$ [12] From amido benzene *m*-sulphonic acid by sulphonation, diazotisation, and boiling with alcohol (Drebes, *B* 9, 553)

Chloride $\text{C}_6\text{H}_4(\text{SO}_3\text{Cl})_2$. [105°] Four-sided plates

Amide $\text{C}_6\text{H}_4(\text{SO}_2\text{NH}_2)_2$. [238°]

Benzene-*m* disulphonic acid $\text{C}_6\text{H}_4(\text{SO}_3\text{H})_2$ [13]

Formation — From amido benzene *p* sulphonic acid by sulphonation, diazotisation, and heating with alcohol (Zander, *A* 198, 8)

Preparation — When benzene or benzene sulphonic acid is treated with fuming H_2SO_4 , both *m* and *p* disulphonic acids are formed The *m* acid is formed chiefly when the temperature is low or when the mixture is kept at a high temperature for a short time only (Buckton *a* Hofmann, *C* *J* 9, 255 Barth *a* Senhofer, *B* 8, 754, 1477, 9, 969, Lamprecht, *B* 9, 550, Korner *a* Monselise, *B* 9, 583) Benzene (1 pt) is freed from thiophene by shaking with conc H_2SO_4 , and is then dissolved in fuming (70 p c) sulphuric acid (4 pts) at 40° The solution is heated for 2 hours at 275°, cooled, poured into water, and neutralised with lime, CaSO_4 is removed by filtration, and the lime salts of the *m* and *p* acid may be separated by crystallisation, the former separating first (Binschedler *a* Busch, *Monit Scient* 1878, 1169, cf Egl, *B* 8, 817, Heinzelmann, *A* 188, 159)

Properties — Very deliquescent crystals (containing 2½ aq) The alkaline salts are v. sol water

Salts — NaA'' 4aq — KA'' aq *S* 66.6 at 100° — BaA'' 2aq *S* 44.2 at 100° Large prisms — CuA'' 6aq v sol water — CaA'' 1½aq — ZnA'' 4aq — PbA'' 2aq *S* (of PbA'') 86.2 at 26° — AgA''

Reaction — 1 By fusion with potash or soda it is converted into resorcin The acid is first converted into *m* phenol sulphonic acid (at 180°) The amount of resorcin formed by fusing this body (1 mol) with potash (24 mols) at 270° for 10 minutes is 2.7 p c, at 270° for 20 minutes it is 21 p c, and at 250° for 30 minutes it is 26 p c When soda, or a mixture of potash and soda, is used, the yield is rather less (Degener, *J* *pr* 128, 318) — 2 By fusion with potassium cyanide the potassium salt is converted into $\text{C}_6\text{H}_4(\text{CN})_2$, which, when boiled with potash, gives isophthalic acid (Wislicenus *a* Brunner, *B* 4, 984, Ross Garrick, *Z* 5, 549, Barth *a* Senhofer, *A* 174, 238, *B* 8, 754, V Meyer *a* Michler, *B* 8, 672)

Chloride $\text{C}_6\text{H}_4(\text{SO}_3\text{Cl})_2$. [63°] From sodium benzene disulphonate and PCl_5 or $\text{S}_2\text{O}_5\text{Cl}_2$ (Heumann *a* Köchlin, *B* 16, 488) Monosymmetrical crystals, *a* *b* *c* = 11991 1 08688, β = 85° 44' (Otto, *B* 19, 2424)

Amide $\text{C}_6\text{H}_4(\text{SO}_2\text{NH}_2)_2$ [229°] Needles

Benzene *p*-disulphonic acid $\text{C}_6\text{H}_4(\text{SO}_3\text{H})_2$ [14]. Prepared as above The potassium salt distilled with KCN gives di cyano benzene, which, on saponification, gives terephthalic acid (Wislicenus *a* Brunner, *B* 4, 984)

Salts — KA'' aq thin plates *S* (of KA'') 66.6 at 100° — BaA'' aq *S* (of BaA'') 71.9 at 100° — CaA'' aq — CuA'' 4aq — PbA'' aq *S* (of PbA'') 24.9 at 26° — ZnA'' 4aq

Chloride $\text{C}_6\text{H}_4(\text{SO}_3\text{Cl})_2$. [131°] Needles

Amide $\text{C}_6\text{H}_4(\text{SO}_2\text{NH}_2)_2$ [288°] Thin scales (from water)

s Benzene-tri-sulphonic acid $\text{C}_6\text{H}_3(\text{SO}_3\text{H})_3$ [135] Prepared by heating 5 pts of the potassium salt of the mono- or *m*-di sulphonic acid with 6

pts of ordinary H_2SO_4 in an open dish till H_2SO_4 volatilises, this ready sulphonation is probably due to the presence of KHSO_4 or of potassium pyrosulphate. By heating the potassium salt with KCN the nitrile of trimesic acid $\text{C}_6\text{H}_2(\text{CO}_2\text{H})_3$ is obtained. NaOH fusion yields phloroglucin. The Ba salt is sparingly soluble in water. Salts— $\text{K}_2\text{A}'''$ 8aq— $\text{Ba}_2\text{A}'''$ 2.5— $\text{Ba}_3\text{A}'''$ 2.6aq— $\text{Pb}_2\text{A}'''$ 4aq slender needles, v sol water— $\text{Ag}_2\text{A}'''$ 8aq (Senhofer, A 174, 243).

Chloride [184°] **Amide** [306°] (Jackson & Wing, B 19, 898).

Benzoyl amide $\text{C}_6\text{H}_5(\text{SO}_2\text{NHBz})_2$ [285°] **Anilide** $\text{C}_6\text{H}_5(\text{SO}_2\text{NPhH})_2$ [287°] (J Am 9, 346).

Derivatives of the sulphonic acids of benzene are described as—DIAZO BENZENE SULPHONIC ACID (p 405), SULPHO BENZENE AZOXY BENZENE SULPHONIC ACID (p 428), AMIDO, BROMO, BROMO AMIDO, BROMO NITRO, CHLORO, IODO, METHYL, NITRO, PROPYL, BENZENE SULPHONIC ACIDS.

BENZENE DI-SULPHOXIDE v **PHENYL BENZENE THIOSULPHONATE**

BENZENE SULPHYDRATE v **PHENYL MERCAPTAN**

BENZENE THIOSULPHONIC ACID

$\text{C}_6\text{H}_5\text{SO}_2\text{SH}$

Preparation—1 By the action of KHS on benzene sulphonic chloride—2 By heating a solution of a salt of benzene sulphonic acid with sulphur.

Salts— KA' v sol hot alcohol and water— NaA' 1½aq

Ethyl ether $\text{C}_6\text{H}_5\text{SO}_2\text{SEt}$ **Ethyl-phenyl-di sulphoxide**. From the potassium salt and EtBr. Colourless heavy oil. Insol water, miscible with alcohol and ether. Slowly volatilises with steam. On reduction with zinc and H_2SO_4 in alcoholic solution it gives phenyl mercaptan and ethyl mercaptan. Boiling KOHAq gives benzene sulphonic acid and di-ethyl di sulphide (Otto, B 15, 127).

Ethylene ether $\text{A}'_2\text{C}_6\text{H}_5$ [85°] Formed by heating an alcoholic solution of the Na or K salt (2 mols) with ethylene bromide (1 mol). Small thin silky needles. Without taste or smell. V sol benzene and hot alcohol, far less in cold alcohol. By warming with alcoholic KOH it gives benzene sulphonic acid, ethane di sulphonic acid $\text{C}_6\text{H}_5(\text{SO}_2\text{H})_2$, and di ethylene tetra sulphide $(\text{C}_2\text{H}_4)_2\text{S}_4$. By warming with alcoholic KHS it gives the potassium salt and ethylene mercaptan $\text{C}_2\text{H}_5(\text{HS})_2$. If the alcoholic solution is warmed with ethylene mercaptan, benzene sulphonic acid and di ethylene tetra sulphide are produced. On reduction it gives primarily benzene sulphonic acid and ethylene mercaptan. By warming with alcoholic H_2S it is converted into phenyl tetra sulphide, ethylene sulphhydrate, &c (Otto & Rössing, B 20, 2079, 2090).

Phenyl ether $\text{C}_6\text{H}_5\text{SO}_2\text{SC}_6\text{H}_5$ **Benzene di sulphoxide** **Diphenyl di sulphoxide** [45°] Formed by the decomposition of benzene sulphonic acid (q v) by boiling water, or even by spontaneous decomposition (Pauly & Otto, B 9, 1639, 10, 2181, 11, 2070). Monosymmetrical prisms, $a, b, c = 1.446, 1.14709$ (Otto, B 15, 131). **Reactions**—1 By saponification with alkalis it is decomposed into benzene sulphonic acid and di phenyl-di sulphide.

$3\text{C}_6\text{H}_5\text{SO}_2\text{SC}_6\text{H}_5 + 2\text{H}_2\text{O} =$

$4\text{C}_6\text{H}_5\text{SO}_2\text{H} + (\text{C}_6\text{H}_5)_2\text{S}_2$. This probably takes place in two stages.

(a) $2\text{C}_6\text{H}_5\text{SO}_2\text{SC}_6\text{H}_5 + 2\text{H}_2\text{O} =$

$3\text{C}_6\text{H}_5\text{SO}_2\text{H} + \text{C}_6\text{H}_5\text{SH}$.

(b) $\text{C}_6\text{H}_5\text{SO}_2\text{SC}_6\text{H}_5 + \text{C}_6\text{H}_5\text{SH} =$

$\text{C}_6\text{H}_5\text{SO}_2\text{H} + (\text{C}_6\text{H}_5)_2\text{S}_2$.

The benzene thiosulphonic phenyl-ether reacts in the cold with sodium phenyl mercaptide according to the last equation (b) (Otto & Rössing, B 19, 1235)—2 Zinc dust added to an alcoholic solution gives zinc phenyl mercaptide and zinc benzene sulphinate—3 H_2S forms benzene sulphonic acid, phenyl mercaptan, phenyl tetra sulphide, &c—4 Zinc phenyl mercaptide added to an alcoholic solution gives di-phenyl di-sulphide and zinc benzene sulphinate—5 Phenyl mercaptan on heating forms di phenyl di sulphide and benzene sulphonic acid—6 Ethyl mercaptan at 115° gives di-ethyl di sulphide, phenyl ethyl disulphide, di phenyl di sulphide, and other products (Otto & Rössing, B 19, 3137).

BENZENYL ALCOHOL v **Ortho-BENZOIC ACID**

BENZENYL AMIDINE v **BENZAMIDINE**.

BENZENYL-TRI-AMIDO-BENZENE

$\text{C}_{11}\text{H}_{11}\text{N}_3$, i.e. $\text{PhC} \begin{smallmatrix} \text{NH} \\ \diagup \quad \diagdown \end{smallmatrix} \text{C}_6\text{H}_4\text{NH}_2$. [240°].

Amido phenylene benzamidine. From benzenyl-nitro phenylene-diamine, tin, and HCl (Hubner, A 208, 309). Needles, v sl sol water, v sol alcohol— $\text{B}''\text{HCl}$ — $\text{B}''\text{HNO}_2$ — $\text{B}''\text{H}_2\text{SO}_4$ 2aq.

Benzoyl derivative

$\text{PhC} \begin{smallmatrix} \text{NH} \\ \diagup \quad \diagdown \end{smallmatrix} \text{C}_6\text{H}_4\text{NHBz}$ [125°–214°] From di benzoyl-nitro phenylene-diamine dissolved in HOAc by boiling with tin and HCl (Ruhemann, B 14, 2653). Plates (containing aq. from dilute alcohol)— $\text{B}''\text{HCl}$ needles.

BENZENYL-(β) AMIDO- α -NAPHTHOL

$\text{C}_{17}\text{H}_{11}\text{NO}$ i.e. $\text{C}_{10}\text{H}_7 \begin{smallmatrix} \text{O} \\ \diagup \quad \diagdown \end{smallmatrix} \text{C}_6\text{H}_4$ [122°] Prepared by reduction of the benzoyl-derivative of o-nitroso (α) naphthol (Worms, B 15, 1816). Colourless needles. Sublimable. Sol alcohol and acetic acid, sl sol water.

Benzenyl (α) amido-(β) naphthol

$\text{C}_{10}\text{H}_7 \begin{smallmatrix} \text{O} \\ \diagup \quad \diagdown \end{smallmatrix} \text{C}_6\text{H}_4$ [186°]

Formation—1 As a by product in the reduction of (α) nitro (β) naphthyl benzoate—2 By heating benzoyl amido (β) naphthol—(Bottoher, B 16, 1936, C C 1884, 898).

Properties—Long colourless needles. Sublimable. V e sol alcohol, ether, and benzene, sl sol petroleum ether, insol water. Dissolves in strong acids. Its solutions have a beautiful blue fluorescence. $\text{B}''\text{H}_2\text{O}_2$, PtCl_4 , yellow needles.

BENZENYL-(α)-AMIDO-NAPHTHYL MERCAPTAN

$\text{C}_{10}\text{H}_7 \begin{smallmatrix} \text{S} \\ \diagup \quad \diagdown \end{smallmatrix} \text{C}_6\text{H}_4$ [103°] Formed by heating benzoyl-(α) naphthylamine (2 pts) with sulphur (1 pt) for two hours (yield 10 p c) (Hofmann, B 20, 1798). Obtained also by oxidation of the thio benzoyl derivative of (α) naphthylamine $\text{C}_{10}\text{H}_7\text{N} \begin{smallmatrix} \text{C}(\text{SH}) \\ \diagup \quad \diagdown \end{smallmatrix} \text{C}_6\text{H}_4$ with potassium ferricyanide (Jacobsen, B 20, 1898). Glistening colourless needles (from alcohol). V sol ether, benzene, and hot alcohol. Very weak base.

Picrate $B'C_6H_4(NO_2)OH$ [181°], small orange needles

Benzonyl - (β) - amido - naphthyl mercaptan
 $C_{10}H_7 \cdot \langle \text{N} \rangle \text{C}_6H_5$ [107°] Prepared by heating benzoyl (β) naphthylamine with sulphur Felted needles — $B'_2H_2Cl_2PtCl_4$ (Hofmann, *B* 20, 1803)

BENZENYL - AMIDO - PHENANTHROL *v* PHENANTHRENE

BENZENYL o-AMIDO-PHENOL $C_{12}H_9NO$ *v* $PhC \langle \text{N} \rangle \text{C}_6H_4$ [103°] (*c* 315°) From *o* amido phenol and $BzCl$ or phthalic anhydride (Ladenburg, *B* 9, 1526) Plates (from dilute alcohol) Insol water, sol dilute H_2SO_4 . Split up by HCl at 130° into benzoic acid and *o* amido phenol Its salts are decomposed by water — $B'_2H_2PtCl_4$.

BENZENYL DIAMIDO DIPHENYL $C_{17}H_{11}N_2$ *v* $C_6H_5 \cdot C \langle \text{NH} \rangle \text{C}_6H_5$ [198°] From benzoyl nitro *p* amido diphenyl, tin and glacial $HOAc$ (Hubner, *A* 209, 347) Plates (from alcohol) — $B'HCl$ — $B'_2H_2PtCl_4$ — $B'_2H_2SO_4$.

BENZENYL - AMIDO - PHENYLENE DIAMINE *v* BENZENYL TRI AMIDO BENZENE

BENZENYL-AMIDO PHENYL MERCAPTAN
 $C_{11}H_9NS$ *v* $[12] C_6H_5 \cdot \langle \text{N} \rangle \text{CPh}$ [115°] (*c* 360°)

Formation — 1 By heating amido phenyl mercaptan with $BzCl$, with benzoic aldehyde (probably benzyl alcohol is also formed), or with benzonitrile (NH_3 being evolved) — 2 By heating phenyl amido acetomitrile with sulphur (H_2S and HCN being evolved) — 3 In small quantity by the action of benzoyl chloride on methenyl amido phenyl mercaptan — 4 From thiobenzoic anilide and alkaline K_2FeC_6 (Jacobsen, *B* 19, 1068)

Preparation — Benzanilide (2 pts) is heated with S (1 pt) for a few hours to boiling The yield is 50 to 60 p.c. of the benzanilide used

Properties — Needles Weak base Sol alcohol, ether, CS_2 and $HClAq$ Has a pleasant smell of tea roses and geraniums It remains almost unaltered on boiling with aqueous acids or alkalis On fusion with KOH it is decomposed into benzoic acid and *o* amido phenyl mercaptan Salt — $B'HaNCl_4$.

References — Hofmann, *B* 12, 2359, 13, 7, 1236, Tiemann *a* Piebst, *B* 15, 2033

BENZENYL AMIDO - THIO CRESOL *v* BENZENYL AMIDO TOLYL MERCAPTAN

BENZENYL - AMIDO THIO PHENOL *v* BENZENYL AMIDO PHENYL MERCAPTAN

BENZENYL - TRI AMIDO - TOLUENE
 $C_{14}H_{11}N_3$ *v* $PhC \langle \text{NH} \rangle \text{C}_6H_4Me$ NH_2 [$\frac{4}{5}13$]

[183°] From benzoyl di nitro toluidine, tin, and HCl (Kelbe, *B* 8, 877) Needles, insol water — $B'HCl$ — $B'_2H_2SO_4$, *aq*

BENZENYL TRI-AMIDO TOLUENE

$PhC \langle \text{NH} \rangle \text{C}_6H_4Me$ NH_2 [$\frac{4}{3}16$] (?)

Benzoyl derivative $C_{21}H_{17}N_3O$ *aq* [195°–218°] From di benzoyl nitro *m*-tolylene-diamine, tin, and HCl (Ruhemann, *B* 14, 2656) Needles (from alcohol).

BENZENYL AMIDO TOLYL MERCAPTAN

$C_{11}H_{11}NS$ *v* $C_6H_5(CH_2) \langle \text{N} \rangle \text{C}_6H_5$ [125°]

Prepared by heating amido tolyl mercaptan $C_6H_5Me(SH)NH_2$ [184] with benzoyl chloride Slender needles — $B'HCl$ tables, decomposed by water — $(B'HCl)_2PtCl_4$, *aq* (Hess, *B* 18, 493)

BENZENYL-AMIDOXIM *v* BENZ AMIDOXIM DI-BENZENYL TRI-AMINE

$C_{11}H_{11}N_3$ *v* $\{PhC(NH)\}_3NH$ [109°] Formed by boiling benzamidine with Ac_2O Needles (Pinner *a* Klein, *B* 11, 8)

BENZENYL - AMYL - PHENYLENE - DI-AMINE *v* BENZENYL PHENYLENE DIAMINE

BENZENYL - BROMO - PHENYLENE - DI-AMINE

$C_{13}H_9BrN_2$ *v* $C_6H_5C \langle \text{NH} \rangle \text{C}_6H_4Br$ [$\frac{1}{2}4$]

[200°] From benzoyl bromo nitro aniline by reduction (Hubner, *B* 8, 564, 10, 1710) Small needles, insol water — $B'HCl$ — $B'HNO_2$ — $B'H SO_4$.

BENZENYL-DICINNAMYLENE-DI-AMINE

$C_{22}H_{19}N_2$ *v* $PhCHCHCH-NH \langle \text{N} \rangle CPh$ [207°]

Phenyl di styryl glyoxaline di hydride Formed by heating di benzoyl dicinnamylene diamine with potash in a sealed tube (Japp *a* Wynne, *C J* 49, 470) Faint yellow crystals Boiled with HCl it forms a hydrochloride, sol $EtHO$, which yields a platinumchloride ($C_6H_5N_2HCl$), $PtCl_4$.

BENZENYL-ETHOXIM-CHLORIDE

$C_6H_5CClNOEt$ (125°) at 45 mm, (230°) at 760 mm *V D* (to *H*) = 9.26 (obs) Colourless oil *V* sol alcohol and ether, insol water It is very stable towards water, acids, and alkalis Formed by the action of $NaNO_2$ and HCl upon the ethyl ether of benzenyl amidoxim $C_6H_5C(NH_2)NOEt$ By heating with alcoholic NH_3 the parent substance is reproduced By heating with sodium ethylate it yields benzenyl-ethoxim ethyl ether $C_6H_5C(OEt)NOEt$ (Tiemann *a* Kruger, *B* 18, 727, 1057)

BENZENYL - ETHOXIM - ETHYL ETHER

$C_6H_5C(OEt)NOEt$ *a* *Ethyl benz hydroxamic-ethyl ether* (128°) at 40 mm, (238°) at 760 mm *V D* (to *H*) = 96.75 (obs) Colourless oil Insol water Formed by heating benzenyl-ethoxim chloride $C_6H_5C(NOEt)Cl$ with sodium ethylate By HCl it is decomposed into benzoic ether and the ethyl ether of hydroxylamine $H_2N OEt$ (Tiemann *a* Kruger, *B* 18, 742)

BENZENYL-ETHYL-AMIDINE $C_6H_5N_2$ *v* $PhC(Net)NH_2$ From benzamidine and EtI (Pinner *a* Klein, *B* 11, 7) Oil — $(B'HCl)_2PtCl_4$.

DI BENZENYL-IMIDO-AMIDE *v* DI BENZENYL TRIAMINE

BENZENYL ETHYL - PHENYLENE - DI-AMINE *v* BENZENYL PHENYLENE DIAMINE

BENZENYL-METHOXIM-CHLORIDE

$C_6H_5CClNOMe$ (225° uncorr) *V D* 74.95 Formed by the action of HCl and $NaNO_2$ upon the methyl ether of benzenyl amidoxim $C_6H_5C(NH_2)NOMe$ (Kruger, *B* 17, 1689, 18, 1057) Only fluid Very volatile with steam Sol alcohol, ether, benzene, and ligroin, insol water

BENZENYL-METHYL - PHENYLENE - DI-AMINE *v* BENZENYL PHENYLENE-DIAMINE

BENZENYL-NAPHTHYL-AMIDINE v. NAPHTHYL BENZAMIDINE
BENZENYL-NAPHTHYLENE-DIAMINE

$C_{11}H_{12}N_2$, *is* $PhC \begin{smallmatrix} N \\ \diagup \diagdown \end{smallmatrix} C_{10}H_8$ [210°] From benzoyl nitro (β) naphthylamine, tin, and HCl in presence of alcohol (Ebell, *A* 208, 328) Yellowish crystals, sl sol water, v sol alcohol

Salts — $B'HCl$ — $B'HNO_3$ — $B'_2H_2SO_4$ — $BC_6H_{11}I$ small needles, NaOH aq or hot water removes the isoamyl iodide

BENZENYL-OXAMIDINE *is* **BENZENYL AMIDOXIM** (*q v*)

BENZENYL-OXIMIDAMIDE *is* **BENZENYL AMIDOXIM** (*q v*)

BENZENYL-PHENYL-AMIDINE v. PHENYL BENZAMIDINE

BENZENYL-DI-PHENYL-DI-AMINE v. DI PHENYL BENZAMIDINE

BENZENYL-o-PHENYLENE-DI-AMINE

$C_{11}H_{10}N_2$, *is* $C_6H_5C \begin{smallmatrix} NH \\ \diagup \diagdown \end{smallmatrix} C_6H_4$ [280°]

Anhydro benzoyl di amido benzene From benzoyl nitro aniline, tin, and HCl (Hubner, *A* 208, 302, 210, 328) Plates (from glacial HOAc) M sol alcohol, sl sol benzene and water

Salts — $B'HCl$ — $B'_2H_2PtCl_6$ — $B'HI$ aq — $B'HNO_3$ — $B'_2H_2SO_4$ 1½ aq

Reactions — 1 *Benzoyl chloride* at 200° has no action — 2 Heated with *cyanogen iodide* and benzene, pale yellow crystals of $PhC \begin{smallmatrix} N(CN) \\ \diagup \diagdown \end{smallmatrix} C_6H_4$ [106°] are formed (Howe, *Am* 5, 416) — 3 *Methyl iodide* forms $C_{11}H_{12}MeN_2MeI$, [141°], whence potash forms $C_{11}H_{12}MeN_2MeOH$ [152°], insol hot water, sl sol cold alcohol It forms the following crystalline salts $C_{11}H_{12}MeN_2MeCl$ aq — ($C_{11}H_{12}MeN_2MeCl$) $PtCl_6$ — $C_{11}H_{12}MeN_2MeI$, [280°] $C_{11}H_{12}MeN_2MeNO_3$ — $C_{11}H_{12}MeN_2MeSO_4H$ aq — 4 *Ethyl iodide* forms at 180° $C_{11}H_{12}EtN_2$, m sol water It forms soluble crystalline salts, $B'HCl$ and $B'_2H_2SO_4$ — 5 *Ethyl iodide* at 210° forms $C_{11}H_{12}EtN_2EtI$, [155°] whence hot potash liberates the crystalline ammonium base $C_{11}H_{12}EtN_2EtOH$ [132°], insol water and alkalis, sl sol cold alcohol, v e sol benzene and ligroin Its salts are crystalline and not decomposed by NH_3 , Na_2CO_3 , or cold KOH, but hot potash liberates the base Salts — $C_{11}H_{12}EtN_2EtCl$ 2aq — ($C_{11}H_{12}EtN_2EtCl$) $PtCl_6$ — $C_{11}H_{12}EtN_2EtI$ — $C_{11}H_{12}EtN_2EtSO_4H$ aq — 6 *Isoamyl iodide* at 170° gives $C_{11}H_{12}(C_4H_9)_2N_2$ Salts — $B'HCl$ — $B'HI$ — $B'HNO_3$ — $B'_2H_2SO_4$ 2aq — 7 *Isoamyl iodide* at 165° for 24 hours gives $C_{11}H_{12}(C_4H_9)_2N_2(C_4H_9)_2I$, [112°] The free ammonium base, $C_{11}H_{12}(C_4H_9)_2N_2(C_4H_9)_2OH$ [81° and 92°] crystallises from alcohol, and is insol water Salts — $B'C_6H_5Cl$ aq (and 3aq) — $B'_2(C_6H_5)_2PtCl_6$ — $B'C_6H_5NO_3$, HNO_3 , [90°] — $B'C_6H_5I$ — 8 Conc *nitric acid* forms a nitro-compound, $C_{11}H_{12}(NO_2)_2N_2$, [196°] — 9 H_2SO_4 forms an unstable sulphonic acid

BENZENYL-PHENYLENE-DIAMINE-p-CARBOXYLIC ACID $C_6H_4 \begin{smallmatrix} NH \\ \diagup \diagdown \end{smallmatrix} C_6H_4CO_2H$

Slender needles (containing 1½ aq) Almost insol in cold, v sol in hot water Prepared by the oxidation of toluenyl phenylene diamine

$C_6H_4 \begin{smallmatrix} NH \\ \diagup \diagdown \end{smallmatrix} C_6H_4CH_3$ with $K_2Cr_2O_7$ and H_2SO_4

Salts — BaA' , 6aq small needles, sl sol water — CaA' , 5aq slender needles — KA' , 7aq long needles, v e sol water — AgA' white gelatinous pp

Reaction — The silver salt on distillation gives a ketone *Anhydro-tolyl ketamine* $C_{12}H_{12}N_2O$ or

$C_6H_4 \begin{smallmatrix} NH \\ \diagup \diagdown \end{smallmatrix} C_6H_4CO_2C_6H_4 \begin{smallmatrix} NH \\ \diagup \diagdown \end{smallmatrix} C_6H_4$

[277°] which forms salts $B''2HCl$ and $B''H_2PtCl_6$ *Ethyl ether* EtA' — [243°], colourless needles (Stoddard, *B* 11, 293, Bruckner, *A* 205, 113, Hubner, *A* 210, 337)

BENZENYL-PHENYL-THIURAMIDOXIM $C_6H_4C(NHCSNHC_6H_5)NOH$ [163°] Formed by the combination of phenyl thio carbimide with benz amidoxim (Kruger, *B* 18, 1060) Plates V e sol alcohol, ether, and benzene

BENZENYL-PHENYL-URAMIDOXIM $C_6H_4C(NHCO_2NHC_6H_5)NOH$ [115°] Formed by the combination of phenyl cyanate with benz amidoxim (Kruger, *B* 18, 1059) White plates V e sol alcohol, ether and benzene, insol cold water

BENZENYL-TOLYLENE-DIAMINE

$C_{11}H_{12}N_2$, *is* $C_6H_5C \begin{smallmatrix} NH \\ \diagup \diagdown \end{smallmatrix} C_6H_4CH_3$, [$\frac{1}{2}$ 24]

[240°] From benzoyl nitro *p* toluidine, tin, and HCl (Hubner, *A* 208, 316) Also by heating acetophenone with *o* tolylene diamine (Ladenburg a Rugheimer, *B* 12, 951) Crystalline, insol water, v sol hot alcohol, may be distilled

Salts — $B'HCl$ needles, sl sol cold water and alcohol — $B'_2H_2SO_4$ needles, v sl sol cold water

Reactions — 1 *Methyl iodide* at 240° gives $C_{11}H_{12}MeN_2MeI$, [106°] whence KOH forms $C_{11}H_{12}MeN_2MeOH$ [144°], insol water, of which base the following salts are crystalline, viz

$C_{11}H_{12}MeN_2Cl$ 2aq — ($C_{11}H_{12}MeN_2$) $PtCl_6$ — $C_{11}H_{12}MeN_2I$ — $C_{11}H_{12}MeN_2SO_4H$ Nitrous acid produces a nitro compound $C_{11}H_{10}(NO_2)MeN_2OH$, [165°] (Hubner, *A* 210, 371) which forms a platinumochloride, ($C_{11}H_{10}(NO_2)MeN_2Cl$) $PtCl_6$, and reduces to an amido compound — 2 *Ethyl iodide* at 800° gives $C_{11}H_{12}EtN_2I$, [129°] whence

$C_{11}H_{12}EtN_2OH$ [153°] and its salts

$C_{11}H_{12}EtN_2Cl$ aq — ($C_{11}H_{12}EtN_2$) $PtCl_6$ — $C_{11}H_{12}EtN_2I$ — $C_{11}H_{12}EtN_2SO_4H$ aq

BENZENYL-p-TOLYL-TOLYLENE-DI-AMINE $C_6H_4 \begin{smallmatrix} NH \\ \diagup \diagdown \end{smallmatrix} C_6H_4$, [166°] Needles or prisms Formed by reduction of benzoyl nitro-*di* tolyl amine with tin and HCl

Salts — $B'HCl$ aq — $B'_2H_2SO_4$ prisms (Lellmann, *B* 15, 832)

BENZENYL-XYLYLENE-DIAMINE

$C_{11}H_{12}N_2$, *is* $C_6H_5C \begin{smallmatrix} NH \\ \diagup \diagdown \end{smallmatrix} C_6H_4Me$, [$\frac{1}{2}$ 18]. [195°] From benzoyl nitro xylidine [185°], tin, and glacial HOAc (Hubner, *A* 208, 320) Needles, insol water Boiling fuming HNO_3 forms a compound, crystallising in yellow needles [202°].

Salts — $B'HCl$ — $B'HNO_3$ — $B'_2H_2SO_4$ — $B'H_2C_2O_4$

Benzenyl-xylylene diamine

$\text{O}, \text{H}_2\text{C} \begin{smallmatrix} \text{N} \\ \text{NH} \end{smallmatrix} > \text{C}_6\text{H}_4\text{Me}$, [215°] From benzoyl-nitro-xylylene [178°] Needles — $\text{B}^{\text{HCl}}\text{Aq}$ (Hubner, *B* 10, 1711)

BENZ ERYTHRENE $\text{C}_{22}\text{H}_{18}$, [307°–308°] Formed in leading benzene through a red hot tube (Berthelot, *J* 1866, 541, 1867, 599, 605; Schultz, *B* 11, 95) Small leaflets Almost insoluble in alcohol, difficultly soluble in hot acetic acid and in cold benzene

BENZ FURIL $\text{C}_{12}\text{H}_8\text{O}_4$, *ie* $\text{Ph CO CO C}_6\text{H}_4\text{O}$ [41°] From benz furin and Fehling's solution at 50° (Fischer, *A* 211, 229) Yellow needles V sol alcohol or ether (unlike furil) Volatile

Tetra bromide $\text{C}_{12}\text{H}_4\text{O}_4\text{Br}_4$, [127°–128°] Yellow needles

BENZFURILIC ACID $\text{C}_{12}\text{H}_8\text{O}_4$, *ie* $\text{C}_6\text{H}_4\text{O CPh(OH) CO}_2\text{H}$ From benz furil and aqueous KOH at 60° Prisms (from a mixture of ether with light petroleum) Turns brown at 108° V sol ether, alcohol, or chloroform, sl sol light petroleum Its aqueous solution gradually decomposes The crystals in conc H_2SO_4 give a blood red colour, turning brown The only residue got on evaporating an ethereal solution of benzfurilic acid gives with conc H_2SO_4 a reddish violet colour, water then gives a blackish-blue pp, which dissolves in conc H_2SO_4 giving a blue colour (E Fischer, *A* 211, 231)

BENZ FURIN $\text{C}_{12}\text{H}_8\text{O}_4$, *ie* Either $\text{Ph CH(OH) CO C}_6\text{H}_4\text{O}$ or $\text{C}_6\text{H}_4\text{O CH(OH) CO Ph}$ [137°–139°] From furtirol (18 g), benzoic aldehyde (20 g), alcohol (60 g), water (80 g), and KCN (4 g), by boiling for 20 minutes (E Fischer, *A* 211, 228, *B* 13, 1339) Slender prisms (from alcohol) May be distilled V sol hot alcohol, chloroform, or benzene, sl sol water or light petroleum Alcoholic KOH forms a dark red solution with bluish green reflex

BENZGLYCOXYAMINE $\text{C}_8\text{H}_8\text{N}_2\text{O}_2$ Formed by boiling the dicyanide of *m* amido benzoic acid (*v* p 167) with KOHAq (Griess, *B* 1, 191, 3, 708, *Z* 4, 725, 6, 728) or by the action of cyanamide on an alcoholic solution of *m* amido-benzoic acid containing NH_3 (Griess, *B* 7, 575). Thin white four sided plates (containing aq) Sl sol hot water, v sl sol ether, insol NH_4Aq , sol aqueous mineral acids Boiling baryta converts it into *m* amido benzoic acid, urea, NH_3 , and uramid benzoic acid

Salts — B^{HCl} — $\text{B}^{\text{H}_2\text{PtCl}_6}$

BENZGLYCOXYAMIDINE $\text{C}_8\text{H}_8\text{N}_2\text{O}$, *ie* $\text{HN C} \begin{smallmatrix} \text{NH} - \text{C}_6\text{H}_4 \\ \text{NH} - \text{CO} \end{smallmatrix}$ Formed by the prolonged heating of 'ethoxy-cyanamido benzoyl' (*v* p 155) with alcoholic NH_3 at 100°, or by the action of cyanamide on *o* amido benzoic acid (Griess, *B* 1, 191, 2, 415, *Z* [2] 5, 574, *B* 7, 574, 8, 822, 13, 977) Nacreous laminae, v sl sol water, sl sol boiling alcohol Its nitrate forms narrow laminae, v sl sol alcohol Platinochloride $\text{B}^{\text{H}_2\text{PtCl}_6}$

m - Carboxy - phenyl - benz - glycoxyamide

Formed from a

$\text{CO}_2\text{H C}_6\text{H}_4\text{NH C} \begin{smallmatrix} \text{NH} \\ \text{NH} \end{smallmatrix} \text{CO}$ mixture of 'dicyanamido-benzoyl'

and *m*-amido benzoic acid by

long boiling with water Very small white needles or plates Insol neutral solvents. Tolerably strong acid

Salts — A^{Ag} , white amorphous pp — $\text{A}^{\text{H}_2\text{Ba}} 10\text{aq}$ (Griess, *B* 18, 2420)

'Imido phenyl-benz glycoxyamide' so

called $\text{HN C} \begin{smallmatrix} \text{NH C}_6\text{H}_4\text{CO} \\ \text{NH C}_6\text{H}_4\text{NH} \end{smallmatrix}$ [18] Formed by

heating cyanocarbidamidobenzoic acid with *o* phenylene diamine (Griess, *B* 18, 2414) Six sided tables Nearly insol water, alcohol, and ether It has both acid and basic properties

Salts $\text{A}^{\text{H}_2\text{Ba}}$ — A^{HCl} white six sided plates

BENZHYDRAMIDE *v* Benzoic aldehyde

BENZHYDRAZOIN *v* Tri phenyl hydrazoin

BENZHYDROL *v* Diphenyl carbinol

BENZHYDROLENE $\text{C}_{12}\text{H}_{10}$, [210°] Got by distilling succinate or benzoate of benzhydrol (Linnemann, *A* 133, 1), is identical with tetra phenyl ethane (Zagumenny, *J R* 12, 431)

BENZHYDROXYAMIC ACID *v* Hydroxyl-AMINE

BENZHYDRYL ACETATE *v* Acetyl BENZ HYDROL

BENZHYDRYLAMINE *v* Di phenyl CARBINTLAMINE

BENZHYDRYL-BENZOIC ACID *v* Exo^oxy BENZYL BENZOIC ACID

BENZHYDRYL CARBOXYLIC ACID *v* Exo^oxy BENZYL BENZOIC ACID

BENZHYDRYL PHENOL *v* Di oxy DI-PHENYL METHANE

BENZHYDRYL ¹⁸⁰ PHTHALIC ACID *v* Oxy-BENZYL ¹⁸⁰ PHTHALIC ACID

BENZHYDRYL-PROPIONIC ACID *v* γ oxy γ PHENYL BUTYRIC ACID

BENZHYDRYL-PROPIO-CARBOXYLIC ACID *v* OXY CARBOXY PHENYL PROPIONIC ACID

BENZIDINE and derivatives *v* DI-AMIDO DIPHENYL and derivatives

BENZIL $\text{C}_{14}\text{H}_{10}\text{O}_2 = \text{C}_6\text{H}_5\text{CO CO C}_6\text{H}_5$ *Di-benzoyl* [95°] (Limpricht a Schwanert), (346°–348° corr) (Wittenberg a V Meyer)

Formation — 1 By passing chlorine into melted benzoil $\text{C}_6\text{H}_5\text{CH(OH) CO C}_6\text{H}_5 + \text{Cl}_2 = \text{C}_6\text{H}_5\text{CO CO C}_6\text{H}_5 + 2\text{HCl}$ (Laurent, *A Ch* [2] 59, 402) — 2 By oxidising benzoil with nitric acid (Zinin, *A* 84, 188), and in small quantity by the air oxidation of benzoil dissolved in alcoholic potash $\text{C}_{14}\text{H}_{12}\text{O}_2 + \text{O} = \text{C}_{14}\text{H}_{10}\text{O}_2 + \text{H}_2\text{O}$ (Limpricht a Schwanert, *B* 4, 335) — 3 Together with stilbene by heating stilbene dibromide with water to 150° $8\text{C}_6\text{H}_5\text{CHBr CHBr C}_6\text{H}_5 + 2\text{H}_2\text{O} = \text{C}_6\text{H}_5\text{CO CO C}_6\text{H}_5 + 2\text{C}_6\text{H}_5\text{CH CH C}_6\text{H}_5 + 6\text{HBr}$ (L a S, *A* 145, 338) — 4 Together with toluene by heating toluene dibromide with water to 200°

(L a S, *B* 4, 380) — 5 From toluene-tetra chloride by heating it with glacial acetic acid or with conc H_2SO_4 to 165°

(Liebmann a Homeyer, *B* 12, 1975) — 6 By heating benzoyl chloride with sodium amalgam: $2\text{C}_6\text{H}_5\text{COCl} + \text{Na}_2 = \text{C}_{14}\text{H}_{10}\text{O}_2 + 2\text{NaCl}$ (Klinger, *E* 16, 996)

Preparation.—Benzoil is heated with twice

its weight of nitric acid (SG 1.4) until it is converted into a clear oily liquid (Zinin). The product is poured into water, and the benzil, which at once solidifies, is purified by recrystallisation from boiling alcohol.

Properties—Crystallises from hot alcohol in transparent yellow needles, from ether, by spontaneous evaporation, in large six sided prisms. Insol water, v sol hot alcohol and ether. The crystals are optically active, showing sometimes dextro rotation, sometimes laevo rotation, but having no hemihedral faces. Inactive in a fused state or in solution (Descloiseaux, *C C* 1870, 418).

Reactions—1 Benzil is readily attacked by reducing agents. Iron filings and acetic acid, or zinc and hydrochloric acid, acting upon the alcoholic solution, convert it into benzoïn (Zinin, *A* 119, 177). When heated with alcoholic potassium hydrosulphide at 120° it yields a mixture of deoxybenzoïn ($C_6H_5CH_2CO C_6H_5$) and benzoïn (Jena, *A* 155, 87). Sodium amalgam and water convert it into hydrobenzoïn (Zincke a Forst, *B* 8, 797). When a solution of benzil in moist ether is exposed in a sealed tube to sunlight the benzil is reduced to benzil benzoïn $C_{12}H_{10}O_6$ [134°–135°], which separates in rosettes of white or pale yellow crystals on the sides of the tube, whilst the ether is converted into aldehyde. On melting benzil benzoïn, or on attempting to recrystallise it from any of the usual solvents, it breaks up into benzil and benzoïn $C_{12}H_{10}O_6 = 2C_6H_5O_2 + C_{12}H_{10}O_2$ (Klinger, *B* 19, 1864)—2 Benzil is very stable towards acids. It may be boiled with fuming hydrochloric acid without undergoing change, conc sulphuric acid dissolves it, and the addition of water precipitates it unaltered, ordinary strong nitric acid does not attack it. On boiling it with fuming nitric acid, however, it yields a mixture of two dinitrobenzils, $C_{12}H_8(NO_2)_2O_6$, which may be separated by crystallisation octahedral crystals [181°], sl sol alcohol, and laminae [147°], less soluble than the foregoing (Zagumenny, *J R* 4, 278). An isodinitrobenzil [205°] has been indirectly prepared by the oxidation of a or γ dinitro deoxybenzoïn, v sl sol alcohol, m sol boiling benzene or glacial acetic acid (Golubeff, *J R* 13, 29). A mononitrobenzil, $C_{12}H_9(NO_2)O_6$ [110°], has also been indirectly obtained by boiling 1 part of deoxybenzoïn with 8 parts of nitric acid (SG 1.2), or by adding benzoïn to nitric acid (SG 1.5) cooled to 0°. Yellow laminae or flat needles, m sol alcohol, more readily in ether. Hot alcoholic potash decomposes it into potassium m azo benzoate and potassium m azo benzoate

Tin and hydrochloric acid convert it into amido deoxybenzoïn, $C_{12}H_{11}(NH_2)O$ (Zinin, *A Suppl* 3, 153)—3 When heated with soda lime, benzil yields benzene and benzophenone, $CO(C_6H_5)_2$ (Jena, *A* 155, 87), distilled over heated litharge it yields benzophenone (Wittenberg a V Meyer, *B* 16, 501)—4 When benzil is heated with an equal weight of caustic potash or caustic soda dissolved in 20 parts of water, the benzil slowly dissolves, forming a benzilate (v BENZILIC ACID). $C_6H_5CO CO C_6H_5 + KOH = (C_6H_5)_2C(OH)COOK$ A small quantity of diphenyl carbinol is formed

at the same time by the decomposition of the benzoilic acid (Klinger, *B* 19, 1868). Alcoholic potash dissolves benzil with a violet colour, on heating, the colour is discharged and the solution contains potassium benzoilate. According to Klinger (*loc cit*) aqueous potash gives this colouration only with benzoïn, and then only when air is admitted. When benzil is dissolved, without heating, in very dilute alcoholic potash (4 grams KOH to the litre) and allowed to stand, with exclusion of air, for about a fortnight, it is converted into a mixture of two compounds, $C_{12}H_{10}O_6$ [200°–201°] (Limpriicht a Schwanert's so-called ethyl dibenzoïn) and $C_{12}H_{10}O_6$ [232°]. The alcohol takes part in the formation of these compounds

$2C_{12}H_{10}O_6 + C_2H_5O = C_{12}H_{10}O_6 + H_2O$, and $8C_{12}H_{10}O_6 + 2C_2H_5O = C_{12}H_{10}O_6 + 4H_2O$. These two substances can be separated by recrystallisation from alcohol, in which the compound $C_{12}H_{10}O_6$ is the more soluble. The compound $C_{12}H_{10}O_6$ is sl sol boiling alcohol, sl sol boiling benzene, v sol boiling glacial acetic acid, deposited from alcohol in colourless granular crystals with 1 mol of alcohol of crystallisation which is expelled at 120° but not at 100°, crystallises also with 1 mol of acetic acid and with benzene of crystallisation. The compound $C_{12}H_{10}O_6$ is finally purified by dissolving in boiling phenol and precipitating with alcohol, yellow crystalline powder, v sl sol alcohol, m sol boiling phenol (Japp a Owens, *C J* 47, 90, cf also Limpriicht a Schwanert, *B* 4, 835). Benzil also reacts with isopropyl alcohol when it is dissolved in a dilute solution of caustic potash in isopropyl alcohol (2 100) and allowed to stand for some months in a stoppered vessel a compound $C_{12}H_{10}O_6$ [147°–148°] is formed, $2C_{12}H_{10}O_6 + C_3H_7O = C_{12}H_{10}O_6 + O$, a reduction taking place. $C_{12}H_{10}O_6$ forms very lustrous crystals, of rhombohedral habit, v sl sol boiling alcohol (Japp a Raschen, *C J* 49, 882)—5 Benzil reacts with acetone in presence of caustic potash, yielding the compounds acetone benzil, $C_{12}H_{10}O_6$, anhydrazetone benzil, $C_{12}H_{10}O_6$, and anhydrazetone dibenzil, $C_{12}H_{10}O_6$ (v ACETONE BENZIL, p 32). With methyl ethyl ketone it yields methyl anhydrazetone benzil, $C_{12}H_{10}O_6$, colourless thin prisms [179°], with diethyl ketone, dimethyl anhydrazetone benzil, $C_{12}H_{10}O_6$, rhomboidal plates [150°], with methyl propyl ketone, ethyl anhydrazetone benzil, $C_{12}H_{10}O_6$, needles [156°], with methyl heptyl ketone, amyl anhydrazetone benzil, $C_{12}H_{10}O_6$, silky needles [150.5°], all sol alcohol (Japp a Burton, *C J* 51, 431)—6 Benzil reacts with ammonia, and also with aldehydes and ammonia jointly, to form a number of well characterised condensation compounds (v BENZIL, AMMONIA DERIVATIVES or). Heated with aniline in a sealed tube at 200° it yields benzil anilide, $C_6H_5C(N C_6H_5)CO C_6H_5$ [105°]. Yellow prisms, sl alcohol (Voigt, *J pr* [2] 34, 23)—7 Warmed with (1,2,4)-tolylene diamine in alcoholic solution it forms diphenyl-toluenecarbazone

(Hinsberg, *B* 17, 822). Benzil also reacts with ethylene diamine to yield a crystalline compound (Mason, *B* 19, 118) -- 8 Forms compounds

with *hydroxylamine* and with *phenylhydrazine*. Benzil with free hydroxylamine in aqueous-alcoholic solution at the ordinary temperature yields *benzil mono-oxim* $C_6H_5C(NOH)CO C_6H_5$, [130°–131°], even when an excess of hydroxylamine is employed. Small square white leaflets, ν sol alcohol and ether, sl sol water (Wittenberg a V Meyer, *B* 16, 503). Boiled with hydroxylamine hydrochloride in methyl alcohol, with the addition of one drop of hydrochloric acid, a *di-oxim*, (α)-*diphenyl glyoxim* $C_6H_5C(NOH)C(NOH)C_6H_5$, [237°] separates. Forms lustrous white laminae, sl sol methyl alcohol, alcohol, and ether. Dissolves in caustic soda and is reprecipitated by acids. Sol with difficulty in ammonia, the solution giving with silver nitrate a yellow pp (Goldschmidt a V Meyer, *B* 16, 1617). If benzil, hydroxylamine hydrochloride, and alcohol, acidulated with hydrochloric acid, are heated in a sealed tube for several hours at 170°, an isomeric (β) *diphenyl glyoxim* [206°] is formed. White needles, ν sol boiling alcohol, sl sol ether and boiling water. Sol caustic soda and ammonia. The (α)-compound can be converted into the (β) compound by heating it with alcohol in a sealed tube at 180°. The nature of this isomerism is not understood, but analogous cases of isomerism have been observed in the benzil and benzoin groups—thus benzil and isobenzil, hydrobenzoin and isohydrobenzoin (Goldschmidt, *B* 16, 2177). By heating benzil with phenylhydrazine on the water bath, benzil di-phenylhydrazide, $C_6H_5C(N_2HC_6H_5)C(N_2HC_6H_5)C_6H_5$, [225°], separates. Faintly yellow needles, ν sol hot chloroform and benzene, sl sol alcohol and ether. Gives a dark violet colouration with conc sulphuric acid. Does not regenerate phenylhydrazine when heated with strong hydrochloric acid (Pickel, *A* 232, 230)—9. When benzil in alcoholic solution is mixed with an excess of nearly anhydrous *hydrocyanic acid* and allowed to stand, large, colourless, tabular, rhombic crystals of *benzil dihydrocyanide* $C_6H_5C(OH)CN$

are deposited (Zinin, *A* 34, $C_6H_5C(OH)CN$ 189). The same compound is formed when an ethereal solution of benzil is mixed with powdered potassium cyanide and conc hydrochloric acid is added drop by drop, cooling during the operation. Melts at 132°, with decomposition into benzil and hydrocyanic acid. Insol water and benzene, ν sol ether and light petroleum. When dissolved in alcohol it is decomposed, even in the cold, into benzil and hydrocyanic acid (Jacoby, *B* 19, 1519). When finely powdered benzil dihydrocyanide is mixed with a large excess of a concentrated solution of HBr in glacial acetic acid and left for some weeks, a solution is obtained which by spontaneous evaporation deposits lustrous crystals of *di-phenyl tartrate* $C_6H_5C(OH)CONH_2 \cdot HBr$

made hydrobromide

$C_6H_5C(OH)CONH_2$, [185°] and these, when decomposed by ammonia, yield the free *di-phenyl-tartramide*. ν sol alcohol, ν sl sol ether (Burton, *B* 16, 2232). Pure benzil dihydrocyanide is not hydrolysed by conc hydrochloric acid, but when an alcoholic solution of benzil, to which an excess of

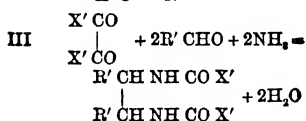

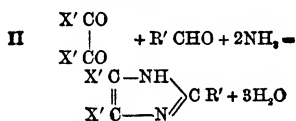

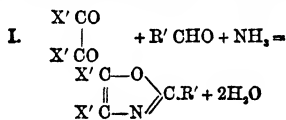

anhydrous hydrocyanic acid has been added, is saturated with gaseous HCl and allowed to stand for some weeks, an acid, C_6H_5NO , (colourless prisms, sol boiling water, melting at 196°), and a compound, $C_6H_5N_2O$ [196°–197°], are formed. The compound $C_6H_5N_2O$ forms lustrous pale yellow laminae or flat needles, sl sol boiling water and benzene, ν sol boiling alcohol. It is feebly basic and forms with hydrochloric acid a colourless salt which is stable only in presence of excess of acid (Japp a Miller, *C J* 51, 29). When benzil is heated with absolute alcohol and hydrocyanic acid at 200° for four hours, it is decomposed into benzoic aldehyde and ethyl benzoate $C_6H_5CO CO C_2H_5 + C_2H_5OH = C_6H_5CHO + C_2H_5CO C_2H_5$, the hydrocyanic acid apparently undergoing no change. Benzoic acid is also formed (Michael a Palmer, *Am* 7, 191). Benzil and alcohol may also be made to react to form benzoic aldehyde and ethyl benzoate by tritulating benzil and *potassium cyanide* with alcohol, but in this case a portion of the benzaldehyde is further changed into benzoin by the action of the potassium cyanide. By neutralising with sodium carbonate the small quantity of benzoic acid which is also formed in this reaction, and which would otherwise decompose the potassium cyanide, 1 part of the cyanide may be made to induce the foregoing change in 50 parts of benzil (Jourdan, *B* 16, 658)—10. Benzil unites with *nitriles* in presence of conc sulphuric acid, taking up the elements of water. Thus when powdered benzil (1 mol) is suspended in conc sulphuric acid, and propionitrile (2 mols) is gradually added, cooling during the process, a compound $C_{10}H_{10}N_2O_3$ [197°] is formed $C_{10}H_{10}O_2 + 2C_3H_7N + H_2O = C_{10}H_{10}N_2O_3$. Lustrous, colourless needles, ν sol hot alcohol. Boiling with dilute sulphuric acid decomposes it into benzil, propionic acid, and ammonia. With benzonitrile and sulphuric acid benzil yields a mixture of two compounds which can be readily separated by means of their very different solubilities in hot alcohol. $C_{10}H_{10}N_2O_3$, [168°], analogous to the propionitrile derivative, ν sol boiling alcohol, crystallises from alcohol in efflorescent oblique prisms of the formula $(C_{10}H_{10}N_2O_3)_2 \cdot EtOH$, and a compound $C_{10}H_{10}N_2O_3$, [225°], almost insol alcohol, ν sol boiling phenol, sl sol boiling benzene, which crystallises from benzene in microscopic, flat rectangular prisms $2C_{10}H_{10}O_2 + C_6H_5N + H_2O = C_{10}H_{10}NO_2 + C_6H_5CO_2H$ (Japp a Tresidder, *B* 16, 2652)—11. Heated with somewhat more than the equivalent quantity of *phosphorus pentachloride*, benzil yields *dichlorodeoxybenzoin* (*chlorobenzil*) $C_6H_5CCl_2CO C_6H_5$, [71°]. Short, thick rhombic prisms, insol water, ν sol ether, not so readily in alcohol. When heated with alcohol or water to 180° it yields benzil and hydrochloric acid. Zinc and hydrochloric acid, acting on an alcoholic solution, convert the compound into deoxybenzoin, acetic acid and zinc dust reduce it first to deoxybenzoin, and finally to stilbene. PCl_5 at 200° replaces the remaining oxygen atom by Cl , yielding toluene tetrachloride, $C_6H_5Cl_4$ (Zinin, *A* 119, 177, *J* 1880, 614, *A* 149, 874).

Isobenzil —1. A substance having the same composition as benzil is obtained by acting with sodium amalgam on a solution of *benzoyl*

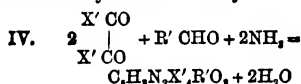

chloride in anhydrous ether (Brigel, *A* 185, 179) Ordinary benzil is formed at the same time (Klinger, *B* 16, 995) Isobenzil forms colourless tabular monoclinic crystals, also lustrous laminae or needles [145° – 156°], sol alcohol, ether and CS_2 . It is probably a polymeride of benzil, for when treated with bromine it yields benzil (1 mol) and benzoyl bromide (2 mols) $\text{C}_{27}\text{H}_{20}\text{O}_2 + \text{Br}_2 = \text{C}_7\text{H}_5\text{O}_2 + 2\text{C}_6\text{H}_5\text{COBr}$ Heated with alcoholic potash it gives the violet colouration of benzil and is converted into benzoic acid together with a small quantity of benzoic acid (Klinger, *loc cit*, also *B* 19, 1862)—2 By heating benzoic aldehyde with sodium amalgam in an atmosphere of CO_2 Alexéet (*A* 129, 347) obtained an oil (314° approx) to which he assigned the formula $\text{C}_{17}\text{H}_{12}\text{O}_2$ SG 12 = 1.104 (approx)

BENZIL. AMMONIA DERIVATIVES OF

There are four general reactions known, according to which compounds containing the dicarbonyl group—CO CO—form condensation compounds with aldehydes and ammonia jointly. As a knowledge of these reactions is necessary to an understanding not only of the behaviour of benzil with aldehydes and ammonia, but also of that of benzil with ammonia alone, the general equations for these reactions will be introduced at this stage. In the following equations X' stands for the monad hydrocarbon radical of the dicarbonyl compound, and R' for the monad hydrocarbon radical of the aldehyde.

Here the dicarbonyl compound is broken up into two halves, whilst the two aldehyde groups become directly united. Lastly

The constitution of the compounds of the last mentioned type is unknown (Japp & Streetfield, *C J* 49, 155, Japp & Hooker, *C J* 45, 678, Japp & Wynne, *C J* 49, 464)

It will be shown later on, that in the reactions of benzil with ammonia a part of the benzil is first broken up with formation of benzoic acid and benzoic aldehyde, which latter then takes part, together with benzil and ammonia, in the final reaction. The benzil-ammonia reactions are therefore in reality

Vol. L

benzil aldehyde ammonia reactions, and will be more readily understood if the reactions of the latter class are described first

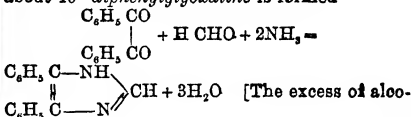

REACTIONS OF BENZIL WITH ALDEHYDES AND AMMONIA.—

Equation I (*vide supra*)—Benzil gives no reactions according to this equation so long as free aldehydes are used, but with *nascent* benzoic aldehyde, produced by the decomposition of a portion of the benzil, it reacts according to this equation, yielding *benzilam*, $C_{20}H_{11}NO$ (*vide infra*). In the case of some other dicarbonyl compounds, however, such as phenanthraquinone (*q v*), this reaction occurs with various free aldehydes

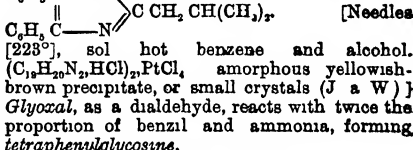

Equation II—Benzil reacts according to this equation with *formic aldehyde*, *acetic aldehyde*, *isovaleric aldehyde*, *glyoxal*, *benzoic aldehyde* (free), and *p oxybenzoic aldehyde*. The compounds formed are derivatives of gly-

Thus when benzil and *formic aldehyde* are warmed with ammonia in alcoholic solution at about 40° *diphenylglyoxaline* is formed

hol and ammonia is expelled by heating, the base is extracted with dilute hydrochloric acid, precipitated with ammonia, and crystallised from hot alcohol. It separates from hot alcohol on cooling in long oblique crystals (monosymmetric), and from cold alcohol by evaporation in short lustrous crystals (also monosymmetric, but not referable to the same parameters) [227*]. Monacid base ($C_{13}H_{12}N_2 \cdot HCl$), $PtCl_4$: pale yellow, amorphous precipitate, speedily changing into microscopic flat needles (Japp, *C J* 51, 558).—When *acetic aldehyde* is substituted for formic aldehyde in the foregoing reaction, *methylidiphenylglyoxaline*, $C_6H_5 \cdot C-NH \begin{matrix} \parallel \\ N \end{matrix} \rangle CCH_3$, is formed [Orthorhombic crystals [235*], v sol ether and hot alcohol ($C_6H_5 \cdot N \cdot HCl$), $PtCl_4$, 2aq yellow microscopic needles (Japp & Wynne)]. The base forms a molecular compound with diphenylglyoxaline (J)] Benzil, *isovaleric aldehyde*, and ammonia yield *isobutyldiphenylglyoxaline*, $C_6H_5 \cdot C-NH \begin{matrix} \parallel \\ N \end{matrix} \rangle CCH_3$.

$$\begin{array}{c} \text{C}_6\text{H}_5-\text{C}-\text{NH} \quad \text{NH}-\text{C}-\text{C}_6\text{H}_5 \\ \parallel \quad \quad \quad \parallel \\ \text{C}_6\text{H}_5-\text{C}=\text{N} \quad \text{N}=\text{C}-\text{C}_6\text{H}_5 \end{array} \quad \text{[From hot} \\

Equation III—Illustrations of this equation are to be found in the reactions of *salicylic aldehyde* and *furfuraldehyde* (pyromucic aldehyde) with benzil and ammonia. *Cinnamic aldehyde* also reacts according to this equation, but in this case another reaction, according to Equation IV, occurs simultaneously.

Thus when equal weights of *salicylic aldehyde* and benzil are dissolved in warm alcohol and the liquid is saturated with gaseous ammonia, the condensation compound *dibenzoyl dioxy stilbene diamine* separates as a crystal line powder

[It is purified by dissolving it in boiling phenol and precipitating with alcohol. Microscopic plates, melting with decomposition above 300°, insol in the ordinary organic solvents, sol boiling phenol, sol caustic soda, forming a sodium compound. By fusion with caustic soda it yields sodium benzoate and sodium salicylate. Heated with dilute hydrochloric acid at 210° it is hydrolysed into benzoic acid and *dioxy stilbene-*

diamine

$$\begin{array}{c} \text{C}_6\text{H}_4(\text{OH})\text{CH.NH}_2 \\ \text{C}_6\text{H}_4(\text{OH})\text{CH.NH}_2 \end{array}$$
 , small lustrous laminae [180.5°], ν sol hot benzene, di acid base the Pt salt, $\text{C}_{12}\text{H}_{16}\text{N}_2\text{O}_2 \cdot 2\text{HCl} \cdot \text{PtCl}_4 \cdot 4\text{aq}$ forms thick, orange-coloured, rhomboidal plates with bevelled edges, anhydrous at 100°. This base is, however, more readily obtained from its acetyl-derivative (*infra*). When the condensation compound is boiled with acetic anhydride until it dissolves, *dibenzoyl-diacetoxystilbene-*

$$\text{C}_6\text{H}_4(\text{O C}_2\text{H}_3\text{O})\text{CH.NH(C}_2\text{H}_3\text{O)}$$

diamine

$$\text{C}_6\text{H}_4(\text{O C}_2\text{H}_3\text{O})\text{CH.NH(C}_2\text{H}_3\text{O)}$$
 15 formed (rhomboidal laminae [225°-227°], sol acetic acid), and by boiling this compound for eight hours with acetic anhydride the benzoyl-groups are replaced by acetyl groups yielding *diacetyl-dioxy stilbene-diamine*

$$\text{C}_6\text{H}_4(\text{O C}_2\text{H}_3\text{O})\text{CH.NH(C}_2\text{H}_3\text{O)}$$

(prisms

$$\text{C}_6\text{H}_4(\text{O C}_2\text{H}_3\text{O})\text{CH.NH(C}_2\text{H}_3\text{O)}$$
 [216°-219°] sol. glacial acetic acid and alcohol, deposited from latter solvent with 1 mol. of alcohol of crystallisation). This compound is a tetra acetyl derivative of the above-mentioned base. By the action of caustic alkali or conc.

hydrochloric acid on this tetra-acetyl-compound, the four acetyl-groups may be removed in successive pairs, yielding first *diacetyl-dioxy*

$$\text{C}_6\text{H}_4(\text{OH})\text{CH.NH(C}_2\text{H}_3\text{O)}$$

stilbene diamine

$$\begin{array}{c} \text{C}_6\text{H}_4(\text{OH})\text{CH.NH(C}_2\text{H}_3\text{O}) \\ \text{C}_6\text{H}_4(\text{O C}_2\text{H}_3\text{O})\text{CH.NH(C}_2\text{H}_3\text{O}) \end{array}$$
 (crystalline powder melting above 300°, sol hot phenol, sol caustic alkalis), and finally dioxy stilbene diamine. The latter base is most conveniently prepared by heating the tetra acetyl compound with conc. hydrochloric acid at 120°. By heating the condensation compound with *benzoic anhydride* a dibenzoyl derivative, corresponding with the diacetyl derivative is obtained, it is a tetra benzoyl derivative

$$\text{C}_6\text{H}_4(\text{O C}_2\text{H}_3\text{O})\text{CH.NH(C}_2\text{H}_3\text{O)}$$
 of the base, thus

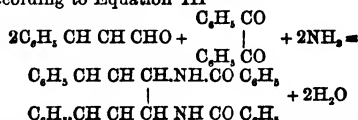

$$\text{C}_6\text{H}_4(\text{O C}_2\text{H}_3\text{O})\text{CH.NH(C}_2\text{H}_3\text{O)}$$

Microscopic plates [246°-248°], sol acetic acid, sol dilute caustic potash on long boiling, regenerating the condensation-compound. These various acetyl and benzoyl derivatives may also be synthesised from dioxy stilbene diamine by treatment with acetic anhydride and benzoic anhydride. The dibenzoyl derivative thus prepared is identical with the original condensation compound (Japp a. Hooker).

Benzil, *furfuraldehyde*, and ammonia also react according to Equation III

$$\text{C}_{12}\text{H}_{10}\text{O}_2 + 2\text{C}_6\text{H}_4\text{O}_2 + 2\text{NH}_3 = \text{C}_{12}\text{H}_{12}\text{N}_2\text{O}_2 + 2\text{H}_2\text{O}$$
 forming, however, two isomeric compounds of the formula $\text{C}_{12}\text{H}_{12}\text{N}_2\text{O}_2$. One of these is an analogue of the salicylic aldehyde compound, it is separated by means of its insolubility in alcohol, and purified by dissolving in boiling phenol and precipitating with alcohol. Crystal line powder, ν sol hot phenol, sl sol glacial acetic acid. The isomeric compound crystallises from alcohol in tufts of silky needles [246°] (J a H).

When *cinnamic aldehyde*, benzil, and ammonia are allowed to react in alcoholic solution, a mixture of two compounds is obtained. Boiling alcohol extracts one of these, and the remaining compound, which is insoluble in alcohol, is purified by dissolving in hot phenol and precipitating with alcohol. The compound soluble in alcohol is *cinnamabenzil*, $\text{C}_{17}\text{H}_{14}\text{N}_2\text{O}_2$ (*infra*). The compound insoluble in alcohol is *dibenzoyl-dicinnamylene diamine* and is formed according to Equation III

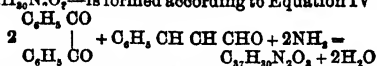

Crystalline powder, consisting of short microscopic prisms [264°], insol in the ordinary organic menstrua, sol hot phenol. When heated with a solution of potash in methyl alcohol at 150°, it parts with the elements of benzoic acid and is converted into *benzenyl-dicinnamylene-diamine*

$$\text{C}_6\text{H}_5\text{CH.CH.CH}-\text{NH} \begin{array}{c} \text{C}_6\text{H}_5 \\ \text{C}_6\text{H}_5\text{CH.CH.CH}-\text{N} \end{array}$$
 Silky needles, [223°], sol benzene and alcohol. Monacid base Pt salt, $(\text{C}_{12}\text{H}_{12}\text{N}_2\text{HCl})_2 \cdot \text{PtCl}_4 \cdot 2\text{aq}$, forms silky needles.

Equation IV—The above mentioned soluble product of the reaction of cinnamic aldehyde

with benzil and ammonia — *cinnimabenzil*, $C_{17}H_{15}N_3O_3$ — is formed according to Equation IV

Crystallises from hot alcohol in two forms — slender needles and minute short prisms [188°], sol benzene. A solution of *potash* in methyl alcohol, when allowed to act upon it in the cold, forms potassium benzoate and *cinnidimabenzil*, $C_{30}H_{28}N_2O_2$.
 $C_{17}H_{15}N_3O_3 + KOH = C_{16}H_{13}N_3O_2 + C_6H_5 \cdot COOK$
 Crystalline powder [283°], sol hot phenol, precipitated by alcohol. By boiling *cinnimabenzil* with dilute *sulphuric acid* it is hydrolysed, yielding benzilimide (*infra*), cinnamic aldehyde, benzoic acid, and ammonia. $C_{17}H_{15}N_3O_3 + 2H_2O = C_{21}H_{17}NO_2 + C_6H_5O + C_6H_5O_2 + NH_3$ (Japp and Wynne)

REACTIONS OF BENZIL WITH AMMONIA ALONE — Laurent, *Revue Scient.* 10, 122, 19, 440, Zinin, *A* 34, 190, Zincke, *B* 16, 890, Japp, *B* 16, 2636, Henius, *A* 228, 339, Japp & Wynne, *C J* 49, 473

By heating benzil with alcoholic ammonia the following compounds are obtained — *imabenzil*, $C_{17}H_{15}N_3O_3$, *benzilimide*, $C_{21}H_{17}NO_2$, *benzilam*, $C_{21}H_{17}NO$, and *lophine*, $C_{21}H_{15}N_2$. At the same time benzoic acid, ethylic benzoate, and benzamide are formed. This reaction was first studied by Laurent, who prepared the first three of the above mentioned compounds, ascribing to them, however, incorrect formulae.

Benzil is dissolved in alcohol so that the solution is saturated at 40°, gaseous ammonia is passed into the warm liquid to saturation, and the whole is allowed to stand for 24 hours. Prismatic crystals of *imabenzil* are deposited, whilst benzilimide, benzilam, and the other compounds above enumerated remain in solution. If slender acicular crystals of benzilimide should separate they may be removed by warming with alcohol, in which *imabenzil* is soluble only with difficulty. The formation of *imabenzil* may be expressed by the equation $3C_{17}H_{15}O_2 + 2NH_3 = C_{17}H_{15}N_3O_3 + C_6H_5 \cdot COOH + H_2O$. *Imabenzil* forms small lustrous orthorhombic prisms [194°], sol hot alcohol, decomposing on long boiling, and yielding among other products benzilimide, the best solvent is hot methyl alcohol. Boiled with dilute *sulphuric acid* (1 vol acid 2 vols water) it is converted into benzilimide, benzil, and ammonia.

$C_{17}H_{15}N_3O_3 + H_2O = C_{21}H_{17}NO_2 + C_6H_5O_2 + NH_3$, whilst cold *conc sulphuric acid* dissolves it, converting it into benzilam, benzaldehyde, benzoic acid, and ammonia.

$C_{17}H_{15}N_3O_3 + H_2O = C_{21}H_{15}NO + C_6H_5O + C_6H_5O_2 + NH_3$ (Japp & Wynne). The formation of benzilam in this reaction was first observed by Laurent. Boiling with alcoholic *potash* converts *imabenzil* into benzilimide (Laurent). *Acetic acid* and *acetic anhydride* act like dilute *sulphuric acid*, decomposing it on boiling with formation of benzilimide and benzil (Henius). Heated for some time to 140° it decomposes and melts, forming benzilimide, benzilam, and lophine, whilst an odour of benzoic aldehyde is perceptible (H.).

The alcoholic ammoniacal mother-liquor from the preparation of *imabenzil* yields, when concentrated, a mixture of *benzilimide* and *benzilam*. A similar mixture is obtained by heating benzil with alcoholic ammonia for some hours at 100°, the *imabenzil* which is first formed being converted into benzilimide and benzilam, at 130° *lophine* is also formed (Henius). The formation of lophine occurs according to the equation $2C_{17}H_{15}O_2 + 2NH_3 = C_{21}H_{15}N_2 + C_6H_5 \cdot COOH + 2H_2O$.

Benzilimide and benzilam are best separated by boiling the mixture with light petroleum, which extracts the whole of the benzilam, depositing it on cooling, in rosettes of prisms, and hardly dissolves the benzilimide, which may be purified by crystallisation from hot alcohol. *Ben zilimide* is formed from benzil and ammonia according to the equation —

$2C_{17}H_{15}O_2 + NH_3 = C_{21}H_{17}NO_2 + C_6H_5 \cdot COOH$
 Tufts of silky needles [137°–139°] (H.), sol. hot alcohol. Concentrated *sulphuric acid* dissolves it in the cold, abstracting the elements of water, and converting it into benzilam (L). $C_{21}H_{17}NO_2 - H_2O = C_{21}H_{17}NO$. Heating with *acetic anhydride* produces the same effect (H.). *Chromic mixture* oxidises it to benzoic acid (H.). Benzilimide may also be prepared from *imabenzil* by Laurent's method of boiling it with alcoholic potash.

Benzilam ($C_{21}H_{17}NO$) may be obtained as above, along with benzilimide, and separated from it as already described, or it may be obtained either from *imabenzil* or from benzilimide, by the action of cold conc *sulphuric acid*. The solution of *imabenzil* in the cold acid is poured into water, when benzilam separates and may be purified by recrystallisation from alcohol. Most readily obtained by heating benzil with fused ammonium acetate in a flask over a flame until the ammonium salt is volatilised (Japp & Wilson, *C J* 49, 829, footnote), but as some lophine is formed at the same time, the benzilam must be extracted by means of hot light petroleum, in which the lophine is practically insoluble. The formation of benzilam from benzil and ammonia may be expressed thus

$2C_{17}H_{15}O_2 + NH_3 = C_{21}H_{17}NO + C_6H_5 \cdot COOH + H_2O$
 Well developed rhombic prisms (from a mixture of ether and alcohol by spontaneous evaporation (H.)), colourless when pure, thin lustrous laminae, sometimes iridescent, (from hot alcohol), rosettes of prisms (from hot light petroleum) [113°–114°]. Distils at a high temperature without decomposition (L). V.D. (air=1) 10.23 calculated 10.28 (J). With *nitric acid* it yields a mono-nitro derivative (needles [178°–182°] from benzene) and a dinitro-derivative (H.). *Chromic mixture* oxidises it to benzoic acid (H.).

The above reactions of benzil with ammonia may be explained as follows. In the first place a portion of the benzil is broken up according to the following equations

then diluted with water Not volatile without decomposition (J)

Ethyl benzoic acid, $C_{10}H_{10}O_2$, isomeric with the foregoing, is a resinous substance obtained by heating benzoïn in alcoholic solution with sodium ethoxide at 150° Scarcely soluble in potash and ammonia, save in presence of alcohol (Jena a Limpricht, *A* 155, 96)

Dibenzilic acid, $C_{16}H_{14}O_4$ [196°], obtained by heating benzoic acid to 180° (v *supra*), crystallises from alcohol in minute needles It is an anhydride, and, by heating with water at 180° , is converted into benzoic acid (Jena, *B* 2, 385) F R J

BENZO-TRI CHLORIDE, $C_6H_5Cl_3$ v e

$C_6H_5CCl_3$, Mol w 195.5 (214°) S G 14 138

Formation—1 From benzoïl chloride and PCl_3 (Wohler a Liebig, *A* 3, 265, Schischkoff a Rosing, *C R* 46, 367, Limpricht, *A* 134, 55, 135, 80, *Bl* 1860, n 468)—2 From benzoïl chloride by chlorination (Cahours, *C R* 56, 703)—3 By chlorination of toluene (Naquet, *C R* 55, 407, 56, 482)

Preparation—By passing chlorine (3 mols) into cold toluene (1 mol) exposed to direct sunshine (Schramm, *B* 18, 608) or into boiling toluene

Properties—Pungent liquid, insol water, which slowly converts it into benzoic acid (the change is rapid at 140°) Alcohol at 130° forms benzoic ether

Reactions—1 Sodium has no action.—2 Ag_2O forms benzoic anhydride—3 *Aqueous ammonia* at 140° gives benzoic acid, benzamide, and benzonitrile, reacting thus $C_6H_5CCl_3 + 4NH_3 = 8NH_4Cl + C_6H_5CN$ —4 *Aniline* forms di-phenylbenzamidine, $C_6H_5C(NC_6H_5)NHC_6H_5$ —5 Reacts with aromatic bases thus $C_6H_5CCl_3 + 2C_6H_5NXY = C_6H_5CCl(C_6H_5NXY)_2 + 2HCl$ —

$C_6H_5C \begin{matrix} \diagup C_6H_5NXY \\ \diagdown C_6H_5NXY \end{matrix} + 2HCl$, whence KOH

forms the carbinol $C_6H_5C(OH)(C_6H_5NXY)_2$. The reaction requires presence of a metallic chloride or other condensing agent, it takes place most easily with tertiary bases, least readily with primary bases The products are dyes, the primary bases giving violet, the secondary and tertiary green, colours—6 It acts similarly on *phenols* $C_6H_5CCl_3 + 2C_6H_5OH = 2HCl + C_6H_5CCl(C_6H_5OH)_2$. The products are converted by treatment with water into carbinols $C_6H_5C(OH)(C_6H_5OH)_2$, the alkaline salts of which are colouring matters (Doebner, *A* 217, 226)—7 Converted by heating with dry *oxalic acid*, first into $PhCOCl$, then into $(PhCO)_2O$

(Anschütz, *A* 226, 20)—8 *Copper* produces, on heating, $C_6H_5CCl_3$, $COCl_2$, C_6H_5 (Onufrowicz, *B* 17, 833)

BENZOIC ACID $C_6H_5O_2$ v e $C_6H_5CO_2H$ Mol w 122 [121.4°] (Schiff) (249.2 cor) (Kopp, *A* 94, 303) S G 21 120 (Mendeleëff), 1 337 (Rudorff, *B* 12, 250), 1 292 (Schroder, *B* 12, 562) S 156 at 0° (Ost, *J pr* [2] 17, 232), 172 at 0° , 207 at 10° , 425 at 31° , 1 78 at 75° (Bourgoin, *J Ph* [4] 30, 488) S (ether) 66 at 15° S (alcohol) 47 at 15° (Bourgoin, *Bl* [2] 29, 245) H F 94,533 (Stohmann, *J pr* [2] 36, 2) S V 126 (Ramsay) S V S 112 09 (S) R_{∞} 64.21 (in a 6 p c benzene solution, Kanonnikoff)

Occurrence—In various resins, e.g. gum benzoïn, dragon's blood, storax, and balsams of Peru and Tolu (Blaise de Vigenère, *Traité du feu et du sel*, 1608, Liebig a Wohler, *A* 3, 249) In castoreum (Wohler, *A* 67, 360), in the spindle tree (*Euonymus europæus*) In putrid urine (Liebig, *A* 50, 168) In cranberries (Loew, *J pr* [2] 19, 312) In the higher boiling phenolic portion of coal tar oils (Schulze, *B*, 18, 615)

Formation—1 By oxidation of benzoic aldehyde, benzyl alcohol, toluene, cinnamic acid, &c—2 In small quantity, by passing a current of dry CO_2 through a nearly boiling mixture of aluminum chloride and benzene (Friedel a Crafts, *C R* 86, 1368)—3 In small quantity, by the action of H_2SO_4 and MnO_2 on benzene, especially when formic acid is added (Carius, *A*, 148, 51, 59)—4 By distilling calcopthalate with lime (Depouilly, *Bl* [2] 3, 163, 469)—5 By the action of H_2SO_4 and MnO_2 on casein or gelatin (Guckelberger, *A* 64, 80)—6 By fusing potassium benzene sulphonate with sodium formate (V Meyer, *B* 3, 112)—7 From benzonitrile by saponification—8 By passing CO into sodium bromo benzene (Kekulé, *A* 137, 129)

Preparation—1 From gum benzoïn by sublimation or by extracting with lime water or acetic acid (Mohr, *A* 29, 178, Scheele, *Opus.* 2, 23, Wohler, *A* 49, 245, Loew, *J pr* 108 257, Guichard, *Bl* [2] 19, 357) Some varieties of gum benzoïn contain cinnamic acid, but this acid is absent from the benzoïn of Siam or the Palembang benzoïn from Sumatra, the latter yields 10 p c benzoic acid (Saalfeld, *Ar Ph* [3] 16, 280) Benzoic acid that has been sublimed from gum benzoïn leaves a small quantity of oily residue when treated with aqueous Na_2CO_3 , this oil consists of guaisacol, methyl benzoate, pyrocatechin, acetyl guaisacol, benzyl benzoate, benzophenone, and benzoyl-guaisacol (Jacobsen, *Ar Ph* [3] 22, 866).—2 From hippuric acid Urine of horses &c

oxen is left for some days to putrefy, when the hippuric acid is split up into glycocholic and benzoic acid milk of lime is added and the liquid concentrated, excess of lime is added by CO_2 , and the filtrate added by FeCl_3 , the ferric benzoate is decomposed by HCl . Benzoic acid prepared in this way crystallises in plates and smells of urine, but by sublimation it may be freed from the smell and then crystallises in needles (Dymond, *Ph* [3] 14 463) —3 From benzo trichloride by decomposing it with water under pressure, with lime or baryta water, or with ZnCl_2 and glacial HOAc (2 mols.) at 100° (Jacobsen, *B* 13, 2013) —4 From benzyl chloride by boiling with dilute HNO_3 (Lunge a Petri, *B* 10, 1275, cf v Rad, *D P J* 231, 538)

Properties —Needles or pearly plates When pure it does not melt under water, but slight impurities greatly affect its physical properties, the so called salicylic acid was impure benzoic acid (Kolbe a Lautemann, *A* 115, 187, Kekulé, *A* 117, 159, Griess, *A* 117, 34, Reichenbach a. Beilstein, *B* 132, 309, Kolbe, *J pr* [2] 12, 151) Volatile with steam (1 g passing over with about 2,000 c.c water) It dissolves in conc H_2SO_4 and is reprecipitated by water. It is not attacked by boiling dilute HNO_3 or CrO_3 (which convert cinnamic acid into benzoic aldehyde), its neutral salts give a buff coloured pp with FeCl_3 .

Reactions —1 Passage of the vapour through a red hot tube gives CO and benzene —2 Distillation with lime produces benzene —3 Fusion with NaOH produces benzene (75 p.c. of the theoretical amount) and a little diphenyl (Barth a. Senhofer, *B* 12, 1256) —4 Fusion with KOH produces chiefly p oxy benzoic acid, but also o and m oxy benzoic acids, oxy iso phthalic acid, diphenyl o, m, and p carboxylic acids, and a brown amorphous substance (Barth a. Schreder, *M* 3, 799) —5 MnO_2 and H_2SO_4 form CO_2 , formic acid, and small quantities of phthalic and terephthalic acids (Carius, *A* 148, 50, Oudemans, *Z* [2] 5, 84) —6 Hydrogen peroxide and H_2SO_4 produce salicylic acid (Hanriot, *C R* 102, 1250) —7 Vapours of benzoic acid passed over heated zinc dust form benzoic aldehyde (Baeyer, *A* 140, 295) —8 Sodium amalgam reduces it to benzyl alcohol, and benzoic acid $\text{C}_6\text{H}_5\text{O}_2$, and an oil $\text{C}_7\text{H}_5\text{O}_2$ (Kolbe, *A* 118, 122, Hermann, *A* 132, 75) —9 PCl_5 forms benzoyl chloride —10 Distillation with KSCN or Pb(SCN)_2 gives benzonitrile —11 Benzene and P_2O_5 at 190° give benzophenone (Kollaris a. Merz, *B* 5, 447) —12 Dimethylaniline and P_2O_5 give $\text{C}_6\text{H}_5\text{CO C}_6\text{H}_5\text{NMe}_2$ (O Fischer, *B* 10, 958) —13 Chlorine produces chloro benzoic acids —14 Bromine forms bromo-benzoic acids —15 Iodine in presence of HIO_3 forms iodobenzoic acid —16 Conc HNO_3 forms m nitro-benzoic acid —17 Fuming H_2SO_4 forms sulphobenzoic acid —18 In the animal organism it is converted into hippuric acid and excreted in the urine (Wöhler) —19 Cr_2F_6 forms di fluoro benzoic acid (Jackson a. Harshorn, *B* 18, 1993)

Salts —Benzoic acid decomposes carbonates, but an alcoholic solution of potassium benzoate is decomposed by CO_2 . Calcium benzoate gives on distillation benzophenone, and smaller quantities of benzene, anthraquinone,

and tetra phenyl methane (Kekulé a. Franchimont, *B* 5, 909) Calcium benzoate distilled with calcium formate gives benzoic aldehyde. Potassium benzoate distilled alone or with sodium formate gives terephthalic and isophthalic acids (Richter, *B* 6, 876, Conrad, *B* 6, 1895) Cupric benzoate gives on distillation benzene, benzoic acid, di phenyl oxide Ph_2O , phenyl benzoate PhO_2C , and phenol (List a. Limpriht, *A* 90, 190) Cyanogen bromide acts upon potassium benzoate thus. $\text{Ph CO}_2\text{K} + \text{CNBr} = \text{Ph CN} + \text{CO}_2 + \text{KBr}$ (Cahours, *A Ch* [3] 52, 201) Potassium benzoate when electrolysed gives K and benzoic anhydride, in presence of excess of KOH acetylene is also formed (Bourgoin, *Z* [2] 4, 566)

$\text{Al}_2\text{A}_3(\text{OH})_3$, aq crystals (Sestini, Cicognani, a Zavatti, *Bl* [2] 13, 488) — NH_4A deliquescent, on distillation it gives benzonitrile — NH_4HA , — BaA , 2aq — CdA , 2aq — CaA , 3aq S 3.5 — CeA , 3aq — CoA , 2aq — CuA , 2aq needles — CrA , 2aq — CrA , 2aq — Cr_2A , $(\text{OH})_2$, 2aq (Schiff, *A* 124, 169) — $\text{Fe}_2\text{A}_3(\text{OH})_3$, 6aq buff coloured pp — LaA , 3aq — PbA , 2aq plates — PbA , 2aq — MgA , 3aq S 4.5 at 25° — MnA , 4aq large flat prisms, S 6.55 at 15° (Seubert, *B* 20, 791) — Hg_2A , 2aq — Hg_2A , — NiA , 3aq — KA , 3aq — AgA , S (alcohol) 5 at 20° — NaA , aq — SnA , aq — ZnA .

Sulphinide of benzoic acid v IMIDE OF SULPHENOUS ACID

BENZOIC ALDEHYDE $C_6H_5 \cdot CO \cdot H$ Benzaldehyde Oil of bitter almonds Mol w 106 (179°) S G 2 1 0455 (Bruhl), 2 1 0504 (Mendeleeff, *J* 1860, 7) S 33 (Flückiger, *J* 1875, 482) μ_{25} 1 5624 R 25 51 65 (B) HF 23,254 (Stohmann, *J pr* [2] 36, 3)

Formation — 1 From almonds (*q v*) — 2 By oxidation of benzyl alcohol (Cannizzaro, *A* 88, 130), cinnamic acid (Dumas & Peligot, *A* 14, 50), and proteids (Guckelberger, *A* 64, 60, 72, 86) — 3 By boiling benzyl chloride with water and nitrate of lead (Lauth & Grimaux, *A* 143, 80), nitrate of copper, or sodium nitrate — 4 By heating benzylidene chloride with water or alkalis (Cahours, *C R* 56, 222) — 5 By mixing benzylidene chloride with conc H_2SO_4 , diluting, and distilling (Oppenheim, *Z* [2] 5, 441) — 6 By passing vapour of benzoic or phthalic acid over heated zinc dust (Baeyer, *A* 140, 295) — 7 By reducing benzoic acid with $SnCl_2$ (Dusart, *J* 1862, 263), or sodium amalgam in slightly acid solution (Kolbe, *A* 118, 122) — 8 By distilling calcium benzoate with calcium formate (Piria, *A* 100, 104) — 9 From benzylidene chloride and silver oxalate (Golowkinsky, *A* 111, 252) or potassium carbonate (Meunier, *Bl* [2] 88, 159) — 10 From toluene by successive treatment with CrO_2Cl_2 and water (Etard, *C R* 90, 534) — 11 From benzylidene chloride, acetic acid, and $ZnCl_2$. $Ph \cdot CHCl_2 + CH_3 \cdot CO_2H = Ph \cdot CHO + CH_3 \cdot COCl + HCl$

Preparation — 1 Benzyl chloride (1 pt) is cohobated at 100° with water (10 pts) and lead nitrate (1½ pts), a current of CO_2 being passed through the apparatus The product is distilled and the light oil fractionated It is shaken with a saturated solution of $NaHSO_4$, and the resulting crystalline compound is washed with alcohol, crystallised from water, and then decomposed by boiling aqueous Na_2CO_3 (Lauth & Grimaux, *A* 143, 80, Bertagnini, *A* 85, 183) — 2 Crude benzylidene chloride is heated at 110°-130° with an equivalent quantity of dry oxalic acid, the product is distilled *in vacuo* $Ph \cdot CHCl_2 + H_2C_2O_4 = Ph \cdot CHO + 2HCl + CO_2 + CO$ (Anschutz, *A* 226, 18) — 3 A mixture of benzyl chloride (2 mols) with benzylidene chloride (1 mol) obtained by chlorinating toluene till the S G is 1 175 is boiled with water and MnO_2 (2 mols) (Schmidt) — 4 By heating benzylidene chloride with aqueous KOH under pressure, or by boiling it with milk of lime — 5 Bitter almonds are freed from almond oil by pressure The press cake (12 pts) is made into a paste with boiling water (110 pts), after 15 minutes the paste is allowed to cool The emulsion is destroyed by boiling, and therefore a second quantity of the press cake (1 pt) is mixed with cold water (6 pts) and added to the first After 12 hours' maceration the whole is distilled with steam The yield is 2 p.c. of the press cake (Pettenkofer, *A* 122, 77, cf Liebig & Wöhler, *A* 22, 1) In this operation amygdalin is split up by the unorganised ferment emulsin, the products being benzoic aldehyde, prussic acid, and glucose

$C_{20}H_{27}NO_{11} + 2H_2O = C_6H_5 \cdot CO \cdot H + CNH + 2C_6H_5 \cdot O_2$ Benzoic aldehyde so prepared contains prussic acid, which appears to be combined in the form of the cyanhydrin $C_6H_5 \cdot CH(OH) \cdot CN$, for a mixture of benzoic aldehyde and prussic acid yields methylamine on reduction, while crude oil of bitter almonds yields amido phenyl ethane $C_6H_5 \cdot CH_2 \cdot CH_2 \cdot NH_2$, again, a mixture of benzoic aldehyde and prussic acid, on treatment with chlorine, yields $C_6H_5 \cdot Cl \cdot CO \cdot Cl$, while oil of bitter almonds yields, by similar treatment, $C_6H_5 \cdot CH(OH) \cdot CO \cdot N \cdot CH \cdot C_6H_5$ (Fiolet, *G* 9, 446) Prussic acid may be removed by shaking with $FeSO_4$ and lime or potash, or by digesting with HgO and water The aldehyde is then purified by means of $NaHSO_4$ as described under 1

Properties — Colourless oil It is not poisonous It oxidises rapidly in the air, but the addition of a little prussic acid hinders the oxidation (Dusart, *Bl* 8, 459) It does not reduce Fehling's solution

Reactions — 1 Oxidised to benzoic acid by air or other oxidising agents Conc HNO_3 , however, forms *m*- (and a little *o*) nitro benzaldehyde — 2 Aqueous or alcoholic potash gives benzyl alcohol and potassium benzoate — 3 Led over red hot pumice it is split up into CO and benzene (Barreswil & Boudault, *A* 52, 360) — 4 PCl_5 forms benzylidene chloride (Cahours, *A* 70, 89) $COCl_2$ acts similarly (Kempt, *J pr* [2] 1, 412) — 5 Chlorine forms benzoyl chloride and a compound of that body with benzoic aldehyde, $C_6H_5 \cdot CHCl(OBz)$ (Laurent & Gerhardt, *J* 1850, 439) Bromine acts similarly, forming $C_6H_5 \cdot CHBr(OBz)$ (70°) (Liebig & Wöhler, *A* 3, 266, Claisen, *B* 14, 2475) — 6 Succinyl chloro-

ride produces succinic acid and benzylidene chloride (Rembold, *A* 138, 189)—7 Sodium amalgam reduces it, in presence of water, to benzyl alcohol, hydrobenzoin, and isohydrobenzoin—8 Potassium cyanide produces benzoin 9 Aqueous HI (SG 20) at 280° reduces it to toluene (Berthelot, *J* 1867, 346)—10 H₂S forms thiobenzaldehyde—11 Aqueous NH₃ forms hydrobenzamide (C₆H₅CH)₂N₂—12 Ammonium sulphide forms thiobenzaldine C₆H₅NS, —13 NH₃ and sulphide of carbon form NH₂CSSN(CH C₆H₅)₂—14 With acetic anhydride and sodium acetate, on heating, it forms sodium cinnamate (v PERKIN'S SYNTHESIS, p 108) The reaction probably takes place in two stages C₆H₅CHO + CH₃CO Na =

H₂O + C₆H₅CH CH CO₂Na—15 With Ac₂O and sodium succinate it gives the lactone of CO₂HCH₂CH(CO₂H)CH(OH)C₆H₅—16 With sodium isobutyrate and isobutyric anhydride it forms C₆H₅CH(OH)CMe₂CO₂H, v OXY PHENYL VALERIC acid (Fittig, *A* 216, 119)—17 With Ac₂O and sodic butyrate at 100° it gives only phenyl angelic acid, whereas at 180° the chief product is cinnamic acid (Slocum, *A* 227, 53)—18 The reaction PhCHO + CH₃XY = H₂O + PhCH XXY takes place under influence of dry HCl or aqueous or alcoholic KOH on condition that X or Y is of the form CO₂Z, e.g. benzoic aldehyde acting on acetone, mesityl oxide, acetophenone, pyruvic acid, malonic ether, and aceto acetic ether Perkin's reaction is of a similar nature Occasionally intermediate compounds of the form PhCH(OH)CHXY are formed (Claisen, *A* 218, 121)—19 Sodium malonate and Ac₂O react in the cold, giving off CO₂ and forming cinnamic acid, as follows PhCHO + CH₂(CO₂H)₂ = PhCH C(CO₂H)₂ + H₂O = PhCH CO₂H + CO₂ + H₂O (Stuart, *C J* 43, 404)—20 Sodium isosuccinate and Ac₂O act similarly, forming phenyl iso crotonic acid

21 Acetyl chloride and zinc dust form diacetyl hydrobenzoin, while benzoyl chloride and zinc dust form di benzoyl hydrobenzoin (Paal, *B* 15, 1818, 16, 636, 17, 909)—22 Reacts with nitro paraffins thus PhCHO + H₂C(NO₂)CH₂ = H₂O + PhCH C(NO₂)CH₂ (Priests, *A* 225, 319)—23 A solution of aniline in conc HCl pps yellow crystals of a molecular compound They are only stable in presence of conc HCl (Elbers, *A* 227, 357) If SnCl₄ be also present a compound (NPhH₂HCl)₂(C₆H₅O)₂SnCl₄ is formed (E)—24 Aniline forms benzylidene aniline, C₆H₅CH N C₆H₅, o toluidine acts similarly When heated in presence of HCl or ZnCl₂ aniline forms di amido tri phenyl methane Dimethylamine in presence of ZnCl₂ gives C₆H₅CH(O₂C₂H₅NMe)₂ (Fischer, *B* 10, 1623), dimethyl m- (but not o or p) toluidine behaves similarly (Fischer, *B* 13, 807)—25 Ethylene diamine forms (C₆H₅CH N)₂C₂H₄ [64°] (Mason, *B* 20, 287)—26 (8-Naphthylamine forms benzylidene-(8) naphthylamine and then phenyl-naphthacridine dihydride PhCH<C₁₀H₇>NH (Claisen, *A* 237, 261)—27 Resorcin in presence of HCl forms a resin C₁₂H₁₀O₂ (Baeyer, *B* 6, 25). Phenol, pyrocatechin, phloroglucin,

cin, and orcin act similarly (Michaela Rydér, *B* 19, 1888, *Am* 9, 130)—28 (β-Naphthol left to stand for several days in the cold with an acetic acid solution of benzaldehyde treated with a few drops of HCl forms di (β) naphthyl benzaldehyde (di naphthyl ortho benzoic aldehyde) C₁₀H₇CH(OC₁₀H₇)₂ [205°] It is a crystalline pp, sol all ordinary solvents, insol aqueous alkalis By warming with acetic acid and a few drops of HCl it is converted into the isomeric di oxy di naphthyl phenyl methane C₁₀H₇CH(C₁₀H₇OH)₂, which at the same time loses H₂O, giving the compound C₆H₅CH<C₁₀H₇>O (Claisen, *B* 19, 3317)—

29 Acetone in presence of aqueous NaOH produces C₆H₅CH CH CO CH₃ and the compound C₆H₅CH CH CO CH CH C₆H₅ In general compounds containing the group CH₃CO react with benzoic aldehyde, exchanging the H₂ for CHPh (Claisen, *B* 14, 349, 2468, v BENZYLIDENE-ACETONE)—30 Prussic acid forms mandelonitrile or the cyanhydrin of benzoic aldehyde, C₆H₅CH(OH)CN (v MANDELIC ACID) This is converted by alcohol and HCl into mandelic imido ether, C₆H₅CH(OH)C(NH)OEt (Volckel, *A* 52, 361, Tiemann, *B* 14, 1967) Benzoic aldehyde (4 vols) mixed with nearly anhydrous prussic acid (1 vol) and shaken with alcoholic KOH forms benzimide C₁₂H₁₀N₂O₂ [167°], a flocculent substance, insol water, alkalis, and acids (Laurent, *A Ch* [2] 59, 397, 66, 193, Zinn, *A* 34, 188, *B* 2, 552, Gregory, *A* 54, 372) 31 Hydrosulphide forms a pungent compound C₆H₅I₂O [28°] insol water (Geuther a Cartmell, *A* 112, 20)—32 SO₃ forms a disulphonic acid C₆H₅(SO₃H)₂CHO (Engelhardt, *J* 1864, 350)—33 By treatment with a methyl alcoholic solution of sodium methylate a white solid compound C₆H₅C(OMe)(OC₆H₅)₂(ONa) is formed The same body is formed by the action of sodium methylate on benzyl benzoate or of sodium benzoate on methyl benzoate By treatment with acetic acid it is split up into a mixture of benzyl benzoate, methyl benzoate, benzyl alcohol, and methyl alcohol—34 If benzaldehyde is heated with a small quantity of sodium benzoate for several days at 100°, it is slowly polymerised to benzyl benzoate Probably the compound C₆H₅C(OC₆H₅)₂ONa is first formed, and then decomposes into benzyl benzoate and sodium benzoate, which latter again reacts upon a further quantity of benzaldehyde, producing more of the intermediate compound, and so on (Claisen, *B* 20, 646)—35 By boiling with ammonium formate it yields tri-, di-, and mono benzylamine and their formyl derivatives, together with other products (Leuchart, *B* 19, 2128)—36 Ammonium sulphocyanide at 140° forms benzylidene thioburet C₆H₅CH<NHCS>NH [237°] (Brodsky, *M* 8, 27)—37 Benzene-azo benzene and ZnCl₂ forms "benzylidene benzidine" C₁₂H₁₀N₂O₂? [239°] (Barzilowsky, *J R* 1885, 368)—38 Acts upon an alcoholic solution of sodium acetate, forming C₁₂H₁₀O₂ [127°], sol dilute alkalis (Michael, *J pr* [2] 85, 450)—39 Hydrazine-benzoic acid, NH₂NH C₆H₄CO₂H, forms benzoic acid-hydrazine-benzoic acid C₁₂H₁₂N₂O₄ [172° uncar] (Roder, *A* 236, 171)

Combinations — 1 With bisulphites $\text{C}_6\text{H}_5\text{CH}(\text{OH})\text{SO}_3\text{Na}$, aq. Small crystals, v. sol. water, insol. cold alcohol. Decomposed by boiling water, boiling dilute acids, or cold alkalis or alkaline carbonates (Bertagnini, *A* 85, 188). — $\text{C}_6\text{H}_5\text{CH}(\text{OH})\text{SO}_3\text{K}$ laminae — $\text{C}_6\text{H}_5\text{CH}(\text{OH})\text{SO}_3\text{NH}_4$, aq. formed by action of SO_2 on an alcoholic solution of hydrobenzamide (Otto, *A* 112, 305). — $\text{C}_6\text{H}_5\text{CH}(\text{OH})\text{SO}_3\text{Ba}$, 2aq. from the Na salt and BaCl_2 . — 2 With SO_2 and aniline $(\text{C}_6\text{H}_5\text{CHO})_2(\text{C}_6\text{H}_5\text{N})_2\text{SO}_2$ (Schiff, *A* 140, 130). — *p*-Toluidine forms, similarly, $(\text{C}_6\text{H}_5\text{O})_2(\text{C}_6\text{H}_4\text{N})_2\text{SO}_2$. — Amido acids shaken with aqueous solutions of SO_2 and benzoic aldehyde form crystalline compounds, e.g. (from glyocoll), $\text{C}_6\text{H}_5\text{CH}(\text{OH})\text{SO}_3\text{NH}_2\text{CH}_2\text{CO}_2\text{H}$, and $\text{C}_6\text{H}_5\text{CH}(\text{OH})\text{SO}_3\text{NH}_2\text{C}_6\text{H}_4\text{CO}_2\text{H}$ (from amido benzoic acid) (Schiff, *A* 210, 123). — 3 With inorganic salts $\text{C}_6\text{H}_5\text{O}_2\text{CaCl}_2$ (?) (Ekmann, *A* 112, 175). — $\text{C}_6\text{H}_5\text{OBF}_4$ (Landolph, *J* 1878, 621).

Oxime BENZALDOXIM

Phenyl hydrazide $\text{C}_6\text{H}_5\text{CHN}_2\text{HC}_6\text{H}_5$, [153°] Formed by adding a solution of phenyl hydrazine hydrochloride and sodium acetate to an aqueous solution of benzaldehyde, the white pp. is distinctly visible with a solution of 1 pt. of benzaldehyde in 50,000 pts. of water (Fischer, *B* 17, 674). Can be crystallised from alcohol insol. water. **Acetyl derivative** $\text{C}_6\text{H}_5\text{CHN}_2\text{Ac}$ [120°], long needles (Schroeder, *B* 17, 2096). **Benzoyl derivative** $\text{C}_6\text{H}_5\text{CHN}_2\text{NBzPh}$ [122°] Formed from benzaldehyde and benzyl phenyl hydrazine. Very thin silky needles. V. sol. alcohol (Michaelis & Schmidt, *B* 20, 1717).

Methyl phenyl hydrazide

$\text{PhMeN}_2\text{CHPh}$ [102°–104.5°] — 1 Formed in small quantity from the methyl phenyl hydrazide of phenyl glyoxylic acid (*g* v) at 120°. Benzoic aldehyde and methyl aniline are also formed. — 2 From benzoic aldehyde and methyl phenyl hydrazine in an alcoholic solution. White needles (Wallach, *A* 227, 352).

Derivatives of Benzoic ortho aldehyde are described as BENZYLIDENE derivatives.

BENZOIC ALDEHYDE, AMMONIA-DERIVATIVES OF The most important of these are hydrobenzamide, amarine, and lophine.

1 **HYDROBENZAMIDE** $\text{C}_6\text{H}_5\text{H}_2\text{N}_2$, v. e. ($\text{C}_6\text{H}_5\text{CH}_2\text{N}_2$, Tribenzylidene diamine [110°]).

Formation — By the action of ammonia upon benzoic aldehyde (Laurent, *A* Ch [2] 62, 23, 66, 18), upon benzylidene acetate $\text{C}_6\text{H}_5\text{CH}(\text{O C}_6\text{H}_5\text{O})_2$ (Wicke, *A* 102, 368), or upon benzylidene dichloride (Engelhardt, *A* 110, 78).

Preparation — Benzoic aldehyde, which must be free from hydrocyanic acid, is left for some days in contact with strong aqueous ammonia. The crystalline mass which separates is washed, first with water and then with ether, and finally recrystallised from alcohol. Heat accelerates the action, but diminishes the yield. Equation $8\text{C}_6\text{H}_5\text{CHO} + 2\text{NH}_3 = (\text{C}_6\text{H}_5\text{CH}_2)_2\text{N}_2 + 3\text{H}_2\text{O}$.

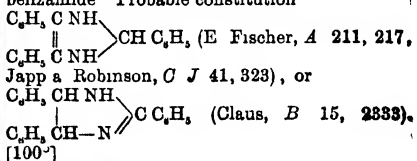

Properties — Crystallises from hot alcohol in colourless rhombic octahedra, which are generally wedge shaped. Insol. water sol. alcohol and ether. Has a sweetish taste and is not poisonous.

Reactions — 1. When heated for several hours to 120°–130° it is converted into the iso-

meric amarine (Bertagnini, *A* 88, 127). By destructive distillation it yields lophine $\text{C}_6\text{H}_5\text{N}_2$ (Laurent). — 2. Boiling with aqueous potash converts it into amarine (Fownes, *T* 1845, 263), whilst alcoholic potash breaks it up into benzoic aldehyde and ammonia. This last decomposition is also effected by prolonged boiling with alcohol alone. Fusion with potash produces very complex decomposition, yielding among other products lophine. — 3. Dilute acids hydrolyse it readily on boiling, slowly in the cold, into benzoic aldehyde and ammonia. The ease with which this hydrolysis occurs is best accounted for on the assumption that hydrobenzamide is tribenzylidene diamine. — 4. Dry hydrobenzamide absorbs gaseous hydrochloric acid. During the process a non nitrogenous substance volatilises, and the residue, when treated with water, yields benzoic aldehyde and ammonium chloride. If instead of treating the residue with water it is heated, benzonitrile and benzyl chloride distil over, whilst a complex mixture of basic substances remains (Ekmann, *A* 112, 151, Kuhn, *A* 122, 308). — 5. It unites with 2 mols of hydrocyanic acid to form hydrobenzamidodihydrocyanide, a yellow crystalline mass melting at 55°, which, when treated with hydrochloric acid, is decomposed into benzoic aldehyde and phenylamidacetoneitrile $\text{C}_6\text{H}_5\text{N}_2\cdot 2\text{HCN} + \text{H}_2\text{O} = \text{C}_6\text{H}_5\text{O} + 2\text{C}_6\text{H}_5\text{CH}(\text{NH}_2)\text{CN}$, the latter compound being subsequently hydrolysed to the corresponding acid (Plochl, *B* 13, 2119). Under other conditions the benzoic aldehyde and phenylamidacetoneitrile thus formed may unite with elimination of water to form benzoyl azotide, $\text{C}_6\text{H}_5\text{N}_2$, thus $\text{C}_6\text{H}_5\text{O} + \text{C}_6\text{H}_5\text{CH}(\text{NH}_2)\text{CN} = \text{C}_6\text{H}_5\text{N}_2 + \text{H}_2\text{O}$ (Plochl, *B* 14, 1142). When an ethereal solution of hydrobenzamide is mixed with 1 mol of hydrocyanic acid, and gaseous hydrochloric acid is passed into the liquid, a hydrochloride of the monohydrocyanide of hydrobenzamide, $\text{C}_6\text{H}_5\text{N}_2\cdot\text{HCN}\cdot\text{HCl}$, separates. On boiling this precipitate with concentrated hydrochloric acid, it is decomposed into benzoic aldehyde, ammonia, and the hydrochloride of an anhydride of the formula $\text{C}_6\text{H}_5\text{H}_2\text{N}_2\text{O}$. $\text{C}_6\text{H}_5\text{N}_2\cdot\text{HCN} + 2\text{H}_2\text{O} = \text{C}_6\text{H}_5\text{N}_2\text{O} + \text{C}_6\text{H}_5\text{CHO} + \text{NH}_3$. The free anhydride melts at 164° and sublimes without decomposition, the acid $\text{C}_6\text{H}_5\text{N}_2\text{O}$ melts at 120° (Plochl, *B* 14, 1139). — 6. Dissolved in absolute alcohol and treated in the cold with 3 p.c. sodium amalgam it yields benzylidene di-benzylamide $\text{C}_6\text{H}_5\text{CH}(\text{NHCH}_2\text{C}_6\text{H}_5)_2$. Astronger amalgam, aided by heat, converts it into benzylamine and toluene (O. Fischer, *B* 19, 748).

7. Hydrobenzamide is also acted upon by chlorine, sulphurous anhydride, sulphuretted hydrogen, and ethyl iodide, but the reactions are not of importance.

2 **AMARINE** $\text{C}_6\text{H}_5\text{N}_2$. Isomeric with hydrobenzamide. Probable constitution

Formation — 1. By the action of ammonia upon an alcoholic solution of benzoic aldehyde.

(Laurent *C R* 19, 853)—2 By boiling hydrobenzamide with aqueous potash (Fownes, *T* 1845, 263)—3 By heating hydrobenzamide to 120°–130° (Bertagnini, *A* 88, 127)—4 Together with lophine by distilling the double compound of benzoic aldehyde and ammonium hydrogen sulphite with excess of slaked lime (Gossmann, *A* 93, 329)—5 In small quantity when ammonia acts upon a mixture of benzoic acid and benzoic aldehyde— $C_{10}H_{12}O_2 + C_6H_5O + 2NH_3 = C_{21}H_{18}N_2 + 3H_2O$ (Radziszewski, *B* 15, 1495)

Preparation—Hydrobenzamide is heated from 2 to 4 hours at 120°–130°. The vitreous mass thus obtained is dissolved in boiling alcohol, and an excess of hydrochloric acid is added. The amarine hydrochloride, which separates in white crystals, is purified by recrystallising from boiling alcohol and is then decomposed with ammonia.

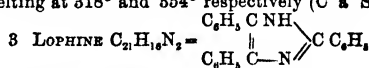

Properties—Deposited from alcohol in lustreous prisms. Melts at 100° (Fownes), but by boiling for some time with water, is converted into a granular substance melting as high as 126°. This modification is reconverted into prismatic amarine, melting at 100°, by recrystallisation from alcohol (Claus, *B* 18, 1678). Insol water, v sol alcohol and ether, the alcoholic solution having an alkaline reaction. Has a bitter taste, which is noticeable only after a time. Very poisonous. Combines with acids to form sparingly soluble salts which have an intensely bitter taste— $C_{21}H_{18}N_2 \cdot HCl$. Needles, sparingly soluble in boiling water— $(C_{21}H_{18}N_2 \cdot HCl)_2 \cdot PtCl_6$. Yellow crystalline salt (Gossmann)— $C_{21}H_{18}N_2 \cdot HI$ (Borodine, *A* 110, 79)— $C_{21}H_{18}N_2 \cdot HNO_3$ (Fownes) ($C_{21}H_{18}N_2 \cdot H_2SO_4 + 3\frac{1}{2}H_2O$ (Groth, *A* 152, 122)— $(C_{21}H_{18}N_2)_2 \cdot H_2CrO_4$. Yellow precipitate, almost insol water.

Reactions—1 By destructive distillation it yields ammonia, toluene, and lophine, $C_{21}H_{18}N_2$ (Fownes, v also Radziszewski, *B* 10, 70)—2 By limited oxidation, as when the chromate is boiled with glacial acetic acid, it is converted into lophine $C_{21}H_{18}N_2 + O = C_{21}H_{16}N_2 + H_2O$ (Fischer & Troschke, *B* 13, 707). Excess of chromic acid oxidises it to benzoic acid—3 When a hot alcoholic solution of amarine is acidified with acetic acid and a hot concentrated solution of an alkaline nitrite is added, nitroso amarine, $C_{21}H_{17}(NO)N_2$, separates, and, by recrystallisation from alcohol, may be obtained in rhombic tables, which, when heated to 150°, decompose with formation of lophine (Borodine, *B* 8, 934)—4 With nitric acid in the cold, mononitro amarine, $C_{21}H_{17}(NO_2)N_2$, is formed, hot nitric acid converts it into dinitro amarine, $C_{21}H_{16}(NO_2)_2N_2$. The latter compound yields, with reducing agents, diamido amarine, $C_{21}H_{16}(NH_2)_2N_2$. Salts of these nitro and amido bases have been prepared (Claus & Witt, *B* 18, 1670)—5 With acetyl chloride an ethereal solution of amarine yields a product which, when treated with alcohol, is separated into amarine hydrochloride and diacetyl amarine, $C_{21}H_{16}(C_2H_3O)_2N_2$ [268°] (Bahrman, *J pr* [2] 27, 295)—6 Amarine reacts with the halogen compounds of the alkyls to form substitution and addition compounds. Thus when amarine, methyl iodide, and ether are allowed to stand together in the cold, methyl amarine hydroiodide, $C_{21}H_{17}MeN_2 \cdot HI$, is formed

Ammonia is without action upon this salt, but alcoholic potash liberates methylamarine [184°]. When amarine is heated with methyl iodide, a dimethylamarine hydroiodide, $C_{21}H_{17}Me_2N_2 \cdot HI$, is formed. Like the monomethyl compound it is not decomposed by ammonia, by treatment with alcoholic potash, dimethylamarine [148°] is obtained and this base unites with hydriodic acid to form a hydroiodide isomeric with the foregoing and differing from it in being decomposed by ammonia even in the cold (Claus & Elbs, *B* 13, 1418). Dimethylamarine and the other dialkyl amarines do not combine with the halogen compounds of the alkyls.

Further derivatives of amarine—Ethyl amarine, $C_{21}H_{19}EtN_2$ [163°] (Claus & Scherbel, *B* 18, 3080), diethylamarine, $C_{21}H_{18}Et_2N_2$ [110°–115°] (Borodine, *A* 110, 82)—Benzylamarine, $C_{21}H_{17}(C_6H_5)N_2$ [123°–124°], dibenzylamarine, $C_{21}H_{16}(C_6H_5)_2N_2$ [139°–140°] (Claus & Elbs, *B* 13, 1418, Claus, *B* 15, 2330, Claus & Kohlstock, *B* 18, 1849)—Ethylbenzylamarine, $C_{21}H_{18}Et(C_6H_5)N_2$ [135°] (C & K)—Hydro methylbenzylamarine, $C_{21}H_{17}Me(C_6H_5)N_2$ [208°], hydrotrimethylamarine, $C_{21}H_{16}Me_3N_2$ [158°] (Claus, *B* 15, 2326)—Other derivatives $C_{21}H_{18}N_2(C_2H_5O)OEt$, $C_{21}H_{17}N(COEt)_2$, and $C_{21}H_{18}N_2(CO_2Et)(CONH_2)$ (Bahrman, *J pr* [2] 27, 295)—Amarine silver, $C_{21}H_{17}AgN_2$ (Claus & Elbs, *B* 16, 1272), diamarine silver nitrate, $(C_{21}H_{18}N_2)_2 \cdot AgNO_3$ aq [218°] (C & K).

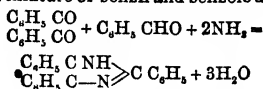

When amarine silver is mixed with one molecular proportion of an alkyl halogen compound (the latter diluted with benzene) and allowed to stand in the cold, a double compound of amarine-silver with the alkyl halogen is obtained. At the same time a small quantity of monalkyl amarine is formed from the double compound by elimination of silver iodide. In this way the following compounds have been prepared (Claus & Scherbel, *B* 18, 3077) amarine silver methyl iodide, $C_{21}H_{17}AgN_2 \cdot CH_3I$ [173°], amarine silver ethyl iodide, $C_{21}H_{17}AgN_2 \cdot C_2H_5I$ [116°], amarine silver isopropyl bromide, $C_{21}H_{17}AgN_2 \cdot C_3H_7Br$ [140°], and finally amarine silver benzyl chloride, $C_{21}H_{17}AgN_2 \cdot C_6H_5Cl$ [250°]. When amarine silver is treated with benzyl chloride it yields benzoyl amarine, $C_{21}H_{17}(C_6H_5O)N_2$, [180°], which forms salts with acids and also unites with benzyl chloride to form benzoyl amarine benzoyl chloride, $C_{21}H_{17}(C_6H_5O)_2N_2 \cdot C_6H_5OCl$, [312°], and with benzyl chloride to form benzoyl amarine benzyl chloride, $C_{21}H_{17}(C_6H_5O)_2N_2 \cdot C_6H_5Cl$ [351°], which latter is isomeric with benzylamarine benzoyl chloride, $C_{21}H_{17}(C_6H_5)_2N_2 \cdot C_6H_5OCl$, [340°–350°], obtained by the action of benzyl chloride upon benzyl amarine. The bases corresponding with these two chlorides are also isomeric. Benzoyl amarine also unites with methyl iodide and with ethyl iodide to form additive compounds melting at 318° and 354° respectively (C & S)

Triphenylglyoxaline (Japp & Robinson, *C J* 41, 323) [275°]

Formation—1 By the destructive distillation of hydrobenzamide (Laurent, *A Ch* 19, 869), of amarine (Fownes, *T* 1845, 263), or of tribenzylamine (Brunner, *A* 151, 185). By the limited oxidation of amarine with chromic

acid (E Fischer & Troschke, *B* 18, 708) — 3 By passing ammonia into a warm alcoholic solution of a mixture of benzil and benzoic aldehyde

(Radziszewski, *B* 15, 1493, cf Japp, *B* 15, 2410) — 4 By heating together *p* oxybenzoic aldehyde, benzil, and ammonia, *p* oxy lophine, $\text{C}_{21}\text{H}_{18}(\text{OH})\text{N}_2$, is formed (*v* BENZIL, AMMONIA DERIVATIVES OF, p 466), and this, by distillation with zinc dust, is converted into lophine (Japp & Robinson, *C J* 41, 323) — 5 By warming cyanphenine, $\text{C}_{21}\text{H}_{18}\text{N}_2$, with acetic acid and zinc dust, or by distilling it with potash and iron filings, it is converted into lophine and ammonia $\text{C}_{21}\text{H}_{18}\text{N}_2 + 2\text{H}_2 = \text{C}_{21}\text{H}_{16}\text{N}_2 + \text{NH}_3$ (Radziszewski) — Preparation — Hydrobenzamide is heated in a retort until the more volatile products of its decomposition — hydrogen, ammonia, and toluene — have been given off. The residue, which can only be distilled at a high temperature is treated with ether, and then dissolved in glacial acetic acid. From this solution water precipitates lophine, which is finally purified by recrystallising it from boiling alcohol (Radziszewski, *B* 10, 70)

Properties — Crystallises in very slender, colourless silky needles [275°] (Radziszewski). Distils without decomposition at a high temperature. The vapour density agrees with the formula $\text{C}_{21}\text{H}_{18}\text{N}_2$ (Fischer & Troschke). Insol water, sl sol alcohol and ether. Its solution in alcoholic potash phosphoresces when air is admitted, owing to a process of oxidation, in which the lophine is slowly converted into benzoic acid and ammonia (Radziszewski). Feebly basic the salts are partially decomposed by water, in which they are for the most part insoluble, but they may be crystallised from alcohol

Salts — (Laurent, *A Ch* 19, 369, Atkinson & Gossmann, *A* 97, 233 Brunner, *A* 151, 135) $\text{C}_{21}\text{H}_{18}\text{N}_2\text{HCl}$ obtained by adding hydrochloric acid to an alcoholic solution of lophine. According to Laurent and Brunner this salt is anhydrous — $\text{C}_{21}\text{H}_{18}\text{N}_2\text{HCl}$ formed by the action of gaseous hydrochloric acid upon lophine — $(\text{C}_{21}\text{H}_{18}\text{N}_2\text{HCl})_n\text{PtCl}_4$ rhombic plates. Contains $5\text{H}_2\text{O}$ (Brunner) — $\text{C}_{21}\text{H}_{18}\text{N}_2\text{HI}$ — $\text{C}_{21}\text{H}_{18}\text{N}_2\text{HNO}_3$ — With silver nitrate it gives rise to $\text{C}_{21}\text{H}_{18}\text{N}_2\text{AgNO}_3$, $2\text{C}_{21}\text{H}_{18}\text{N}_2\text{AgNO}_3$, and $2\text{C}_{21}\text{H}_{18}\text{N}_2\text{AgNO}_3$ (A G)

Reactions — 1 Oxidation with chromic acid in acetic acid solution converts lophine into a mixture of benzamide and dibenzamide

(Fischer & Troschke) — 2 By the action of bromine upon lophine hydrobromide, an unstable perbromide of the formula, $\text{C}_{21}\text{H}_{18}\text{N}_2\text{Br}_2$, HBr(?), is obtained (F & T) — 3 Nitric acid yields, according to temperature and concentration, either dinitrolophine, $\text{C}_{21}\text{H}_{14}(\text{NO}_2)_2\text{N}_2$, or trinitrolophine $\text{C}_{21}\text{H}_{12}(\text{NO}_2)_3\text{N}_2$ (Laurent, Ekmann, *A* 112, 161) — 4 Heated with concentrated sulphuric acid to 160°–170° lophine is converted into lophine-disulphonic acid, $\text{C}_{21}\text{H}_{16}\text{N}_2(\text{SO}_3\text{H})_2$ (F & T) — 5 With ethyl iodide at 100° it yields lophine hydriodide

and diethyllophinum iodide, $\text{C}_{21}\text{H}_{18}\text{EtN}_2$, EtI; and this latter compound, by treatment with moist silver oxide yields the corresponding base (Kuhn, *A* 122, 826)

ISOMERIDE OF LOPHINE — According to Kuhn (*A* 122, 313) an isomeride of lophine, $\text{C}_{21}\text{H}_{18}\text{N}_2$, is obtained, together with ordinary lophine, by saturating hydrobenzamide with gaseous HCl, and heating the mixture to 230° Needles [170°], v sol. boiling alcohol. Forms salts

AZOBENZOLIDE, $\text{C}_{22}\text{H}_{18}\text{N}_2$ (?) (Laurent, *A Ch* [3] 1, 306) and **DIBENZOYLIMIDE**, $\text{C}_{21}\text{H}_{18}\text{NO}$ (Robson, *C J* 4, 225), are also compounds which are stated to have been obtained by the action of ammonia upon benzoic aldehyde. They have been very little studied

BENZOIC ALDEHYDE, HYDROCYANIC ACID, AND AMMONIA — A number of compounds are obtained when ammonia acts upon benzoic aldehyde containing hydrocyanic acid. Some of these are, however, more readily prepared from the hydrocyanides of hydrobenzamide (*q v*) and have therefore been described under that head — 1 *Benzoylazotide*, $\text{C}_{15}\text{H}_{12}\text{N}_2$. Formed along with other products when a mixture of benzoic aldehyde, hydrocyanic acid, and ammonia is allowed to stand for some weeks (Laurent, *A Ch* [2] 66, 180, *vide supra*, 'Hydrobenzamide'). Crystalline powder, consisting of minute rhombic prisms, sl sol boiling alcohol. By destructive distillation it yields *amarone*, $\text{C}_{10}\text{H}_8\text{N}_2$, together with lophine and other products. *Amarone* forms colourless needles [233°], sl sol boiling alcohol (Laurent, *Revue Scient* 18, 207) — 2 *Azobenzoyl*, $\text{C}_{22}\text{H}_{18}\text{N}_2$, is formed according to the equation

(Beilstein & Reinecke, *A* 136, 175) White crystalline powder, insol. water, v sol ether. When warmed with alcohol and hydrochloric acid it is decomposed into HCN, *amarone*, and a base of the formula $\text{C}_{15}\text{H}_{12}\text{N}_2$, which latter crystallises in laminae, melting at 122° (Müller & Lumprecht, *A* 111, 140) — 3 *Benzhydramide*, $\text{C}_{21}\text{H}_{18}\text{N}_2\text{O}$, is formed, along with the foregoing, from the same generating substances according to the equation $3\text{C}_6\text{H}_5\text{O} + \text{HCN} + \text{NH}_3 = \text{C}_{22}\text{H}_{18}\text{N}_2\text{O} + 2\text{H}_2\text{O}$, and differs from it by containing the elements of a molecule of water more. Microscopic crystals. Sl sol. alcohol, v sol ether (Laurent, *A Ch* [2] 66, 180, Laurent & Gerhardt, *A* 76, 302)

BENZOIC ALDEHYDE, AMMONIA, AND SULPHURETTED HYDROGEN — 1 Benzoic aldehyde and ammonium sulphide, if mixed and allowed to stand for some weeks, yield thio benzaldin,

(Laurent, *A Ch* [3] 1, 291, also [3] 36, 342) Deposited from ether in monoclinic crystals [125°] When boiled with alcohol it gradually evolves sulphuretted hydrogen — 2 By the action of ammonium sulphide upon crude oil of bitter almonds Laurent obtained a compound $\text{C}_{21}\text{H}_{18}\text{N}_2\text{S}_2$ (?)

Benzoic aldehyde slowly reacts in the cold with CS_2 and NH_3 to form a compound, $\text{C}_{11}\text{H}_8\text{N}_2\text{S}_2$ (Quadrat, *A* 71, 13) The same substance is formed when benzoic aldehyde is mixed with ammonium thio carbamate: $2\text{C}_6\text{H}_5\text{O} + \text{CS}_2 + 2\text{NH}_3 = \text{C}_{11}\text{H}_8\text{N}_2\text{S}_2 + 2\text{H}_2\text{O}$ (Mul-

der. *A* 168, 238) Prismatic crystals, melting with decomposition at 100°. Cannot be dissolved in alcohol or ether without decomposition. The compound may be regarded as *di-benzylidene - ammonium ditrio - carbamate*, $\text{NH}_2\text{CSNH}(\text{CH C}_6\text{H}_5)_2$. F R J

BENZOIC ALDEHYDE CARBOXYLIC ACID

v ALDEHYDE BENZOIC ACID

BENZOIC ALDEHYDE GREEN v *Tetra METHYL DIAMIDO TRIPHENYL CARBINOL*

BENZOIC ANHYDRIDE $\text{C}_6\text{H}_4\text{O}_2$ *ee*
($\text{C}_6\text{H}_5\text{CO}$)₂O *Benzoyl oxide* Mol w 226
[42°] (360° i V) SG (liquid) Δ 1.227
H.F. 104.815 (Stohmann, *J pr* [2] 86, 8)

Formation—1 From BzCl and NaOBz , BaO , $\text{H}_2\text{C}_2\text{O}_4$, or $\text{K}_2\text{C}_2\text{O}_4$, or from NaOBz by the action of PCl_5 , POCl_3 , or S_2Cl_2 (Gerhardt, *A Ch* [3] 37, 299, Wunder, *J pr* 61, 498, Heintz, *P* 92, 458, Gal, *A* 128, 127, Anschütz, *L* 10, 1882)—2 From benzoitrichloride (1 pt) and H_2SO_4 (3 pts of 95.4 pc) (Jenssen, *B* 12, 1495)—3 By the action of the dry nitrates (6 mols) of Pb, Ag, Hg, Cu, or Zn upon benzoyl chloride (1 mol) (*q v*) (Lachowicz, *B* 18, 2990)

Properties—Trimetric prisms, insol water, m sol alcohol and ether. Slowly converted into benzoic acid by boiling water, more rapidly by alkalis. Hot NH_3aq forms benzamide and ammonium benzoate. Combines with bromine (1 mol). Gaseous HCl forms BzCl and HOBz .

Mixed Anhydrides—Mixed anhydrides of the form BzOR are formed by the action of benzoyl chloride on the alkaline salts of various acids, or by the action of various alkyl chlorides on sodium benzoate. They are generally decomposed by heat into a mixture of two anhydrides, and by water, more rapidly by alkalis, into two acids.

BENZOIN $\text{C}_6\text{H}_5\text{CH}_2\text{O} = \text{C}_6\text{H}_5\text{CH}(\text{OH})\text{CO C}_6\text{H}_5$

Phenyl benzoyl-carbinol [187°] First prepared by Stange (*R P* 16, 93), and almost simultaneously by Bobiquet (*A Ch* [2] 21, 254), by acting with a solution of potassium hydroxide or barium hydroxide upon crude oil of bitter almonds containing HCN .

Formation—1 By partial oxidation of

hydro-benzoin, $\text{C}_6\text{H}_5\text{CH}(\text{OH})\text{CH}(\text{OH})\text{C}_6\text{H}_5$ (Zinin, *A* 123, 128)—2 By treating benzil $\text{C}_6\text{H}_5\text{CO CO C}_6\text{H}_5$ with zinc and alcoholic hydrochloric acid (*Z*, *A* 119, 177), with acetic acid and iron filings, or with K_2S .

Preparation—200 g of pure benzoic aldehyde are heated for a short time with a solution of 20 g of KCN in 800 g of 50 pc alcohol, and the liquid allowed to cool. Benzoïn separates and is removed by filtration. The filtrate, on heating with more KCN, yields a fresh quantity of benzoïn (Zincke, *A* 198, 151). Two mols of benzoic aldehyde unite to form 1 mol of benzoïn $2\text{C}_6\text{H}_5\text{CHO} = \text{C}_6\text{H}_5\text{CH}(\text{OH})\text{CO C}_6\text{H}_5$. The action of the KCN is not understood.

Properties—Colourless, lustrous, six sided prisms. Sl sol boiling water. V sol hot alcohol, al sol in cold. Conc H_2SO_4 dissolves it with a violet colour.

Reactions—1 Partially decomposed by distillation. Repeated distillation breaks it up for the most part into 2 mols of benzoic aldehyde, a smaller portion yields benzil and deoxybenzoïn $2\text{C}_6\text{H}_5\text{O} = \text{C}_6\text{H}_5\text{O} + \text{C}_6\text{H}_5\text{O} + \text{H O}$ (Zinin, *B* 6, 1207)—2 Treated in alcoholic solution with zinc and hydrochloric acid it is converted into deoxybenzoïn (Zinin *A* 126 218), at the same time deoxybenzoïn pinacone, $\text{C}_{12}\text{H}_{12}(\text{OH})_2$, and hydrobenzoïn are formed (Goldenberg, *A* 174, 332). Sodium amalgam reduces it to hydrobenzoïn. Heating with conc hydrochloric acid for some hours to 130° converts it into di-benzyl $\text{C}_6\text{H}_5\text{CH}_2$ (Goldenberg). By distillation with zinc dust it yields stilbene, $\text{C}_{12}\text{H}_{10}$, together with an oily hydrocarbon isomeric with stilbene (Jena *A* Lämprecht, *A* 155, 90)—3 Nitric acid oxidises it to benzil (Zinin), but chromic acid, or potassium permanganate, converts it into benzaldehyde and benzoic acid (Zincke *B* 4, 839). It reduces Fehling's solution in the cold, a property common to all compounds containing the group $\text{CO CH}(\text{OH})$ (E Fischer, *A* 211, 215)—4 Fusion with caustic potash converts it into benzoic acid with evolution of hydrogen (Liebig & Wöhler, *A* 3, 276). When distilled with soda lime, the benzoate which is first formed is decomposed by the excess of soda lime, and benzene is obtained (Jena *A* Lämprecht). The action of alcoholic potash is complex when benzoïn and alcoholic potash are heated with access of air, benzoic acid, a small quantity of benzoic acid ($\text{C}_6\text{H}_5\text{O}_2$), benzoïn ether ($\text{C}_{12}\text{H}_{12}\text{O}_2$ [157°]), and a compound $\text{C}_{12}\text{H}_{12}\text{O}_4$ (to which Lämprecht & Schwanert gave the name ethyl dibenzoïn, assigning to it the formula $\text{C}_{12}\text{H}_{12}\text{O}_4$) are formed—this last, however, is produced from benzil generated by the air oxidation of the benzoïn (v BENZIL). If the benzoïn is heated with alcoholic potash in a sealed tube at 100° the products are benzoic acid, hydrobenzoïn, and ethylbenzoic acid ($\text{C}_6\text{H}_5\text{O}_2$). With very concentrated alcoholic potash at 160° benzoïn yields benzoic acid, stilbene, a compound $\text{C}_{12}\text{H}_{10}\text{O}_2$, and a small quantity of ethyl benzoic acid. By heating benzoïn with a solution of sodium ethylate in alcohol, ethyl benzoïn, $\text{C}_6\text{H}_5\text{CH}_2\text{O C}_2\text{H}_5$ [95°], is formed, together with the various products already mentioned. Prisms, with a vitreous lustre, v sol alcohol (Jena *A* Lämprecht, *A* 155, 89, Lämprecht & Schwanert, *B* 4, 836, Japp & Owens, *C J* 47, 90)—5. Chlorine acts like nitric acid, con-

merging benzoïn into benzil (Laurent, *A Ch* [2] 59, 101).—6 When heated with fuming hydrochloric acid at 180° for 6 or 8 hours it yields lepidene, $C_{12}H_{10}O$ (g v), benzil, and a thick yellow oil (Zinin, *J pr* 101, 160).—7 When boiled with dilute sulphuric acid it parts with the elements of water, yielding oxleydene — $2C_{12}H_{12}O_2 = C_{24}H_{20}O_2 + 2H_2O$ (Lamprecht & Schwanert, *B* 4, 335). Concentrated sulphuric acid converts it into benzil (Zinin).—8 Heated with alcoholic ammonia for some hours at 100° in sealed tubes it yields benzoinam, $C_{26}H_{24}N_2O$ (silky needles, v sl sol alcohol, melting with decomposition), benzoinamidam, $C_{26}H_{24}NO_2$? [199°] (granular crystals, sl sol alcohol), and tetra

phenyl-azine, $C_6H_5 \begin{array}{c} \parallel \\ C \\ \parallel \end{array} C-N \begin{array}{c} \parallel \\ C \\ \parallel \end{array} C_6H_5$ [246°], to-

gether with some lophine, $C_{24}H_{18}N_2$. Tetra phenyl azine is best prepared by heating benzoïn with ammonium acetate until the salt is volatilised, dissolving the product in the strongest alcoholic hydrochloric acid, and ppg with alcohol V sl sol alcohol, v sol alcoholic hydrochloric acid, v sol boiling benzene, sol with blood red colour in cold conc H_2SO_4 . Sublimes without decomposition. Heating with soda lime converts it into tetraphenylene azine $C_{24}H_{18}N_2$ (Laurent, *A Ch* [2] 66, 181, Erdmann, *A* 135, 181, Japp & Wilson, *C J* 1886, 825, Japp & Burton, *C J* 1886, 843, 1887, 98).—9 Benzoïn reacts with the primary amines of the benzenoid series, when heated with them to 200°, eliminating 1 mol of water and generating feebly basic compounds which by boiling with acids are decomposed into their generating substances. Anilbenzoïn $C_6H_5 \cdot CH(OH) \cdot C(N \cdot C_6H_5) \cdot C_6H_5$ [99°], from aniline and benzoïn, forms yellowish needles, v sol most organic menstrua. Yields with nitrous acid nitroso anilbenzoïn $C_6H_5 \cdot CH(OH) \cdot C(N \cdot C_6H_5 \cdot NO) \cdot C_6H_5$ [140°], with acetic anhydride a monoacetyl derivative [153°], and with bromine a monobromo derivative [168°]. Sodium amalgam reduces anilbenzoïn in alcoholic solution to hydrobenzoïn anilide $C_6H_5 \cdot CH(OH) \cdot CH(NH \cdot C_6H_5) \cdot C_6H_5$ [119°], which forms with sulphuric acid a salt not decomposed by boiling with the dilute acid — *p Tolilbenzoïn* $C_6H_5 \cdot CH(OH) \cdot C(N \cdot C_6H_4 \cdot CH_3) \cdot C_6H_5$ [144°] resembles in its properties and its behaviour towards reagents the aniline compound. It yields with nitric acid a mono nitro derivative [125°] and a di nitro derivative [195°].—*β Naphthilbenzoïn* [130°] also resembles the aniline compound (Voigt, *J pr* 34, 1).—10 Benzoïn reacts with hydroxylamine and with phenyl hydrazine — Benzoïn oxim, $C_6H_5 \cdot CH(OH) \cdot C(N \cdot OH) \cdot C_6H_5$ [151°–152°]. An alcoholic solution of benzoïn is mixed with an aqueous solution of hydroxylamine and allowed to stand for a week. Microscopic prisms, soluble in benzene (Wittenberg & V Meyer, *B* 16, 504).—Benzoïn phenylhydrazide, $C_6H_5 \cdot CH(OH) \cdot C(N \cdot H \cdot C_6H_5) \cdot C_6H_5$ [155°] Benzoïn and phenylhydrazine, together with a little alcohol, are heated at 100°. Needles, sol benzene (Pickel, *A* 232, 229).—11 By heating with acetyl chlorides the hydroxylic hydrogen of benzoïn may be replaced by acid radicals to form etheral salts. Benzoïn acetate, $C_{11}H_{11}(C_2H_3O)_2$ [75°],

From benzoïn and acetyl chloride Monoclinic prisms or tables, v sol ether and alcohol (Zinin, *A* 104, 120, Jena & Lamprecht, *A* 155, 92).—Benzoïn benzoate, $C_{11}H_{11}(C_6H_5O)_2$ [125°] By warming benzoïn with benzoïl chloride Slender needles Sol hot alcohol Yields a mono nitro compound [137°] (Zinin).—Benzoïn succinate, $(C_6H_5O)_2 \cdot C_6H_5O_2$ [129°] By heating benzoïn with succinyl chloride to 100° Leaflets from alcohol Sol also in ether and CS_2 (Lukann, *B* 5, 331).—12 When benzoïn is heated with hydrocyanic acid and alcohol to 200° the process of its formation is reversed and it is broken up into benzoic aldehyde. A part of the benzoic aldehyde undergoes a further change, yielding amongst other products ethylic benzoate (Michael & Palmer, *Am* 7 192).—13 Phenyl cyanate forms Ph CH(O CONPhH) CO Ph [163°] (Gumpert, *J pr* [2] 32, 280) F R J

BENZOÏN, GUM A resin which flows from the bark of *Styrax benzoïn*, a tree growing in Sumatra, Borneo, Java, and Siam Gum benzoïn contains, besides various resins, benzoic acid and, frequently, cinnamic acid. Siamese and Palembang benzoïns are free from cinnamic acid. Potash fusion produces benzoic, oxy benzoic, and protocatechuic acids, and pyrocatechin. Distillation with zinc dust gives toluene and a little o xylene, naphthalene, and methyl naphthalene.

$HO_2C \begin{smallmatrix} \text{CMe} \\ \text{O} \end{smallmatrix} \begin{smallmatrix} \text{CMe} \\ \text{O} \end{smallmatrix} C_6H_2 \begin{smallmatrix} \text{CMe} \\ \text{O} \end{smallmatrix} \begin{smallmatrix} \text{CMe} \\ \text{O} \end{smallmatrix} C CO_2H$ [Far

above 310°] Formed by saponification of the di-ethyl ether. This ether is obtained, together with a much larger quantity of the (β) isomeride by the action of chloro acetacetic ether upon di sodium resorcin $C_6H_4(ONa)_2$ in presence of alcohol, extracting with benzene, dissolving the undissolved portion in conc H_2SO_4 , pouring into water, and extracting with ether, when the ethereal solution is mixed with hot alcohol and allowed to cool the (α) ether crystallises out, whilst the (β) ether remains in solution. The two ethers are also formed (the α in very small quantity) by heating oxy methyl coumarilic ether

$C_6H_2(OH) \begin{smallmatrix} \text{CMe} \\ \text{O} \end{smallmatrix} \begin{smallmatrix} \text{CMe} \\ \text{O} \end{smallmatrix} C CO_2Et$ with chloro aceto

acetic ether and alcoholic NaOEt, and dissolving the product in H_2SO_4 . The acid is a white microcrystalline solid. Scarcely soluble in water, more readily in alcohol. The salts of the heavy metals are all sparingly soluble. Warm H_2SO_4 produces a pure blue colouration.

Di-ethyl ether $A''Et_2$ [186°], needles, sl sol alcohol (Hantzsch, *B* 19, 2930)

(β) *m* Benzo di-methyl-di-furfurane-di-carboxylic acid $C_{14}H_{10}O_6 \pm e$

$HO_2C \begin{smallmatrix} \text{CMe} \\ \text{O} \end{smallmatrix} \begin{smallmatrix} \text{CMe} \\ \text{O} \end{smallmatrix} C_6H_2 \begin{smallmatrix} \text{CMe} \\ \text{O} \end{smallmatrix} \begin{smallmatrix} \text{CMe} \\ \text{O} \end{smallmatrix} C CO_2H$ [Far

above 310°] Formed by saponification of its di-ethyl ether. Microcrystalline solid. Scarcely soluble in water, more easily in alcohol. Gives sparingly soluble pps with the salts of the heavy metals. The acid and its ether give a pure blue colouration with warm H_2SO_4 .

Di-ethyl ether $A''Et_2$ [141°], small white needles, more soluble than the (β) isomeride. Formed, together with a small quantity of the (β) ether, by the action of chloro acetacetic ether upon dry di sodium resorcin, extraction with benzene, dissolving the residue in conc H_2SO_4 , pouring into water, and extracting with ether. Also by heating oxy methyl coumarilic ether

$C_6H_2(OH) \begin{smallmatrix} \text{CMe} \\ \text{O} \end{smallmatrix} \begin{smallmatrix} \text{CMe} \\ \text{O} \end{smallmatrix} C CO_2Et$ with chloro acetacetic

ether and alcoholic NaOEt, and dissolving the product in H_2SO_4 . By evaporation with alcoholic KOH and lime and dry distillation it yields (β) benzo di methyl di furfurane

$C_6H_2 \left(\begin{smallmatrix} \text{CMe} \\ \text{O} \end{smallmatrix} \right) \text{CH}$. (Hantzsch, *B* 19, 2930)

p Benzo-di-methyl-di-furfurane di-carboxylic acid $C_6H_2 \left(\begin{smallmatrix} \text{CMe} \\ \text{O} \end{smallmatrix} \right) \text{C CO}_2H$. Obtained by

saponification of its ethyl ether which is formed by dissolving in conc H_2SO_4 the product of the action of chloro acetacetic ether (2 mols) upon di sodium hydroquinone (1 mol). Amorphous solid (containing aq)

Salts —Ag A'' white pp —BaA'' 2aq sl sol yellowish white powder

Ethyl ether EtA'' [150°], glistening greenish plates, v sl sol all solvents (Nuth, *B* 20, 1334)

Benzo-tri-methyl-tri-furfurane tri carboxylic acid $C_{15}H_{12}O_6 \pm e$ $C_6 \left(\begin{smallmatrix} \text{CMe} \\ \text{O} \end{smallmatrix} \right) \text{C CO}_2H$.

Formed by saponification of its ethyl ether which is obtained by treating dry powdered tri sodium phloroglucol (1 mol) with chloro acetacetic ether (3 mols), dissolving the product in H_2SO_4 and pouring into water. Gelatinous pp (containing aq). Scarcely soluble in alcohol and ether. Its salts are mostly insoluble and gelatinous. Ba₂A''' 7aq microcrystalline

Ethyl ether Et_2A'' [c 298°], small white glistening needles, sl sol all solvents, most readily in chloroform (Lang, *B* 19, 2935)

BENZONAPHTHONE *v* NAPHTHOQUINONE

BENZONAPHTHYL THIAMIDE *v* Thoben-

zoyl (a) NAPHTHYLAMINE
BENZONITRILE $C_6H_5N \pm e$ C_6H_5CN Mol w 103 [−17°] (Hofmann) (190 5°) SG 2 1 023, 12 1 008 (Kopp, A 98, 373) S 1 at 100° SV 123 7 (Ramsay)

Formation —1 By the dry distillation of ammonium benzoate (Fehling, A 49, 91) —2 From benzamide by heating it alone or with CaO (Anschutz & Schultz, A 196, 48), BaO (Wöhler, A 192, 362), P₂O₅ (Hofmann & Buckton, A 100, 155), PCl₅ (Hencke, A 106, 276), or P₂S₅ (Henry, B 2, 307) —3 By heating hippuric acid alone (Limpricht & Usler, A 88, 133), or with ZnCl₂ (Gössmann, A 100, 74) —4 By the action of BzCl or Bz₂O on benzamide —5 By the action of BzCl on oxamide, on potassium sulphocyanide (Limpricht, A 99, 117), or on potassium cyanate (Schiff, A 101, 93) —6 By heating Bz₂O with potassium cyanate or sulphocyanide —7 By the action of HgO on thiobenzamide —8 By heating benzoic acid with sulphocyanide of lead (Krüss, B 17, 1767), or of potassium (Letts, B 5, 678) —9 From potassium benzoate and cyanogen bromide (Cahours,

A. Ca. [3] 52, 200) —10 By distilling a mixture of aniline and oxalic acid (Hofmann, *C R* 64, 888) —11 Formed by distilling formalinide over zinc dust, the yield is nearly 20 p.c. of the formalinide (Gasiorowski a Merz, *B* 17, 73, *B* 18, 1001) —12 Formed together with sodium formate, by the action of dilute NaOH upon aniline di chloro acetate (Cech a Schwebel, *C C* 1877, 134) —13 Formed by running an aqueous solution of diazobenzene chloride into a hot solution of $\text{Cu}_2(\text{CN})_2$ (Sandmeyer, *B* 17, 2653) —14 By heating tri phenyl phosphate with potassium cyanide or ferrocyanide, the yield is 25 p.c. of the theoretical (Scruggam, *A* 92, 318, Heim, *B* 16, 1771) —15 By heating potassium benzene sulphinate with KCN (Merz, *Z* 1868, 33) —16 From K_2FeC_6 and chloro or bromo benzene at 400° (Merz a Weith, *B* 8, 918, 10, 749) —17 From iodo benzene and AgCy (Merz a Scheinberger, *B* 8, 1630) —18 Together with terephthalonitrile, by passing a mixture of benzene and cyanogen through a red hot tube (M a S) —19 By passing dimethyl aniline through a red hot tube (Nietzki, *B* 10, 474) —20 By the action of CvCl on benzene in presence of aluminium chloride (Friedel a Crafts, *Bl* [2] 29, 2) —21 From bromo benzene, Cy_2Cl_2 , and Na (Klason, *J pr* [2] 35, 83) —22 By boiling phenyl thiocarbimide with finely divided Cu —23 From phenyl carbamine by intramolecular change at 240° (Weith, *B* 6, 213) —24 By the action of acetic anhydride on benzaldoxim (Lach, *B* 17, 1571)

Properties—Colourless oil, smelling of almonds, sinks in cold, but swims in hot water, miscible with alcohol and ether

Reactions—1 Cold aqueous potash has no action, but on boiling it forms NH_3 and KOBz , dilute acids act similarly —2 Heating with potassium gives KCy, cyaphenine, $(\text{C}_6\text{H}_5)_3\text{Cy}$, and other bodies (Bingley, *Chem Gaz* 1854, 829, Hofmann, *B* 1, 198) When the boiling alcoholic solution is treated with sodium, the greater part is saponified whilst a smaller portion undergoes reduction to benzylamine and to benzene (Bamberger a Lotter, *B* 20, 1709) —3 H_2S or ammonium sulphide forms thiobenzamide —4 Zn and HCl in alcoholic solution form mono, di, and tri benzylamine (Mendius, *A* 121, 129, Spica, *G* 10, 516) —5 Fuming H_2SO_4 forms, on heating, benzene sulphonic acid, at 20° it forms cyaphenine Benz nitrile (10g) cooled with ice and treated with fuming H_2SO_4 (7 g) added slowly, forms dibenzamide NHBz , [148°], and 'benzimidobenzamide' $\text{NHBzC}(\text{NH})\text{C}_6\text{H}_5$, [106°], called by Pinner a Klein 'benzimidobenzate' and 'dibenzimidobenzate', respectively Dilute HCl converts the former into the latter (F Gumpert, *J pr* [2] 30, 87, Pinner, *ibid*, 125) —6 Boiled with *sine ethyl* it gives off ethano (1 vol) and an olefine (1 vol) and forms a product, whence, by treatment first with alcohol, and then with aqueous HCl, cyaphenine (*q v*) and the hydrochloride of a base which crystallises in six sided plates, $\text{C}_{12}\text{H}_{11}\text{N}_2\text{Cl}$, is formed This body [257°] is readily soluble in alcohol, but sparingly so in water Potash liberates the base as a colourless oil (Frankland a Evans, *C J* 87, 565) —7 By exhaustive chlorination with SbCl_5 it yields penta chloro cyano benzene $\text{C}_6\text{Cl}_5(\text{CN})$

(Merz a. Weith, *B* 16, 2885) —8 With methylal and H_2SO_4 it gives the benzoyl derivative of methylene diamine (*q v*) —9 With *diphenylamine hydrochloride* at 180° it forms di phenylbenzamide, but at 240° it forms a Base $\text{C}_{12}\text{H}_{11}\text{N}$, [183°], thus $\text{C}_6\text{H}_5\text{C}(\text{NH})\text{N}(\text{C}_6\text{H}_5)_2 = \text{NH}_2 + \text{C}_{12}\text{H}_{11}\text{N}$ **Properties**—Thick prisms (from benzene), containing benzene of crystallisation, yellow tablets (occasionally from benzene), long thin prisms (from alcohol) The tablets are monochmic, $a b c = 5875 \cdot 1 \cdot 5014$, $L = 51^\circ 23'$ (Bodewig) Soluble in benzene and ether, slightly in alcohol Its alcoholic solution is neutral Acetyl chloride does not act on it Salts B'HCl Narrow red prisms [Above 220°]—(B'HCl), PtCl_4

Combinations—1 With metallic chlorides — ($\text{C}_6\text{H}_5\text{N}$), AuCl_3 — ($\text{C}_6\text{H}_5\text{N}$), PtCl_4 — ($\text{C}_6\text{H}_5\text{N}$), SnCl_4 — ($\text{C}_6\text{H}_5\text{N}$), TiCl_4 (Henke, *A* 106, 284) —2 With halogens $\text{C}_6\text{H}_5\text{CBr NBr}$ — ($\text{C}_6\text{H}_5\text{CN}$), Br_2 , needles (Engler, *A* 133, 137) —3 With hydrogen chloride $\text{C}_6\text{H}_5\text{N}2\text{HCl}$ (Pinner a Klein, *B* 10, 1891, cf Gerhardt, *Transl*, 4, 762) —4 With hydrogen bromide $\text{C}_6\text{H}_5\text{N}2\text{HBr}$ [70°] (Engler, *A* 149, 307) —5 With alcohols —Benzimidobenzamide, $\text{C}_6\text{H}_5\text{C}(\text{OEt})\text{NH}$ The hydrochloride, B'HCl , is formed by passing dry HCl gas into a mixture of ethyl alcohol and benzonitrile, 'diluted with ether Large glistening prisms, decomposes on heating to about 120° into ethyl chloride and benzamide (Pinner, *B* 16, 1654) Benzimidobenzamide, $\text{C}_6\text{H}_5\text{C}(\text{OC}_2\text{H}_5)\text{NH}$ The hydrochloride B'2HCl is formed by passing HCl into a cooled mixture of benzonitrile and isobutyl alcohol (Pinner a Klein, *B* 10, 1890), it gradually loses HCl becoming B'HCl , [185°] — $\text{B}_2\text{H}_2\text{PtCl}_4$ — $\text{B}_2\text{H}_2\text{SO}_4$ —6 With acids —Benzimidobenzamide, $\text{C}_6\text{H}_5\text{C}(\text{OAc})\text{NH}$ [116°] From benzimidobenzamide and Ac_2O (Pinner a Klein, *B* 11, 9) —7 With mercaptans —Benzimidobenzamide, $\text{C}_6\text{H}_5\text{C}(\text{SEt})\text{NH}$ From benzonitrile, mercaptan, and HCl, or from thiobenzamide and EtI (Bernthsen, *A* 197, 348) Oil, decomposes readily into mercaptan and benzonitrile — B'HCl [188°] — $\text{B}_2\text{H}_2\text{PtCl}_4$ — B'HI [142°] Benzimidobenzamide, $\text{C}_6\text{H}_5\text{C}(\text{SC}_2\text{H}_5)\text{NH}$ The hydrochloride, B'HCl , is formed by passing HCl into a mixture of benzonitrile and isoamyl mercaptan (Pinner a Klein, *B* 11, 1825) The free base is an oil Benzimidobenzamide, $\text{C}_6\text{H}_5\text{C}(\text{SC}_2\text{H}_5)\text{NH}$ Prepared like the ethyl ether — B'HCl [181°]

Derivatives of Benzonitrile are described as Bromo, Nitro &c BENZONITRILE

BENZO-PHENOL v OXY BENZOPHENONE

BENZOPHENONE $\text{C}_{12}\text{H}_{10}\text{O}$ v $\text{C}_6\text{H}_5\text{CO C}_6\text{H}_5$, *Di-phenyl-ketone* Mol w 182 [48°] (805° v)

Formation—By the dry distillation of calcium benzoate (Peligot, *A* 12, 41, Chancel, *A* 72, 279) —2 From BzCl and HgPh_2 (Otto, *B* 3, 197) —3 From BzCl and benzene in presence of Al_2Cl_3 —4 From benzoic acid, benzene, and P_2O_5 at 190° (Kollarits a Merz, *B* 6, 446, 538) —5 From benzene, COCl_2 , and AlCl_3 (Friedel, Crafts, *A* 86, 873) —6 By oxidation of di phenyl methane (Zincke, *A* 159, 877).

Preparation—From BzCl , C_6H_5 , and Al_2Cl_3 ;

the yield is 70 p.c. of the calculated (Elbs, *J. pr.* [2] 85, 465)

Properties—Prisms, insol. water, v. sol. alcohol and ether

Reactions—1 Reduced by HI to di. phenyl methane (Graebe, *B.* 7, 1624)—2 Reduced by zinc dust to di. phenyl methane, tetra. phenyl ethylene, and tetra. phenyl ethane (Staedel, *A.* 194, 307)—3 Potash fusion gives benzoic acid and benzene—4 Reduced to di. phenyl carbinol by sodium amalgam or by heating with alcoholic potash—5 Ammonia has no action—6 Zn and alcoholic H_2SO_4 reduce it to benzpinacolone and (a) and (b) benzpinacolin (Zincke, *A.* Thorne, *B.* 11, 1396)—7 $AcCl$ in presence of zinc dust acts on an ethereal solution forming crystalline (a) and (b) benzpinacolin—8 PCl_5 forms di. chloro di. phenyl methane—9 Passage through a red hot tube slightly decomposes it, the product contains benzene, di. phenyl, and *p*. di. phenyl benzene, while gaseous carbonic oxide, hydrogen, and acetylene escape (Barbier *a. Roux*, *C. R.* 102, 1559)—10 When heated with ammonium formate at 200° – 220° it yields the formyl derivative of di. phenyl carbinyl amine (C_6H_5)₂CH.NH.CHO (Leuchart *a. Bach*, *B.* 19, 2129)—11 P_2S_5 at 100° forms $C_{26}H_{18}S_2$ [153°], crystallising in lustrous flat monoclinic needles At 200° it turns deep blue (Japp *a. Raschen*, *C. J.* 49, 481)—12 P_2S_5 at 140° forms $C_{26}H_{18}P_2S_5$ [227°], crystallising in minute plates, insol. alcohol, sl. sol. hot benzene. On melting it turns deep blue. It is oxidised by CrO_3 in $HOAc$ to benzophenone (J *a. R.*)

Oxim (C_6H_5)₂C.NOH Di. phenyl ketoxim [140°]. Prepared by boiling an alcoholic solution of benzophenone (30g.) with hydroxylamine hydrochloride (28g.) and a little HCl for a day (Beckmann, *B.* 19, 988, Janny, *B.* 15, 2782) Bulky needles, v. sol. ether and acetone, m. sol. benzene and ligroin, v. sl. sol. cold water. Sol. acids and alkalis. Resolved by acids into its constituents. By PCl_5 or $POCl_3$ it is converted into ω . chloro benzylidene aniline, C_6H_5 .N.CCl. C_6H_5 , produced by intramolecular change from (C_6H_5)₂C.NCl (B). By warming with conc. H_2SO_4 to 100° it is converted by similar isomeric change into benzanilide (Beckmann, *B.* 20, 1507) Salts— C_6H_5 .N(ONa) crystalline powder— C_6H_5 .N(OH).HCl white powder

Methyl oxim $C_{13}H_{10}N(OMe)$ [92°], yellow crystals

Ethyl oxim $C_{13}H_{10}N(OEt)$ (276°–279°), fluid

Benzyl oxim $C_{13}H_{10}N(OC_6H_5)$ [56°], white crystals

Acetyl oxim $C_{13}H_{10}N(OAc)$ [55°], white crystals (Spiegler, *B.* 17, 810, M 5, 203)

Phenyl hydrazide $Ph_2C.N_2HPh$ [137°] Got by boiling benzophenone with phenyl hydrazine and alcohol, or by heating the oxim with phenyl hydrazine, N_2 and NH_3 being evolved. Needles (from alcohol). Insoluble in water, not very soluble in alcohol. Heated for some time with dilute (20 p.c.) HCl , it is resolved into benzophenone and phenyl hydrazine (Pickel, *A.* 232, 228, Fischer, *B.* 17, 576, Just, *B.* 19, 1206)

Isomeride of Benzophenone [26°] (305°) Sometimes formed in oxidising di. phenyl methane or in distilling calcium acetate with

calcium benzoate (Zincke, *A.* 159, 367) Readily changes into ordinary benzophenone

Derivatives of benzophenone are described as AMIDO, BROMO, CHLORO, CYANO, NITRO, OXY, &c. BENZOPHENONE, and as DI. PHENYLENE KETONE OXIDE

BENZOPHENONE-CARBOXYLIC ACID v. BENZOYL BENZOIC ACID

BENZOPHENONE-DI. p. CARBOXYLIC ACID [4 1] $C_6H_4(CO_2H)CO.C_6H_4(CO_2H)$ [1 4] Formed by boiling di. p. cyano benzophenone with alcoholic KOH (Bromme, *B.* 20, 522) Also by the oxidation of di. tolyl methane, or di. methyl benzophenone, with chromic mixture (Weiler, *B.* 7, 1185, Ador *a. Crafts*, *B.* 10, 2173) Microscopic needles. Sublimes at a high temperature without melting. Sl. sol. alcohol, benzene, and ether. S (hot water) = 002. The NH_4 salt gives pps. with salts of Fe, Co, Cu, Ba, and Ca, but not with salts of Pb, Cr, Zn, Mg, and Ni. Silver salt $A''Ag$, AgO insol. water. Di. methyl ether $A''Me$, [138°], large needles (B)— AgA' (A *a. C.*)

Benzophenone dicarboxylic acid

$C_6H_4.CO.C_6H_4(CO_2H)_2$
Benzoyl isophthalic acid [280°] From benzyl isoxylene and chromic mixture (Zincke, *B.* 9, 1762) Sl. sol. hot water and HCl , v. sol. alcohol. Converted by Zn and HCl into the lactone of $C_6H_4.C(OH)H.C_6H_4(CO_2H)_2$,—Salts CaA' aq.— BaA' aq.— AgA'

Methyl ether MeA' [118°]

Ethyl ether EtA' [95°]

Benzophenone dicarboxylic acid

$C_6H_4.CO.C_6H_4(CO_2H)_2$ [1 2 5]

Benzoyl terephthalic acid [290°] (W), [285°] (E)

Formation—1 By oxidising benzyl cymene with chromic mixture (Weber, *J.* 1878, 402)—2 From benzoyl *p*. xylene and HNO_3 (S G 1 15) at 170° (Elbs, *J. pr.* [2] 35, 479)—3 From phenyl *p*. cymyl ketone and dilute HNO_3

Properties—V. sl. sol. water, v. sol. alcohol. Reduced by Zn and HCl to

$C_6H_5.CH(OH).C_6H_4(CO_2H)_2$ — CaA'' aq.— BaA'' 5aq.— AgA''

Methyl ether MeA'' [101°] needles

Ethyl ether EtA'' [101°] prisms

Benzophenone tetra. carboxylic acid

$C_6H_4.CO.C_6H_4(CO_2H)_4$ From benzoyl iso. durene and $KMnO_4$ (Essner *a. Gossin*, *Bl.* [2] 42, 170)

BENZOPHENONE CHLORIDE is *exo* DI. CHLORO DI. PHENYL METHANE (q. v.)

BENZOPHENONE OXIDE v. DI. PHENYLKETONE OXIDE

BENZOPHENONE SULPHONE $C_{12}H_8SO_2$ *s. a.*

$SO_2 \cdot \begin{smallmatrix} C_6H_5 \\ \diagup \quad \diagdown \\ C_6H_5 \end{smallmatrix} \cdot CO$ [187°] From benzophenone and fuming H_2SO_4 (Beckmann, *B.* 6, 1112, 8, 992) V. sol. ether, sol. alkalis, converted by water at 190° into an isomeride (?) [175°]

BENZOPHENONE DI-SULPHONIC ACID

$C_{12}H_8(SO_3H)_2O$ From benzophenone and fuming H_2SO_4 by warming (Staedel, *A.* 194, 814). Converted by potash fusion into phenol and *p*. oxy benzoic acid— BaA''

Chloride $CO(C_6H_4SO_2Cl)_2$ [122°] (Beckmann, *B.* 8, 992)

BENZOPHENYL- v. BENZOYL PHENYL-

BENZOPHOSPHINIC ACID is CARBOXY

BENZENE PHOSPHONIC ACID (*q v*)

BENZOPINACOLIN is BENZPINACOLIN (*q v*)

BENZOPINACONE is BENZPINACONE (*q v*)

BENZOQUINOL is HYDROQUINONE (*q v*)

BENZOQUINONE is QUINONE (*q v*)

BENZOBESORBIN is DIOXYBENZOPHENONE

DI BENZO-RESORCIN is DIOXYPHENYLENE-DI PHENYL DI KETONE

BENZOSTILBINE is Iophine (*v p* 474)

BENZO-SUCCINIC ACID *v* BENZOYL SUCCINIC ACID

BENZOTHIAMIDE *v* THIO BENZAMIDE

BENZO TOLUIDINE *v* PHENYL AMIDO TOLYL KETONE

BENZTROPEINE *v* BENZOYL-TROPEINE

BENZOXAMIDINE *v* BENZAMIDOXIM

BENZ-OXIMIDO-AMIDE *v* BENZAMIDOXIM

BENZ-OXIMIDO-ETHYL-ETHER

$C_6H_5NO_2$, *ie* $C_6H_5C(OEt)NOH$ Formed by the action of hydroxylamine hydrochloride on benz imido ether (*v* BENZONITRILE), (Pinner, *B* 17, 184) Colourless fluid Decomposes on distillation

BENZOXY- *v* Benzoyl Oxy

BENZOXY PROPIO-CARBOXYLIC ACID *v* CARBOXY BENZOYL PROPIONIC ACID

BENZOYL The radicle C_6H_5CO . Benzoyl derivatives obtained by displacement of H in amidogen, imidogen, or hydroxyl, are described under the compounds from which they are thus derived

Di benzoyl is called **BENZIL** (*q v*)

BENZOYL-ACET-CARBOXYLIC ACID *v* ACETOPHENONE DI CARBOXYLIC ACID

BENZOYL-ACETIC ACID $C_6H_5O_2$, *ie*

$C_6H_5COCH_2CO_2H$ *Acetophenone α carboxylic acid* [104°]

Formation—1 From the ether by leaving it 24 hours with cold dilute KOH (3 per cent), cooling to 0° and then adding dilute H_2SO_4 . The acid is then ppd as white flakes (Baeyer & Perkin, *B* 15, 2705, 16, 2123, W H Perkin, jun, *C J* 45, 176)—2 From phenyl propionic acid and conc H_2SO_4 , the solution being poured upon ice—3 From the ether by allowing it to stand for 14 days with 20 vols of conc H_2SO_4 and then pouring upon ice (Perkin, *C J* 47, 240)

Properties—Minute needles, which polarise light (from benzene at 70° containing a little light petroleum). At 104° it melts, and gives off CO_2 . Sl sol light petroleum, *v* sol alcohol, ether, hot benzene, and hot water. $FeCl_3$ colours its alcoholic or aqueous solutions reddish violet

Reaction—1 Heated alone or with dilute H_2SO_4 it gives acetophenone and CO_2 .—2 The ammonium salt gives with $AgNO_3$ a pp of AgA' , with Fe_2Cl_3 a blackish violet pp, with $FeSO_4$ no pp, with $CuSO_4$ a greenish yellow pp

Methyl ether MeA' An oil prepared by the action of conc H_2SO_4 on methyl phenyl propionate (W H Perkin, jun, a Calman, *C J* 49, 154). Fe_2Cl_3 gives a violet colour in alcoholic solution. Sodium ethylate gives a white amorphous salt, $C_6H_5COCHNaCO_2Me$. This salt is *v* sol water and hot alcohol

Ethyl ether $A'Et$ (265°–270°) at 760 mm, (230°–235°) at 200 mm

Formation—1 From phenyl propionic ether (100 g) and H_2SO_4 (3000 g) at 0° After three Vol 1.

hours the product is poured upon powdered ice, and the new body extracted with ether—2 By heating diazo acetic ether with benzoic aldehyde (Buchner & Curtius, *B* 18, 2371)—3 By heating $EtONa$ (140 g) with benzoic ether (300 g) at 100°, mixing the product with acetic ether (350 g) and heating for 15 hours at 100° (Claisen & Lowman, *B* 29, 651).—4 By the action of cold conc H_2SO_4 upon (o) bromo cinnamic ether (Michael & Browne, *B* 19, 1392)

Properties—Colourless oil. Partly decomposed when distilled. Sl sol water, sol alcohol and ether

Reactions—1 The alcoholic solution gives with $FeCl_3$ a violet colour.—2 Boiled with water, or dilute H_2SO_4 , it gives acetophenone, alcohol, and CO_2 .—3 Boiling for 8 minutes produces dehydro benzoyl acetic acid (*q v*). Boiling for 80 minutes forms two isomerides ($C_6H_5O_2$). One of these ($n=3$?) crystallises in plates, [275°], m sol hot alcohol, *v* sl sol benzene, sol alcoholic NaOH but ppd by CO_2 . The second ($n=4$?) is an acid, not being ppd by CO_2 from its solution in alcoholic NaOH, conc H_2SO_4 forms a yellow solution, turning violet when warmed (Perkin, jun, *C J* 47, 262).—4 NaO and H_2SO_4 added to the sodium derivative produce an oxim of benzoyl glyoxylic ether, $PhCOC(NOH)COEt$ [121°], whence alkalis produce a substance $C_6H_5O_2$ [125°]

Metallic derivatives— $BzCHNaCO_2Et$ Got by adding $NaOEt$ to alcoholic solution of the ether. Silky needles, turns brown in air, insol ether— $\{C_{11}H_{11}O_3\}_2Ba$ — $C_{11}H_{11}AgO_3$ — $\{C_{11}H_{11}O_3\}_2Cu$ pale green, soluble in aqueous NaOH. On boiling Cu_2O is ppd

Nitrile *v* BENZOYL ACETONITRILE

Benzylidene-benzoyl-acetic ether

$C_6H_5CHCBzCO_2Et$ [99°] From benzoyl-acetic ether and benzoic aldehyde, either by passing HCl at 0° into the mixture, or by heating in a sealed tube (Perkin, jun, *C J* 47, 240). Monoclinic prisms $a b c = 1.2730 \ 1.7460$, $\beta = 86^\circ 36'$. Sol hot methyl alcohol. Conc H_2SO_4 forms a yellow solution, which becomes colourless on heating.

Benzylidene di-benzoyl di-acetic acid (CO_2HCHBz), $CHPh$ [130°] The ethers of this acid are formed by dropping diazo acetic ethers (2 mols) into benzoic aldehyde (3 mols) at 170° (Buchner & Curtius, *B* 18, 2374). They dissolve in conc H_2SO_4 forming rose coloured solutions, which turn brown on warming. The acid and its ethers give off a smell of hyacinths when burnt

Methyl ether [113°] prisms

Ethyl ether [103°] tables, $NaOEt$ added to its ethereal solution gives ($CO_2EtCNaBz$), $CHPh$

Di-benzoyl-acetic acid $CHBzCO_2H$ [109°]

Formed by the action of $BzCl$ on sodium benzoyl acetic ether, and saponification of the product with KOH (Baeyer & Perkin, jun, *B* 16, 2133, *C J* 47, 240). Slender felted needles, sl sol cold alcohol and water, *v* sol ether, sol aqueous alkalis. Fe_2Cl_3 gives a red colouration. Conc H_2SO_4 gives no colour on warming

Reactions—1 Boiling water splits it up into di-phenyl-methylene di-*o*-ketone, (C_6H_5CO), CH_2 , and CO_2 .—2 Boiling dilute H_2SO_4 gives acetophenone, benzoic acid, and CO_2 .

Salt — AgA'.

Ethyl ether EtA' Oil, not solid at -10°

Methyl-benzoyl-acetic acid is (a)-BENZOYL-PROPIONIC ACID (q v)

Ethyl-benzoyl-acetic acid $\text{BzCHEtCO}_2\text{H}$ [111° – 115°] From NaOEt and EtI on alcoholic $\text{BzCH}_2\text{CO}_2\text{Et}$, and saponifying the only product by allowing it to stand for some days with alcoholic KOH (Baeyer a Perkin, jun, B 16, 2130, C J 45, 180, 47, 240) Small needles, melts about 115° with slight decomposition Easily soluble in alcohol, ether, and benzene Boiled with dilute alcoholic KOH, it gives phenyl-propyl ketone, benzoic and butyric acids are also formed, especially if the potash be strong

Ethyl ether EtA' (232°) at 225° mm

Propyl-benzoyl-acetic ether $\text{BzCHPrCO}_2\text{Et}$ (239°) at 225° mm Prepared like the preceding Alkalis from phenyl butyl ketone PCl_5 forms β chloro α propyl cinnamic ether

Isopropyl-benzoyl-acetic ether

$\text{BzCHPrCO}_2\text{Et}$ (237°) at 225° mm From benzoyl acetic ether, Na, and PrI

Iso-butyl-benzoyl acetic ether

$\text{BzCH}(\text{CH}_3, \text{CHMe}_2)\text{CO}_2\text{Et}$ (217°) at 225° mm Prepared like the preceding (Perkin a Calman, C J 49, 165)

Di-ethyl-benzoyl-acetic acid $\text{BzC}(\text{Et})_2\text{CO}_2\text{H}$ [128° – 130°] From $\text{BzCHEtCO}_2\text{Et}$ by NaOEt and EtI The diethyl benzoyl acetic ether is saponified by standing for weeks with dilute alcoholic KOH (Baeyer a Perkin, jun, B 16, 2131, C J 45, 183) Heated alone or with dilute H_2SO_4 , it gives off CO_2 Boiling dilute alcoholic KOH forms benzoic acid, diethylacetic acid, and di-ethyl acetophenone (v amyl phenyl ketone)

Tri-benzoyl-acetic ether $\text{CBz}_3\text{CO}_2\text{Et}$ From ethyl di benzoyl acetate, NaOEt, and BzCl (Perkin, jun, C J 47, 240) Thick yellow oil, sol alcoholic KOH but reppd by water Boiling dilute H_2SO_4 forms acetophenone

BENZOYL-ACETIC-ALDEHYDE

$\text{C}_6\text{H}_5\text{COCH}_2\text{CHO}$ Prepared by dissolving sodium (1 atom) in 20 or 30 times its weight of absolute alcohol, cooling to 0° , and adding acetophenone (1 mol) and formic ether (1 mol) On long standing the sodium compound separates as a granular pp., this is dissolved in water and the aldehyde ppd by acetic acid Colourless unstable oil Cupric acetate gives a pp of bright green needles, which soon change to dark green prisms It reacts with amines very readily

Anilide $\text{C}_6\text{H}_5\text{COCH}_2\text{CHNC}_6\text{H}_5$ [141°], yellow prisms or plates, sol hot alcohol
p Toluide $\text{C}_6\text{H}_5\text{COCH}_2\text{CHNC}_6\text{H}_4$ [160° – 163°], small yellow crystals

(β) *Naphthylamide*

$\text{C}_6\text{H}_5\text{COCH}_2\text{CHNC}_{10}\text{H}_7$ [182°], small bronzy crystals, sl sol almost all solvents (Claisen a Fischer, B 20, 2191)

BENZOYL ACETIMIDO ETHYLIC ETHER

$\text{C}_6\text{H}_5\text{COCH}_2\text{C}(\text{NH})\text{OEt}$ [89° 5 corr]

Benzoyl acetonitrile $\text{C}_6\text{H}_5\text{COCH}_2\text{CN}$ treated with alcoholic hydrochloric acid gives rise to $\text{C}_6\text{H}_5\text{COCH}_2\text{C}(\text{NHHCl})\text{OEt}$ and this loses HCl when treated with ammonia giving the imido-ether (Haller, Bl [2] 48, 24, C R 104, 1448)

Properties — Prisms or tables. V sol ether

Reactions — KNO_3 and H_2SO_4 give the nitroso derivative $\text{C}_6\text{H}_5\text{COCH}_2\text{C}(\text{NNO})\text{OEt}$ [117°],

which gives Liebermann's reaction The hydrochloride of the base dissolved in aqueous alcohol deposits MH_2Cl and benzoyl acetic ether is left in solution

Hydrochloride B'HCl [140° corr], Entangled needles Insol aq and ether Strongly irritates the mucous membranes

BENZOYL-ACETO-ACETIC ETHER v p 21

BENZOYL-ACETO-CARBOXYLIC ACID v.

ACETOPHENONE CARBOXYLIC ACID

BENZOYL ACETONE $\text{C}_{10}\text{H}_{10}\text{O}_2$ v e

$\text{C}_6\text{H}_5\text{COCH}_2\text{COCH}_3$ Phenyl methyl methylene di ketone Acetyl acetophenone Acetyl benzoyl methane [61°] (261°)

Formation — By the action of dry NaOEt upon a mixture of acetone and benzoic ether (Claisen, B 20, 655)

Preparation — 1 Benzoyl aceto acetic ether, formed by the action of benzoyl chloride upon sodio aceto acetic ether, is boiled with water for a few hours, the yield is 25 p c — 2 Prepared by adding acetophenone (1 mol) to a cooled mixture of acetic ether (about 2 mols) and alcohol free sodium ethylate, yield 80–90 p c of the acetophenone (Beyer a Claisen, B 20, 2078)

Copper compound $(\text{C}_6\text{H}_5\text{O}_2)_2\text{Cu}$ formed as a pale green pp by adding cupric acetate to the alcoholic solution It is m sol alcohol and benzene, from which it crystallises in bright green needles

Amide $\text{C}_6\text{H}_5\text{COCH}_2\text{C}(\text{NH})\text{CH}_3$ [143°], clear glistening trimetric crystals, $a b c = 99271 \ 8820$

Anilide $\text{C}_6\text{H}_5\text{COCH}_2\text{C}(\text{NPh})\text{CH}_3$ [110°], plates By warming with H_2SO_4 (10 pts) it is converted into (*Py* 1 3) phenyl methyl quino line (Beyer, B 20, 1770)

Properties — Crystals, distils undecomposed, volatile with steam Sol hot water, alcohol, and ether Dissolves in alkalis with a yellow colour Sl sol strong acids Fe_2Cl_6 gives a dark red colouration

Reactions — By warming with alkalis or by long boiling with acids it yields acetophenone It has slightly acid characters, the H of the central CH_2 group being replaceable as in aceto acetic ether, since it lies between two CO groups By heating with strong aqueous NH_3 at 120° it is converted into the imide

$\text{C}_6\text{H}_5\text{C}(\text{NH})\text{CH}_2\text{COCH}_3$, or $\text{C}_6\text{H}_5\text{COCH}_2\text{C}(\text{NH})\text{CH}_3$ It condenses with (1 mol) of phenyl hydrazine with elimination of $2\text{H}_2\text{O}$, forming methyl di phenyl pyrazol (Fischer a Bulow, B 18, 2131)

Salts — $\text{C}_{10}\text{H}_9\text{O}_2\text{Na}$ small yellowish plates — $\text{C}_{10}\text{H}_9\text{O}_2\text{Ag}$ white pp, v sl sol water (Fischer a Kuzel, B 16, 2239)

Oxim $\text{C}_6\text{H}_5\text{C}(\text{NH})\text{O}_2\text{N}_2\text{C}_6\text{H}_5\text{C}(\text{NH})\text{CH}_2\text{COCH}_3$, or $\text{C}_6\text{H}_5\text{COCH}_2\text{C}(\text{NOH})\text{CH}_3$ [66°] Formed by heating benzoyl acetone with hydroxylamine hydrochloride in alcoholic solution (Ceresole, B 17, 812) White glistening scales Volatile with steam V sol acetone, benzene, and CS_2 , insol water

Di-benzoyl-acetone $(\text{C}_6\text{H}_5\text{CO})_2\text{CHCOCH}_3$ [102°] Formed by the action of benzoyl chloride upon sodio benzoyl acetone (Fischer a Bulow, B 18, 2133) Small needles Sol alcohol and ether, v sl. has no action upon it.

BENZOYL-ACETONIMIDE $C_{10}H_{11}NO$ 46

$C_6H_5CO(CH_3)CH_2COCH_3$ or $C_6H_5COCH_2C(NH)CH_3$ [143°] Obtained by heating benzoyl acetone with strong aqueous NH_3 at 120° (Fischer a Bulow, B 18, 2134) Distils undecomposed Small plates, or large quadratic crystals V sol dilute acids, by heating with which it is converted back into benzoyl acetone and NH_3 .

BENZOYL ACETONITRILE C_9H_9NO 46

$C_6H_5COCH_2CN$
Cyano acetophenone [81° cor] Formed by the action of boiling water on benzoyl cyanacetate ether $C_6H_5COCH(CN)CO_2Et$ (Haller, Bl [2] 48, 23) White needles, sol boiling water, alcohol, ether, and alkalis Boiling conc KOH acts thus $C_6H_5COCH_2CN + 2KHO + H_2O = NH_3 + C_6H_5CO_2K + CH_3CO_2K$ In alcoholic solution gaseous HCl gives a body C_9H_9ONCl (probably $C_6H_5COCH_2C(NHCl)OEt$ [140corr]), whence ammonia in the cold gives the imido ether $C_6H_5COCH_2C(NH)OEt$ If the action of the alcoholic HCl is prolonged, the products are the same as with KOH

Silver salt $C_6H_5COCHAgCN$ White pp Insol aq and alcohol, sol ammonia

BENZOYLACETOPHENONE v DI PHENYL METHYLENE DI KETONE**BENZOYL-ACETYL-ETHANE** v ACETO-PHENONE ACETONE, p 36**Di-benzoyl-di acetyl ethane**

$C_{12}H_{10}O_4$ 46
 $C_6H_5COCH_2COCH_2C_6H_5$ Di phenyl
 $C_6H_5COCH_2COCH_2C_6H_5$

di methyl-acetylene tetra ketone [175°] Formed by the action of an ethereal solution of iodine upon 2 mols of sodio benzoyl acetone (Fischer a Bulow, B 18, 2133) White needles Sol hot alcohol, sl sol ether, insol water and dilute alkalis Decomposed by boiling with alkalis.

BENZOYL-ACRYLIC ACID

$C_9H_7COCH_2CO_2H$ White plates, [64°], from water, after fusion its melting point is altered to [97°] Long needles, [99°] from toluene Sl sol cold water and ligrom, v sol other solvents Prepared by the action of $AlCl_3$ on a mixture of benzene and maleic anhydride By alkalis it is decomposed into acetophenone and glyoxylic acid On heating by itself or with Ac_2O , it gives a red condensation product (Pechmann, B 15, 885)

Bromine addition product [135°] Colourless crystals

$C_{15}H_{11}CO_2C_6H_5CO_2COCH_3$ [112°] Prepared by heating o benzoyl benzoic acid with acetic anhydride to 100° (Freiher a Pechmann, B 14, 1865) Large crystals Insol alkalis At 200° it decomposes into acetic and benzoyl-benzoic anhydrides

BENZOYL BENZOIC ACID $C_{14}H_9O_4$ 46
 $C_6H_5CO_2C_6H_4CO_2H$ [12] *Benzophenone carboxylic acid* Mol w 226 [87°] (Z), [94°] (Hemilian, B 11, 838)

Formation—1 By oxidation of o-benzoyl-toluene (Zincke a Plaskuda, B 6, 907), phenyl-o tolyl ketone (Behr a Van Dorp, B 7, 17), or di benzyl benzene (Zincke, B 9, 32) with chromic mixture

Preparation—150 grms of Al_2Cl_3 are slowly added during 3 hours to a solution of 100 grms of phthalic anhydride in 1000 grms of benzene (pure), the benzene is then poured off and can be used at once for a fresh operation, whilst the solid residue is washed with dilute HCl and with water, dissolved in Na_2CO_3 and the acid precipitated from the solution by HCl , and finally recrystallised from xylene (3 pts), the yield is 60 p c of the phthalic anhydride used (Friedel a Crafts, C R 86, 1368, 92, 833, Freiher a Pechmann, B 13 1612)

Properties—Triclinic needles (containing aq) When dry it melts at 128°

Reactions—1 P_2O_5 at 190° forms anthraquinone—2 *Hot fuming sulphuric acid* forms anthraquinone sulphonic acid (Liebermann, B 7, 805)—3 *Sodium amalgam* first reduces it to $C_6H_5CH(OH)C_6H_4CO_2H$ and then to $C_6H_5CH_2C_6H_4CO_2H$ —4 *Resorcin*, *pyrogallol* &c, on heating, form phthaleins—5 With phenyl hydrazine it gives a condensation product $C-Ph$

duct $C_6H_5\text{---}\text{C}_6H_4\text{---}N_2Ph$ [182°] (Roser, B 18, 805).

This forms small needles, sl sol alcohol, insol water

Salts— CaA_2 .— BaA_2 .— $ZnA_2 \cdot 2aq$.— $CuA_2 \cdot aq$

Methyl ether MeA' [52°]. prisms

Ethyl ether EtA' [58°]

Anhydride ($BzC_6H_4CO_2O$) [120°] (Pechmann, B 14, 1866)

m **Benzoyl-benzoic acid** $PhCO_2C_6H_4CO_2H$ [13] [161°]

Formation—1 From phenyl-m-tolyl methane (10 g), $K_2Cr_2O_7$ (60 g), H_2SO_4 (90 g) and water (270 g) by boiling for 3 days (Rotering, Senff, A 220, 237) It is purified by reduction to $PhCH(OH)C_6H_4CO_2Na$ by sodium amalgam, crystallising this salt from water and oxidising again with H_2SO_4 and $K_2Cr_2O_7$ —2 A quantitative yield is obtained by treating phenyl-m-tolyl methane at 180° with bromine vapour sufficient to form $PhCH_2C_6H_4CH_2Br$ and treating the product with chromic mixture for 12 hours—3 From Bz_2O (1 mol) and $BzCl$ (2 mols.) in presence of $ZnCl_2$ (Doeberner, A 210, 277, B 14, 648)—4 Formed as a by product in the pre-

paration of isophthalophenone by the action of AlCl_3 on a mixture of benzene and isophthalyl chloride (Ador, *B* 13, 321)

Properties—Long silky needles (from water or glacial acetic acid), or small plates (from alcohol) Sl sol cold water, v sol benzene or toluene, v e sol alcohol or ether May be sublimed as plates Dissolves in conc H_2SO_4 , giving no colour Potash fusion gives benzoic acid Reduced by sodium amalgam to *exo-oxy* benzyl benzoic acid (*q v*)

Salts— BaA' , 3aq white crystalline powder— BaA' , 4aq small plates— CaA' , 2aq white crystalline powder— AgA' white leaflets *Methyl ether* MeA' [69°]

p Benzoyl-benzoic acid $\text{C}_6\text{H}_5\text{COCH}_2\text{CO}_2\text{H}$ [14] [194°] Formed by oxidation of phenyl p tolyl methane, phenyl p tolyl ketone, p phenyl benzophenone or di benzyl benzene (Zincke, *A* 161, 98, *B* 6, 907, 9, 32, Goldschmiedt, *M* 2, 438) Monoclinic plates (from water) V sl sol cold water, sl sol hot water (difference from the o acid), v sol alcohol and ether, sl sol benzene Sublimes in plates

Salts— CaA' , 2aq needles— BaA' , 2aq— AgA' v sl sol water

Methyl ether MeA' [107°] Satiny plates *Ethyl ether* EtA' [52°] Monoclinic

DI BENZOYL BENZOIC ACID $\text{C}_{14}\text{H}_{10}\text{O}_4$ *ee* ($\text{C}_6\text{H}_5\text{CO}$) $_2\text{C}_6\text{H}_4$ Two acids of this composition are formed, together with an acid $\text{C}_{14}\text{H}_{10}\text{O}_4$, by oxidising the hydrocarbon $\text{C}_{21}\text{H}_{20}$ obtained as a by product in the preparation of benzyl toluene (Weber & Zincke, *B* 7, 1153)

(a) Acid [32°] Resinous, and forms resinous salts Potash fusion forms benzoic acid and a small quantity of an acid $\text{C}_{14}\text{H}_{10}\text{O}_4$

(B) Acid [212°] Needles insol water, v sol alcohol and ether Its salts are sl sol water *Ethyl ether* EtA [107°]

DI BENZOYL BENZYLIDENE DI-ACETIC ACID v *Benzylidene di BENZOYL DI-ACETIC ACID*
BENZOYL BENZOTRICHLORIDE v *PHENYL TRI-CHLORO TOLYL KETONE*
BENZOYL-BENZYL ANILINE v *BENZYL ANILINE*

BENZOYL-BENZYL CHLORIDE v *PHENYL CHLORO TOLYL KETONE*

BENZOYL-BENZYLIDENE CHLORIDE v *PHENYL DI-CHLORO TOLYL KETONE*

BENZOYL-BROMANILINE v *BROMO ANILINE*
BENZOYL BROMIDE $\text{C}_6\text{H}_5\text{COBr}$ (219°i V) [a little below 0°] SG 1.25 157 Colourless fluid, which fumes in the air

Preparation—Benzoic acid (500 pts) is warmed with phosphorus tribromide (740 pts) and the product is separated from the phosphorous acid by distillation *in vacuo*, the yield is 400 pts (Clausen, *B* 14, 2473) The so-called benzoyl bromide of Liebig and Wohler (*A* 3, 266) and of Paternò was probably benzylidene bromide benzoate, $\text{C}_6\text{H}_5\text{CHBr}(\text{OBz})$, a compound of benzoic aldehyde with benzoyl bromide

BENZOYL - BROMO - NITRANILIDE v *BROMO-NITRO ANILIN*

BENZOYL - BROMO - PHENOL v *BROMO PHENOL*

DI-BENZOYL-ISOBUTYRIC ACID ($\text{C}_6\text{H}_5\text{COCH}_2$) $_2\text{CHCO}_2\text{H}$ *Di phenacyl-acetic acid* [133°]. Formed by loss of CO_2 by heat

ing di β benzoyl di methyl malonic acid (BzCH_2) $_2\text{C}(\text{CO}_2\text{H})_2$ Silky needles V sol alcohol, ether, acetic acid, and hot benzene, insol ligroun—ATNa glistening needles (Kues & Paal, *B* 19, 3147)

BENZOYL-CARBAMIC ACID $\text{C}_6\text{H}_5\text{CONHCO}_2\text{H}$,
Ethyl ether $\text{C}_6\text{H}_5\text{CONHCO}_2\text{Et}$ [110°].

Formed by boiling benzoyl thiocarbamic ether in alcoholic solution with PbO (Lossner, *J pr* [2] 10, 254) Needles (from dilute alcohol), sl sol water Decomposed by aqueous KOH into KOBz, alcohol, NH_3 , and K_2CO_3 Alcoholic KOH gives a pp of $\text{C}_6\text{H}_5\text{CO}_2\text{NEt}$, v e sol water

BENZOYL-CARBINOL PhCOCH_2OH [86°]. $\text{PhC}(\text{OH})(\text{CH}_2\text{OH})$ [74°] *Exo oxy phenyl-methyl ketone Oxy acetophenone Aceto phenone alcohol Phenacyl alcohol*

Formation—1 By the action of alkalis on the acetate or chloride, $\text{C}_6\text{H}_5\text{COCH}_2\text{Cl}$ —2 From phenyl glycol (2 g) and HNO_3 (6 cc of SG 1.36) The mixture is warmed and, as soon as reaction sets in, it is cooled The product is diluted, neutralised with Na_2CO_3 , and the crystalline carbinol filtered off Ether extracts a further quantity from the filtrate (Hunaeus & Zincke, *B* 10, 1487)

Properties—Prisms or plates (from benzoline) Large crystals (from alcohol or ether) V sol ether, alcohol, or CHCl_3 Large plates containing H_2O (from water or dilute alcohol) In drying these, decomposition readily occurs, benzoic aldehyde being formed The carbinol combines with NaHSO_4 Readily reduces ammoniacal silver nitrate or Fehling's solution, the chief product of the oxidation being mandelic acid $\text{C}_6\text{H}_5\text{CH}(\text{OH})\text{CO}_2\text{H}$ (Breuer & Zincke, *B* 13, 635)

Reactions—1 Heated alone it gives off benzoic aldehyde and a pungent body—2 Heated with aqueous NaOH or *baryta* it becomes yellow and forms benzoic aldehyde—3 Water at 140° acts similarly—4 With HCN it yields the nitrile of atrogyneric acid $\text{CH}_2(\text{OH})\text{CPh}(\text{OH})\text{CO}_2\text{H}$ (Plöchl & Blumlein, *B* 16, 1290)

Acetate $\text{PhCOCH}_2\text{OAc}$ [49°] (270°) From chloro acetophenone and AgOAc (Graebe, *B* 4, 34), or from the carbinol and Ac_2O (Zincke) Trimetric tables (from benzoline) V sol alcohol, ether, or chloroform M sol benzoline

Benzoate $\text{PhCOCH}_2\text{OBz}$ [117°] (Zincke) From chloro aceto phenone and AgOBz or from benzoyl carbinol and Bz_2O Small tables (from dilute alcohol) V sol ether, benzene, or CHCl_3

BENZOYL CHLORANILIDE v *CHLORO ANILINE*

BENZOYL CHLORIDE $\text{C}_6\text{H}_5\text{COCl}$ [−1°] (Lieben, *A* 178, 43) (198°) (194°) (Bruhl, *A* 235, 11) SG 1.21, 1.2122 (V) VD 4.99 (calc 4.90) $\mu_D = 1.5537$ SV 126.3 (Ramsay)

Formation—1 From chlorine and benzoic aldehyde (Liebig & Wöhler, *A* 3, 262)—2 From benzoic acid and PCl_5 (Cahours, *A Ch* [3] 23, 334)—3 From benzoates and POCl_3 (Gerhardt, *A Ch* [3] 37, 291)—4 In small quantities, by the action of Cl upon mandelic acid or on benzoic ethers (Malaguti, *A Ch* [2] 70, 374)—5.

By heating benzoic acid, NaCl, and $K_2S_2O_8$ at 200° (Beketoff, *A* 109, 256) —6 By the action of $COCl_2$ on benzene in presence of $AlCl_3$ (Friedel, Crafts, a Ador, *B* 10, 1855) —7 From benzoic acid or benzoates and S_2Cl_2 (Carius, *A* 106, 800) —8 By heating benzoic acid with $ZnCl_2$ and adding pentachloride (*D P J* 239, 157) $C_6H_5CCl_2 + C_6H_5CO_2H = 2C_6H_5COCl + HCl$

Properties — Colourless pungent oil Decomposed into HCl and benzoic acid slowly by cold, quickly by hot, water Alcohol reacts vigorously, forming benzoic ether and HCl Ether and CS_2 dissolve it without decomposition

Reactions —1 Aqueous KOH gives KOBz and KCl —2 Dry BaO at 150° forms Bz_2O (Gal, *A* 128, 127) —3 Dry NH_3 or ammonium carbonate forms benzamide, other bases act similarly —4 Sodium has no action in the cold, but in presence of ether at 100°, 'dibenzoyl' [140°] is slowly formed (Briegel, *Bl* [2] 5, 278) —5 Hydride of Copper forms $CuCl_2$ and benzoic aldehyde (Chiozza, *A* 85, 232) —6 KI forms BzI —7 $HgCy_2$ forms $BzCy$ —8 KSCN forms benzonitrile, CO, and CS_2 (Lumprecht, *A* 99, 117) —9 $Pb(SCN)$ forms $BzSCN$ —10 $KNCO$ forms benzonitrile (Schiff, *A* 101, 93) and cyanophenine (Cloeze, *Bl* 1859, 100) —11 $NaOBz$ gives BzO (Gerhardt) —12 Sodium formate forms CO, NaCl, and benzoic acid —13 Potassium oxalate forms Bz_2O , KCl, CO, and CO —14 By the dry nitrates of Pb, Ag, Hg, or Cu, it is converted into benzoic anhydride, with formation of the chloride of the metal, N_2O_5 , and oxygen (Lachowicz, *B* 18, 2990) —15 Conc H_2SO_4 forms, apparently, $BzSO_3H$, which on heating becomes benzene sulphonic acid (Oppenheim, *Z* [2] 7, 21) —16 PCl_5 at 200° gives $C_6H_5CCl_2$, C_6H_5ClCCl , $C_6H_5Cl_2CCl$, and at a higher temperature CCl_4 and chlorinated benzenes (Schischkoff a Rösing, *J* 1858, 279, Lumprecht, *A* 134, 55, Claus a Hoch, *B* 19, 1194) —17 KHS forms $BzSH$ —18 BaO_2 gives Bz_2O —19 Sodium amalgam in acid solution forms benzoic aldehyde and benzyl alcohol (Lippmann, *A* 137, 252) —20 KNH_2 forms benzamide and dibenzamide (Baumert a Landolt, *A* 111, 1) —21 Succinic ether at 200° gives succinic anhydride, $EtOBz$, and $EtCl$ (Kraut, *A* 137, 254)

Combination — $TiCl_4BzCl$ [65°] Yellow crystals (Bertrand, *Bl* [2] 34, 631)

BENZOYL CHLORO TOLUIDE *v* CHLOROTOLUIDINE

BENZOYL CHOLIC ACID *v* CHOLIC ACID
BENZOYL CROTIC ACID $C_{11}H_{18}O_4$ *v* $C_6H_5COCH(CH_3)CHCO_2H$ [113°] Long pointed crystals Prepared by the action of $AlCl_3$ on a mixture of benzene and citraconic anhydride By alkalis it is resolved into phenyl ethyl ketone and glyoxylic acid (Pechmann, *B* 15, 891)

BENZOYL CUMIDIC ACID *v* PHENYL XYLITL-KETONE *DI* CARBOXYLIC ACID

BENZOYL CUMIDINE *v* CUMIDINE

BENZOYL-CYANACETIC ETHER *v* CYANO

BENZOYL ACETIC ETHER

BENZOYL CYANIDE C_6H_5COCN [83°] (208°) Formed by distilling $BzCl$ with $HgCy_2$ or $AgCy$ (Laebig a Wöhler, *A* 3, 267, H Strecker, *A* 90, 62, Hübner a Buchka, *B* 10, 480, Kolbe, *A* 90, 63, 98, 847) Formed also by mixing isonitroso acetophenone $C_6H_5COCHNOH$ with

$AcCl$ in the cold, and then distilling the mixture The isonitroso acetophenone need not be separately prepared, but amyl nitrite (1 mol) can be allowed to drop slowly into a warm mixture of acetophenone (1 mol) and acetyl chloride (3 mols), and the product distilled, yield 65–70 p.c. of the theoretical (Claisen a Manasse, *B* 20, 2196) Pungent crystalline mass Decomposed slowly by water, more readily by KOH_{aq} into $HOBz$ and HCN Fuming HCl forms $C_6H_5COCONH_2$ whence phenyl glyoxylic acid Zinc and HCl reduce it to benzoic aldehyde NH_3 gives benzamide and NH_4CN Aniline gives benzanilide PCl_5 appears to form $C_6H_5CCl_2CN$ (224°) (Claisen, *B* 12, 626) $ZnEt_2$, diluted with ether forms 3 p.c. of 'benzoyanidine' $C_{12}H_{15}NO_2$, [121°], needles (from alcohol), another product (200°–220°), either contains phenyl ethyl ketone or yields that body on oxidation (Frankland a Louis, *C J* 37, 742)

BENZOYL CYANIDINE *v* BENZOYL CYANIDE

BENZOYL CYANURATE *v* CYANURIC ACID
BENZOYL-CYMENE *v* SULPHAMIDE *v* CYMENE SULPHONIC ACID

BENZOYL-CYMENOL *v* CYMENOL

BENZOYL CYMIDIDE *v* CYMIDINE

BENZOYL DESOXALIC ACID *v* DESOXALIC ACID

BENZOYL-ISODURENE *v* PHENYL TETRAMETHYL PHENYL KETONE

o TRI BENZOYLENE BENZENE $C_{27}H_{20}O_3$ *v* $C_6(C_6H_5CO)_3$ [above 360°] Formed together with methylene phthalyl by heating phthalic anhydride with malonic ether and sodium acetate, or by the action of H_2SO_4 on phthalyl acetic acid (Gabriel a Michael, *B* 10, 1557, 11, 1007, 1679, 14, 925) Yellow crystals Soluble in nitrobenzene, nearly insoluble in other solvents Potash fusion converts it into phenyl tri benzoic acid $C_6H_5(C_6H_5CO_2H)_3$ [261°]

DI-BENZOYL ETHANE *v* *DI* PHENYLETHYLENE *DI* KETONE

BENZOYL-ETHYL-ACETIC ACID *v* BENZOYL ACETIC ACID

BENZOYL ETHYL ANILINE *v* ETHYLANILINE

BENZOYL ETHYL BENZENE *v* PHENYLETHYL PHENYL KETONE

BENZOYL-ETHYL *o* CARBOXYLIC ACID *v*.

PHENYL ETHYL KETONE *o* CARBOXYLIC ACID

BENZOYL FORMIC ACID *v* PHENYL GLYOXYLIC ACID

BENZOYL FLUORIDE C_6H_5COF (162°) From HKF , and $BzCl$ (Borodin, *A* 126, 60) Pungent liquid, attacks glass Decomposed by water into HF and $HOBz$

DI BENZOYL FUMARIC ETHER

$CO_2EtCBzCBzCO_2Et$ Formed by the action of iodine dissolved in ether upon the disodium compound of di benzoyl succinate, $CO_2EtCBzNa.CBzNa.CO_2Et$ (Perkin, *C J* 47, 262)

BENZOYL-GALLIC ACID *v* GALLIC ACID

BENZOYL GLYCOCOLL *v* HIPURIC ACID

BENZOYL GLYCOLLIC ACID *v* GLYCOLLIC ACID

α -BENZOYL ISO HEXOIC ACID *v*. Isobutyl BENZOYL ACETIC ACID.

BENZOYL HYDRIDE *v* BENZOIC ALDEHYDE

DI BENZOYL IMIDE *v* p 475

DI-BENZOYL INDIGO *v* INDIGO

BENZOYL IODANILINE *v* IODO ANILINE

BENZOYL IODIDE C_6H_5COI Easily fusible crystalline mass obtained by heating $BzCl$ with KI (Liebig & Wöhler, *A* 3, 266).

BENZOYL-ISATIN *v* ISATIN

BENZOYL ISETHIONIC ACID *v* ISETHIONIC ACID

BENZOYL LACTIC ACID *v* LACTIC ACID

BENZOYL LEUCINE *v* LEUCINE

TRI BENZOYL MELAMINE *v* MELAMINE

BENZOYL-TRIMELLITIC ACID *Benzo-phenone tricarboxylic acid* $C_{16}H_{10}O_8$, *i.e.* $C_6H_5CO \cdot CO \cdot C_6H_4(CO_2H)_2$, [5124] Formed by phenyl ψ -cumyl ketone by oxidation with dilute HNO_3 or $KMnO_4$ (Elbs, *J pr* [2] 35, 494) Salts— $BaHA''$

BENZOYL MESIDIDE *v* MESIDINE

BENZOYL-MESITYLENE *v* PHENYL TRI-METHYL-PHENYL KETONE

Dibenzoyl mesitylene v Di phenyl tri methyl phenylene diketone

Tri benzoyl-mesitylene $C_{36}H_{24}O_6$, *i.e.* $(C_6H_5CO)_3C_6Me_3$, *Tri phenyl tri methyl phenyl tri ketone* [216⁷] Formed by heating benzoyl mesitylene or di benzoyl mesitylene with $BzCl$ and $AlCl_3$ at 198° . Crystals (from alcohol), *v* sl sol cold alcohol, *v* sol a mixture of chloroform and acetone. When $BzCl$ acts on mesitylene in presence of $AlCl_3$ below 118° only benzoyl mesitylene is formed, at 150° di benzoyl mesitylene is the chief product (Louise, *C R* 98, 1440, *A Ch* [6] 6, 237)

o-**BENZOYL MFSITYLENIC ACID** $C_{16}H_{10}O_8$, *i.e.* $C_6H_5CO \cdot C_6H_3Me_3COOH$ *Phenyl xylyl ketone carboxylic acid* [185⁷] Prepared in the same way as the *p* acid (*v infra*) (Louise, *Bl* [2] 44, 418) Colourless crystals, insol cold water, sl sol boiling water, sol $CHCl_3$, acetone, ether, and benzene. Its salts do not crystallise well— AgA'' — CuA_2

p **Benzoyl-mesitylenic acid** $C_{16}H_{10}O_8$, [160⁷] Prepared by oxidising phenyl tri methyl phenyl ketone (benzoyl mesitylene) (Louise, *Bl* [2] 44, 418, *A Ch* [6] 6, 218) Nacreous scales, very sol ether, $CHCl_3$, acetone, &c., sol boiling water. Salts— $A''NH_4$ small brilliant crystals— $A''Ag$ white pp sol boiling water— $A''Ba$ 2aq long needles— $A''Ca$ long white filaments— $A''Mg$ 6aq crystals, sol hot water— SrA''_2

BENZOYL-METHANE *v* ACETOPHENONE

Di-benzoyl methane *v* DI PHENYL METHYLENE DIKETONE

Tri-benzoyl-methane $(C_6H_5CO)_3CH$ *Me theryl tri phenyl tri ketone* [225⁷] Formed by the action of benzoyl chloride on sodio di benzoyl methane (Baeyer & Perkin, *B* 16, 2135, *C J* 47, 240) Small needles. Sublimable. *V* sl sol alcohol, *v* sol. dilute alcoholic KOH . Converted by $NaOEt$ and $BzCl$ into a substance [260° — 270°]

BENZOYL-METHYLAMINE *v* METHYL-AMINE

BENZOYL METHYL-ANILINE *v* METHYL-ANILINE

BENZOYL-DIMETHYLANILINE *v* DI-METHYL AMIDO-BENZOPHENONE

BENZOYL-TRIMETHYLENE *v* PHENYL TRI-METHYLENE KETONE.

DI β BENZOYL DI METHYL-MALONIC ACID $(C_6H_5COCH_2)_2C(CO_2H)_2$, *Di-phenacyl-malonic acid* [184⁷]

Formed by saponification of its ether, which is obtained by the action of ω -bromo aceto phenone upon sodio malonic ether. Large colourless prisms. *V* sol alcohol, ether, and acetic acid, sl sol water, insol benzene and ligroin. Reacts with phenyl hydrazine. Evolves CO_2 on heating, giving di benzoyl isobutyric acid— $A''K_2$ white needles or plates, *v* sol water— $A''Ag_2$ nearly insol white pp. *Diethyl ether* $A''Et_2$ [119⁷], large white glistening prisms or long flat needles, *v* sol water, benzene, acetic acid, and CS_2 , less in alcohol, insol ligroin. Reacts with phenyl hydrazine but not with hydroxylamine (Kuss & Paal, *B* 19, 3144)

BENZOYL-METHYL-*p*-NITRANILINE *v* *p*-NITRO PHENYL ω AMIDO ACETOPHENONE

BENZOYL-METHYL-PHENYL-NITROS-AMINE *v* PHENYL AMIDO ACETOPHENONE

BENZOYL-NAPHTHALIDE *v* NAPHTHYLAMINE

BENZOYL-NAPHTHYLAMINE-IMIDE-CHLORIDE *v* α CHLORO BENZYLIDINE NAPHTHYLAMINE

BENZOYL NAPHTHYL THIO UREA *v* NAPHTHYL THIO UREA.

BENZOYL NITRANILIDE *v* NITRO ANILINE.

BENZOYL-NITRITE $BzNO_2$ (?) An oil formed together with *m* nitro benzoic aldehyde by the action of 20 vols of a mixture of HNO_3 (1 vol) and H_2SO_4 (2 vols) upon 1 vol of benzoic aldehyde (Lippmann & Hawliczek, *B* 9, 1463). It is decomposed by distillation.

BENZOYL-NITRO-AMIDO-DIPHENYL *v* NITRO AMIDO DIPHENYL

BENZOYL NITRO-AMIDO PHENOL *v* NITRO AMIDO PHENOL

BENZOYL NITRO ANISIDINE *v* NITRO-AMIDO-PHENOL

BENZOYL NITRO-CUMIDINE *v* NITRO-CUMIDINE

BENZOYL-NITRO-NAPHTHALIDE *v* NITRO NAPHTHYLAMINE

BENZOYL NITRO-DIPHENYLAMIDE *v* NITRO DIPHENYLAMINE

BENZOYL NITRO-TOLUENE SULPHAMIDE *v* NITRO-TOLUENE SULPHONIC ACID

BENZOYL NITRO-TOLUIDE *v* NITRO-TOLUIDINE

BENZOYL PEROXIDE $C_{14}H_{10}O_8$, *i.e.* Bz_2O_2 , [104⁷] $BzCl$ is mixed with hydrated BaO_2 and the resulting solid cake washed with water and Na_2CO_3 , and crystallised from CS_2 (Brodie, *Pr* 9, 361, 12, 655, Sperlich & Lippmann, *Sitz B* 62, 613) Trimetric crystals, insol water, *v* sol ether and benzene. Decomposed by heat, giving off CO_2 with slight explosion. Boiling $KOHAq$ forms O and $KOBz$. Benzoyl peroxide acts as an oxidising agent, splitting up into Bz_2O and O thus it oxidises *p* toluidine to toluene azo-toluene.

BENZOYL PHENOL C_6H_5OBz *v* PHENOL, $C_6H_5CO \cdot C_6H_5OH$ *v* OXY BENZOPHENONE

BENZOYL PHENOL SULPHONIC ACID *v* PHENOL SULPHONIC ACID

BENZOYL-PHENYL AMINE

$C_6H_5CO \cdot C_6H_5NH_2$. Benzanilide (18 g.), $BzCl$ (14 g.), and $ZnCl_2$ gave the *p* benzoyl derivative [150°], together with a little of the *o* benzoyl-

derivative $C_6H_5CO.C_6H_5NHBz$ [170°] (Higgin, *C J* 41, 133) Dilute HCl at 120° liberates the free bases, which are described as AMIDO BENZO-PHENONES (*q v*)

p BENZOYL PHENYL CARBAMIC ETHER
 $C_6H_5CO.C_6H_5NH.CO_2Et$ [189°] Prepared by the action of chloroformic ether on *p* amido benzophenone (Doebner a Weiss, *B* 14, 1839, *A* 210, 246) Plates Sol boiling alcohol, boiling acetic acid, and chloroform, insol cold water Decomposed by boiling KOH

BENZOYL PHENYL CARBAMINE

$C_6H_5CO.C_6H_5NC$ *Iso cyano benzophenone* [119°] From *p* amido benzophenone (10 g), chloroform (8 g), and alcoholic KOH (Doebner, *A* 210, 246) Silky needles, volatile with steam Sl sol hot water, v sol alcohol Split up by acids into formic acid and amido acetophenone

BENZOYL PHENYLENE-DIAMINE v

PHENYLENE DIAMINE •

BENZOYL PHENYL DI ETHYL-AMINE v

DI ETHYL AMIDO BENZOPHENONE

BENZOYL PHENYL DI METHYL AMINE

v DIMETHYL AMIDO BENZOPHENONE

p DI BENZOYL DI PHENYL THIO UREA

$SC(NH.C_6H_5.CO.C_6H_5)_2$ [160°] Prepared by the action of CS₂ on an alcoholic solution of *p* amido benzophenone in presence of a little KOH (Doebner a Weiss, *B* 14, 1839) Colourless plates Sol chloroform, sl sol hot alcohol, ether, benzene and CS₂, insol water

BENZOYL PHENYL METHANE is BENZOYL-

PHENYL CARBAMIC ETHER (*q v*)

BENZOYL PIPER PROPYL-ALKEIN v

Benzoyl OXYPROPYL PIPERIDINE

BENZOYL PROPANE CARBOXYLIC ACID

v PHENYL PROPYL KETONE CARBOXYLIC ACID

a BENZOYL PROPIONIC ACID $C_6H_5O_2$ v e

$C_6H_5.CO.CHMe.CO_2H$ *Phenyl ethyl ketone a carboxylic acid* From the ether and conc H_2SO_4 , the mixture being left for 3 weeks It is an oil and gives a reddish brown colour with $FeCl_3$ Alkalis produce phenyl ethyl ketone

Ethyl ether $CH_3CH_2CO_2Et$ (227°) at 225 mm Formed by the action of NaOEt and MeI on benzoyl acetic ether (*q v*) Aromatic smelling oil $FeCl_3$ gives no colour in its alcoholic solution NaOEt forms the sodium derivative $CH_3CNaBz.CO_2Et$ Phosphorus pentachloride forms $C_6H_5CClMe.CO_2Et$ (Perkin a Calman, *C J* 49, 156)

B benzoyl propionic acid

$C_6H_5.CO.CH_2.CO_2H$ *Phenyl ethyl ketone ω carboxylic acid* [116°], [114°] (Bischoff, *B* 19, 95)

Formation—1 By the reduction of benzoyl-acrylic acid—2 By the action of Al_2Cl_3 (1½ pts) on a mixture of succinic anhydride (1 pt) and benzene (10 pts) The product is shaken with water, when the acid remains dissolved in the benzene, whence it is extracted by shaking with KOH and ppg with HCl (Burcker, *Bl* [2] 35, 17, *A Ch* [5] 26, 433, Pechmann, *B* 15, 889) 3 By oxidising its aldehyde—4 Its chloride is formed by the action of Al_2Cl_3 upon a mixture of succinyl chloride (1 mol) and benzene (1 mol) (Claus, *B* 20, 1875)—5 By heating benzoyl-isosuccinic acid above its melting point, CO_2 being evolved (Kues a Paal, *B* 18, 8325)

Properties—White prisms, v sol hot water

Converted by potash fusion into benzoic and propionic acids Reduced by sodium amalgam to γ oxy phenyl-butyric acid (or its lactone) $C_6H_5.CH(OH).CH_2.CH_2.CO_2H$

Salts— BaA'_2 needles— AgA' sl. sol. water

Ethyl ether EtA' [32°] white crystals, turned red by heat

Phenyl hydrazide

$C_6H_5.C(N.HPh).CH_2.CH_2.CO_2H$ [65°] White silky needles, v sol alkalis, acids, alcohol, and benzene, sl sol ether

BENZOYL PROPIONIC ALDEHYDE

$C_6H_5.CO.CH_2.CH_2.CHO$ (245°) SG 2 1 005; 12 998 Prepared by the action of water upon the compound of phenyl propyl ketone with $CrOCl_2$ Oil, sol ether and chloroform It readily reduces $AgNO_3$, but does not combine with $NaHSO_4$ Sodium amalgam reduces it to syrupy $C_6H_5.CH(OH).CH_2.CH_2.CO_2H$ (c 200°) (Burcker, *A Ch* [5] 26, 469, *C R* 94, 220)

BENZOYL-PROPIONIC-CARBOXYLIC ACID

v PHENYL ETHYL KETONE DI CARBOXYLIC ACID

BENZOYL-PYROCATECHIN v DI OXY BENZ

OPHENONE

BENZOYL PYRROL v PYRROL

Pseudo-benzoyl-pyrrol v PYRROL PHENYL KETONF

BENZOYL PYRUVIC ACID $C_6H_5O_4$ v e

$C_6H_5.CO.CH_2.CO_2H$ [156°] Obtained by saponification of the ethyl ether Yellowish-white prisms (from hot benzene) Strong acid. Evolves CO_2 at its melting point

Ethyl ether $A'Et$ [43°] Prepared by adding 48 pts of acetophenone to a cooled solution of 92 pts of sodium in 150 pts alcohol, and then 584 pts of oxalic ether The precipitated sodium compound is washed with ether, dried, dissolved in ice water, and decomposed by CO_2 , when the benzoyl pyruvic ether crystallises out, the yield is 78 p c of the theoretical It crystallises from petroleum ether in long prisms V sol all ordinary solvents $FeCl_3$ gives a blood red colouration The aqueous alcoholic solution gives with cupric acetate a light-green pp of $(C_6H_5O_4)_2Cu$; this crystallises from hot benzene or alcohol in long green needles By heating with dilute aqueous NaOH the ether is split up into acetophenone, oxalic acid, and alcohol By boiling its acetic acid solution with phenyl hydrazine it is converted into di-phenyl-pyrazol carboxylic ether $C_6H_5PhN(NPh).CO_2Et$ By cold alcoholic NH_3 it is converted into acetophenone, oxamide, and alcohol (Beyer a Claissen, *B* 20, 2181)

BENZOYL QUINALDINE v METHYL-QUIN-OLYL PHENYL KETONE

BENZOYL-RESORCIN v DI OXY BENZOPHE-

NONE

Di-benzoyl-resorcin v DIOXY PHENYLENE DI-PHENYL DIKETONE

BENZOYL-SUCCINIC ACID *Phenyl ethyl*

ketone di-carboxylic acid Ethyl ether $CO_2Et.CHBz.CH_2.CO_2Et$ (c 265°) at 160 mm. From sodium benzoyl acetic ether and chloroacetic ether (Perkin, jun, *C J* 47, 274)

Properties—Thick colourless oil Its alcoholic solution gives a claret colour with $FeCl_3$. Conc H_2SO_4 forms a yellow solution turned red by heat NaOEt forms a solid sodium compound Boiling baryta water decomposes it

into benzoic and succinic acids Boiling dilute H_2SO_4 forms benzoyl propionic acid

Di benzoyl-succinic acid

CO_2H CHBz CHBz CO_2H Obtained by dissolving the ether in alcoholic KOH and treating with H_2SO_4 (Perkin, jun, *C J* 47, 265) The acid dissolved in alcohol gives a dark green pp with $FeCl_3$ Conc H_2SO_4 forms a yellow solution, turned crimson by heat.

Ethyl ether CO_2Et CHBz CHBz CO_2Et [130°] Formed by adding iodine to a solution of sodium benzoyl acetic ether in dry ether (Perkin, jun, *C J* 47, 262) Crystals (from alcohol), sl sol cold alcohol, v sol ether Conc H_2SO_4 forms a colourless solution turned red, olive green, and finally bluish red by heat Sodium ethylate forms CO_2Et CNaBz CNaBz CO_2Et In the alcoholic solution $FeCl_3$ gives a red colour Boiling dilute sulphuric acid (12) forms an acid probably diphenyl furfuran dicarboxylic acid, $C_{18}H_{12}O_8$, [238°], whence Ac_2O forms an anhydride $C_{18}H_{10}O_8$, [255°] (Baeyer a Perkin, *B* 17, 62)

β Benzoyl-isosuccinic acid v PHENYL ETHYL KETONE α DI CARBOXYLIC ACID

BENZOYL SULPHIDE $(C_6H_5CO)_2S$ [48°] From BzCl and potassium thiobenzoate (Engelhardt, Latschnoff, a Malyscheff, *Z* 1868, 357) Waxy prisms, insol water, v sol ether Ammonia forms benzamide and ammonium thio benzoate Alcoholic KOH forms KOBz and KSBz Alcoholic KSH forms KSBz

Benzoyl disulphide $(C_6H_5CO)_2S_2$ Mol w 274 [128°] Formed from $C_6H_5CO SH$ by atmospheric oxidation of its solution in CS_2 (Cloeze, *A* 115, 27), or by treatment with iodine, $FeCl_3$, or HNO_3 Also, together with Bz_2S , by warming BzCl with PbS and ether (Mosling, *A* 118, 304) When heated above its melting point it turns violet. Prisms or tables (from CS_2), sl sol boiling ether and alcohol. Insol water, NH_4Aq , and KOHAq Alcoholic KOH forms KOBz and KSBz Alcoholic KHS forms KSBz

BENZOYL SULPHOCYANIDE C_6H_5COSCN SG 1.20 From BzCl and $Pb(SCN)_2$ in the cold (Miguel, *A Ch* [5] 11, 300) Pungent liquid Decomposed by boiling water into benzamide and COS On long standing it deposits an isomeride [160°], which is decomposed by water at 200° into NH_3 , benzoic acid, and H_2S

BENZOYL-TARTARIC ACID v TARTARIC ACID

BENZOYL TEREPHTHALIC ACID v BENZO PHENONE DICARBOXYLIC ACID

BENZOYL THIOARSENITE $C_2H_5AsS_2O_5 \cdot e$ As(SBz), [179°] From BzCl and As_2S_3 An ammoniacal solution gives with $HgCl_2$ a pp of $Hg(SBz)_2$ (Rayman, *Bl* [2] 47, 896)

BENZOYL-THIO-CARBAMIC ACID

$C_6H_5NCSO_2$ **Methyl ether** BzNH CO S Me [97°] From benzoyl sulphocyanide and methyl alcohol (Miguel, *A Ch* [5] 11, 330) Slender needles (from dilute alcohol) Sl sol water, v sol alcohol Water in large excess at 100° forms $BzNH_2$, methyl alcohol, H_2S , and CO_2 . Salt— $BzNNa$. $CO SMe$ From the ethereal solution and MeONa

Ethyl ether BzNH CO S Et [74°] From $BzSCN$ and HOEt, or from alcohol, BzCl, and

KSCN (Lössner, *J pr* [2] 10, 286) Long needles, v sl sol water, v sol alcohol Boiling KOHAq forms KOBz, KSCN, alcohol, CO_2 , NH_3 , and H_2S Heated alone it gives benzonitrile, CO, and mercaptan Salt— $BzNK$ CO S Et needles

BENZOYL THIOCYANATE v, BENZOYL SULPHOCYANIDE

BENZOYL-THIO-UREA v THIO UREA

BENZOYL-THYMOL v THYMOL

BENZOYL TOLUENE SULPHAMIDE v TOLUENE SULPHONIC ACID

BENZOYL XYLIDE v XYLIDINE

(a) **BENZ PINACOLINE** $C_{22}H_{20}O \cdot e$.

Tetra phenyl ethylene oxide

Formation—1 Together with the (β) modification by boiling a 5 p c alcoholic solution of benzophenone with zinc and HCl (Thörner a Zincke, *B* 11, 65)—2 Together with benz pinacone by heating an alcoholic solution of benzophenone with zinc and H_2SO_4 (Thörner a Zincke, *B* 11, 1396)—3 By the action of zinc dust on an ethereal solution of acetyl chloride (1 mol) and benzophenone (1 mol) If the acetyl chloride is used in excess the (α) benz pinacoline first formed is converted into the (β) benz pinacoline (Paal, *B* 17, 911)—4 By the oxidation of tetra phenyl ethylene with chromic mixture (Behr, *B* 5, 277)

Properties—Needles Almost insoluble in cold alcohol and in cold acetic acid

Reactions—1 By acetyl chloride, HCl or H_2SO_4 it is converted into the (β) modification 2 By heating with soda lime it gives a hydrocarbon [244°] which is possibly tetraphenyl-ethylene—3 By CrO_3 and acetic acid it is oxidised to benzophenone

(β) **Benz pinacoline** $(C_6H_5)_2C CO C_6H_5$, [179°] (T a Z), [182°] (Zagumenny)

Formation—By boiling a concentrated solution of benzophenone in alcohol with zinc and HCl for 20 hours (Thörner a Zincke, *B* 10, 1473, 11, 65)—2 From benzpinacone and $AcCl$ or BzCl (Linnemann, *A* 133, 28)—3 From benzpinacone and dilute H_2SO_4 or HCl at 200° It is even slowly formed by repeatedly recrystallising benzpinacone from hot alcohol (Z)—4 From (α) benzpinacoline by heating with $AcCl$, HCl, or H_2SO_4

Preparation—HClAq is added to a saturated solution of benzpinacone in HOAc until a turbidity appears The mixture is boiled 45 minutes, with gradual addition of HClAq (Zagumenny, *Bl* [2] 84, 329, 35, 560)

Properties—Slender needles, ν sl sol cold, m. sol hot, alcohol

Reactions—1 Gives on oxidation benzoic acid and tri phenyl carbinol—2 Heating with alcoholic KOH produces tri-phenyl methane and benzoic acid (Zagumenny, *Bl* [2] 34, 330)
3 Reduced by HI to *s* tetra phenyl ethane (?)

BENZPINACONE $C_{12}H_{10}O_2$ ν e
 $Ph_2C(OH)C(OH)Ph_2$ Tetra phenyl ethylene glycol [168°] S (Sene) 38 at 80°, S (HOAc) 87 at 118°, S (95 p c alcohol) 25 at 80°

Formation—From benzophenone by reducing the alcoholic solution with Zn and H_2SO_4 (Linnemann, *A* 133, 26) or a solution in acetic acid (10 pts) diluted with water (2 pts) with zinc (Zagumenny, *J R* 12, 426)

Properties—Minute prisms, sl sol boiling alcohol, ν sol ether On fusion it splits up into benzhydrol and benzophenone (Thorner & Zincke, *B* 10, 1473)

Reactions—1 Chromic acid oxidises it to benzophenone—2 Sodium amalgam reduces it to di phenyl carbinol—3 Readily converted into (a) or (B) benzpinacolone by dehydration, this is effected by $BzCl$, $AcCl$, dilute acids, or even by recrystallisation from alcohol (Za) —4 Ac_2O gives benzhydrol and benzophenone—5 HI and P at 170° give tetra phenyl ethane (Graebe, *B* 8, 1054)

BENZ URAMIDOXIM $C_6H_5N_3$ ν e
 $C_6H_5C(NO_2)(NHCO_2NH_2)$ [115°] Formed by the action of potassium cyanate upon benz amidoim hydrochloride in conc aqueous solution (Falk, *B* 19, 1486) Long thin white needles ν sol alcohol, ether, benzene, and ligroin, sl sol water

BENZ URANILIDOXIM $C_{11}H_{11}N_3O_2$ ν e
 $C_6H_5C(NO_2)NPhCO_2NH_2$ (?) Benz phenyl uramidoxim [167°] Formed by the action of potassium cyanate upon benzanilidoxim hydrochloride in concentrated aqueous solution (Muller, *B* 19, 1671) Yellowish needles Sol alcohol, ether, benzene, and chloroform, insol water

BENZYL The radicle phenyl methyl, $C_6H_5CH_2$. It is isomeric with methyl phenyl or tolyl $CH_3C_6H_5$.

DIBENZYL ν *s* DI PHENYL ETHANE

BENZYL ACETAMIDE ν Acetyl BENZYLAMINE

BENZYL ACETATE $C_6H_5CH_2OCOCH_3$ (206°) S G 1.057 From benzyl alcohol (2 vols), acetic acid (4 vols) and H_2SO_4 (1 vol), or by boiling benzyl chloride with alcoholic KOAc (Cannizzaro, *A* 88, 130) Formed also by boiling a mixture of benzoic aldehyde and glacial acetic acid with zinc dust (Tiemann, *B* 19, 355) Oil, smelling of pears Sodium acting upon benzyl acetate does not form benzyl aceto acetate but the chief product is benzyl β -phenyl propionate $4CH_3CO_2C_6H_5 + Na_2 = 2CH_3CO_2Na + 2C_6H_5CH_2CO_2CH_3 + H_2$, and by a secondary reaction, sodic phenyl propionate, sodic phenyl acrylate, and toluene

$2C_6H_5CH_2CO_2CH_3 + Na_2 = C_6H_5CH_2CO_2Na + C_6H_5CH_2CH_2CO_2Na + 2C_6H_5CH_3$ (Conrad & Hodgkinson, *A* 193, 300)

BENZYL ACETIC ACID ν β PHENYL PROPIONIC ACID.

Di-benzyl-acetic acid $C_{16}H_{16}O_4$ ν e.
 $(C_6H_5CH_2)_2CHCO_2H$ Di-phenyl isobutyric acid [85°] Obtained by saponifying the ether, by heating di benzyl malonic ether with alcoholic KOH (Lellmann & Schleich, *B* 20, 439), or by heating di benzyl malonic acid (Bischoff & Siebert, *A* 239, 101)

Properties—Prisms (from ligroin), sl sol cold water, ν sol alcohol Heated with soda-lime it gives di benzyl methane

Salts— AgA' trimetric prisms, sol boiling water (Michael & Palmer, *Am* 7, 70)— BaA' — CaA' aq

Ethyl ether EtA' (above 300°) Formed, together with β phenyl propionic ether by heating acetic ether with benzyl chloride and sodium (Lydia Sesemann, *B* 6, 1086, Merz & Weith, *B* 10, 759)

BENZYL ACETO-ACETIC ETHER ν p 24

BENZYL-ACETONE $C_{11}H_{12}O$ ν e
 $C_6H_5CH_2CH_2COCH_3$ Methyl phenylethyl ketone (236°) S G 0.989

Formation—1 By the dry distillation of a mixture of calcium hydrocinnamate and calcium acetate, the yield is 33 p c (Jackson, *B* 14, 890)
2 From benzyl aceto acetic ether by boiling with alcoholic KOH (Ehrlich, *A* 187, 15)

Properties—Oil Combines with $NaHSO_4$, forming $C_{10}H_{12}ONaHSO_4$ aq Oxidised by CrO_3 to acetic and benzoic acids

BENZYL-ACETONE γ -CARBOXYLIC ACID

ACETYL PHENYL PROPIONIC ACID
Benzyl-acetone α carboxylic-acid $C_{11}H_{12}O_4$ ν e
 $CO_2HCH_2CH_2COCH_3$ [114°] Obtained by boiling α carboxy benzyl aceto acetic ether with baryta-water (Bulow, *A* 236, 192) Slender needles (from water)

BENZYL-ACETOXIM ν ACETOXIM, p 38

BENZYL ACETYL SUCCINIC ETHER ν .
ACETYL BENZYL SUCCINIC ETHER, p 39

ν **BENZYL-DI ACETYL PYRROL** ν BENZYL-PYRROLENE DI METHYL KETONE

BENZYL ALCOHOL $C_6H_5CH_2OH$
Mol ν 108 (206.5°) S G 1.0429 (Bruhl)
S 4 at 17° μ_D 1.5518 R_{20} 53.16 H F 38.733 (Stohmann, *J pr* [2] 36, 4)

Occurrence—Balsam of Peru contains benzyl benzoate, benzyl cinnamate and small quantities of benzyl alcohol (Kraut, *A* 152, 129) Liquid storax contains benzylcinnamate (Laubenheimer, *A* 164, 289) Balsam of tolu contains benzyl cinnamate and some benzyl benzoate (Busse, *B* 9, 830) In small quantity, together with benzoic aldehyde, prussic acid, and a resin in the volatile oil of cherry laurel (Tilden, *Ph* [3] 5, 761)

Formation—1 Together with KOBz by the action of alcoholic KOH on benzoic aldehyde (Cannizzaro, *A* 88, 129)—2 From benzyl chloride by converting it into benzyl acetate by alcoholic KOAc, and boiling the product with alcoholic KOH (Cannizzaro, *A* 96, 246)—3 From benzyl chloride by heating with an aqueous solution of K_2CO_3 (Meunier, *Bl* [2] 38, 159), with water (10 pts) and freshly ppd $Pb(OH)_2$ (3 pts) (Lauth & Grimaux, *A* 143, 81), or merely with water (30 pts) (Niederst, *A* 196, 353)—4 From balsam of Peru by boiling with aqueous KOH (Kachler, *J pr* 107, 307)—5 By the action of sodium amalgam upon

benzoic aldehyde (Friedel, *J* 1862, 263), benzoic acid, hippuric acid (Hermann, *A* 132, 76, 138, 385), benzyl chloride in presence of HCl (Lippmann, *Bl* [2] 4, 249), or benzamide (Guareschi, *G* 4, 465)

Preparation—10 pts of benzaldehyde are shaken in a stoppered cylinder with a solution of 9 pts of KOH in 6 pts of water, and left to stand over-night. Sufficient water is then added to dissolve the potassium benzoate which has separated, and the solution is extracted with ether, after evaporating the ether the residue is distilled, the yield is 92 p.c. of the theoretical. Benzyl alcohol cannot be dried with CaCl_2 as it combines with it (Meyer, *B* 14, 2394)

Properties—Liquid with little odour, sl sol water, sl alcohol and ether

Reactions—1 Oxidised by dilute HNO_3 or air and platinum black to benzoic aldehyde, and by CrO_3 to benzoic acid—2 HI and P at 140° reduce it to toluene (Graebe, *B* 8, 1054)—3 Alcoholic KOH forms toluene and benzoic acid (Cannizzaro, *A* 90, 253)—4 Conc H_2SO_4 , P_2O_5 , and ZnCl_2 form a resin (Cannizzaro, *A* 92, 118)—5 B_2O_3 at 110° forms di benzyl oxide ($\text{C}_6\text{H}_5\text{CH}_2$)₂O—6 Solid cyanogen chloride forms benzylcarbamate and di benzyl urea (Cannizzaro, *G* 1, 33, *B* 3, 617)—7 Urea *nitrate* at 120° forms di benzyl urea and benzoic aldehyde, at 140° it forms benzyl carbamate (Campisi a. Amato, *G* 1, 39)—8 BCl_3 forms *s* di phenyl ethane and benzyl chloride (Counciller, *B* 10, 1655)

Methyl ether $\text{C}_6\text{H}_5\text{CH}_2\text{OMe}$ (168°) From benzyl chloride, KOH, and MeOH (Sintenis, *A* 161, 834) Also from benzyl sulphide, methyl alcohol, and MeI (Cahours, *A Ch* [5] 10, 23)

Ethyl ether $\text{C}_6\text{H}_5\text{CH}_2\text{OEt}$ (185°) Gives anthracene when heated with P_2O_5 . Chlorine in the cold forms HCl, ethyl chloride, and $\text{C}_6\text{H}_5\text{CHO}$, at a higher temperature it gives EtCl and benzyl chloride. Chlorine in the cold in presence of I forms chloro benzoic aldehydes and EtI (Sintenis, *A* 161, 331) Br forms in the cold HBr, EtBr, benzyl bromide, benzoic aldehyde, and BzBr (Paternò, *B* 5, 288)

Isobutyl ether $\text{C}_6\text{H}_5\text{CH}_2\text{OC}_4\text{H}_9$ (c 210°) (Claus a. Trainer, *B* 19, 3006)

Phenyl ether PhOCH_2Ph [39°] (287°) From phenol potassium, benzyl chloride and a little alcohol at 100° with inverted condenser for 3 hours (Staedel, *A* 217, 44, Lauth a. Grimaux, *A* 143, 81, Sintenis, *A* 161, 337) Glittering white plates which feel greasy (from alcohol) Conc HCl at 100° splits it up into phenol and benzyl chloride. Chlorine in presence of HgO forms the chloro phenyl ether, $\text{C}_6\text{H}_5\text{CH}_2\text{OC}_6\text{H}_4\text{Cl}$ [71°], bromine forms similarly $\text{C}_6\text{H}_5\text{CH}_2\text{OC}_6\text{H}_4\text{Br}$ [60°]

***o*-Tolyl ether** $\text{C}_6\text{H}_4(\text{CH}_3)\text{OC}_6\text{H}_5$ [1 2] **Benzyl *o*-cresyl oxide** (285° – 290°) (Staedel, *B* 14, 899)

***m*-Tolyl ether** $\text{C}_6\text{H}_4(\text{CH}_3)\text{OC}_6\text{H}_5$ [1 3] [43°] (300° – 305°) Satiny tablets

***p*-Tolyl ether** $\text{C}_6\text{H}_4(\text{CH}_3)\text{OC}_6\text{H}_5$ [1 4] [41°] From potassium *p* cresol, a little alcohol, and benzyl chloride (Staedel, *A* 217, 44) The yield is 86 p.c. White silky scales or transparent six sided columns (from alcohol) Feels greasy

(a) **Naphthyl ether** An oil, decomposed by distillation.

(*B*) **Naphthyl ether** $\text{C}_{10}\text{H}_7\text{OCH}_2\text{Ph}$ [99°] From (*B*) naphthol (70 g), KOH (27 g), a little water and alcohol, and benzyl chloride (70 g) White plates (from alcohol) No smell Not volatile with steam (Staedel, *A* 217, 47)

Other benzyl ethers are described under the hydroxylated compounds from which they are derived

BENZYL *o* AMIDO ACETOPHENONE

$\text{C}_6\text{H}_5(\text{NH}\text{C}_6\text{H}_5)\text{COCH}_3$ [81°] Formed by heating *o* amido acetophenone with benzyl chloride (Baeyer, *B* 17, 971) Large prisms V sol alcohol, ether, benzene, chloroform and CS_2 , sl. sol ligroin Weak base

Nitrosamine $\text{C}_6\text{H}_5(\text{N}(\text{C}_6\text{H}_5)\text{NO})\text{COCH}_3$ [55°], long colourless needles By heating with H_2SO_4 it gives a mixture of indigo and benzyl indigo

BENZYL *o* AMIDO BENZOIC ACID

$\text{C}_6\text{H}_5\text{NH}\text{C}_6\text{H}_4\text{CO}_2\text{H}$ [176° uncor] Formed to gether with its formyl derivative by oxidation of benzyl quinoline with alkaline KMnO_4 . Long needles or thick prisms

Salts $\text{C}_6\text{H}_5\text{NO}_2\text{HCl}$ [105° uncor], large tables—($\text{C}_6\text{H}_5\text{NO}_2$)₂ $\text{CH}_2\text{Cl}_2\text{PtCl}_4$ [158° uncor], orange yellow tables

Formyl derivative $\text{C}_6\text{H}_5\text{N}(\text{CHO})\text{C}_6\text{H}_5\text{CO}_2\text{H}$ [196°], large colourless tables (Claus a. Glyekherr, *B* 16, 1283)

BENZYL AMIDO TRI PHENYL METHANE

$\text{Ph}_3\text{CNHCH}_2\text{Ph}$ [110°] The hydrochloride H^+Cl^- [249°] is formed by the action of benzyl chloride on ω amido tri phenyl methane (Elbs, *B* 17, 703)

Di benzyl amido di phenyl methane

$\text{PhCH}_2\text{C}_6\text{H}_4\text{N}(\text{CH}_2\text{Ph})_2$ From aniline hydrochloride and benzyl chloride at 120° Also from acetanilide and benzyl chloride at 120° White amorphous powder (Meldola, *C J* 41, 200) Soluble in benzene Solutions have a blue fluorescence

BENZYLAMINE $\text{C}_6\text{H}_5\text{NH}_2$ \pm $\text{C}_6\text{H}_5\text{CH}_2\text{NH}_2$

Mol w 107 (184°) SG 1.399

Formation—1 Together with di and tri benzylamine by heating benzyl chloride with alcoholic NH_3 (Cannizzaro, *A* 134, 128, Lippmann, *A* 144, 304)—2 Together with di and tri benzylamine by the action of Zn and HCl upon benzonitrile (Mendius, *A* 121, 144, Spica, *G* 10, 515)—3 By reducing thiobenzamide $\text{C}_6\text{H}_5\text{CSNH}_2$ with Zn and HCl (Hofmann, *B* 1, 102)—4 From benzyl cyanate and KOH (Strakosch, *B* 5, 692)—5 By saponification of its acetyl derivative, obtained by the action of acetamide on benzyl chloride (Rudolph, *B* 12, 1297)—6 By the action of bromine in alkaline solution on phenyl acetamide $\text{C}_6\text{H}_5\text{CH}_2\text{CONH}_2$ the yield is 60 p.c. of the theoretical quantity (Hofmann, *B* 18, 2738, Hoogewerff a. Van Dorp, *R T C* 5, 252)—7 Together with toluene, by energetic reduction of hydrobenzamide dissolved in absolute alcohol by means of sodium or sodium amalgam, very good yield (O Fischer, *B* 19, 748)—8 By reduction of an alcoholic solution of benzaldehyde phenyl hydrazide by means of sodium amalgam and acetic acid (Tafel, *B* 19, 1928)—9 By reduction of benzaldoxim (5 pts), dissolved in alcohol (15 pts), at 50° – 60° with sodium amalgam (160 pts of $\frac{1}{2}$ p.c. Na), keeping acid by gradual addition of acetic acid good yield (Goldschmidt,

B 19, 3232—10 In considerable quantity by heating benzaldehyde with glycoooll (Curtius a Lederer, *B 19, 2462*)—11 Together with di- and tri benzyl-amine, as a by product, in the preparation of di benzyl hydroxylamine from hydroxylamine hydrochloride, benzyl chloride and NaOH (Walder, *B 19, 3293*)

Properties—Liquid, miscible with water, alcohol, and ether. Separated from water by KOH. Strongly alkaline, absorbs CO_2 , forming a crystalline carbonate, and fumes with HCl. With cyanogen it forms a compound $(\text{C}_6\text{H}_5\text{N})_2(\text{CN})_2$, [140°] which crystallises from alcohol, and forms a hydrochloride $(\text{C}_6\text{H}_5\text{N})_2(\text{CN})_2 \cdot 2\text{HCl}$ (Strakosch, *B 5, 693*)

Salts— B^+HCl^- large leaflets or flat tables— B^+HBr^- $\text{B}^+\text{H}_2\text{PtCl}_6^-$ orange tables or yellow plates, sl sol water— $\text{B}^+\text{H}_2\text{SO}_4^-$

Acetyl derivative $\text{C}_6\text{H}_5\text{CH}_2\text{NHAc}$ [61°] (800°), crystalline solid, sol water (Amsel a Hofmann, *B 19, 1285*, Strakosch, *B 5, 697*, Rudolph, *B 12, 1297*)

Di-benzylamine $\text{C}_{12}\text{H}_{15}\text{N}$ *see* $\text{NH}(\text{CH}_2\text{C}_6\text{H}_5)_2$, *SG 14 1033*

Formation—1 By the action of NH_3 on $\text{C}_6\text{H}_5\text{CH}_2\text{Cl}$ or by reduction of benzonitrile (*supra*)—2 By the action of bromine water in tribenzylamine (Lumprecht, *A 144, 313*)—3 By boiling benzoic aldehyde with ammonium for mate (Leuckart a Bach, *B 19, 2128*)—4 Occurs together with mono- and tri benzyl amine as a by product in the preparation of di benzyl hydroxylamine from hydroxylamine hydrochloride, benzyl chloride, and NaOH—5 Formed by the action of PCl_5 upon di benzyl hydroxylamine and treatment with water, the reaction probably being
 $(\text{C}_6\text{H}_5)_2\text{N OH} + \text{PCl}_5 = (\text{C}_6\text{H}_5)_2\text{N O PCl}_2 + \text{HCl}$ and
 $(\text{C}_6\text{H}_5)_2\text{N O PCl}_2 + 3\text{H}_2\text{O} =$
 $(\text{C}_6\text{H}_5)_3\text{N} + \text{H}_3\text{PO}_4 + 2\text{HCl}$ (Walder, *B 19, 3287*)

Properties—Liquid, insol water, v sol alcohol and ether. Does not absorb CO_2 from the air. On distillation it decomposes into *s* di phenyl ethane, *s* di phenyl ethylene, lophine, and various bases (Brunner, *A 151, 133*)

Salts— B^+HNO_3^- , [186°], very sparingly soluble thin glistening needles— B^+HCl^- [256°]— B^+HBr^- [276°]— B^+HI^- [224°]— $\text{B}^+\text{H}_2\text{PtCl}_6^-$ golden yellow needles

Nitrosamine $(\text{C}_6\text{H}_5\text{CH}_2)_2\text{N NO}$ [61°], white crystals v sol alcohol and ether, insol water (*W*, *cf* Rohde, *A 151, 364*)

Picryl derivative $(\text{C}_6\text{H}_5\text{CH}_2)_2\text{N OC}_6\text{H}_2(\text{NO}_2)_3$ [171°], orange plates

Formyl derivative $(\text{C}_6\text{H}_5\text{CH}_2)_2\text{N CHO}$ [52°], (above 360°) (Leuckart a Bach, *B 19, 2128*)

Di sulphonic acid $\text{C}_{12}\text{H}_{15}(\text{SO}_3\text{H})_2$ (Lumprecht, *A 144, 317*)— BaA^+

Tri-benzylamine $\text{C}_{21}\text{H}_{27}\text{N}$ *see* $(\text{C}_6\text{H}_5\text{CH}_2)_3\text{N}$ [91°]

Formation—1 From benzyl chloride and NH_3 (*supra*)—2 By heating di benzylamine with benzyl chloride at 100° (Walder, *B 19, 3287*)—3 Together with mono and di benzyl amine as a by product in the preparation of di-benzyl hydroxylamine from hydroxylamine hydrochloride, benzyl chloride, and NaOH (*W*)—4 By heating benzaldehyde with rather more than an equal weight of ammonium formate, the yield is 40 p.c. of the benzaldehyde em-

ployed (Leuckart, *B 18, 2341*) White plates (from hot alcohol), v sl sol water. When heated for a long time with MeI or EtI at 150°, benzyl iodide and tetra methyl- (or ethyl) ammonium iodide are formed (Marquardt, *B 19, 1027*) Fuming sulphuric acid forms $\text{C}_{12}\text{H}_{15}(\text{SO}_3\text{H})_2\text{N}$ (Lumprecht, *A 144, 311*)

Salts— B^+HCl^- [228°], thick prisms or iridescent plates, v sol hot alcohol, insol water— $\text{B}^+\text{H}_2\text{Cl}_2\text{PtCl}_6^-$ orange-yellow needles— B^+HNO_3^- [125°], insol water— B^+HBr^- [208°]— B^+HBr^- — B^+HI^- [178°]— $\text{B}^+\text{HAl}(\text{SO}_3)_2^-$ [110°], sol water

Methylo-iodide B^+MeI^- [184°], needles or plates, sol hot alcohol, sl sol cold water

Methylo hydrate $\text{B}^+\text{Me}(\text{OH})^-$ crystalline solid, alkaline reaction, v sol water. On heating it evolves MeOH forming tri benzylamine

Methylo-chloride-platinum-salt $(\text{B}^+\text{MeCl})_2\text{PtCl}_6^-$ [197°], orange pp, insol cold water and alcohol

Ethylo iodide B^+EtI^- [190°], colourless rhombic crystals, sol alcohol and hot water

Isopropyllo-iodide B^+PrI^- [170°], needles, sl sol hot water

BENZYLAMINE-*oxy*-DI-SULPHONIC ACID

$\text{C}_6\text{H}_5\text{CH}(\text{SO}_3\text{H})\text{NH}(\text{SO}_3\text{H})$ The di sodium salt $\text{A}^+\text{Na}_2\text{Saq}$ is formed by shaking benzaldoxim with a 30 p.c sodium bisulphite solution. It crystallises in small white needles, v e sol water, insol cold alcohol. By warming with dilute acids it is split up into benzaldehyde, sodium sulphate, and ammonium sulphate
 $\text{C}_6\text{H}_5\text{CH}(\text{SO}_3\text{Na})\text{NH}(\text{SO}_3\text{Na}) + 2\text{H}_2\text{O} =$
 $\text{C}_6\text{H}_5\text{CHO} + \text{Na}_2\text{SO}_4 + (\text{NH}_4)_2\text{HSO}_4$

Alkalis decompose it in the cold, and water on boiling (Pechmann, *B 20, 2539*)

BENZYL-ANILINE $\text{C}_6\text{H}_5\text{NH}(\text{C}_6\text{H}_5)$ [33° uncor] (above 360°) Obtained by reducing thiobenzoyl aniline (Bernthsen a Trompeter, *B 11, 1760*) Formed also by boiling diazobenzene benzyl anilide (50 g) with HCl (200 c.c), the yield is 20 g (Friswell a Green, *B 19, 2036*) Yellowish crystals

Salts— B^+HCl^- [203° uncor], white plates, decomposed by water— $\text{B}^+\text{H}_2\text{Cl}_2\text{PtCl}_6^-$ [168° uncor], slender yellow needles, tolerably easily soluble in water— $\text{B}^+\text{C}_6\text{H}_5\text{O}_4^-$ — $\text{B}^+\text{CdCl}_6^-$

Benzoyl derivative [104°] (Fleischer, *A 188, 229*)

Di benzyl aniline $\text{C}_6\text{H}_5\text{N}(\text{CH}_2\text{C}_6\text{H}_5)_2$ [67°] (above 300°) Prepared by heating a mixture of aniline (54 pts), benzyl chloride (150 pts) and NaOH (30 pts) on the water-bath for three or four weeks. After cooling the solidified cake is pressed, distilled with steam to remove excess of benzyl chloride, washed with hot water, and crystallised from alcohol. Colourless needles. V sol ether, benzene, hot alcohol and hot acetic acid, sl sol cold alcohol and cold acetic acid, nearly insol water. Weak base
Salts— $\text{B}^+\text{HCl}_2\text{aq}$ glistening prisms— $\text{B}^+\text{H}_2\text{Cl}_2\text{PtCl}_6^-$ thin orange-yellow scales. Picrate $\text{B}^+\text{C}_6\text{H}_5(\text{NO}_2)_3\text{OH}^-$ [132], long yellow needles (Matzudaira, *B 20, 1611*)

TRI-BENZYL-ARSENINE *see* p 322

BENZYL-BARBITURIC ACID v BARBITURIC ACID

BENZYL-BENZENE v DI-PHENYL-METHANE.
p-Di-benzyl benzene $\text{C}_{18}\text{H}_{16}$ *see*
 $(\text{C}_6\text{H}_5\text{CH}_2)_2\text{C}_6\text{H}_4$ [86°] Formed, together with

the *o* isomeride and di phenyl methane, by the action of zinc on a mixture of benzyl chloride and benzene, or by the action of H_2SO_4 on a mixture of benzene and methylal, $CH_3(OMe)_2$, (Zincke, *B* 6, 119, 221, 9, 81) Transparent; laminae, sl sol ether, v sol benzene and hot alcohol CrO_3 forms *a* dibenzoyl benzene and *p* benzoyl benzoic acid

o Di benzyl benzene $C_6H_5CH_2C_6H_5$ [78°] Silky needles (from alcohol), v sol ether and alcohol CrO_3 forms *o* di benzoyl benzene and *o* benzoyl benzoic acid

BENZYL BENZOATE $C_6H_5H_2O_2$ *te*
 $C_6H_5CH_2OCO C_6H_5$ (324° i V) [21°] SG (fluid, at 19°) 1.1224 From benzyl alcohol and $BzCl$ (Kraut, *A* 152, 130) Formed also by several days' heating of benzaldehyde at 100° with a small quantity of sodium benzyolate, probably the compound $C_6H_5C(OC_6H_5)_2ONa$ is first formed and then decomposes into benzyl benzoate and sodium benzyolate, which latter again reacts upon a further quantity of benzaldehyde, producing more of the intermediate product, and so on Large colourless crystals (Claisen, *B* 20, 646)

o **BENZYL BENZOIC ACID** $C_6H_5H_2O_2$ *te*
 $C_6H_5CH_2C_6H_4CO_2H$ Mol w 212 [114°] From *o* benzoyl benzoic acid and sodium amalgam (Rotering, *J* 1875, 598, *B* 9, 633) Slender needles, may be sublimed, sl sol cold water, v sol alcohol and ether — $CaA', 2aq - CaA', 3\frac{1}{2}aq - BaA', 5aq - AgA' - MeA'$

m-Benzyl-benzoic acid
Ph CH₂ C₆H₄ CO₂H [108°]

Formation—1 From *exo oxy* benzoic acid, $PhCH(OH)C_6H_4CO_2H$ and conc HI at 170°—2 From *exo bromo m* toluic acid, $CH_2BrC_6H_4CO_2H$, benzene and $AlCl_3$ (Senff, *A* 220, 247) Yield 50 p c of theoretical from toluic acid—3 A small quantity from benzoic ether, benzyl chloride, and $ZnCl_2$ by boiling

Properties—Short slender needles (from hot water), small plates (from hot dilute alcohol), sl sol cold water, m sol hot water, v e sol alcohol, ether or chloroform Conc H_2SO_4 forms a colourless solution $K_2Cr_2O_7$ and H_2SO_4 give *m*-benzoyl-benzoic acid. — $CaA', aq - BaA', 4aq - AgA'$

p Benzyl-benzoic acid
Ph CH₂ C₆H₄ CO₂H [14] [155°]

Formation—1 By oxidising *p* benzyl toluene with dilute H_2SO_4 (Zincke, *A* 161, 106)—2 By reducing *exo oxy p* benzyl benzoic acid with HI 8 From *p* benzoyl benzoic acid and sodium-amalgam or HI and P (Graebe, *B* 8, 1054)

Properties—Minute needles (from water), may be sublimed, sl sol cold water, v sol alcohol and ether Chromic mixture oxidises it to *p*-benzoyl benzoic acid — $CaA', HA' - BaA', 2aq - AgA'$

BENZYL BROMIDE $C_6H_5CH_2Br$ (199°)
SG $\frac{3}{4}$ 1.4380

Formation—1 From benzyl alcohol and HBr (Kekulé, *A* 137, 190)—2 From Br and boiling toluene (Beilstein, *A* 143, 869, Jackson *a* Field, *Am* 2, 11)—3 From benzyl chloride and $AsBr_3$ (Brix, *A* 225, 163)

Preparation—By the action of bromine (1 mol) upon cold toluene (1 mol) in direct sunshine, the yield is quantitative (Schramm, *B* 18, 608).

Properties—Pungent liquid. The zinc copper couple acts vigorously upon it, producing two isomeric benzylenes In presence of ether, the zinc copper couple produces dibenzyl, $ZnBr_2$, and C_6H_5ZnBr , whence water produces toluene. $2C_6H_5ZnBr + 2H_2O = 2C_6H_5 + ZnBr_2 + Zn(OH)_2$ In presence of alcohol, the couple produces toluene and $EtOZnBr$ In presence of water, the couple produces dibenzyl and a little toluene (Gladstone *a* Tribe, *C* J 47, 448)

BENZYL BUTYRATE $C_{11}H_{14}O_2$ *te*
 $C_6H_5CH_2OCO Pr$ (240°) SG $\frac{10}{175}$ 1.016 (Conrad *a* Hodgkinson, *A* 193, 320)

Benzyl isobutyrate $Me_2CHCO_2CH_2Ph$ (228° i V) SG $\frac{11}{175}$ 1.016 Prepared by boiling an alcoholic solution of benzyl chloride and potassium isobutyrate for five days with inverted condenser The product is mixed with water and the oil distilled

Properties—Oil, with pleasant odour

Reactions—When benzyl isobutyrate (90 g) is heated with sodium (8 g) a violent action occurs, the products being hydrogen sodio isobutyrate, benzylic benzyl isobutyrate (*q* v), sodio benzoate toluene, and an oil ($C_{11}H_{14}O_2$)_s (340°–350°) The principal reaction is
 $4Me_2CHCO_2CH_2Ph + Na =$

$2Me_2C(CH_2Ph)CO_2CH_2H + 2Me_2CHCO_2Na + H_2$
(W R Hodgkinson, *C* J 33, 496)

a **BENZYL ISOBUTYRIC ACID** $C_{11}H_{14}O_2$ *te*
 $Me_2C(CH_2Ph)CO_2H$

Benzyl ether $(C_6H_5)A'$ (280°–285°) SG $\frac{18}{175}$ 1.0285 Prepared by the action of sodium on benzyl isobutyrate (*q* v)

Reactions—1 Heated with sodium a violent action occurs, toluene, sodio benzoate, sodio benzyl isobutyrate and an oil, $C_{11}H_{14}O$ (350°–355°) being formed—2 It is attacked by alkalis with great difficulty, the saponification gives isobutyric not benzyl isobutyric acid (W R Hodgkinson, *C* J 33, 503, *A* 201, 171)

BENZYL CARBAMATE $NHCOOC_6H_5$ [86°] From benzyl alcohol and urea nitrate at 140° (Campisi *a* Amato, *B* 4, 412) or solid cyanogen chloride (Cannizzaro, *B* 3, 518) Large plates (from water), sl sol hot water, v sol alcohol Decomposes above 200° into benzyl alcohol and cyanuric acid

BENZYL-CARBAMIC ACID $C_6H_5NHCOOH$
Benzyl ammonium salt

$C_6H_5NHCO.NH_2C_6H_5$ [99°] From benzylamine and CO_2 Formed also by heating *a* amido-phenyl acetic acid at 260°, the yield being nearly the theoretical (Tiemann *a* Friedlander, *B* 14, 1969) Plates, sol water and alcohol, insol ether, volatile with steam Decomposed by acids or alkalis into CO_2 and benzylamine

BENZYL DI CARBOXY GLUTACONIC ACID
v DI CARBOXY GLUTACONIC ACID

DIBENZYL-CARBOXYLIC ACID *v* DI-PHENYL ETHANE-CARBOXYLIC ACID

DIBENZYL DI CARBOXYLIC ACID *v* DI-PHENYL SUCCINIC ACID and DI-PHENYL ETHANE DI CARBOXYLIC ACID

BENZYL CARBINOL *v* PHENYL ETHYL ALCOHOL

BENZYL CHLORIDE C_6H_5Cl *te* $C_6H_5CH_2Cl$
Mol w 126.5 *a* Chloro toluene (178°) at 754 mm SG $\frac{175}{175}$ 0.9458 SV 133.45 (Schiff, *B* 19, 563, *A* 220, 98), 133.18 (Ramsay)

Formation—1 From benzyl alcohol and HCl (Cannizzaro, *A* 88, 129, 96, 246, Deville, *A Ch* [3] 8, 178)—2 By distilling toluene in a current of chlorine (Lauth & Grimaux, *Bl* 1867, 1 105)

Preparation—By passing chlorine (1 mol) into cold toluene (1 mol) exposed to direct sunshine, the yield is nearly theoretical (Schramm, *B* 18, 608)

Properties—Oil, sol alcohol and ether

Reactions—1 Boiling alcoholic KOH forms C_6H_5OEt —2 Alcoholic KOAc forms C_6H_5OAc —3 Alcoholic KCN forms C_6H_5CN —4 Alcoholic NH_3 forms, on heating, mono, di, and tri benzylamine—5 Hot dilute HNO_3 (or a nitrate) forms benzoic aldehyde—6 Boiling $Pb(OH)_2$ forms benzyl alcohol—7 KOH forms phenyl benzyl oxide—8 Water at 180 gives a product which, on distillation, yields benzyl toluene and anthracene. Before distillation the product is perhaps $C_6H_5CH_2C_6H_5CHCl$ (Van Dorp, *B* 5, 1070, Zincke, *B* 7, 276)—9 Long boiling with water (30 vols) produces benzyl alcohol—10 Sodium amalgam produces a little *s* di phenyl ethylene—11 Aromatic hydrocarbons in presence of powdered zinc give off HCl and form condensation products (Zincke, *B* 6, 137)—12 Chloroformic ether and sodium form di phenyl ethane exo carboxylic ether, $PhCH_2CHPhCO_2Et$ (Wurtz, *C R* 70, 350)—13 Heated with $AlCl_3$ it gives off HCl, forming toluene and anthracene (Perkin, jun & Hodgkinson, *C J* 37, 726)—14 In carbon disulphide solution yields, when chloral chloride is added gradually, a brown precipitate of composition $PhCH_2Cl, CrO_2Cl_2$, slowly converted by moist air into benzoic aldehyde,

The compound heated to 170° loses HCl, forming a compound $PhCHClCrO_2Cl$, which also yields benzoic aldehyde

(*E*tard, *A Ch* [5] 22, 235)—15 HI reduces it to toluene—16 Zinc dust gives toluene, phenyl tolyl methane, and anthracene (Frost, *Bl* [2] 46, 249)

BENZYL CHLORO MALONIC ACID *v* CHLORO BENZYL MALONIC ACID

BENZYL CINCHONINE *v* CINCHONINE

α BENZYL CINNAMIC ACID $C_{15}H_{11}O_2$ *v* $C_6H_5CH_2CH(C_6H_5)CO_2H$ [157°] Formed by the action of alkalis on the compound $PhSO_2C(CH_2Ph)_2CO_2Et$ (Michael & Palmer, *Am* 7, 70) Large white needles, insol water, sol alcohol

p BENZYL CRESOL $C_6H_5CH_2C_6H_4MeOH$ (240°) at 40 mm From benzyl chloride, cresol, and zinc (Mazzara, *G* 8, 303, 11, 438, 12, 264)

Reactions—1 Chloro-acetic acid and KOH form $C_6H_5CH_2C_6H_4MeOCH_2CO_2H$ [111°]—2 (α) chloropropionic acid forms $C_6H_5CH_2C_6H_4MeOCHMeCO_2H$ [115°]—3 CO_2 and Na forms $C_6H_5CH_2C_6H_4(OH)CO_2Na$

Acetyl derivative $C_{15}H_{11}AcO$ (245°) at 40 mm

BENZYL CRESYL OXIDE

$C_6H_5CH_2OC_6H_4CH_3$ *v* Toly ether of BENZYL ALCOHOL

BENZYL CYANAMIDE $C_6H_5N_2$ *v* $C_6H_5CH_2NH_2CN$ [38°]

Formed by passing CyCl into benzylamine in ether (Strakosch, *B* 5, 694) Plates (from ether), insol water, *v* sol alcohol and ether On keeping it changes to isomeric tri benzyl melamine Boiling HCl forms benzyl urea

Di-benzyl-cyanamide $(C_6H_5CH_2)_2N_2CN$ [54°] From CyCl and dibenzylamine in alcohol (Lumprecht, *A* 144, 317) Plates, insol water

BENZYL CYANATE $C_6H_5CH_2NCO$ (175°-200°) Formed, together with benzyl cyanurate, by the action of silver cyanate on benzyl chloride or bromide (Letts, *C J* 25, 446, Ladenburg & Struve, *B* 10, 46) Pungent liquid Changes spontaneously into the cyanurate Alcoholic NH_3 converts it into benzyl urea

BENZYL CYANIDE *v* PHENYL ACETONITRILE

BENZYL CYANURATE $(C_6H_5CH_2)_3N_3C_3O_3$ [157°] (above 320°) The chief product of the action of silver cyanate on benzyl chloride (*v* supra), formed by isomeric change from benzyl cyanate Silky needles (from alcohol), insol water Potash fusion gives K_2CO_3 and benzylamine

BENZYL CYMENE $C_{17}H_{20}$ *v* $C_6H_5CH_2C_6H_4MePr$ [297°] (Mazzara, *G* 8, 508, [308°] (Weber, *J* 1878, 402) SG 12 97

From benzyl chloride, cymene, and zinc On oxidation it gives benzoyl terephthalic acid

Benzyl-cymene disulphonic acid

$C_{17}H_{18}(SO_3H)_2(M)$

BENZYL DURENE *v* BENZYL TETRA METHYL BENZENE

BENZYLENE $(C_6H_5)_2$ Two hydrocarbons of this composition are formed by the action of the copper zinc couple upon benzyl bromide (or chloride) (α) benzylene, [42], μ_r 6091, is a yellowish red resin, sl sol alcohol, *v* sol ether and benzene (β) benzylene is a brown resin, insol alcohol or ether (Gladstone & Tribe, *C J* 47, 448)

BENZYLENE *v* BENZYLIDENE-

BENZYLENE-DIAMINE *v* AMIDO BENZYL-AMINE

BENZYLENE-IMINE C_6H_5N *v* $C_6H_5CH=NH$

[12] Formed by reduction of

$C_6H_5CH_2NO_2$ nitro benzyl chloride with $SnCl_2$ in conc HCl Greyish yellow powder Sol chloroform and acetic acid Dissolves in HCl to a red fluorescent solution The salts are amorphous The hydrochloride forms a reddish yellow transparent solid (BHCl) The platinichloride ($B_2H_4PtCl_6$) is an insoluble, amorphous, reddish-brown powder (Lellmann & Stickel, *B* 19, 1611)

BENZYL ETHER $C_{15}H_{13}O$ *v* $(C_6H_5CH_2)_2O$ *D* benzyl ether, *D* benzyl oxide (298° 1 V) SG 12 1036 μ 1.5525 Formed by heating benzyl alcohol with B_2O_3 at 120° (Cannizzaro, *A* 92, 115) Also by heating benzyl chloride with water at 190° (Lumprecht, *A* 139, 313). From benzyl chloride and sodium benzoate (Lowe, *C J* 51, 700) Decomposed by heat into toluene and benzoic aldehyde

BENZYL-DI-ETHYL-AMINE $C_{17}H_{25}N$ *v* $C_6H_5CH_2NEt_2$ (212° cor)

From benzylamine and EtI at 180° (Ladenburg & Struve, *B* 10, 47, 561, 1152, 1634), or from di ethyl amine and

benzyl chloride at 100° (V Meyer, B 10, 810, 964)

Ethyl-iodide $C_6H_5CH_2NEt_2I$ Large crystals, v sol water On dry distillation it gives triethylamine and benzyl iodide — $C_6H_5CH_2NEt_2I$ [87°] — $(C_6H_5CH_2NEt_2Cl)_2PtCl_4$

Di-benzyl-ethyl-amine $C_{16}H_{19}N$ e $(C_6H_5CH_2)_2NEt$ From di benzyl amine and EtI (Lumprecht, A 144, 315) — $BHCl$

Ethyl iodide $(C_6H_5CH_2)_2NEt_2I$ Sl sol cold water

BENZYL ETHYL-BENZENE $C_{15}H_{16}$ t e $C_6H_5CH_2C_2H_5Et$ [14] Mol w 196 (295° 1 V) SG 1.99 From benzyl chloride, ethyl benzene, and zinc (Walker, B 5, 686) or from p ethyl benzophenone, HI, and P (Sollischer, B 15, 1682) Oxidation gives p benzoyl benzoic acid

BENZYL ETHYL OXIDE v **BENZYL ALCOHOL**

BENZYL ETHYL KETONE $C_{10}H_{12}O$ t e $C_6H_5CH_2CO C_2H_5$ Mol w 148 (c 226°) SG 1.100 From phenyl acetic chloride and $ZnEt_2$ (Popoff, B 5, 501) Does not combine with $NaHSO_4$ Oxidised by CrO_3 to benzoic and propionic acids

BENZYL p-ETHYLPHENYL-CARBINOL $C_{15}H_{18}O$ CH(OH) $C_6H_5CH_2$ [14] (350°) Liquid Formed by heating benzyl ethylphenyl ketone with alcoholic KOH at 160° Boiled with dilute H_2SO_4 it gives phenyl ethylphenyl ethyl ene (Sollischer, B 15, 1681)

BENZYL ETHYLPHENYL p-KETONE $C_{15}H_{16}O$ $CH_2CO C_6H_5CH_2$ [14] *Ethyl-desoxybenzoin* [64°] Prepared by the action of Al_2Cl_3 on a mixture of ethyl benzene and phenyl acetyl chloride (Sollischer, B 15, 1680) Boils under composed VD 8.03 (obs) Small plates Sol ether, benzene, and hot alcohol, sl sol cold alcohol On oxidation it gives terephthalic acid On reduction it gives phenyl ethylphenyl ethane

BENZYL-ETHYLPHENYL-METHANE v **PHENYL ETHYLPHENYL-ETHANE**

BENZYL DI ETHYL SULPHINE *Platino-chloride* $(C_6H_5CH_2SEtCl)_2PtCl_4$ From EtI and di benzyl sulphide, the product being treated with AgCl and $PtCl_4$ successively (Schöller, B 7, 1274)

DI-BENZYL-ETHYL pseudo THIOUREA $C_{17}H_{20}N_2S$ t e $C_6H_5CH_2S C(NH_2)_2NH$ Formed by heating di benzyl thiourea with ethyl iodide at 100° Oil

Salts — BH [93°], monoclinic prisms, v sol alcohol, sl sol water — BH_2SO_4 large four sided rhombic soluble tables — BH_2PtCl_4 fine needles (Reimarus, B 19, 2349)

BENZYL-FLUORENE $C_{20}H_{16}$ t e $C_6H_5CH_2C_2H_5 < \begin{smallmatrix} CH_2 \\ CH_2 \end{smallmatrix} >$ [102°] Formed by heating fluorene with benzyl chloride and zinc dust (Goldschmidt, M 2, 443) Plates (from alcohol)

BENZYL-FORM-ALDEHYDE v **PHENYL-ACETIC ALDEHYDE**

DI-BENZYL-GLYCOLLIC ACID $C_{16}H_{18}O_4$ t e $(C_6H_5CH_2)_2C(OH)CO_2H$ *Oxalobutic acid* *α-Oxy-di-phenyl-iso-butyric acid* [157°]

Formation — 1 From the nitrile and conc HCl at 140°–160° (Spiegel, A 219, 46, B 18, 2219, 14, 1687) — 2 By boiling vulpic acid (q. v) with aqueous KOH. $C_{16}H_{18}O_4 + 8H_2O$

$= CH_2O + 2CO_2 + C_{16}H_{18}O_4$ (Möller & Strecker, A 113, 56)

Rhombic prisms (from alcohol) $abc = 5113.1 \ 8058$ Fluffy mass of needles (from benzene) Salt — AgA'

Reactions — 1 HNO_3 gives a viscid nitro acid (Möller & Strecker) — 2 Conc aqueous KOH gives toluene and oxalic acid of boiling — 3 Treated with PCl_5 and H_2O successively a monophosphate, $C_{16}H_{18}O_4PO_4H_2$, crystallising in prisms, [160°] is formed

Acetyl derivative [106°] Plates in rosettes (from $CHCl_3$ mixed with petroleum)

Methyl ether MeA' [71°], needles

Anhydride $C_{16}H_{14}O_2$ [169°] Got by heating the acetyl derivative Prisms (from benzene) V sol alcohol and ether Na_2CO_3 Aq converts it into sodium di benzyl glycolate

Nitrile $(C_6H_5CH_2)_2C(OH)CN$ [114°] From di benzyl ketone, KCN and HCl Colourless flat rhombs (from alcohol) At 118° it splits up into HCN and di benzyl ketone

Amide [193°] From the nitrile and conc. HCl at 125° Fluffy mass of long needles

BENZYL-GLYOXALINE $C_{14}H_{16}N_2$ [71°] (310°) Formed by the action of benzyl chloride on glyoxaline (Wallach, B 16, 539) Colourless crystals Sl sol ether, insol cold water — $BH_2Cl_2PtCl_4$, yellow pp, insol cold water

DI-BENZYL-GUANIDINE $C_{14}H_{16}N_4$ t e $(C_6H_5CH_2NH)_2C NH$ [100°] Formed by boiling benzylamine hydrochloride with benzyl cyanamide in alcohol (Strakosch, B 5, 695) — *Laminæ* (from alcohol) Sol water, alcohol, and ether — $BHCl$ [176°]

BENZYL HYDROXYLAMINE v **HYDROXYLAMINE**

BENZYLIDENE The radicle C_6H_5CH , also called *benzal* or *benzylene* The latter name is more appropriate to the isomeric radicle $C_6H_5CH_2$

BENZYLIDENE DI-ACETAMIDE

$C_{11}H_{14}N_2O_2$ t e $C_6H_5CH(NHCOCH_3)_2$ Formed by boiling acetamide with benzoic aldehyde (Roth, A 154, 72, Z [2] 4, 650, 6, 680) Silky crystals, sl sol cold water and ether Not affected by boiling KOHAq but decomposed by hot $HClAq$ into benzoic aldehyde and NH_4Ac

BENZYLIDENE DI-ACETATE $C_{11}H_{12}O_4$ t e $CHPh(OAc)_2$ *Di-acetyl benzoic ortho-aldehyde* [45°] From benzoic aldehyde and Ac_2O or from benzylidene chloride and $AgOAc$ (Geuther, A 106, 251, Wicke, A 102, 368, Hübner, Z 1867, 277, Neubof, A 146, 323, Lumprecht, A 139, 321, Perkin, Z 1868, 172)

BENZYLIDENE ACETIC ACID v **CINNAMIC ACID**

Benzylidene di-acetic acid v **PHENYL GLUTARIC ACID**

BENZYLIDENE ACETO-ACETIC ACID v **P 24**

BENZYLIDENE DI-ACETO ACETIC ETHER $C_{17}H_{18}O_6$ t e $C_6H_5CH[OHCH(COOEt)COCH_3]_2$ (?)

[153°] Formed together with dehydro benzylidene-di-acetoacetic ether $C_{16}H_{16}O_6$, by the action of benzoic aldehyde (1 mol) upon acetoacetic ether (2 mols) in presence of a primary amine Long white needles Sl sol cold alcohol and ether (Hantzsch, B 18, 2588).

Dehydro benzylidene di acetoacetic-ether

[88°] Formed as described above Glistening prisms V sol cold or hot solvents (Hantzsch, B 18, 2586)

BENZYLIDENE DI ACETONAMINE *v p 27*

BENZYLIDENE ACETONE $\text{C}_{10}\text{H}_{16}\text{O}$ *ie* Ph CH CH CO CH₃ *Aceto cinnamone Methyl styryl ketone* [42°] (152°) at 25 mm (261° i V) at 760 mm

Formation — 1 From benzoic aldehyde, acetone and a little ZnCl₂ at 260° (Claisen a Claparède, B 14, 2461) — 2 By heating a mixture of calcium acetate with calcium cinnamate, also in small quantity by heating cinnamic aldehyde with Na and MeI at 130°, or by boiling cinnamic aldehyde with MeOH and ZnCl₂ (Engler a Leist, B 6 234)

Preparation — From benzoic aldehyde (20 g), acetone (40 g), water (1800 cc) and aqueous (10 p c) NaOH (20 g) in the cold After four days the oil that has separated is extracted with ether, dried over CaCl₂ and rectified *in vacuo* (Claisen a Ponder, A 223, 138)

Properties — Plates, apparently rectangular It has an odour of coumarin and rhubarb and attacks the skin Easily soluble in alcohol, ether, benzene, and chloroform, less in petroleum ether In conc H₂SO₄ it forms an orange solution Forms a crystalline compound with NaHSO₄, and a dibromide C₁₀H₁₀OBr₂ [125°] crystallising in needles from alcohol

Phenyl hydrazide C₁₅H₁₄N₂ [156°], flat yellow needles, sol hot alcohol, sl sol cold alcohol and ether, insol water (Fischer, B 17, 576, Knorr, B 20, 1099)

Oxim Ph CH CH C(NO)H CH₃ [116°] (220°) at 100 mm Forms a bromide, [145°], and an acetyl derivative [91°] (Zelinsky, B 20, 922)

Di benzylidene acetone

PhCH CH CO CH CH Ph *Cinnamone Di-styryl ketone* [112°]

Formation — From benzoic aldehyde (20 pts), acetone (6 pts), and acetic acid (40 pts), by adding H₂SO₄ (30 pts) at 0° or passing in HCl

Preparation — From benzoic aldehyde (10 g), acetone (3 g), water (100 g) and dilute (10 per cent) NaOH (20 g) left 4 days in the cold, or from benzylidene acetone (7 g), benzoic aldehyde (5 g), water (200 g), alcohol (150 g) and dilute NaOH (20 g) (Claisen a Ponder, A 223, 142, cf Claisen a Claparède, B 14, 350, 2460, Schmidt, B 14, 1459)

Properties — Bright yellow monoclinic tablets (from acetone or CHCl₃) *abc* = 4 886 1 1 378 β = 78° 43' Readily soluble in chloroform or acetone, less in ether or cold alcohol Gives an orange solution in H₂SO₄

Tetrabromide C₁₁H₁₁OBr₄ white needles [208°–211°]

BENZYLIDENE DIACETONE ALCAMINE

C₁₁H₁₄NO *ie* (C₆H₅)HC — NH — C(CH₃)₂ (?)

Ory phenyl di-methyl tetra hydro pyridine Thick colourless oil Formed by reduction of an acid solution of benzylidene di acetoneamine

(*v p 27*) with sodium amalgam.—B'HC1, small crystals, easily soluble in water and alcohol (Fischer, B 16, 2236)

BENZYLIDENE DI-ACETONINE *v p 34***BENZYLIDENE - ACETOPHENONE**

C₁₅H₁₄CH CH CO C₆H₅ *Phenyl styryl ketone. Phenyl cinnamonyl ketone Benzylidene methyl phenyl ketone Benzal acetophenone* [58°] (345°–348°) Formed by passing HCl gas into a mixture of acetophenone and benzaldehyde, by adding H₂SO₄ to the two latter bodies diluted with acetic acid, by heating them with acetic anhydride to 170°, or by treating them with dilute NaOH (Claisen a Claparède, B 14, 2463, Claisen a Ponder, A 223, 148)

Preparation — 12 pts of acetophenone are mixed with 10.5 pts of benzaldehyde and 3 pts of a 20 p c sodium methylate solution, and allowed to remain in the cold for a few days when the whole will have solidified to a crystal line mass, the yield is 90 p c of the theoretical (Claisen, B 20, 657) Large trimetric tables V sol chloroform, ether, benzene and CS₂, m sol alcohol, sl sol petroleum ether On oxidation it gives benzoyl formic and benzoic acids On boiling with dilute acids it is decomposed into acetophenone and benzaldehyde By reduction with HI and P it is converted into di benzyl methane The HCl addition product C₆H₅CO CHCl CH₂ C₆H₅ [120°] forms colourless trimetric plates, sparingly soluble in cold alcohol and ether It is prepared by the addition of gaseous HCl to the ketone The di bromide C₆H₅CO CHBr CHBr C₆H₅ [157°] forms short colourless prisms sol hot alcohol Prepared by the addition of bromine to the ketone

BENZYLIDENE β - ACETYL - PROPIONIC

ACID C₁₂H₁₂O₄ *ie* CHPh CH₂CO CH₂CH₂CO₂H *Benzylidene laevulic acid Cinnamoyl propionic acid* [120°–125°] Formed by heating laevulic acid with benzoic aldehyde and sodium acetate Small white crystals The lead salt is insoluble Dissolves in cold conc H₂SO₄ with a red colouration Boiling conc KOH splits off benzaldehyde Reduction in alkaline solution yields *benzyl valero lactone* C₁₂H₁₄O₂ which forms large prisms of melting point [85°] (Erdmann, B 18, 3441)

BENZYLIDENE-ISOAMYL AMINE An oil formed from benzoic aldehyde and isoamylamine (Schiff, A 140, 93)

BENZYLIDENE DI ISOAMYL DI OXIDE

C₆H₅CH(OC₅H₁₁)₂ (292° cor) From benzylidene chloride and NaOC₅H₁₁ (Wicke, A 102, 363)

BENZYLIDENE - ANILINE C₁₁H₁₁N *ie*

C₆H₅CH NPh *Anilide of benzoic aldehyde*. [49°] (Tiemann a Piest, B 15, 2028)

Formation — 1 By warming aniline with benzoic aldehyde (Laurent a Gerhardt, *Compt chim* 1850, 117) — 2 By heating di phenyl-thio-urea with benzoic aldehyde (Schiff, A 148, 386)

Properties — Lamine, volatile with steam, insol water, v e sol alcohol and ether At 200° it changes to an isomeride which differs from it in forming a salt B'H₂PtCl₄

Hydrocyanide C₁₁H₁₁N₂ [82°] Formed by passing HCN into fused benzylidene-aniline, or by the action of KCN on a mixture of benzoic aldehyde and aniline hydrochloride dissolved

in alcohol (Coch, *B* 11, 246) It forms concentric needles, insol alkalis and dilute acids

BENZYLIDENE-DI ANTIPYRINE *v* Di oxy-TETRA METHYL DI QUINIZYL PHENYL METHANE

DI-BENZYLIDENE BENZIDINE $C_{22}H_{16}N_2$, $\epsilon \epsilon$ $C_6H_5(N \text{ CHPh})_2$ [232°] (C), [239°] (B) Obtained by heating hydrazo benzene or benzene azo benzene with benzoic aldehyde and $ZnCl_2$ (Clève, *Bl* [2] 45, 188, Barzilovsky, *J R* 1885, 866) Yellow scales (from benzene and chloroform) Resolved by HCl into benzoic aldehyde and benzidine

BENZYLIDENE DI BENZAMIDE

$C_{21}H_{18}N_2O_2$, $\epsilon \epsilon$ $C_6H_5CH(NHCO C_6H_5)_2$ [197°] Formed by heating benzoic aldehyde with benzamide (Roth, *A* 154, 76) Long silky needles (from alcohol), insol water Resolved by hot HClAq into the parent substances

BENZYLIDENE DI BENZOATE

$C_{21}H_{18}CH(OBz)_2$ From benzylidene chloride and AgOBz (Engelhardt, *J* 1857, 471) Crystalline

BENZYLIDENE BENZYL AMINE

$C_{12}H_{14}CHNCH_2C_6H_5$ (c 300°) Formed by the action of PCl_5 upon di benzyl hydroxylamine, probably by intermediate formation of the chloride (C_6H_5CHNCl) Oil V sol alcohol and ether, insol water

Salts — $BHCl$ [251°], long plates or tables, v sol alcohol, sparingly in cold water, more readily in hot — $B'H_2PtCl_4$ * small golden yellow crystals (Walder, *B* 19, 1632)

BENZYLIDENE BROMIDE $C_6H_5Br_2$, $\epsilon \epsilon$ $C_6H_5CHBr_2$ Benzal bromide ω Di bromo toluene (130°–140°) at 20 mm From benzoic aldehyde and PBr_3 Can only be distilled *in vacuo* Sodium at 180° forms toluene and di benzyl (Michaelson & Lippmann, *Bl* [2] 4, 251)

BENZYLIDENE BROMIDE BENZOATE

$C_{14}H_{11}BrO_2$, $\epsilon \epsilon$ $C_6H_5CH \begin{smallmatrix} Br \\ \diagup \\ O \\ \diagdown \end{smallmatrix} CO C_6H_5$ [70°] Colourless tables or prisms Sol alcohol, ether, and acetic acid Prepared by mixing benzaldehyde and benzoyl bromide On distillation it again decomposes into these bodies (Claisen, *B* 14, 2475, cf Liebig & Wohler, *A* 3, 266)

BENZYLIDENE DI BUTYRAMIDE

$C_{18}H_{24}N_2O_2$, $\epsilon \epsilon$ $C_6H_5CH(NHCO C_4H_9)_2$ Slender crystals formed by heating butyramide with benzoic aldehyde (Strecker, *A* 154, 76)

BENZYLIDENE DI CARBAMIC ACID

$C_6H_5CH(NHCO_2H)_2$, Ethyl ether Et.A" [171°] From carbamic ether, benzoic aldehyde, and HCl (Bischoff, *B* 7, 634) Crystals, may be sublimed

Propyl ether Pr.A" [143°] (Bischoff, *B* 7, 1082)

BENZYLIDENE CHLORAL AMMONIA

$C_6H_5Cl_2NO$, $\epsilon \epsilon$ $CCl_2CH(OH)NCH C_6H_5$ [130°] White leaflets Decomposed by dilute acids and by boiling water Prepared by the action of benzoic aldehyde on chloral ammonia (Schiff, *B* 11, 2166)

BENZYLIDENE CHLORIDE $C_6H_5Cl_2$, $\epsilon \epsilon$ $C_6H_5CHCl_2$ Benzal chloride Chlorobenzol

Benzylene chloride Mol w 161 (204°) at 766 mm. SG $\frac{1}{4}$ 1.27 SV 154.25 (Schiff, *B* 19, 563)

Formation — 1 From benzoic aldehyde and PCl_5 (Cahours, *A* 70, 89, *Suppl* 2, 253, 806)

2 By passing chlorine into boiling toluene (Beilstein, *A* 116, 536, 146, 822, Lauth & Grimaux, *Bl* 2, 347) — 3 From benzoic aldehyde and succinyl chloride (Rembold, *A* 188, 189) or $COCl_2$ (Kempt, *Z* 1871, 79)

Preparation — 1 By passing 2 mols of chlorine into cold toluene (1 mol) exposed to direct sunshine (Schramm, *B* 18, 648) — 2 By heating toluene (7 pts) with PCl_5 (30 pts) at 190°, the yield being nearly that calculated (Colson & Gautier, *Bl* [2] 45, 87)

Properties — Oil, with faint odour

Reactions — 1 Converted into benzoic aldehyde by water or aqueous K_2CO_3 at 130°, or by warming with H_2SO_4 at 50° and treating the product with water (Oppenheim, *B* 2, 213) —

2 Alcoholic KHS forms benzyl disulphide and di thio benzoic acid — 3 Red hot soda lime forms benzene (Lumprecht, *Bl* 1866, u 467) —

4 Chlorine forms *p* chloro benzylidene chloride

5 Nitric acid forms *p* nitro benzylidene chloride (Hubner & Bente, *B* 6, 803, cf Beilstein, *A* 146, 333) — 6 AgOAc forms $C_6H_5CH(OAc)_2$

7 Silver ozalate forms benzoic aldehyde (Golwinsky, *A* 111, 252) — 8 Na forms di phenyl ethylene — 9 MeI and Na form cumene —

10 NH_3 forms hydrobenzamide — 11 $ZnEt_2$ diluted with benzene forms $C_{11}H_{14}$, di ethyl phenyl methane and $C_{10}H_{12}$ (Daferet, *M* 4, 618)

12 Copper at 100° gives $CPhCl_2$, $CPhCl_3$ and $CPhHCl$ (Onufrowicz, *B* 17, 833)

BENZYLIDENE-DI-CHLORO CHROMIC ACID *v* TOLUENE

DI BENZYLIDENE-ETHYLENE DIAMINE

$C_{16}H_{18}N_2$, $\epsilon \epsilon$ $C_6H_5(NCH C_6H_5)_2$ [54°] Formed by heating ethylene diamine (1 mol) with benzoic aldehyde (2 mols) to 120° Large colourless tables V sol alcohol and benzene, insol water Decomposed into its constituents by acids (Mason *B* 20, 270)

BENZYLIDENE ETHYLENE DI SULPHIDE

$C_6H_5CH \begin{smallmatrix} S \\ \diagup \\ CH_2 \\ \diagdown \\ S \end{smallmatrix} CH_2$ [29°] Formed by passing

HCl gas into a mixture of equal mols of benzaldehyde and ethylene sulphhydrate Crystals

Easily soluble in alcohol, ether, and benzene, insoluble in water Very stable body By the action of bromine upon the chloroform solution

di-ethylene tetra sulphide $C_2H_4 \begin{smallmatrix} S \\ \diagup \\ S \\ \diagdown \\ S \end{smallmatrix} C_2H_4$ is

formed (Fasbender, *B* 20, 460)

BENZYLIDENE DI ETHYL DI OXIDE

$C_6H_5CH(OEt)_2$ (222° cor) Diethyl derivative of benzoic ortho aldehyde From benzylidene chloride and $NaOEt$ (Wicke, *A* 102, 363)

BENZYLIDENE DI HEPTYLENE TETRA

UREA $C_{26}H_{34}N_4O_2$, $\epsilon \epsilon$ $C_6H_5CH(NHCO NH C_6H_5, NHCO NH_2)_2$ From benzoic aldehyde and heptylene diurea (Schiff, *A* 151, 195) Insoluble powder

BENZYLIDENE MALONIC ACID

$PhCHC(CO_2H)_2$ [196°] (C), [193°] (S)

Formation — 1 From the ether by aqueous baryta — 2 From benzoic aldehyde, malonic acid and Ac_2O at 100° (Claisen & Crismer, *A* 218, 135) — 3 From benzoic aldehyde, sodic malonate, and glacial acetic acid at the ordinary temperature

$PhCHO + CH_2(CO_2Na)_2 = PhCHC(CO_2Na)_2 + H_2O$

The product is diluted with water, shaken out

with ether, acidified, shaken again with ether and the ether distilled off (Stuart, *C J* 43, 405, v also Claisen, *A* 218, 129)

Properties—Colourless glassy prisms. Sol. cold water, v sol hot water, v sol alcohol, acetic ether or acetone, m sol ether or glacial acetic acid. Insol benzene, chloroform or petroleum. Does not give in neutral solutions a pp with BaCl_2 , but on warming such a mixture needles of the salt BaA separate (characteristic reaction)

Salt— Ag_2A

Reactions—1 At 200° it splits up into CO_2 and cinnamic acid—2 Boiling water decomposes it into benzoic aldehyde and malonic acid, some CO_2 and cinnamic acid being also formed—3, Reduced by sodium amalgam to benzyl malonic acid $\text{PhCH}_2\text{CH}(\text{CO}_2\text{H})_2$ —4 Bromine acts on its solution in chloroform forming $\text{PhCHBrCBr}(\text{CO}_2\text{H})_2$ [968] whence water forms a bromo cinnamic acid (Stuart, *C J* 49, 360)—5 Cold alcoholic potash forms crystals of $\text{PhCH}(\text{OEt})\text{CH}(\text{CO}_2\text{K})_2$, whence a silver salt, $\text{PhCH}(\text{OEt})\text{CH}(\text{CO}_2\text{Ag})_2$, may be got. The free acid, if heated rapidly, melts at 120° – 130° , splitting up into EtOH and benzylidene malonic acid, which then solidifies again, and melts a second time at 190° . By crystallisation from water the acid is partly split up into alcohol and benzylidene malonic acid—6 HBr forms β bromo phenyl isosuccinic acid $\text{PhCHBrCH}(\text{CO}_2\text{H})_2$, which is decomposed by water into HBr , cinnamic acid and CO_2 (Stuart, *C J* 49, 360)

Ethyl ether Et.A [32°] (192°) at 17 mm SG 1.111. Formed by passing HCl into a mixture of malonic ether and benzoic aldehyde or by treating the mixture with AcO at 160° (Claisen, *B* 14, 348). Large transparent crystals (Stuart, *C J* 49, 360). Boils at 308° – 312° with decomposition.

BENZYLIDENE MESITYL OXIDE $\text{C}_{15}\text{H}_{10}\text{O}$ *tc* $(\text{CH}_3)_2\text{CCHCOCHCH}_2\text{C}_6\text{H}_5$, (179°) at 14 mm Oil. Prepared by passing HCl gas into a mixture of mesityl oxide and benzaldehyde (Claisen, *B* 14, 351). Forms a tetrabromide [118°]

BENZYLIDENE METHYL KETOLE $\text{C}_8\text{H}_{10}\text{N}_2$ [248°]. Colourless plates. Formed by reduction of dimethyl rosindole $\text{C}_{15}\text{H}_{20}\text{N}_2$ with zinc dust and H_2 . It is oxidised in acetic acid solution by FeCl_3 back to dimethyl rosindole (Fischer & Wagner, *B* 20, 816)

BENZYLIDENE DI METHYL DI OXIDE

$\text{C}_8\text{H}_8\text{CH}(\text{OMe})_2$. *Di methyl derivative of benzoic orthoaldehyde* (208° cor). From benzylidene chloride and NaOMe (Wicke, *A* 102, 363)

BENZYLIDENE DI METHYL P PHENYL

ENE DIAMINE $\text{C}_8\text{H}_8\text{CHN}(\text{C}_6\text{H}_5)\text{NMe}_2$. *Benzylidene-amido-di methyl aniline. Methyl phenylene-diamide of benzoic aldehyde* [98°]. Glistening plates or needles. Sol hot alcohol and benzene, sl sol cold alcohol. Weak base. Formed by mixing benzoic aldehyde and *u di methyl p phenylene diamine*, either directly or in alcoholic solution. By HCl it is split up into its generators— $\text{B}''\text{H}_2\text{Cl}_2$ white solid (Cahn, *B* 17, 2940)

BENZYLIDENE-(Py 3) METHYL-QUINOLINE $\text{C}_{17}\text{H}_{15}\text{N}$ *tc*

$\text{C}_6\text{H}_5\text{CH}(\text{CHCH})\text{N}(\text{C}_6\text{H}_4\text{CH})\text{C}=\text{CH}-\text{CH}_2\text{C}_6\text{H}_4(?)$ [100°] Formed

by heating quinaldine (methyl quinoline) with benzoic aldehyde or benzylidene chloride and ZnCl_2 (Jacobsen & Reimer, *B* 16, 2606). Glistening colourless needles. Sublimable. Sol hot alcohol, insol water— $\text{B}''\text{H}_2\text{Cr}_2\text{O}_7$ 23aq very sparingly soluble reddish yellow needles

BENZYLIDENE-(8) NAPHTHYLAMINE $\text{C}_{20}\text{H}_{16}\text{CHN}(\text{C}_6\text{H}_5)_2$ [103°]. From benzoic aldehyde and (8) naphthylamine (Claisen, *A* 237, 261)

BENZYLIDENE-(a) NAPHTHYLAMINE p-SULPHONIC ACID $\text{C}_{18}\text{H}_{14}(\text{NCH}_2\text{C}_6\text{H}_4\text{SO}_3\text{H})_2$ [4]. The sodium salt ($\text{A}''\text{Na}$) is obtained by shaking a strong solution of sodium-(a) naphthylamine sulphate with benzaldehyde. By long boiling with water it is split up into its constituents (Cahn & Lange, *B* 20, 2001)

BENZYLIDENE DI (8) NAPHTHYL OXIDE

$\text{C}_{20}\text{H}_{16}\text{CH}(\text{C}_{10}\text{H}_6\text{O})_2$ *Anhydride of di-oxy di naphthyl phenyl methane* [190°]. Crystalline solid. Insoluble in aqueous alkalis

Formation—1 By heating a solution of (8) naphthol and benzoic aldehyde in acetic acid to 200° , or with addition of H_2SO_4 or HCl on the water bath (Trzcinski, *B* 17, 499)—2 By warming benzylidene di naphthyl di-oxide $\text{C}_{20}\text{H}_{16}\text{CH}(\text{O C}_{10}\text{H}_7)_2$ with acetic acid and a few drops of HCl . In these reactions di oxy di naphthyl phenyl methane $\text{C}_{10}\text{H}_6\text{CH}(\text{C}_{10}\text{H}_6\text{OH})_2$ must first be formed and at once split off H_2O (Claisen, *B* 19, 3317)

Benzylidene di-(8)-naphthyl di-oxide $\text{C}_{22}\text{H}_{18}\text{O}$ *tc* $\text{C}_{10}\text{H}_6\text{CH}(\text{OC}_{10}\text{H}_7)_2$. *Di naphthyl ortho benzaldehyde* [205°]. From benzoic aldehyde (5.3 pts), (8) naphthol (7.2 pts), glacial HOAc (30 pts), and fuming HCl (2 pts) at 0° (Claisen, *A* 237, 269). Tables, sl sol. CHCl_3 and CS_2 , v sl sol alcohol and ether, insol alkalis. Conc H_2SO_4 gives, on gentle warming, a deep red solution. HOAc and some HCl slowly convert it at 100° into benzylidene di naphthyl oxide, a change which also occurs when it is heated at 210°

BENZYLIDENE OXAMIDE $\text{C}_8\text{H}_8\text{N}_2\text{O}$. Formed by warming oxamic ether with benzoic aldehyde (Medicus, *A* 157, 50). Lamine

BENZYLIDENE-PHENYL DIAMINE *v* PHENYL-BENZAMIDINE

DI BENZYLIDENE p-PHENYLENE DIAMINE $\text{C}_{20}\text{H}_{16}\text{N}_2$ *tc* $\text{C}_6\text{H}_4(\text{NCHPh})_2$ [140°]. From *p*-phenylene diamine and benzoic aldehyde at 120° (Ladenburg, *B* 11, 590). Plates (from alcohol). Resolved by hot HClAq into the parent substances

BENZYLIDENE PHTHAL-ETHYL IMIDINE

$\text{C}_{17}\text{H}_{15}\text{ON}$ *tc* $\text{C}_6\text{H}_5\text{C}(\text{CH}_2\text{C}_6\text{H}_5)\text{N}(\text{Et})_2$ *phthalimyl benzyl* [c 77°]. Formed by boiling the ethyl amide of deoxybenzoic carboxylic acid $\text{O}_6\text{H}_4(\text{CO.NHLEt})\text{COCH}_2\text{C}_6\text{H}_5$ with acetic acid. Plates. V sol alcohol, benzene, benzoline, and CS_2 (Gabriel, *B* 18, 2433)

BENZYLIDENE PHTHALIDE $\text{C}_{15}\text{H}_{10}\text{O}_2$ *tc*

$\text{C}_6\text{H}_5\text{C}(\text{CHPh})_2\text{O}$ [99°] *Benzylidene phthalyl. Anhydride of deoxybenzoic carboxylic acid*

Formation—1 By heating phthalic anhydride (5 pts) with phenyl acetic acid (5 pts) and NaOAc (1 pt) (Gabriel & Michael, *B* 11, 1018),

K K

2 By heating phthalyl phenyl acetic acid *in vacuo* (Gabriel, *B* 17, 2526)

Preparation—A mixture of 100 g phenylacetic acid, 110 g phthalic anhydride and 2½ g dry sodium acetate is heated for 2 hours, and the product crystallised from alcohol, the yield is 75–78 p.c. (Gabriel, *B* 18, 3470)

Properties—Long prisms (from alcohol), insol water, sl sol cold alcohol

Reactions—1 Hot aqueous KOH forms potassium deoxybenzoin carboxylate—2 By heating with alcoholic NH_3 at 100° it is converted into deoxybenzoin-*o*-carboxylamide $\text{C}_6\text{H}_4\langle\text{COCH}_2\text{C}_6\text{H}_5\rangle\text{CO NH}_2$, which by solution in H_2SO_4 or by boiling with glacial acetic acid loses H_2O giving benzylidene phthalimidine (phthalimidylyl benzyl) $\text{C}_6\text{H}_4\langle\text{C}(\text{CH}(\text{C}_6\text{H}_5))\rangle\text{NH}$ —3 Similarly *ethyl amine* yields the ethyl amide of deoxybenzoin carboxylic acid, and thus on boiling with acetic acid gives benzylidene phthal ethyl imidine $\text{C}_6\text{H}_4\langle\text{C}(\text{CH}(\text{C}_6\text{H}_5))\rangle\text{NEt}$ (Gabriel, *B* 18, 2433)—4 By dissolving in benzene and treatment with *nitrous acid* gas it yields the compound $\text{C}_6\text{H}_4\langle\text{C}(\text{NO}_2)(\text{CH}(\text{NO}_2)\text{C}_6\text{H}_5)\rangle\text{O}$ (Gabriel, *B* 18, 1251)

References—V CYANO AND NITRO BENZYLIDENE PHTHALIDP

Benzylidene-phthalide-di-bromide

$\text{C}_6\text{H}_4\langle\text{CBr}(\text{CHBrC}_6\text{H}_5)\rangle\text{O}$ [146°] Formed by the combination of benzylidene phthalide with bromine (Gabriel, *B* 17, 2527) Thick glistening prisms Sparingly soluble in alcohol (Iso) Benzylidene-phthalide $\text{C}_6\text{H}_4\text{O}_2$ *vs*

$\text{C}_6\text{H}_4\langle\text{CHC}_6\text{H}_5\rangle\text{CO O}$ [91°] Formed by reduction of nitro benzylidene phthalide

$\text{C}_6\text{H}_4\langle\text{C}(\text{C}(\text{NO}_2)\text{C}_6\text{H}_5)\rangle\text{O}$ with HI and P Prepared by reduction of nitro benzylidene phthalide, yield, 47 p.c. of the phenylacetic acid employed to prepare the benzylidene phthalide (Gabriel, *B* 18, 3471) Flat colourless needles Easily soluble in alcohol and benzene, sparingly in ligrom By further reduction with HI and P at 200° it yields *s*-di phenyl ethane-*o*-carboxylic acid $\text{C}_6\text{H}_5\text{CHCH}_2\text{C}_6\text{H}_5\text{CO}_2\text{H}$ By boiling with aqueous NaOH it is converted into deoxybenzoin-*o*-carboxylic acid $\text{C}_6\text{H}_4(\text{CO}_2\text{H})\text{CH}_2\text{CO C}_6\text{H}_5$ Heated with alcoholic NH_3 it gives isobenzylidene phthalimidine

$\text{C}_6\text{H}_4\langle\text{CHC}_6\text{H}_5\rangle\text{CO NH}$ (Gabriel, *B* 18, 2445)

BENZYLIDENE-PHTHAL-IMIDINE

$\text{C}_{11}\text{H}_{11}\text{ON}$ *vs* $\text{C}_6\text{H}_4\langle\text{C}(\text{CH}(\text{C}_6\text{H}_5))\rangle\text{NH}$ *Phthal-*

imidylyl-benzyl [183°] Yellow plates Formed from the amide of deoxybenzoin-*o*-carboxylic acid $\text{C}_6\text{H}_4(\text{CO NH}_2)\text{CO CH}_2\text{C}_6\text{H}_5$ by solution in H_2SO_4 or by boiling with acetic acid (Gabriel, *B* 18, 2433) *V* also Bromo and Nitro BENZYLIDENE PHTHALIMIDINE

Isobenzylidene-phthalimidine *v* (Py 4) Oxy-(Py 2) phenyl isoquinoline

BENZYLIDENE DI PIPERIDINE

$\text{C}_6\text{H}_5\text{CH}(\text{C}_4\text{H}_9\text{N})_2$ [81°] Formed by heating piperidine with benzoic aldehyde Colourless prisms Very unstable, being decomposed even by boiling with water Dilute acids resolve it into benzoic aldehyde and piperidine (Laun, *B* 17, 678)

BENZYLIDENE-RHODANIC ACID

$\text{C}_{10}\text{H}_7\text{NS}_2\text{O}$ *vs* $\text{C}_6\text{H}_5\text{CH}(\text{C}(\text{SH})\text{CO SCN})$ [200°] Formed by the action of benzoic aldehyde upon rhodanic acid in presence of dehydrating agents (Nencki, *B* 17, 2278) Yellow needles, sol water By heating with baryta water it is split up into a sulphhydro cinnamic acid $\text{C}_6\text{H}_5\text{CH}(\text{C}(\text{SH})\text{CO}_2\text{H})$ and hydrogen sulphocyanide Heated at 410° with conc H_2SO_4 (4 pts) it is converted into benzylidene rhodanicoxy sulphonic acid $\text{C}_{10}\text{H}_7\text{NS}_2\text{O}_3$ (Ginsburg & Bondzynski, *B* 19, 119)

BENZYLIDENE RHODANIC OXY SULPHO

NIC ACID $\text{C}_{10}\text{H}_7\text{NS}_2\text{O}_3$ Formed by heating benzylidene rhodanic acid with conc H_2SO_4 (4 pts) at 110° Needles *V* sol water and alcohol Very strong acid (Ginsburg & Bondzynski, *B* 19, 119)

BENZYLIDENE ROSANILINE

$\text{C}_{27}\text{H}_{21}\text{N}_3$ From rosaniline and benzoic aldehyde by heat or by shaking with SO_2Aq (Schiff, *A* 140, 111, *Z* 1867, 176)— $\text{B}^+\text{H}_2\text{PtCl}_6$

BENZYLIDENE SELENIDE

$\text{C}_6\text{H}_5\text{CHSe}$ *Seleno benzoic aldehyde* [70°] From benzylidene chloride and alcohol K_2Se (Cole, *B* 8, 1165) Yellow needles (from alcohol), insol water Not attacked by NH_3

BENZYLIDENE DI SKATOLE

$\text{C}_{25}\text{H}_{22}\text{N}_2$ *vs* $\text{PhCH}(\text{C}_6\text{H}_5\text{N})_2$ [142°] From skatole (2½ pts), benzoic aldehyde (1 pt) and a little ZnCl_2 (Wenzing, *A* 239, 241) Insol water, *v* sol hot alcohol and ether Boiling HCl does not split off benzoic aldehyde

BENZYLIDENE SULPHIDE *v* THIO BENZOIC

ALDEHYDE

BENZYLIDENE THIO BIURET

$\text{C}_6\text{H}_5\text{CH}(\text{N C}(\text{SH})\text{NH})_2$ [237°] Formed by heating benzoic aldehyde with ammonium sulphocyanide at 137° – 165° (Brodsky, *M* 8, 27) Minute prisms (from alcohol), insol water, sl sol cold alcohol, sol dilute KOH Boiling baryta water forms benzoic aldehyde, barium sulphocyanide, and di phenyl thio urea

Acetyl derivative $\text{C}_6\text{H}_5\text{Ac.N}_2\text{S}_2$ [189°]

BENZYLIDENE *o* TOLUIDINE

$\text{C}_{11}\text{H}_9\text{N}$ *vs* $\text{C}_6\text{H}_5\text{CH N C}_6\text{H}_4\text{CH}_3$ [12] *Benzaldehyde o toluidine* (314°) From *o* toluidine and benzoic aldehyde (Etard, *C R* 95, 730) Resolved by boiling water into its generators By passing through a tube heated to dull redness it is converted into phenyl indole $\text{C}_6\text{H}_4\langle\text{CH}(\text{NH})\rangle\text{C}_6\text{H}_5$ (Pictet, *B* 19, 1063)

Benzylidene-*p* toluidine

$\text{C}_6\text{H}_5\text{CH N C}_6\text{H}_4\text{CH}_3$ [14] From benzoic aldehyde and *p* toluidine at 100° (Schiff, *A* 140, 96, Kohler, *A* 241, 359, Mazzara, *G* 10, 870) Melts below 100° , but changes at 160° into an *isomeride* [120°–125°]— $\text{B}^+\text{H}_2\text{PtCl}_6$

DI BENZYLIDENE TOLYLENE DIAMINE

$\text{C}_{22}\text{H}_{21}\text{N}_2$ *vs* $\text{C}_6\text{H}_5\text{CH}_2\text{Me}(\text{N CHPh})_2$ [124] [122°–128°] From benzoic aldehyde and tolylene diamine at 100° (Schiff, *A* 140, 98) Neutral

crystalline mass, at 140°-150° it gives amara

BENZYLIDENE DI UREA $C_6H_5N_2O_2$ *ee* $C_6H_5CH(NHCOONH_2)_2$ *Benzaldehyde di ureide* [195°] Formed by adding benzoic aldehyde to an alcoholic solution of urea (Schiff, A 151, 192) Crystalline powder, insol water and ether, sol alcohol

Di benzylidene tri urea $C_{12}H_{10}N_6O_6$ Powder, formed by heating urea with benzoic aldehyde

Tri benzylidene tetra urea $C_{18}H_{14}N_8O_8$ [c 240°] Powder, formed by heating benzylidene di urea with benzoic aldehyde

BENZYLIDENE DI URETHANE *v* **BENZYL IDENE DI CARBAMIC ACID**

BENZYL-INDOLE $C_{13}H_{11}N$ *ee*

$C_6H_5 \begin{smallmatrix} \text{CH} \\ \diagup \text{NC}_6H_5 \end{smallmatrix} \text{CH}$ [44 5°] From its carboxylic acid (*q* *v*) by heat Yellowish needles (from alcohol) *v* sol benzene, light petroleum, chloroform and ether Turns pine wood moistened with HCl yellow Picrate forms red needles

BENZYL-INDOLE CARBOXYLIC ACID

$C_{16}H_{13}NO_2$ *ee* $C_6H_5 \begin{smallmatrix} \text{CH} \\ \diagup \text{NC}_6H_5 \end{smallmatrix} \text{C}CO_2H$ [195°, with decomposition] Pyruvic acid combines at 16° with benzyl phenyl hydrazine, forming $*CH_2C(CO_2H)NPhCH_2$, whence HCl at 100° forms benzyl indol carboxylic acid (Antrick, A 227, 362)

Properties—Colourless needles (from glacial acetic acid) Sl sol water, chloroform, and petroleum, sol ether and alcohol, *v* sl sol benzene Converted by heat into CO_2 and benzyl indole

BENZYL IODIDE C_6H_5I *ee* $C_6H_5CH_2I$ [24°] SG 22 173

Formation—1 From benzyl alcohol in CS_2 and iodide of phosphorus—2 Slowly formed by the action of cold HI (SG 196) on benzyl chloride (Lieben, Z [2] 6, 736)—3 From benzyl chloride and KI (V Meyer, B 10, 311, Kumpf, A 224, 126), ZnI_2 , or PbI_2 (Brix, A 225, 154)

Properties—Crystals decomposed by distillation Gives benzyl acetate with $AgOAc$, and tribenzylamine with alcoholic NH_3 Silver nitrate gives benzoic aldehyde and acid (Van Renesse, B 9, 1454, Brunner, B 9, 1744)

BENZYL - (pseudo) - ISATIN $C_{13}H_{11}NO_2$ *ee*

$C_6H_5 \begin{smallmatrix} \text{CO} \\ \diagup \text{NC}_6H_5 \end{smallmatrix} \text{CO}$ [131°] From benzyl indole carboxylic acid and NaOCl in feebly alkaline solution, the insoluble chloride then produced being subsequently boiled with alcoholic NaOH (Antrick, A 227, 365)

Properties—Slender needles (from alcohol) Sl sol water, sol ether Shows the indophenine reaction with H_2SO_4 and crude benzene containing thiophene

DI-BENZYL-KETONE $C_{13}H_{10}O$ *ee* $CO(CH_2Ph)_2$ *Di phenyl acetone* Mol w 210 [30°] (320°) Formed by the dry distillation of barium phenyl acetate Prisms CrO_3 oxidises it to benzoic and acetic acids (Popoff, B 6, 560) Reduced by HI at 180° to di benzyl methane (Graebe, B 7, 1623)

BENZYL-MALONIC ACID $C_{10}H_8O_4$ *ee* $C_6H_5CH_2CH(CO_2H)_2$ *Phenyl isosuccinic acid* [117°]

Formation—1. By saponification of its ether

2 From benzylidene-malonic acid by sodium-amalgam

Properties—Triclinic crystals, sol water, alcohol, and ether Splits up at 180° into CO_2 and β phenyl propionic acid

Ethyl ether EtA" (300°) SG 1.108 (Conrad, A 204, 174, B 12, 752) Sodium benzyl malonic ether is converted by iodine dissolved in ether into $*C_6H_5CH_2Cl(CO_2Et)_2$, which is converted by alcoholic KOH into ethoxy benzyl malonic ether (Bischoff a Hausdorfer, A 239, 110) Converted by alcoholic NH_3 into the amides $CH_2PhCH(CONH_2)_2$ [225°] and $CH_2PhCH(CO_2Et)(CONH_2)$ [98°] (Bischoff a Siebert, A 239, 96)

Di-benzyl malonic acid $(C_6H_5CH_2)_2C(CO_2H)_2$ [172°] P, [163°] (B a H) Formed by saponifying the ether (Perkin, C J 47, 821) Slender needles (from water) or thick prisms (from alcohol) *V* e sol ether and alcohol, m sol hot water, sl sol hot ligroin Gives di benzyl-acetic acid on heating

Ethyl ether $(C_6H_5CH_2)_2C(CO_2Et)_2$ (250°) at 40 mm SG 2.093 Thick yellow liquid Formed by the action of benzyl chloride upon sodio malonic ether By heating with alcoholic KOH it is converted into di benzyl acetic acid (Lellmann a Schleich, B 20, 439) Converted by treatment with alcoholic ammonia into $CO_2EtCH(C_6H_5)CO_2NH_2$ and $(CO_2NH_2)CHCHPh$, benzyl being split off (Bischoff a Siebert, A 239, 97)

TRI-BENZYL-MELAMINE

$(C_6H_5CHNH_2)_3$ Formed spontaneously from benzyl cyanamide by isomeric change (Strakosch, B 5, 694)— $B''3HCl$

BENZYL-MERCAPTAN C_6H_5SH *ee* $C_6H_5CH_2SH$ Mol w 124 (195°) SG 22 1058 From benzyl chloride and KHS in alcohol (Marcker, A 136, 75, 140 86) Pungent liquid with alliaceous odour

Salts — $(C_6H_5S)_2Hg$ needles — $C_6H_5SH_2Cl$ — $(C_6H_5S)_2Pb$

Benzoyl derivative $C_6H_5CH_2SBz$ [40°] Colourless crystals (Otto a Lueders, B 13, 1285)

Ethyl derivative C_6H_5SEt (216°)

BENZYL MESITYLENE $C_{13}H_{10}$ *ee* $C_6H_5CH_2C_6HMe_3$ [36°] (c 302) VD 7 35 Prepared by boiling benzyl chloride with mesitylene in presence of Al_2Cl_3 (Louise, A Ch [6] 6, 176, C R 95, 1163) Prisms, *v* sol. alcohol, ether, and benzene

Reactions—1 HI at 180° gives toluene and mesitylene—2 CrO_3 gives benzoyl mesitylene 3 HNO_3 forms a tri-nitro derivative, [185°] and an acid [236°]—4 Passage through a red hot tube forms two di methyl anthracenes, anthracene, and phenanthrene

Di benzyl mesitylene $(C_6H_5CH_2)_2C_6HMe_3$ [131°] (355°) at 120 mm From benzyl mesitylene, benzyl chloride, and Al_2Cl_3 (Louise, A Ch. [6] 6, 197) Minute prisms

BENZYL-METHANE *v* **ETHYL BENZENE**

Di-benzyl-methane *v* **DI-PHENYL-PROPANE**

BENZYL MUSTARD OIL *v* **BENZYL THIO**

CARBIMIDE

BENZYL-METHYL-ACETIC ACID *v* **PHENYL-ISO BUTYRIC ACID**

BENZYL METHYL ACETO ACETIC ACID *v*

p 25

BENZYL-DI-METHYL-AMINE $C_6H_5N(CH_3)_2$ *Di-methyl benzylamine* (184°) From benzyl chloride and alcoholic dimethylamine (Schotten, *B* 15, 424, Jackson a Wing, *Am* 9, 78) Oil, miscible with alcohol and ether

Salts — *B'HCl — *B'HNO₃ — B'₂H₂PtCl₆ — B'₂H₂FeCy₆ — B'₂H₂ZnCl₄

Methyl chloride B'MeCl white crystals, sol water, v sl sol Na₂CO₃Aq — (B'MeCl)₂PtCl₄

BENZYL-TETRA METHYL BENZENE

$C_6H_5CH_2C(CH_3)_3$ [12346] [61°] (c 310°) From benzoyl iso duren and fuming HI at 250° (Essner a Gossin, *Bl* [2] 42, 170, *A Ch* [6] 1, 516)

BENZYL METHYL-CARBINOL

$C_6H_5CH_2CH(OH)CH_3$ (215° i V) From benzyl methyl ketone and sodium amalgam (Errera, *G* 16, 315)

BENZYL METHYL GLYOXIM $C_{10}H_{10}N_2O_2$ *Di-methyl benzyl glyoxim* (181°) Formed by the action of hydroxylamine hydrochloride on isomeric benzyl acetone (Schramm, *B* 16, 180) Small white needles Sol alcohol and ether Sublimable Weak acid

Di-acetyl derivative $C_{10}H_{10}(NOAc)_2$ — [80°], small white crystals (Schramm, *B* 16, 2188)

BENZYL METHYL-KETONE $C_{10}H_{10}O$ *Di-methyl benzyl ketone* (215°) SG 1.010 Produced, together with acetone and di benzyl ketone, by distilling calcium acetate with calcium phenyl acetate (Otto, *J pr* [2] 1, 144) Unites with NaHSO₃. By heating with conc H₂SO₄ on the water bath it is converted into the sulphonic acid $C_6H_5(SO_3H)CH_2COCH_3$, but by heating quickly to a higher temperature it is split up into *o* toluene sulphonic acid $C_6H_5CH_2SO_3H$ and acetic acid (Krekeler, *B* 19, 2625)

BENZYL-METHYL-KETONE SULPHONIC ACID $C_6H_5(SO_3H)CH_2COCH_3$ Formed by the action of fuming sulphuric acid upon benzyl methyl ketone in the cold — PbA₂ (Krekeler, *B* 19, 2625)

BENZYL-METHYL MALONIC ACID

$C_{11}H_{12}O_4$ *Di-methyl benzyl malonic acid* (135°) Colourless crystals Prepared from the ether On heating it gives CO₂ and phenyl iso butyric acid

Di-ethyl-ether A'Et₂ (300°) SG 1.064 Prepared by the action of benzyl chloride on sodium methyl malonic ether or of methyl iodide on sodio benzyl malonic ether (Conrad a Bischoff, *B* 13, 598, *A* 204, 177)

BENZYL-METHYL OXIDE $C_6H_5CH_2OCH_3$ (170°) From benzyl chloride and KOMe (Cahours, *C R* 80, 1317)

BENZYL METHYL-PIPERIDINE

$C_6H_5N(C_2H_5)(CH_3)$ (245°) Colourless fluid Formed by dry distillation of the alkaline hydrate produced by the action of moist Ag₂O on benzyl piperidine methylo-iodide — (B'HCl)₂PtCl₄ (Schotten, *B* 15, 423)

DI-BENZYL-METHYL-(pseudo)-THIO-

UREA $C_{12}H_{14}N_2S$ *Di-methyl benzyl thio-urea* (100°) Oil. V. sol alcohol and ether, insol water.

Salts — B'HCl [125°]; easily soluble large rhombic four sided tables — B'H₂SO₄ [145°], glistening needles, v sol water and alcohol — B'HI [99°], octahedra, v sol warm alcohol, sl sol hot water — B'₂H₂Cl₂PtCl₄, sparingly soluble four sided prisms (Reimarus, *B* 19, 2348)

(a) **BENZYL NAPHTHALENE** $C_{15}H_{14}$ *Di-methyl benzyl naphthalene* [59°] (c 330°) SG 1.166 S (alcohol) 33 at 78°, S (ether) 50 at 15° From naphthalene, benzyl chloride, and zinc dust (Froté, *C R* 76, 639, Miquel, *Bl* [2] 26, 2) Monoclinic prisms Dilute HNO₃ produces phenyl (a) naphthyl ketone [75°]

Sulphonic acid $C_{15}H_{12}SO_3H$ — KA' aq needles (from alcohol)

(b) **Benzyl-naphthalene** $C_{15}H_{14}$ [55°] (c 345°) SG 1.176 S (alcohol) 225 at 15° Formed, together with the preceding, by heating naphthalene with benzyl chloride and Al₂Cl₃ (Vincent a Roux, *Bl* [2] 40, 163) Monoclinic prisms (from alcohol), v e sol benzene and chloroform Nitric acid produces phenyl (b) naphthyl ketone [82°]

BENZYL-(a)-NAPHTHYLAMINE

$C_{15}H_{13}NH_2$ [67°] From naphthylamine and benzyl chloride (Froté a Tommasi, *Bl* [2] 20, 67)

BENZYL NAPHTHYL KETONE

$C_{15}H_{12}O$ — CO — CH₃ [57°] Tables Prepared by the action of Al₂Cl₃ on a mixture of phenyl acetyl chloride and naphthalene On reduction with HI it gives phenyl naphthyl ethane (Graebe a Bungener, *B* 12, 1078)

BENZYL NAPHTHYL METHANE

PHENYL NAPHTHYL ETHANE

BENZYL (b) NAPHTHYL OXIDE

$C_{15}H_{12}O$ — CO — CH₃ [99°] White plates Prepared by the action of benzyl chloride on sodium (b) naphthol (Staedel, *B* 14, 899, *A* 217, 47)

BENZYL NARCEINE

NARCEINE $C_{15}H_{13}NO$ Is perhaps formed by the action of benzyl chloride on AgNO₃ (Brunner, *B* 9, 1745)

BENZYL NITRO ABBUTIN

NITRO ABBUTIN v p 298

BENZYL NITRO PHENYL-

NITRO PHENYL-BENZYL **BENZYL ISO NITROSO MALONIC ACID** $C_6H_5CH_2ON(CO_2H)_2$ From its ether The potassium salt on dry distillation gives KCN, potassium carbonate and benzyl alcohol

Di-ethyl ether A'Et₂ Prepared by the action of benzyl chloride and sodium ethylate on iso nitroso malonic ether (Conrad a Bischoff, *B* 13, 599)

BENZYL NITROSO-MALONYL UREA

Di-ethyl ether v VOLUTRIC ACID

BENZYL - OXALATE $C_{12}H_{10}O_4$ *Di-methyl benzyl oxalate* [81°] From benzyl chloride and silver oxalate (Beilstein a Kuhlberg, *A* 147, 341) Scales (from alcohol), may be distilled

BENZYL OXAMATE

$C_6H_5CH_2ONHCO_2CH_3$ [135°] From NH₂CO₂CO₂CH₃Ph and benzyl alcohol (Wallich a Liebmann, *B* 13, 507)

DI-BENZYL OXAMIDE

$C_{12}H_{14}N_2O_2$ *Di-methyl benzyl oxamide* [216°] From oxalo ether and benzylamine, or by boiling benzylamine cyanide with HCl (Strakosch, *B* 5, 694) Scales (from alcohol)

BENZYL OXANTHRANOL

TETRA-BENZYL OXY-AMMONIUM IODIDE

v HYDROXYLAMINE

BENZYL OXY BENZOIC ACID v OXY-**BENZYL BENZOIC ACID****BENZYL OXY-BUTYRIC ACID** v. OXY-**PHENYL VALERIC ACID****BENZYL OXY MALONIC ACID** v BENZYL-**IARTRONIC ACID****BENZYL OXY SULPHIDE** v Di BENZYL**SULPHOXIDE**

BENZYL - PHENANTHRENE $C_{21}H_{18}$ 1e CH_2Ph $C_{10}H_8$ [156°] From benzyl chloride, phenanthrene (*q* v) and zinc dust (Goldschmidt, *M* 2, 444) Needles (from benzene) CrO_3 gives benzoic acid and phenanthraquinone

p - **BENZYL PHENOL** $C_{13}H_{12}O$ 1e $C_6H_5CH_2CH_2C_6H_4OH$ [14] *Oxy di phenyl methane* Mol w 184 [84°] (325°-330°)

Formation — 1 From phenol, benzyl chloride and zinc dust (Paterno, *G* 2, 2, 3, 121) — 2 From benzoyl anisol and HI (Paterno, *B* 5, 288, 6, 1202) — 3 From $PhOAc$ and C_6H_5CHCl alone or with $AlCl_3$ and saponification of the product (Perkin, jun., a. Hodgkinson, *C* *J* 37, 722, Rennie, *C* *J* 41, 228) — 4 By heating phenol with benzyl alcohol and $ZnCl_2$ (Liebmann, *B* 15, 152) — 5 By diazotising *p* amido di phenyl methane and treating the product with water (Basler, *B* 16, 2719)

Properties — Long needles or plates (from alcohol) Sol KOH aq but not NH_4 aq

Reactions — 1 Distilling with P_2O_5 gives benzene, phenol, and anthracene — 2 By *bromination* and *nitration*, or by nitration and bromination it gives the same bromo nitro derivative, when treated with HNO_3 in $C_2H_5O_2$ forms $C_6H_4(OH)(NO_2)Br$ [1 2 4 6] Hence the bromo nitro derivative $C_6H_4(OH)(C_6H_4)(NO_2)Br$ is either [1 2 4 6] or [1 4 2 6] But the oxidation of $C_6H_5CH_2CH_2C_6H_4OMe$ to $C_6H_5CO C_6H_4OMe$ [1 4] shows that the arrangement is [1 2 4 6] — 3 Phosphorus pentachloride forms $(C_6H_5)_3PO_4$ [94°] — 4 Chloro acetic acid and KOH convert benzyl phenol into $CH_2Ph C_6H_4O CH_2 CO_2H$ [100°], while $CH_2CHCl CO_2H$ and KOH give rise to $CH_2Ph C_6H_4O CHMe CO_2H$ [102°] (Mazara, *G* 11, 437, 12, 262)

Methyl derivative $C_6H_5CH_2C_6H_4OMe$ **Benzyl anisol** (305°) From anisol, benzyl chloride, and zinc Oxidised by alkaline $KMnO_4$ it gives the methyl derivative of *p* benzoyl-phenol

Acetyl derivative $PhCH_2C_6H_4OAc$ (315°-320°)

Benzoyl derivative $PhCH_2C_6H_4OBz$ [86°]

Sulphonic acid $C_6H_5C_6H_4(SO_3H)(OH)$

Salts — NH_4 aq needles — KA feathery crystals — BaA , — $C_6H_5SO_3Ba$ aq minute crystals — These salts are all sparingly soluble (Rennie, *C* *J* 41, 84, 49, 406) They, as well as the free acid, give a violet colour with Fe_2Cl_6

p **BENZYL-DIPHENYL** $C_{18}H_{16}$ 1e $C_6H_5CH_2CH_2C_6H_5$ [85°] (286°) at 100 mm By heating benzyl chloride and diphenyl with zinc dust at 100° two benzyl diphenyls are produced together with traces of anthracene The *p* hydrocarbon is less soluble and solidifies more easily than its isomeride (Goldschmidt, *M* 2, 433) Leaflets or needles, m sol alcohol, v sol. benzene and ether. CrO_3 oxidises it, to

phenyl-benzophenone and benzophenone *p* carbonylic acid

o-Benzyl diphenyl (?). [54°]. (c 285°) at 110 mm Prepared as above Monoclinic needles CrO_3 oxidises it completely

Di benzyl-diphenyl $C_{18}H_{16}(CH_2Ph)_2$ [118°] From di benzyl diphenyl and HI at 170° (Wolf, *B* 14, 2032) Laminæ (from alcohol)

BENZYL PHENYL v PHENYL BENZYL

BENZYL DIPHENYL AMINE v Di PHENYL-BENZYL AMINE

u Di **BENZYL *p* PHENYLENE-DIAMINE** $C_6H_5(NH_2)N(CH_2C_6H_5)_2$ [14] *Amido di benzyl aniline* [90°] Obtained by reduction of *p* nitro di benzyl aniline with tin and HCl Glistening colourless needles V sol ether and hot alcohol, sl sol cold alcohol With Fe_2Cl_6 it gives a deep red colouration, with Fe_2Cl_6 and H_2S a blue insoluble pp By conc HCl at 170° it is completely resolved into benzyl chloride and *p* phenylene diamine

Benzaldehyde compound $C_6H_5CH(OH)NH C_6H_5N(CH_2C_6H_5)_2$ [130°] Microcrystalline yellow pp V sol benzene, sl sol ether, insol alcohol (Matzuda, *B* 20, 1614)

BENZYL PHOSPHINE C_6H_5P 1e $C_6H_5CH_2PH_2$ (180°) From benzyl chloride, PH_3 , and ZnO (Hofmann, *B* 5, 100) Oil, volatile with steam — BHI decomposed by water into its components

Benzyl triethyl phosphonium chloride $PEt_3(CH_2Ph)Cl$ From benzylidene chloride, tri ethyl phosphine and alcohol (Hofmann, *A. Suppl* 1, 323)

Di benzyl phosphine $(CH_2Ph)_2PH$ [205°]. Prepared together with the preceding, and separated by steam distillation, not being volatile Groups of needles (from alcohol), insol acids

Tri benzyl phosphine $P(CH_2Ph)_3$ Appears to be formed as a by product in the action of benzyl chloride on PNa_3 (Letts a. Collie, *Tr E* 30, 181) Splits up on distillation into phosphorus, *s*-di phenyl ethylene, dibenzyl, and toluene

Tri benzyl phosphine oxide $(CH_2Ph)_3PO$ [213°] Formed by heating PH_3 with benzylidene chloride at 130° and boiling the product with alcohol (Fleissner, *B* 13, 1665) Formed also by the action of conc $Ba(OH)_2$ on tetra benzyl phosphonium acid sulphate, a weak solution of baryta giving $P(CH_2H_5)_3OH$ (Letts a. Collie, *Tr E* 30, 181) Needles, insol water, sol alcohol and ether — $(C_2H_5)_2PO_2H_2Cl$ — $(C_2H_5)_2PO_2FeCl_4$ — $(C_2H_5)_2PO_2CoCl_2$ — $(C_2H_5)_2PO_2PdCl_2$ — $(C_2H_5)_2PO_2PtCl_4$ — $(C_2H_5)_2PO_2ZnI_2$ — $(C_2H_5)_2PO_2Br_3$ — $(C_2H_5)_2PO_2S$

Tri benzyl phosphine sulphide $(CH_2Ph)_3PS$ [206°] Obtained by distilling the acid sulphate of tetra benzyl phosphonium (Letts a. Collie) Long thin needles, m sol alcohol

Tetra-benzyl-phosphonium hydroxide $P(C_6H_5)_4OH$ [over 200°] Obtained by adding $BaCO_3$ to the sulphate Rhombohedral plates; v sol water and alcohol, alkaline to litmus Decomposed by heat into $P(C_6H_5)_3O$ and toluene

Tetra-benzyl-phosphonium salts **Chloride** $P(CH_2Ph)_4Cl$ [224°] From benzyl chloride and PNH_4 (L. a. C.) Crystallises from water with 2aq, and from chloroform with $CHCl_3$ Split up by heat into tri benzyl-phosphine, *s*-di phenyl-ethylene, and HCl

Platinochloride $\{P(CH_2Ph)_4Cl\}_2PtCl_4$

Sulphates — $\{P(C_6H_5)_2\}_2SO_4$ [220°] — $P(C_6H_5)_2SO_4H$ [217°]

Oxalate $P(C_6H_5)_2C_2O_4H$ needles

BENZYL ISO PHTHALIC ACID $C_{15}H_{12}O_4$ *ie* $C_6H_5CH_2CH_2C_6H_4(CO_2H)_2$ [243°] From benzoyl-iso phthalic acid by reduction with sodium amalgam (Zincke, *B* 9, 1765) Crystalline powder, v sl sol water — BaA'' — CaA'' aq

Benzyl terephthalic acid

$C_6H_5CH_2CH_2C_6H_4(CO_2H)_2$ Obtained by reduction of benzoyl terephthalic acid (Weber, *J* 1878, 403) — BaA''

BENZYL PHTHALIMIDINE $C_{15}H_{11}ON$ *ie*

$C_6H_5 \begin{array}{c} \diagup CH-CH_2C_6H_5 \\ \diagdown CO \end{array} NH$ [137°] Colourless

plates or scales Formed by reduction of benzyl idene phthal imidine by means of HI

Nitrosamine $C_6H_5 \begin{array}{c} \diagup CH-CH_2C_6H_5 \\ \diagdown CO \end{array} N(NO)$

[93°], yellow crystals, easily soluble in benzene, ligroin, and chloroform (Gabriel, *B* 18, 1262)

BENZYL-PHTHALIMIDE

$C_6H_5C_2O_2NCH_2C_6H_5$ *Phthalyl benzylamine* [116°] Long needles Obtained by heating potassium phthalimide with benzyl chloride at 170°–180° HCl at 200° splits it up into phthalic acid and benzylamine (Gabriel, *B* 20, 2227)

BENZYL PIPERIDINE $C_{15}H_{19}N$ (C_6H_5) (245°)

Colourless liquid Insol water Prepared by the action of benzyl chloride on piperidine — $(B'HC)_2PtCl_4$ sparingly soluble pp

Methyl iodide $B'Mel$ [145°] Thick prisms By moist Ag_2O it gives an alkaline hydrate which on dry-distillation yields methyl benzyl piperidine (Schotten, *B* 15, 423)

BENZYL PROPIONATE $C_{15}H_{19}O_2$ *ie*

$C_6H_5CH_2CO_2CH_2CH_3$ (220°) $SG \frac{16.5}{17.5} 1.0360$ Decomposed by Na into sodium propionate and benzyl phenyl butyrate (Conrad & Hodgkinson, *A* 193, 320)

***v* - BENZYL - PYRROL** $C_6H_5NCH_2CH_3$ (247° uncorr) Colourless crystalline solid Melts when touched with the hand V sol alcohol and ether, nearly insol water (Ciamician & Silber, *B* 20, 1369)

***v* BENZYL PYRROLENE DI METHYL DI-KETONE** $C_{14}H_{14}(COCH_3)_2NCH_2CH_3$ *v* *Benzyl di-acetyl pyrrol* [130°] Formed by heating *v* benzyl pyrrol with Ac_2O at 240° Colourless plates Sol ether and benzene, sl sol water, nearly insol petroleum ether (Ciamician & Silber, *B* 20, 1370)

BENZYL QUINOLINUM HYDROXIDE *v*

Benzyl hydroxide of QUINOLINE

BENZYL ROSANILINES From rosaniline and benzyl chloride (Dahl, *D P J* 263, 393), *v* **ROSANILINE**

Methyl-iodide From rosaniline, MeI and $MeOH$ (Hofmann, *B* 6, 263)

BENZYL SELENI ($C_6H_5CH_2$) $_2Se$ [46°]

From benzyl chloride and P_2Se_3 (C L Jackson, *A* 179, 1) Long needles or prisms (from alcohol), faint odour, insol water, v sol. alcohol and ether HNO_3 forms "selenobenzyl nitrate" [88°] — $\{(C_6H_5)_2Se\}_2PtCl_4$

Benzyl diselenide $(CH_2Ph)_2Se_2$ [90°] Formed by boiling Na_2Se_2 , benzyl chloride, and alcohol for some hours (*J*). Unctuous yellow

scales (from alcohol) With MeI it forms $(CH_2Ph)_2SMe_2$ [65°] from which may be obtained $\{(CH_2Ph)_2SMe_2Cl\}_2PtCl_4$ Conc HNO_3 forms toluene exo selenic acid, $C_6H_5CH_2SeO_2H$

BENZYL SELENO CYANIDE C_6H_5NSe *ie* $C_6H_5CH_2SeCy$ [72°] From benzyl chloride and potassium selenocyanide (Jackson *B* 8, 321) Prismatic needles with repulsive odour, insol water, v sol hot alcohol HNO_3 forms $C_6H_5(NO_2)CH_2SeCy$ [123°]

BENZYL SELEN UREA C_6H_5NHSe *ie* $NHCSNHCH_2Ph$ [70°] From benzylamine hydrochloride and alcoholic potassium seleno cyanide (Spica, *G* 7, 90) Sol water, alcohol, and ether, gradually depositing Se Conc HCl forms benzylamine, Se , and HCN

u **di-benzyl seleno-urea** $NHCSN(CH_2Ph)_2$ [150°] From dibenzylamine hydrochloride and $KSeCy$ Thin prisms or needles, v sol hot water, alcohol, and ether C_6H_5HCl forms Se , CNH , and dibenzylamine

TETRA BENZYL SILICANE $C_6H_5Si_4$ *ie* $Si(CH_2Ph)_4$ *Silicon tetra benzyl* [128°] (above 550°) $SG \frac{22}{21} 1.078$ Formed by the action of sodium upon a mixture of benzyl chloride and $SiCl_4$, with addition of a little acetic ether (Polis, *B* 18, 1543, 19, 1023) Large mono symmetrical prisms, sol ether, benzene, and chloroform, sl sol alcohol May be distilled

BENZYL SULPHIDE C_6H_5S *ie* $(CH_2Ph)S$ [50°] From benzyl chloride and alcoholic K_2S (Marcker, *A* 136, 88) Thick trimetric tablets (from ether), $a b c = 813.1 \ 515$ (Forst, *A* 178, 370, Bodewig) On distillation it gives *s* di phenyl ethylene and its sulphide (Barbier, *C R* 78, 1772), toluene, benzyl mercaptan, *s* di phenyl acetylene sulphide $SCPh_2$, and thionessal C_6H_5S MeI forms SMe_2I , benzyl iodide and $(CH_2Ph)_2SMe_2I$, the latter gives rise to the compound $\{(CH_2Ph)_2SMe_2Cl\}PtCl_4$ Ethyl iodide at 100° forms similarly $(C_6H_5)_2SEtI$ whence $\{(C_6H_5)_2SEtCl\}PtCl_4$ (Scholler, *B* 7, 1274, cf Cahours, *A Ch* [5] 10, 21)

DI-BENZYL DI SULPHIDE $(C_6H_5CH_2)_2S_2$ *Sulphobenzyl* [70°]

Formation — 1 By the action of an alcoholic solution of KHS or KS on benzylidene di chloride — 2 By the action of alcoholic KHS on (a) thiobenzoyl aldehyde (Klinger, *B* 15, 861) — 3 By the oxidation of benzyl mercaptan by air or bromine (Marcker, *A* 140, 86) — 4 By the action of K_2S_2 on benzyl chloride in alcohol (*M*)

Properties — White plates Gives a crystalline pp $(C_6H_5)_2S_2AgNO_3$ with an alcoholic solution of $AgNO_3$

BENZYL-SULPHINIC ACID *v* **TOLUENE EXO-SULPHINIC ACID**

BENZYL SULPHOCYANIDE

$C_6H_5CH_2SCN$ [41°] (*B*), [38°] (*H*), (*c* 233°) (*B*), (256°) (*H*) From benzyl chloride and alcoholic potassium sulphocyanide (Henry, *B* 2, 636, Barbaglia, *B* 5, 689) Prisms (from alcohol), insol water, pungent smell Combines with HBr , forming a compound decomposed by water Fuming nitric acid forms $C_6H_5(NO_2)CH_2SCy$

DI-BENZYL SULPHONE $C_6H_5SO_2$ *ie* $(CH_2Ph)_2SO_2$ [150°]

Formation — 1 Together with $C_6H_5CH_2SO_3K$ by the action of K_2SO_4 on benzyl chloride (Vogt & Henninger, *A* 165, 375) — 2 By oxida-

tion of di-benzyl sulphoxide with KMnO_4 and HOAc (Otto & Lueders, *B* 13, 1284) — 3 By the action of benzyl chloride on sodium benzene sulphinate — 4 By oxidation of di-benzyl sulphide

Properties — Small needles. Insol water, sol alcohol, benzene, and acetic acid. By oxidising agents it is readily oxidised to benzoic and sulphuric acids (Otto, *B* 13, 1277)

BENZYL SULPHONIC ACID *v* TOLUENE

exo SULPHONIC ACID

DIBENZYL-SULPHONIC ACID *v* Di- PHENYL ETHANE SULPHONIC ACID

DI BENZYL SULPHOXIDE $\text{C}_6\text{H}_5\text{SO}_2$ (CH₂Ph)₂SO [133°] Formed di-benzyl sulphide and cold HNO_3 (S G 13) (Maicker, *A* 136, 89, Otto & Ludwig, *B* 13, 1284) Laminæ (from water or alcohol)

BENZYL SULPHUROUS ACID *v* TOLUENE SULPHONIC ACID

BENZYL TARTRONIC ACID $\text{C}_6\text{H}_5\text{O}_3$ *v* $\text{C}_6\text{H}_5\text{CH}_2\text{C}(\text{OH})(\text{OOH})$ [143°] Formed simultaneously with cinnamic acid by the action of KOH on benzyl chloro malonic ether. On heating it forms β phenyl α oxy propionic acid (phenyl lactic acid [98°]) (Conrad, *B* 13, 2160, *A* 209, 245)

BENZYL TEREPHTHALIC ACID *v* BENZYL- PHTHALIC ACID

BENZYL THIO CARBAMIDE $\text{C}_6\text{H}_5\text{N}_2\text{S}$ *v* $\text{NH}_2\text{C}(\text{NH}_2)\text{SCH}_2\text{Ph}$ Cyanamide benzyl mercaptan [72°] From benzyl chloride and thio urea (Bernthsen & Klinger, *B* 12, 575) Slender needles, m sol water, decomposed by heat into benzyl mercaptan and di cyan di amide — B^+HCl^- [168°] — $\text{B}^+\text{H}_2\text{PtCl}_6^-$

BENZYL THIO CARBIMIDE

$\text{C}_6\text{H}_5\text{CH}_2\text{NCS}$ Benzyl mustard oil (243°) Benzylamine is dissolved in CS and the product boiled with alcohol and HgCl_2 (Hofmann, *Z* [2] 4, 690, *B* 1, 201) Oil, smelling like water cress

BENZYL THIO GLYCOLLIC ACID *v* THIO GLYCOLLIC ACID

BENZYL THIO UREA $\text{C}_6\text{H}_5\text{N}_2\text{S}$ *v* $(\text{CH}_2\text{Ph})\text{NHCSNH}_2$ [101°] From potassium sulphocyanide and benzylamine hydrochloride (Paterno & Spica, *G* 5, 388, *B* 9, 81) Sol water and alcohol

Benzoyl derivative $\text{C}_6\text{H}_5\text{NHCSNHBz}$ [145°] From benzoyl sulphocyanide and benzylamine (Miquel, *A Ch* [5] 11, 313)

s Di benzyl thio urea $(\text{PhCH}_2\text{NH})_2\text{CS}$ [114°] From alcoholic benzylamine and CS_2 (Strakosch, *B* 5, 692) Four sided plates, insol water, sol alcohol and ether. Converted by HgO into di-benzyl urea. Alkyl iodides give the following derivatives

- $\text{PhCH}_2\text{NHCSNMeCH}_2\text{Ph}$ —
- $(\text{C}_6\text{H}_5\text{NHCSNMeC}_6\text{H}_5)_2\text{H}_2\text{PtCl}_6$ —
- $\text{C}_6\text{H}_5\text{NHCSNMeC}_6\text{H}_5\text{HI}$ [99°] —
- $\text{PhCH}_2\text{NHCSNMeCH}_2\text{Ph}$ —
- $(\text{C}_6\text{H}_5\text{NHCSNMeC}_6\text{H}_5)_2\text{H}_2\text{PtCl}_6$ —
- $\text{C}_6\text{H}_5\text{NHCSNMeC}_6\text{H}_5\text{HI}$ [93°] —
- $\text{C}_6\text{H}_5\text{NHCSNMeC}_6\text{H}_5\text{SO}_3$ —
- $\text{PhCH}_2\text{NHCSNPrCH}_2\text{Ph}$ —

$\text{PhCH}_2\text{NHCSN}(\text{C}_6\text{H}_{11})\text{CH}_2\text{Ph}$ (Reimarus, *B* 19, 2348)

u Di benzyl-thio urea $(\text{PhCH}_2)_2\text{NCSNH}_2$ [157°] From potassium sulphocyanide and dibenzylamine hydrochloride (P & S) Large needles, m sol water

BENZYL THYMOL $\text{C}_{11}\text{H}_{20}\text{O}$ *v* $\text{C}_6\text{H}_5\text{MePr}(\text{CH}_2\text{Ph})(\text{OH})$

(255°) at 8 mm. Formed, together with di-benzyl thymol by heating benzyl chloride with thymol and zinc dust (Mazzara, *G* 11, 846) Oil, insol aqueous alkalis, sol alcohol and ether. Fe_2Cl_6 gives a red colour on heating

Acetyl derivative $\text{C}_{11}\text{H}_{18}\text{AcO}$ (245°) at 8 mm

Di benzyl thymol $\text{C}_{21}\text{H}_{36}\text{O}$ *v* $\text{C}_6\text{HMePr}(\text{CH}_2\text{Ph})\text{OH}$ [76°]

Prepared as above Silky laminæ, sol ether and HOAc , insol water and aqueous alkalis. Fe_2Cl_6 gives a red colour on heating

Acetyl derivative $\text{C}_{21}\text{H}_{34}\text{AcO}$ [c 84°]

Methyl derivative $\text{C}_{21}\text{H}_{36}\text{MeO}$ [90°]

Benzoyl derivative $\text{C}_{21}\text{H}_{34}\text{BzO}$ [c 78°]

BENZYL-TOLUENE *v* PHENYL TOLYL

METHANE

DI BENZYL TOLUENE $\text{C}_{21}\text{H}_{26}$ *v* $\text{CH}_3\text{C}_6\text{H}_4(\text{CH}_2\text{Ph})_2$

(c 394°) A product of the action of benzyl chloride on toluene in presence of zinc dust (Weber & Zincke, *B* 7, 1154)

BENZYL *p* TOLUIDINE $\text{PhCH}_2\text{NHCH}_2\text{Me}$ (313°) From benzylidene *p* toluidine (Kohler, *A* 241, 359)

Di-benzyl *p* toluidine $\text{C}_{21}\text{H}_{22}\text{N}_2$ *v* $(\text{PhCH}_2)_2\text{NCH}_2\text{Me}$ [55°] From benzyl chloride and *p* toluidine (Cannizzaro, *A Suppl* 4, 80)

Slender needles, m sol cold alcohol Weak base

BENZYL TOLYL- *v* TOLYL BENZYL

BENZYL TOLYL-METHANE *v* PHENYL TOLYL ETHANE

BENZYL-TOLYL OXIDE *v* BENZYL ALCOHOL

BENZYL UREA $\text{C}_6\text{H}_5\text{N}_2\text{O}$ *v* $\text{NH}_2\text{CO NHCH}_2\text{Ph}$

[147°] Formed, together with di-benzyl urea, by heating benzyl chloride with potassium cyanate in alcoholic solution (Cannizzaro, *G* 2, 41) Also from benzyl cyanate and alcoholic NH_3 (Letts, *C J* 25, 448) or from benzylamine chloride and potassium cyanate (Paterno & Spica, *G* 5, 388, *B* 9, 81) Long needles (from alcohol), m sol water At 200° it splits up into NH_3 and *s* di-benzyl urea

s Di-benzyl urea $(\text{CH}_2\text{PhNH})_2\text{CO}$ [167°]

Formation — 1 From benzyl chloride and KNC O or urea — 2 From benzyl urea by heating — 3 By heating benzyl alcohol with urea nitrate (Campisi & Amato, *G* 1, 39, *B* 4, 412) 4 From *s* di-benzyl thio urea, HgO , and alcohol (Strakosch, *B* 5, 692)

Properties — Needles, insol water, *v* sol alcohol Weak base

u Di-benzyl urea $(\text{CH}_2\text{Ph})_2\text{NCO NH}_2$ [125°] From di-benzyl amine hydrochloride and KNC O (Paterno & Spica, *G* 5, 388, *B* 9, 81) Thick prisms, sl sol cold water

BENZYL URETHANE *v* BENZYL CARBAMIC

ACID

BENZYL *m* XYLENE $\text{C}_{15}\text{H}_{18}$ *v* $\text{C}_6\text{H}_5\text{CH}_2\text{C}_6\text{H}_4\text{Me}$

Phenyl xylyl methane (296° i V) From *m* xylene, benzyl chloride, and zinc dust or Cu (Zincke, *B* 5, 799, 9, 1761) Oxidation gives benzoyl iso-phthalic acid. Appears also to be formed by reducing phenyl xylyl ketone with HI (Sollischer, *B* 15, 1682)

Benzyl-*p* xylene (295°) From *p* xylene, benzyl chloride and zinc dust (Z)

BENZYL XYLYL KETONE

$\text{C}_6\text{H}_5\text{CH}_2\text{CO C}_6\text{H}_4(\text{CH}_2)_2$ [124] *Dimethyl-*

deoxybensoïn (above 350°) Fluid Formed by the action of Al_2Cl_3 on a mixture of *m* xylene and phenyl acetyl chloride. On oxidation it gives di methyl benzoic acid (Sölscher, *B* 15, 1681)

BERBAMINE $\text{C}_{18}\text{H}_{19}\text{O}_2\text{N}$ [156°] Occurs in the root of *Berberis vulgaris*, together with berberine, oxy acanthine, and at least one other alkaloid. Small plates, containing 2 aq. Easily sol ether. The hydrochloride forms small plates, the nitrate needles— $\text{B}'\text{HCl}_2\text{PtCl}_2$, 5 or 6 aq. yellow crystalline pp, sl sol cold water (Hesse, *B* 19, 3193)

BERBERIC ACID $\text{C}_8\text{H}_6\text{O}_4$ aq. An acid formed by fusing berberine with KOH (Hlasiwetz & Gilm, *J* 1864, 407). Needles, v sol alcohol and ether, in sol water. Fe_2Cl_6 gives a green colour turned red by ammonium tartrate. Reduces hot Fehling's solution and silver solution

BERBERINE $\text{C}_{20}\text{H}_{21}\text{NO}_4$ 4 aq [120°] S 22 at 21° S (alcohol) 1 at 15° Occurs in the root of the barberry, *Berberis vulgaris*, together with oxy acanthine (*q v*), berbamine and another alkaloid (Buchner, *A* 24, 228, Hesse, *B* 19, 3190). Occurs also in Colombo root (*Cocculus palmatus*) (Fleitmann, *A* 59, 160, Bödeker, *A* 66, 384, 69, 40), in *Monospermum fenestratum* (Perrins, *C J* 15, 339), in Abocoouta bark from *Calorline polycarpa* (Stenhouse, *Ph* 14, 455, *C J* 20, 187, Daniel, *A* 105, 360), in *Leontice thalictrodes* (Mayer, *J Ph* [3], 46, 496), in *Xanthoxylon clava Hercules* (Chevallier & Pelletan, *Berz J* 7, 266, Perrins, *A Suppl* 2, 171), in bark of *Geoffroyea vermis* (Gastell, *J* 1866, 480), in *Copitis trifolia* (Gross, *J* 1874, 914), and in the root of *Evodia glauca* (Martin, *Ph* [3] 13, 337)

Preparation—1 The finely powdered root of *Hydrastis canadensis* is extracted with alcohol, H_2SO_4 is added to the cooled extract, and the pp decomposed by NH_3 . The operation is repeated a second time (Lloyd, *Ph* [3] 10, 125, cf Merril, *Am J Pharm* 35, 97, Procter, *C N* 9, 112)—2 Barberry root is exhausted with boiling water, the extract evaporated, and treated with 92 p.c alcohol. The berberine is purified by crystallisation from water or alcohol (Buchner)

Properties—Silky yellow needles. tastes bitter, sl sol cold water and alcohol, insol ether. Turned brown by ammonia. On adding iodine in potassium iodide to a solution of berberine hydrochloride the periodide is ppd. It crystallises from alcohol in red needles, but on adding water, green plates separate

Reactions—1 Zinc and dilute acids form hydro berberine—2 Potash fusion produces two acids, $\text{C}_8\text{H}_6\text{O}_4$ and $\text{C}_8\text{H}_6\text{O}_5$ (Hlasiwetz & Gilm, *J* 1864, 406)—3 Nitric acid oxidises it to berberonic acid—4 KMnO_4 in presence of KHO forms hemipic acid, [162°] (E Schmidt & Schilbach *Ar Ph* [3] 25, 164)

Salts—(Fleitmann, *A* 59, 160, Henry, *A* 115, 132, Perrins, *C J* 15, 339, Hlasiwetz, *A Suppl* 2, 191)— $\text{B}'\text{HCl}$ slender yellow needles— $\text{B}'\text{HCl}_2$ 4 aq— $\text{B}'\text{HCl}_2$ 2 aq S G ¹⁹/₄ 1 397 (Clarke, *Am* 2, 175)— $\text{B}'\text{H}_2\text{HgCl}_2$ — $\text{B}'\text{HHgCl}_2$ (Hinterberger, *A* 82, 314)— $\text{B}'\text{H}_2\text{Cl}_2\text{HgCy}_2$ (Kohl & Swoboda, *J* 1852, 550)— $\text{B}'\text{H}_2\text{PtCl}_2$ small needles S G ¹/₂ 1 758 (C)— $\text{B}'\text{H}_2\text{AuCl}_2$ maroon coloured needles—

$\text{B}'\text{HBr}_2$ 1 aq— $\text{B}'\text{HI}$ — $\text{B}'\text{HI}$ — $\text{B}'\text{HCN}$ — $\text{B}'\text{HSCN}$ 1 aq— $\text{B}'\text{H}_2\text{FeCy}_2$ — $\text{B}'\text{H}_2\text{FeCy}_2$ — $\text{B}'\text{H}_2\text{C}_2\text{O}_4$ — $\text{B}'\text{HClO}_4$ — $\text{B}'\text{C}_2\text{H}_3\text{O}_4$ 1 aq— $\text{B}'\text{C}_2\text{H}_3\text{O}_4$ 1 aq— $\text{B}'\text{C}_2\text{H}_3\text{O}_4$ (SbO) (Stenhouse, *Pr* 12, 491)— $\text{B}'\text{H}_2\text{CrO}_4$ — $\text{B}'\text{C}_2\text{H}_3\text{O}_4$ (NO₂) OH— $\text{B}'\text{H}_2\text{SO}_4$ — $\text{B}'\text{HNO}_3$ — $\text{B}'\text{H}_2\text{S}_2\text{O}_7$ Ag₂SO₄

Methylo iodide $\text{B}'\text{MeI}$ needles (Bernheimer, *G* 13, 345)

Ethylo iodide $\text{B}'\text{EtI}$ needles

Hydroberberine $\text{C}_{20}\text{H}_{21}\text{NO}_4$ Obtained by reducing berberine in acid solution with zinc (Hlasiwetz & Gilm, *A Suppl* 2, 191). Granules or needles (from alcohol). Reconverted into berberine by HNO_3 .

Salts— $\text{B}'\text{HCl}$ — $\text{B}'\text{H}_2\text{PtCl}_2$ — $\text{B}'\text{H}_2\text{SO}_4$ — $\text{B}'\text{H}_2\text{SO}_4$ — $\text{B}'\text{H}_2(\text{H}_2\text{SO}_4)_2$ 4 aq (?)— $\text{B}'\text{HI}$ — $\text{B}'\text{HNO}_3$

Methylo iodide $\text{B}'\text{MeI}$ trimetric crystals, $a b c = 1.033 \ 1 \ 1.789$ — $\text{B}'\text{MeOH}$ (Bernheimer, *G* 13, 342)

Ethylo iodide $\text{B}'\text{EtI}$ prisms

BERBERONIC ACID v PYRIDINE TRI CAR

BOXYLIC ACID

BERGAMOT OIL An aromatic essential oil expressed from the rind of an orange, *Citrus bergamia*. Its SG is 87. It contains a steareptene, a terpene, and a terpene hydrate (?) By rectification a liquid (183°) may be got, which absorbs HCl (Soubeiran & Capitaine, *J Ph* 26, 68, 509). The steareptene (*Berg aptene*) is deposited after long keeping. It is solid, [266°], but volatilises without decomposition. It may be $(\text{C}_8\text{H}_6\text{O})_x$ (Mulder, *A* 31, 70, Ohme, *A* 31, 316)

BERGENITE $\text{C}_8\text{H}_6\text{O}_4$ aq [130°] SG 1.5 [α_D] = -51° 36' Obtained from Siberian saxifrage (*Bergenia siberica*) by extracting with hot water, ppg the tannins with lead acetate, and evaporating to crystallisation (Morelli, *C R* 93, 646). Trimetric prisms. Tastes bitter. V sl sol cold alcohol and water

Acetyl derivative $\text{C}_8\text{H}_6\text{AcO}_2$ amorphous, v sol water, alcohol, and ether

Tri acetyl derivative $\text{C}_8\text{H}_6\text{Ac}_3\text{O}_3$

Penta acetyl derivative $\text{C}_8\text{H}_6\text{Ac}_5\text{O}_5$

BERLIN BLUE—Prussian Blue v Ferro-cyanide of iron under CYANIDES

BERONIC ACID v PYRIDINE DI-CARBOXYLIC ACID

BERYLLIUM Be (*Glucinum*) At w 9.08 Mol w unknown SG ²⁰/₂ (after compression) 1.85 (Humpidge, *Pr* 39, 1) SH (100°) 4702, (200°) 540, (400°) 6172, (500°) 6206 (Humpidge, *Pr* 39, 1) SH (20°) 397, (73°) 448, (157°) 519, (257°) 581 (Meyer's calculation, *B* 13, 1780, from data of Nilson and Pettersson who worked with metal containing about 95 p.c Be, *B* 13, 1451) SVS 4.92 Crystallises in hexagonal, holohedral, forms, $a c = 1.15801$ (Brogger & Flink, *B* 17, 849)

Occurrence—Only in combination, in beryl ($3\text{BeO} \cdot \text{Al}_2\text{O}_3 \cdot 6\text{SiO}_2$) and some other silicates, also in *chrysoberyl* $\text{Al}_2\text{O}_3 \cdot \text{BeO}$. Beryllium oxide was recognised as a distinct body in 1797 by Vauquelin, the metal was obtained by Wöhler in 1827, but approximately pure beryllium was not prepared until 1885, in which year Humpidge obtained specimens containing 99.2 p.c Be, 1 Fe, and 7 BeO

Preparation—Wöhler (*P* 13, 577) obtained an impure metal by the action of K on fused

BeCl₂, Debray (*C R* 33, 784) obtained purer specimens by using Na and a special form of apparatus Nilson a Pettersson, by decomposing BeCl₂ by Na in closed iron crucibles heated in a wind-furnace (*B* 11, 881), and sifting the crystals through Pt gauze (*B* 13, 1455), obtained specimens containing 94.4 p.c Be (BeO = 4.99, Fe = 70) Humpidge (*Pr* 38, 188, 39, 1) purified BeO by solution in (NH₄)₂CO₃Aq and decomposing the solution by steam, he mixed the BeO thus obtained with pure charcoal and starch paste and heated in Cl in a glazed porcelain tube, the BeCl₂ thus obtained was placed in an iron boat, and thus in an iron tube surrounded by another tube of hard glass, another iron boat contained Na, the Na was heated in a stream of H, and the BeCl₂ was then vaporised (in H) over the molten Na. The crystals of Be were washed in dilute NaOHaq, to remove BeO, then in water, and dried.

Properties—Steel coloured, hard, hexagonal, holohedral (Brögger a Flunk, *B* 17, 849) crystals. Unchanged in ordinary air, scarcely changed by heating in air. Scarcely acted on by O or S at red heat, but burns in Cl to BeCl₂ (Nilson a Pettersson, *B* 11, 384). Burns in O H flame (Humpidge, *T* 174, 601). Dissolves slowly in acids, also in aqueous alkalis, with evolution of H. Many of the properties ascribed to Be by Wöhler (*P* 13, 577), and Debray (*A Ch* [3] 44, 5), were the results of experiments with very impure material. Emission spectrum characterised by the lines 3320.5, 2649.4, 2493.2, and 2477.7, of which 3320.5 is the most prominent (Hartley, *C J* 43, 316). The atomic weight of Be has been determined (i) by analyses, and determinations of V.D., of BeCl₂ and BeBr₂, (ii) by determinations of S.H. of Be, (iii) by analyses of various compounds, especially recently of the pure crystallised sulphate by Nilson a Pettersson (*B* 13, 1451) [for older analyses v. Berzelius, *P* 8, 187, Awdewj, *P* 56, 101, Klatzo, *J pr* 106, 227], (iv) by the application of the periodic law. There has been much investigation and discussion concerning the value to be given to the atomic weight of Be, some chemists insisted that 13.65 is the true value, and that the oxide is Be₂O₃. The determinations of the V.D. of BeCl₂ and BeBr₂, the careful measurement of the S.H. of almost pure Be, and the consideration of the physical and chemical relations of Be and its compounds to other elements carried out on the lines suggested by the periodic law, have finally established the value 9.08-9.1 for the atomic weight of Be. The S.H. of Be increases rather rapidly as the temperature increases, and approaches a constant value, equal to about 62, between 400° and 500° (Humpidge, *Pr* 39, 1). The relation between S.H. and temperature is expressed by the empirical formula $K_1 = 3756 + 0.0106t - 0.0000114t^2$ (Humpidge, *Pr* 38, 188). The product of S.H. into At w ($62 \times 9.1 = 5.64$) is lower than the mean value of this quantity for the solid elements, but is nearly the same as that obtained for B, C, and Si. The atom of Be is divalent in the gaseous molecules BeCl₂ and BeBr₂, these are the only compounds of Be at present known in the gaseous state. A comparison of the spectrum of Be with those of In and Al on the one

hand, and of Mg, Ca, Ba, Sr, on the other, shows that Be is rather to be classed with the latter than with the former elements, the value 9.1 for the atomic weight of Be is thus confirmed (v. Hartley, *C N* 48, 195). Beryllium is a markedly positive, or metallic, element, it does not exhibit allotropy. It is chemically related to Mg, Ca, Sr, and Ba, in much the same way that Li is related to Na, K, Cs, and Rb. BeO resembles MgO, but is distinctly less basic, *eg* it dissolves in KOHAq, and does not combine directly with H₂O, compare also [BeO·H⁺, H⁺SO⁺Aq] = 16,096, with [MgO·H⁺, H⁺SO⁺Aq] = 31,216. Analogies also exist between Be and Al, *eg* the existence of many basic salts, Be, however, does not form an alum, BeCl₂ does not combine with NaCl and KCl as Al₂Cl₃ does. In dilute acid solutions Be is electronegative to Mg but positive to Al, in caustic alkali solutions the electrochemical order is +Al, Mg, Be— (Humpidge, *Tr* 174, 601). Be forms only one series of compounds, BeCl₂, BeSO₄, Be₂NO₃, &c., it exhibits a marked tendency to form basic salts, *eg*, BeSO₄, BeO 3H₂O, BeCO₃, 3BeO 5H₂O, &c. Brauner (*B* 14, 53) sums up the chemical relations of Be in the three statements (1) Li Be = Be B (2) Li Na = Be Mg = B Al (3) Li Mg = Be Al = B Si. The chemical relations of Be will be more fully discussed in the art MAGNESIUM METALS, v. also the remarks on Group II in art CLASSIFICATION. The following are the principal papers bearing on the At w of Be: Reynolds, *P M* [5] 3, 38, *ibid Pr* 35, 248, Humpidge, *Pr* 35, 358, 38, 188, 39, 1, Hartley, *C J* 43, 316, *ibid Pr* 36 462, Carnelley, *Pr* 29, 190, *ibid B* 17, 1357, Brauner, *B* 11, 872, 14, 53, Meyer, *B* 11, 577, 13, 1780, Nilson a Pettersson, *B* 11, 381, 906, 13, 1451, 2035, 17, 987.

Reactions—As most of the reactions said to characterise Be have been obtained by experimenting with material far from pure, the following statements must be accepted as provisional only—1 *Hydrochloric acid*, whether gaseous or aqueous, reacts readily to produce BeCl₂.—2 *Sulphuric acid* dissolves Be, forming BeSO₄Aq.—3 *Nitric acid* acts very slowly even when hot and concentrated.—4 Be dissolves in warm KOHAq or NaOHaq.

Combinations—1 Be combines readily with Cl, Br, and I to form BeCl₂, BeBr₂, and BeI₂, respectively.—2 It also combines very readily with Si, and, according to the observations of Wöhler, made, however, with very impure material, with P, Se, and S, later experiments seem to show that Be and S do not combine when heated together (Nilson a Pettersson, *B* 11, 381).—3 An alloy of Be and Fe was described by Stromeyer as a white solid, less malleable than iron, obtained by strongly heating BeO with Fe and charcoal.

Detection—1 *Caustic potash or soda* pps. BeOH₂O soluble in excess, but reppd on diluting and boiling.—2 *Ammonium carbonate* pps. the carbonate easily soluble in excess, this reaction distinguishes salts of Be from salts of Al.—3 Be salts give no colour when heated with Co 2NO₃.

Estimation—As oxide, by ppg by excess of NH₄Aq, washing, drying, and strongly heating BeO is separated from Al₂O₃ by the action of

(NH_4) $_2\text{CO}_3$ (v Hofmeister, *J pr* 76, 1), or by converting the alumina into potash alum (v Scheffer, *A* 109, 144)

Beryllium, Alloys of Little or nothing is known, v **BERYLLIUM, Combinations**, No 3

Beryllium, Bromide of BeBr_2 Mol w 168.6 [abt 600°] (Carnelley, *B* 17, 1357), sublimes readily at 450° V D 90 (Humpidge, *Pr* 38, 188)

Preparation —1 By heating Be in Br vapour (Wöhler, *P* 13, 577) —2 By heating BeO mixed with charcoal and made into a paste with starch, in dry Br (Humpidge, *T* 174, 601) Crystals of hydrated BeBr_2 are obtained by dissolving freshly pptd $\text{BeO} \cdot \text{H}_2\text{O}$ in HBrAq , and evaporating (Berthelot, *A Ch* [2] 44, 394)

Properties —Long white needles, very deliquescent Heated in air, partly sublimes, and is partly decomposed into BeO and Br

Beryllium, Chloride of BeCl_2 Mol w 80, at low temps = 160 = BeCl_2 , [about 600°] but sublimes considerably lower (Carnelley, *C J* 37, 26, v also *ibid* *B* 17, 1357) V D (685° to 1500°) 40.96 (mean of 4), V D (520°) 60.4 (Nilson a Pettersson, *B* 17, 987, *J pr* [2] 33, 1)

Preparation —1 By heating Be in Cl_2 —2 By heating BeO and C in Cl_2 and subliming in HCl —3 By heating Be in perfectly dry HCl , and subliming in the same (Nilson a Pettersson, *B* 17, 987)

Properties —Snow-white crystalline mass, easily fused and volatilised, melts to a colourless refractive liquid, may be sublimed unchanged in pure dry N or CO_2 , but is easily decomposed into BeO and Cl_2 if a little air is present (Nilson a Pettersson, *B* 17, 987) Is practically a non conductor of electricity (Nilson a Pettersson, *B* 11, 332, Humpidge, *T* 174, 601)

Reactions —Dissolves in water with production of much heat, on evaporation, an oxychloride $\text{Be}_2\text{OCl}_2 \cdot \text{H}_2\text{O}$ (= $\text{BeCl}_2 \cdot \text{BeO} \cdot \text{H}_2\text{O}$) is obtained, if the solution is placed over H_2SO_4 under a bell-jar, crystals of $\text{BeCl}_2 \cdot 4\text{H}_2\text{O}$ separate out (Awdejew, *P* 56, 101, Atterberg, *Bl* [2] 24, 358)

Combinations —1 With chlorides of various heavy metals, to form double compounds, especially $\text{BeCl}_2 \cdot 3\text{HgCl}_2 \cdot 6\text{H}_2\text{O}$, and $\text{BeCl}_2 \cdot \text{SnCl}_4 \cdot 8\text{H}_2\text{O}$ (Atterberg, *B* 7, 473), $\text{BeCl}_2 \cdot \text{PtCl}_4 \cdot 9\text{H}_2\text{O}$ (Thomsen, *B* 3, 827, 7, 75) The salt $\text{BeCl}_2 \cdot \text{PtCl}_4 \cdot 9\text{H}_2\text{O}$ is analogous in composition to the Ca double salt $\text{CaCl}_2 \cdot \text{PtCl}_4 \cdot 9\text{H}_2\text{O}$, dried from 120° to 300° the Be salt retains $4\text{H}_2\text{O}$, and corresponds with double Ba-Pt salt, $\text{BaCl}_2 \cdot \text{PtCl}_4 \cdot 4\text{H}_2\text{O}$ 2 With ether to form $\text{BeCl}_2 \cdot 2(\text{C}_2\text{H}_5)_2\text{O}$ (Atterberg, *Bl* [2] 24, 358)

Beryllium, Fluoride of Hydrated BeO dissolves easily in HFAq , on evaporation, a transparent, gum like, mass is obtained which becomes opaque at 100°, but remains soluble in water, this is probably BeF_2 (Berzelius) The double compounds $\text{BeF}_2 \cdot 2\text{KF}$, and $\text{BeF}_2 \cdot \text{KF}$, are described by Marignac (*A Ch* [4] 30, 45), the former obtained by adding much KFAq , the latter by adding little KFAq , to a solution of $\text{BeO} \cdot \text{H}_2\text{O}$ in HFAq , and evaporating The compounds $2\text{NaF} \cdot \text{BeF}_2$, $\text{NaF} \cdot \text{BeF}_2$, and $2\text{NH}_4\text{F} \cdot \text{BeF}_2$, are also described by Berzelius

Beryllium, Hydrated oxide of, v **BERYLLIUM, HYDROXIDES OF**.

Beryllium, Hydroxides of A compound of Be, H, and O, agreeing in composition with the formula $\text{BeO} \cdot \text{H}_2\text{O}$ (= $\text{BeO} \cdot \text{H}_2\text{O}$) is obtained as a white powder by ppg a hot solution of a Be salt by NH_4Aq , or KOHAg , boiling, collecting, washing, and drying at 100° (Atterberg, *Bl* [2] 24, 358, Weeren, *P* 92, 91), on heating more highly, BeO remains Van Bemmelen (*J pr* [2] 26, 227) says that the pp by KOHAg has the composition $\text{BeO} \cdot \text{H}_2\text{O}$ only when heated to 150°–180° he describes a gelatinous hydrate, $\text{BeO} \cdot \text{H}_2\text{O}$, obtained by the action of NH_4Aq on BeSO_4Aq , washing with cold water and drying in dry air at 15°–20°, the composition of this hydrate is constant up to 200° The compound $\text{BeO} \cdot \text{H}_2\text{O}$ is not re formed by the action of water on BeO (for more details of this action v Van Bemmelen, *l c*), it seems better to regard it as a hydrated oxide, $\text{BeO} \cdot \text{H}_2\text{O}$, than as a hydroxide $\text{Be}(\text{OH})_2$ Other hydrates of Be are said to be obtained by drying the pp by NH_4Aq over H_2SO_4 , or merely in air, but the composition of these bodies is variable (v Schaffgotsch, *P* 50, 183, Atterberg, *B* 7, 473, Van Bemmelen, *J pr* [2] 26, 227) The gelatinous $\text{BeO} \cdot \text{H}_2\text{O}$ is easily soluble in acids, also in NaOHAg and KOHAg , and in $(\text{NH}_4)_2\text{CO}_3\text{Aq}$ By boiling the solution in KOHAg a ppt of $3\text{BeO} \cdot 4\text{H}_2\text{O}$ (Atterberg, *B* 7, 473) is obtained (but v Van Bemmelen, *J pr* [2] 26, 227) $\text{BeO} \cdot \text{H}_2\text{O}$ acts as a basic hydroxide towards acids, Thomsen gives the following values for its heats of neutralisation, solid $\text{BeO} \cdot \text{H}_2\text{O}$ being used in each case (*Th* 1, 363), [$\text{BeO} \cdot \text{H}_2\text{O} \cdot \text{H}_2\text{SO}_4\text{Aq}$] = 16,096, [$\text{BeO} \cdot \text{H}_2\text{O} \cdot 2\text{HClAq}$] = 13,644 These values are much less than those for the alkaline earth hydroxides (about 31,000 for $\text{H}_2\text{SO}_4\text{Aq}$)

Beryllium, Iodide of BeI_2 Mol w unknown, as V D has not been determined Described as colourless needles obtained by heating together Be and I (Wöhler, *P* 13, 577, Debray, *A Ch* [3] 44, 5) Easily decomposed by action of hot air into BeO and I (Debray, *l c*)

Beryllium, Oxide of BeO Mol w unknown SG 3.016 SH (0° to 100°) 2471 (Nilson a Pettersson, *B* 13, 1454) SVS 8.3

Preparation —Beryl is fused with Na_2CO_3 in graphite crucibles in a wind furnace, the fused mass is heated for some time with excess of $\text{H}_2\text{SO}_4\text{Aq}$, water is added and SiO_2 removed by filtration, the liquid is evaporated until a crust begins to form and is then allowed to stand for 24 hours or more, potash alum and K_2SO_4 separate out, the mother liquor is again evaporated and a second crop of alum crystals is obtained and removed, the mother liquor is now poured into a warm conc aqueous solution of ammonium carbonate, the pp (of Al_2O_3 , &c) is digested in contact with the liquid for four or five days and then filtered, the insoluble portion is again heated with $(\text{NH}_4)_2\text{CO}_3\text{Aq}$ and the liquid is filtered off The solution in $(\text{NH}_4)_2\text{CO}_3\text{Aq}$ contains BeO, free, or almost free, from Al_2O_3 , CaO , Fe_2O_3 , &c, the BeO may be obtained by boiling the solution (Nilson a Pettersson, *B* 11, 383), or by acidulating, boiling off CO_2 , and ppg by NH_4Aq (Hofmeister, *J pr* 76, 3), in either case, the pptd $\text{BeO} \cdot \text{H}_2\text{O}$ should be again treated with $(\text{NH}_4)_2\text{CO}_3\text{Aq}$ and then reppd There are various other ways of

preparing $\text{BeO} \cdot x\text{H}_2\text{O}$ from beryl (*v* especially Joy, *J pr* 92, 232, Scheffer, *A* 109, 146, Berzelius, *P* 8, 187, Debray, *A Ch* [3] 44, 15)

Properties—A white, loose, infusible powder, insoluble in, and unacted on by, water, soluble in acids and in molten KOH. According to Ebelmen (*A* 80, 213) BeO is obtained in hexagonal crystals ($a:c=1.1587$) by cooling a solution of the oxide in molten boric acid, Debray obtained similar crystals of BeO by strongly heating ammonium beryllium carbonate (*A Ch* [3] 44, 15). H. Rose described crystals of BeO obtained by heating the ordinary oxide in a porcelain oven (*Ph Ch* 1848 486), S.G. of these crystals = 3.02.

Reactions and Combinations—1 With most acids to form salts, e.g. BeSO_4 , Be_2NO_3 , &c., the oxide becomes less easily soluble in acids by heating—2 Decomposes molten potassium carbonate with evolution of CO_2 , on addition of water BeO remains dissolved in the KOHAq—3 Does not combine directly with water, but various hydrates, of which $\text{BeO} \cdot \text{H}_2\text{O}$ is the most important, are obtained by the action of NH_4Aq on solutions of Be salts (*v* BERYLLIUM, HYDROXIDES OF).

Beryllium, Oxychloride of
 $\text{Be}_2\text{OCl}_2 = \text{BeCl}_2 \cdot \text{BeO}$ Said to be formed by evaporating an aqueous solution of BeCl .

Beryllium, Phosphide of Described by Wohler as a greyish powder obtained by heating Be in vapour of P, existence very doubtful as Wohler's Be was very impure.

Beryllium, Salts of Salts obtained by replacing H of acids by Be they are generally obtained by the action of aqueous acids on $\text{BeO} \cdot \text{H}_2\text{O}$. Most of the commoner salts—sulphate, nitrate, oxalate, chloride—are soluble in water and have a sweetish taste, the carbonate and phosphate are insoluble in water. When heated, the salts of Be are completely decomposed, except the acid be non volatile. The chief salts of Be are the following (they are described under the headings CARBONATES, NITRATES, &c.) carbonates, chromates, molybdates, nitrates, perchlorate, periodates, phosphates, selenate, selenites, silicates, sulphates. The following salts probably exist, but few if any definite facts concerning them are known—bromate, chlorate, hypophosphite, iodate, phosphate, tungstate, vanadates.

Beryllium, Selenide of Existence very doubtful.

Beryllium, Silicide of Be readily combines with Si, when Be is prepared in porcelain vessels a portion of the SiO_2 is reduced and as much as 20 p.c. Si may combine with the Be to form a hard, brittle mass. It is doubtful whether any definite compound of Be and Si has been obtained.

Beryllium, Sulphide of Described by Wohler (*P* 13, 577) as a greyish fused mass, which evolves H_2S by action of acids, obtained by heating Be in S vapour. But existence is extremely doubtful, according to Fremy (*A Ch* [3] 38, 326) no sulphide of Be is produced by heating BeO in S, or CS_2 , vapour. According to Nilson & Pettersson (*B* 11, 384), Be and S do not combine when heated together.

M M P M.

BERYLLIUM, ORGANIC DERIVATIVES OF

Beryllium ethide BeEt_2 (185°–188°) From HgEt_2 and Be at 130°. Takes fire in air (Cahours, *J* 1873, 520).

Beryllium propide BePr_2 . Does not take fire in air.

BETA—Compounds beginning with *beta* or *bet* are described as *B* compounds under the word to which this prefix has been added.

BETAINE $\text{C}_2\text{H}_5\text{NO}_2$ *z* $\text{Me}_2\text{N} \begin{smallmatrix} \text{CH}_2 \\ \text{O} \end{smallmatrix} \text{CO}$

Internal anhydride of the methylo hydroxide of α methyl amido acetic acid S 16 at 25°. In the hydrated condition $\text{C}_2\text{H}_5\text{NO}_2$ aq. it may be represented by the formula $\text{Me}_2\text{N}(\text{OH})\text{CH}_2\text{CO}_2\text{H}$.

Occurrence—1 In the juice of beet root (*Beta vulgaris*), and in beet root molasses (Scheibler, *Z* 6, 505, *B* 3, 155, Liebreich, *Z* 6, 506, *B* 3, 161). The unripe root contains 25 p.c., the ripe root only 1 p.c. The betaine is not present in the root as such, but is liberated by treatment with HCl or baryta—2 In man gold wurzel (Scheibler, *Z* [2] 5, 539)—3 In cotton seed (Lutthausen, *J pr* [2] 80, 32)—4 In the leaves and branches of *Lycium barbarum* (Marmé & Huscmann, *A Suppl* 2, 383, 3, 245, *Ar Ph* [3] 5, 216)—5 In putrefying flesh (Gautier, *Bil* [2] 48, 13).

Formation—1 From tri methyl amine and chloro acetic acid (Liebreich, *B* 2, 13)—2 By oxidation of neurine $\text{Me}_2\text{N}(\text{OH})\text{CH}_2\text{CH}_2\text{OH}$. 3 Glycocoll (1 mol) is dissolved in KOHAq and mixed with MeI (3 mols) and MeOH, the liquid being kept alkaline (Griess, *B* 8, 1406). 4 Silver glycocoll and MeI gives the iodide, $\text{Me}_2\text{NI} \cdot \text{CH}_2\text{CO}_2\text{H}$.

Preparation—1 Diluted molasses are boiled for twelve hours with baryta, excess of baryta is removed from the filtrate by CO_2 , the liquid is evaporated to a treacle and exhausted with alcohol, the alcoholic solution is treated with alcoholic ZnCl_2 , the pp is recrystallised from water, and decomposed by baryta, the barium is exactly removed from the filtrate by H_2SO_4 , and betaine hydrochloride crystallises on evaporation (Liebreich, *B* 3, 161, cf. Scheibler, *B* 2, 292, Frühling & Schulz, *B* 10, 1070).

Properties—Large crystals (containing aq) (from alcohol). Ppd as plates by adding ether to an alcoholic solution. Deliquescent. Over H_2SO_4 the crystals become $\text{C}_2\text{H}_5\text{NO}_2$. Sweet taste, neutral to litmus, inactive. Decomposed by heat, giving off odours of NMe_3 and of burnt sugar. Not affected by CrO_3 or HI. Fusion with potash gives off NMe_3 . Iodine in KI pps brown needles of a periodide.

Salts— $\text{B} \cdot \text{HCl}$ or $\text{Me}_2\text{NCl} \cdot \text{CH}_2\text{CO}_2\text{H}$ monoclinic tables, *v* sol water— $\text{B} \cdot \text{H} \cdot \text{AuCl}_4$ plates or thin needles— $\text{B} \cdot \text{H} \cdot \text{PtCl}_2 \cdot 2\text{aq}$ (*R*)— $\text{B} \cdot \text{H} \cdot \text{PtCl}_4 \cdot 4\text{aq}$ (*L*)— $(\text{B} \cdot \text{HCl}) \cdot \text{HgCl}_2$ — $\text{B} \cdot \text{ZnCl}_2$ — $\text{B} \cdot \text{KI} \cdot 2\text{aq}$ [139°] (Korner & Menozzi, *G* 18, 351)— $\text{B} \cdot \text{KI}$ [226°]— $\text{B} \cdot \text{H} \cdot \text{I}_2(\text{BiI})_2$ (Kraut, *A* 210, 318)— $\text{B} \cdot \text{H}_2\text{SO}_4$.

Methyl ether—Iodide $\text{INMe} \cdot \text{CH}_2\text{CO}_2\text{Me}$. From silver glycocoll and MeI (Kraut, *A* 182, 180).

BETH A BARRA COLOUR $\text{C}_{22}\text{H}_{20}\text{O}$, [185°]. A dye extracted from a West African wood (Sadler & Rowland, *Am* 3, 22). When dried at 100° it contains 8aq in the molecule.

BETORCIN $C_8H_{10}O_2$, ν $C_8H_7Me_2(OH)_2$
[1435] [163°] (c 279°) *B Orcin Di oxy*
p xylene Di methyl resorcin

Formation—1 By boiling (8)-picroerythrin with baryta (Stenhouse, *A* 68, 104, Lamparter, *A* 184, 248, Menshutkin, *Bl* 2, 428)—2 From amido xyleneol, $C_8H_7Me_2(NH_2)(OH)$ [1435] by the diazo reaction (Kostanecki *B* 19, 2321)

Preparation—The lichen *Usnea barbata* is thoroughly extracted with cold water (10 pts) and CaO (1 pt), the extract is mixed with HCl. A pp of usnic and barbatic acids is formed. This mixture (1 pt) is boiled with water (40 pts) and CaO (1 pt) for four hours. An insoluble basic calic usnate is formed while the barbatic acid splits up into CO_2 and betorcin. Air must be excluded, for betorcin oxidises very readily. The filtrate is at once neutralised with HCl, acidified strongly with acetic acid, evaporated (to 5 pts) filtered from some tarry matter, and evaporated further to crystallisation. Recrystallised first from benzene, then from water. Yield $\frac{1}{10}$ per cent (Stenhouse & Groves, *C J* 37, 896)

Properties—Less soluble in water than orcin. Gives a more crimson colour with hypochlorites than orcin does. $FeCl_3$ gives a green colour. Ammoniacal solutions turn red in air. Boiled with NaOH and chloroform it forms a red, non fluorescent solution.

BETULIC ACID $C_{26}H_{40}O_8$ [195°] From betulin and CrO_3 in HOAc (Hausmann, *A* 182, 378). White powder, v sl sol water, v sol alcohol— $Pb_2(C_{26}H_{40}O_8)_2$

BETULIN $C_{26}H_{40}O_8$ [251°], [258° cor] (Hausmann, *A* 182, 369). S (alcohol) 7 at 15°, 42 at 78°. Occurs in the bark of the birch (Lowitz, *Cyell Chem Ann* 1788, 1 302, Hunefeld, *J pr* 7, 53, Hess, *J pr* 16, 161, Stahelin & Hofstetter, *A* 51, 79, Paterno & Spica, *G* 7, 508)

Preparation—The bark is extracted with 96 p.c. alcohol, the alcohol evaporated and the residue after washing with water and with soda-solution is crystallised from benzene or naphtha, the crystals are finally decolourised with animal charcoal and recrystallised from alcohol (Franchimont, *B* 12, 7)

Needles, may be sublimed. Insol water, v sl sol CS_2 , sl sol alcohol and ether. At 130° it gives an Anhydride $C_{26}H_{38}O_8$. On distillation alone with powdered zinc, P_2O_5 , or P_2S_5 , hydrocarbons are produced of doubtful constitution.

Acetyl derivative $C_{26}H_{40}O(OAc)_8$ [216°]

BETULIN AMARIC ACID $C_{26}H_{40}O_{10}$. From betulin and fuming HNO_3 (Hausmann, *A* 182, 374). Crystals, v sl sol water, v e sol alcohol and ether. At 110° it gives the anhydride $C_{26}H_{38}O_{11}$ [181°]

Salts— $K_2C_{26}H_{38}O_{12}$ — $CaBaC_{26}H_{38}O_{12}$ — $Ca_2C_{26}H_{38}O_{12}$ — $Pb_2C_{26}H_{38}O_{12}$ — $Cu_2C_{26}H_{38}O_{12}$

Ethyl ether $Et_2C_{26}H_{38}O_{10}$ [117°]

BETULORATIC ACID $C_{26}H_{40}O_8$ [94°] A white resin found on young birch shoots and leaves (Kosmann, *J Ph* [3] 26, 197). Insol water, v sol alcohol and ether. Oxidised by HNO_3 to picric acid— $AgC_{26}H_{38}O_8$, flocculent pp.

BEZOAR—A concretion found in the stomach or intestines of a variety of goat, *Capra aegragus*,

or of the gazelle, *Antelope Dorcas*. They contain ellagic and lithopellic acids.

DICHROMATES, same as DICHROMATES, *q v*.
under CHROMIUM, ACIDS OF

BICUHYBA FAT—The fat of *Myristica bicuhyba* consists chiefly of the glycerides of myristic and oleic acids, it also contains small quantities of resins and free fatty acid (myristic acid), and a very small amount of an ethereal oil (Noerdlinger, *B* 18, 2617)

BIEBRICH SCARLET *v p* 868

BILE—A liquid secreted by the liver. It is viscid, of green or brown colour, and has a bitter taste. SG about 1.02. Faintly alkaline. Possesses an emulsifying power like soap. Its composition varies. Ox bile contains sodium glycocholate and taurocholate, cholesterin, urea, fats, salts of acetic and propionic acids, glyceryl triacetate, glyceryl tripropionate, pigments, mucus, KCl, phosphates of Na, Ca, and Mg, and traces of iron, manganese, and silica. Human bile is of a similar composition.

Latschmoff (*B* 18, 3039) has shown that saponified ox gall contains, in addition to cholic acid (which is derived from the glyco and tauro cholic acids), a new acid to which he gives the name *choleic acid*. The latter acid, according to this investigator, occurs in two forms—*anhydrous* $C_{26}H_{40}O_8$, and *hydrated* $C_{26}H_{40}O_{10}$. $1\frac{1}{2}$ aq. Mylius (*B* 19, 369) has found that cholic acid by putrefactive fermentation is reduced to a body (the '*desoxycholic acid*' of M.) which L. considers as identical with his so called '*hydrated choleic acid*'. As however L. (*B* 20, 1043) was unable to convert his 'anhydrous choleic acid' into the 'hydrated choleic acid' by any other method than by boiling with acetic acid and M. (*B* 20, 1968) was unable to effect the conversion even in this way, there appears to be little doubt that these so called 'anhydrous' and 'hydrated choleic acids' are quite distinct acids (the conversion by AcOH is probably erroneous), the latter being identical with the '*desoxycholic acid*' of M. Hence the 'anhydrous' acid will be described as *choleic acid*, the 'hydrated' as *desoxycholic acid*. Both these acids according to L. give *dehydrocholic acid* on gentle oxidation, and *cholanolic acid* on more vigorous oxidation.

To *choleic acid* L. assigns the formula $C_{26}H_{40}O_8$, but M. (*B* 19, 369, 2000, 20, 1968) has shown by a long series of careful analyses that, almost beyond a doubt, it is represented by the formula $C_{26}H_{40}O_8$, originally proposed for it by Strecker. On oxidation it first gives *dehydrocholic acid* $C_{26}H_{38}O_8$ and then *bilanic acid* $C_{26}H_{38}O_9$ (but no *cholanolic acid*, which when obtained from cholic acid by earlier investigators, was due to the presence of choleic acid).

Pig's bile contains sodium hyoglycocholate and hyotaurocholate instead of glycocholate and taurocholate, it also contains glyceric phosphoric acid and neurine derived from the decomposition of lecithin. In other respects it resembles ox bile. The various constituents of bile are separately described.

Pettenkofer's test Bile, or an aqueous solution of a salt of bile, is mixed with two thirds of its volume of H_2SO_4 , and a drop of a 10 p.c. solution of sugar is added. On warming to 75° a crimson colour is produced. The reaction is

given by glycocholic, taurocholic, hyoglycocholic, hyotaurocholic, and by cholic acid (Pettenkofer, *A* 52, 92, cf Neukomm, *A* 116, 80, Strassburg, *Pflüger's Arch*, 4, 461). The test may be modified by using phosphoric acid. The substance to be tested, together with very little cane sugar, is dissolved in 8 drops of a mixture of syrupy phosphoric acid (5 vols) and water (1 vol) and the tube is then dipped into boiling water. A crimson colour soon appears (Kolbe, *J pr* [2] 27, 424). A red colour is produced by many other substances than those mentioned, hence it is necessary to confirm it by observing the absorption spectrum which contains three bands — one extending from midway between c and d to d, the second midway between d and z, and the third between b and f (Heynsius & Campbell, *Pflüger's Arch*, 4, 497, cf Schenk, *Fr* 12, 119).

BILE COLOURING MATTERS v PIGMENTS, ANIMAL

BILIANIC ACID

$C_{22}H_{40}O_8$, probably $C_{26}H_{34}(CO)_2(CO_2H)_2$. Formed by further oxidation of dehydrocholic acid $C_{26}H_{34}(CO)(CHO)(CO_2H)$.

Preparation —Cholic acid (20 pts) in fine powder is added to a mixture of $K_2Cr_2O_7$ (40 pts) and H_2SO_4 (60 pts) in water (160 pts), finally warming on the water bath till the reaction is complete. It is isolated by conversion into the acid potassium salt, which is sparingly soluble in alcohol, and then into the diethyl ether (Mylus, *B* 20, 1981, cf Clève, *Bl* [2] 35, 373, Latschinnoff, *B* 19, 480, *Bl* [2] 46, 818).

Properties —Flat needles (containing $\frac{1}{2}$ aq)

Tri basic ketonic acid

Salts — $A''Ba_6aq$ or $8aq$ tables or prisms — $A'''Hba_2aq$ hexagonal tables, sl sol water and alcohol — Ag_2A'''

Di ethyl ether $A'''HET_2$ [193°], long flat needles, sol alcohol, less sol ether — A'''_2Et_2Ba — A'''_2Et_2Pb

Tri ethyl ether $A'Et_3$ [127°], satiny tablets, or thick pillars

Di oxim $C_8H_8(CNOH)_2(CO_2H)_2$. Formed by warming a slightly alkaline solution of bilianic acid with hydroxylamine. Glistening tables. Sol dilute alcohol, nearly insol water and absolute alcohol. Dissolves in alkalis, forming acid or neutral salts.

Di phenylhydrazide

$C_{26}H_{34}(\bar{C}N_2HPH)_2(CO_2H)_2$, colourless needles. Nearly insol acetic acid and hot alcohol, insol water. Dissolves in alkalis.

iso Bilianic Acid $C_{26}H_{34}O_8$ (?) [234°–237°]

Flat needles. Formed in small quantity, together with bilianic acid, by oxidation of cholic acid with $K_2Cr_2O_7$ and H_2SO_4 .

Salts — $A'''H_3K$ silky rhombic plates, sl sol water and alcohol — $A'''Ag_2$ amorphous pp — $A'''Ba_6aq$ amorphous, sl. sol water, insol alcohol.

Methyl ether $A'''Me$, [98°], needles (Latschinnoff, *B* 19, 1530).

BILIC ACID $C_{26}H_{34}O_8$ [about 190°]

Prepared by careful oxidation of cholic acid with chromic acid mixture (Egger, *B* 12, 1068). White needles. Sol hot water and alcohol, sl sol ether. Dibasic acid. It gives Pettenkofer's reaction with sugar and H_2SO_4 . By oxidation it is converted into cholesteric acid ($C_{27}H_{44}O_8$).

BINARY THEORY OF SALTS The name salt was given in ancient times to the solid residue obtained by boiling sea water, it was then extended to include all solid substances easily soluble in water and obtainable by evaporating watery liquids. At a later time the possession of a taste more or less resembling that of sea salt was regarded as a characteristic property of all salts. When the composition of the bodies called salts began to be studied, a threefold division was made into acid salts, alkaline salts, and neutral salts (*v* ACID, ALKALI, SALT). Lavoisier's discovery of the nature of oxygen led to the definition of acids as highly oxygenated compounds, and Davy's decomposition of soda, potash, lime, and baryta, showed that these alkaline salts were also compounds of oxygen. But as neutral salts were formed by the mutual action of an acid and an alkali, it followed that they too were oxygenated compounds. A neutral salt, or we may say simply a salt, for the qualifying word neutral had been dropped by this time, was then regarded as constituted of two parts, an acid or electro negative part, and a basic or electro positive part. From this time dualistic views prevailed, every compound, said Berzelius, must be constituted of two parts, which may themselves be simple or complex, and of these parts one is positively and the other negatively electrified. Such a salt as sulphate of soda, for instance, was regarded as constructed of positive soda and negative sulphuric acid, rather than as formed by the mutual interaction of the elements sodium, oxygen, and sulphur. When, chiefly as a result of the work of Davy and Dulong, acids had come to be regarded as composed of the positive element hydrogen united with a negative element or group of elements, and salts were said to be formed by putting metals in the place of the hydrogen of acids, the conception of a salt as a binary structure still remained. One part of every salt was a positive element, a metal, the other part was a negative radicle, either a non-metal or a group of non-metallic elements.

In some such way as this arose the binary theory of salts, a theory which is based on the notion of every salt being a definite structure, and which conceives it possible to place all salts in one class, regard being had for classificatory purposes rather to the composition than to the properties of salt (*v* CLASSIFICATION AND SALTS). M M P M M

BIRCH BARK Contains betulin (*q v*) and a kind of tannin which is turned green by $FeCl_3$ (Staheln & Hofstetter, *A* 51, 79).

a. Franz, *P* 89, 497) E C at 0° (Hg at $0^\circ = 1$) 8676 (Lorenz, *W* 13, 422, 582) Cryst form, hexagonal $\alpha = 1$ 13035, isomorphous with Te, As, Sb SVS abt 21.8 HC [Bi⁺, O⁻] abt 95,500 (Woods, *P M* [4] 4, 370) Emission spectrum characterised by very many lines, in arc spectrum the predominant lines are 4722.1, 4119, 3595.3, 3510.4, 3396.2, 2593, 2524, 2400.8, 2277 (LIVING & Dewar, *T* 174, 187, v also, regarding spectrum of Bi, Hartley & Adeney, *T* 1884 63)

Occurrence—Uncombined with other elements, in Saxony and other parts of Germany, in Norway, Spain, California, and in Cornwall and Cumberland, &c Also as Bi₂O₃ (*Bismuth ochre*), Bi₂S₃ (*Bismuth glance*), Bi₂Te₃, Bi₂Cu₃S₈, Bi₂Pb₃S₈, &c, &c Bismuth has been known for many centuries, Basil Valentine (15th century) seems to have been the first to recognise it as a definite metallic body Bergmann gave the earliest fairly accurate account of its reactions

Formation—Native bismuth is melted in iron tubes, and the metal is run off from gangue &c into pots By remelting with $\frac{1}{10}$ of its weight of KNO₃, at as low a temperature as possible, until the nitre forms a solid slag on the surface, approximately pure Bi is obtained

Preparation—Approximately pure metal is dissolved in the minimum quantity of HNO₃Aq, much water is added, the pp of basic nitrate is washed, boiled twice with pure KOHAq, or NaOHAq (Herapath, *D P J* 169, 40), dissolved in as little HNO₃Aq as possible, and water is again added The pp is washed, dried, mixed with *black flux* (obtained by heating cream of tartar in a closed vessel) and heated at about 270°–280° in a closed crucible The reduced metal is washed in dilute HClAq, and in water, and dried Traces of As, Sb, or Fe, which yet remain in the metal are removed by partially oxidising and melting under the small quantity of Bi₂O₃ formed this may be effected (1) by adding a little pure KNO₃, melting in an open porcelain crucible, keeping molten for some time, allowing to cool until a small quantity of the metal solidifies, and pouring off the still molten metal from the more solid oxides on the surface, (2) by melting under Na₂CO₃ containing 2–5 p.c KClO₄ and proceeding as in (1) (Turach, *J pr* [2] 14, 309), (3) by strongly heating with 1 part cream of tartar, then running the molten metal (which contains K) into a crucible containing charcoal, heating for a little, running into an open porcelain vessel, strongly heating in air for some time, and finally pouring off the molten metal from the slag on the surface (Mehu, *D P J* 211, 187) Lowe (*Fr* 22, 498) recommends ppn of Bi₂NO₃ in HNO₃Aq by KOH, solution of pp in excess of KOH in presence of glycerine, addition of grape sugar, filtration from Ag and Cu, and boiling, pure Bi is ppd Bi is obtained in well-formed crystals by melting the commercial metal with a little KNO₃ in a crucible until a small quantity taken out appears yellow on the surface (indicative that foreign metals are oxidised), removing the scum of oxides from the surface, covering the molten mass with pieces of charcoal (to prevent oxidation), allowing to cool until a firm crust has formed, piercing two

holes in the crust, and pouring off the still molten metal, the crucible is found to be lined with crystals of Bi

Properties—Very lustrous, white with a slightly reddish tinge, very easily crystallises, brittle, diamagnetic, but not so when molten (Faraday, *P Suppl* 3, 1, Weber, *P* 73, 241, 87, 145, Reich, *P* 97, 283, Plucker, *P* 72, 339, 76, 576, 81, 133) For thermo electric behaviour v Svanberg, *C R* 31, 250, Franz, *P* 83, 374, Matteucci, *C R* 40, 541 Bi expands as it solidifies (for method of demonstrating this v Bottger *D P J* 212, 441) May be distilled at a high temperature (over 1100°) in an atmosphere of H The atom of Bi is trivalent in the gaseous molecule BiCl₃, Bi forms numerous alloys most of which melt at low temperatures, and expand on solidification (v BISMUTH, ALLOYS or) The atomic weight of Bi has been determined (1) by finding \sqrt{D} of, and determining Cl in, BiCl₃ (Dumas, *A Ch* [3] 55, 129 a 176), (2) by oxidising Bi to Bi₂O₃ by means of HNO₃ (Schneider, *P* 82, 303, *J pr* [2] 30, 237, Lowe, *Fr* 22 498, Marignac, *A Ch* [6] 1, 289), (3) by converting Bi₂O₃ into sulphate (Marignac, *l c*) The exact value to be given to the at w of Bi is still doubtful, it is certainly not greater than 208 Bi is metallic in its chemical functions, it shows a marked tendency to form basic rather than normal salts, many of these basic salts may be represented as containing the group BiO *e g* BiO NO₃, (BiO) SO₄, &c, several oxychlorides and oxybromides are known, no hydride of Bi has yet been obtained, the oxides of Bi are salt forming in their reactions with acids, none of them is an anhydride, but moist Bi₂O₃ dissolves in very conc boiling KOHAq probably with formation of compounds in which Bi acts as part of the negative radicle (v BISMUTHIC OXIDE under BISMUTH, OXIDES or) Bi shows distinct analogies to As and Sb, also to the other members of Group V, in its chemical relations, for fuller discussion v BISMUTH, CHEMICAL RELATIONS of Bi salts are used in medicine the alloys are used in printing, soldering, &c

Reactions—1 Very superficially oxidised in ordinary air heated in air or oxygen burns to Bi₂O₃—2 Decomposes steam at a red heat—3 Combines directly with several elements, especially O, Cl, Br, I, S, Se, and Te [BiCl₃] = 90,630 (*Th* 2, 410), [Bi²⁺O⁻] = abt 95,000 (Woods, *P M* [4] 4, 370)—3 Scarcely acted on by hydrochloric acid dilute or conc—4 With hot conc sulphuric acid a basic sulphate is formed—5 Quickly dissolved by nitric acid with formation of Bi₂NO₃—6 Oxidised, but slowly and partially, by fusion with potassium nitrate or chlorate

Estimation—Generally as Bi₂O₃, after ppn from a solution free from HCl and chlorides by excess of ammonium carbonate, and warming for some time, the pp is washed, dried, and heated whereby Bi₂O₃ is produced Also by adding much water to a solution in as little HCl as possible, warming, collecting BiOCl, and drying at 100°–110° (traces of Bi remain unppd), the BiOCl may be reduced by heating with KCN, and the Bi weighed Ppn as Bi₂S₃, and weighing is not to be recommended, as Bi₂S₃ is easily oxidised in moist air Volumetric

methods of estimating Bi, none of which however is altogether satisfactory, have been based on (1) ppn of $\text{Bi}(\text{IO}_3)_3$ from acetic acid solutions by a measured mass (excess) of HIO_4Aq , and determination of residual HIO_3 (Buisson a Ferray, *M S* [3] 3, 900), (2) ppn of Bi chromate from nearly neutral solutions by $\text{K}_2\text{Cr}_2\text{O}_7\text{Aq}$ or $\text{K}_2\text{Cr}_2\text{O}_7\text{Aq}$, (3) ppn of Bi phosphate by standardised $\text{Na}_2\text{HPO}_4\text{Aq}$, (4) ppn of Bi oxalate, conversion into basic oxalate by boiling water, and titration with $\text{K}_2\text{MnO}_8\text{Aq}$, (5) ppn of double oxalate of Bi and K by standardised $\text{K}_2\text{C}_2\text{O}_4\text{Aq}$ and determination of residual $\text{K}_2\text{C}_2\text{O}_4$ by $\text{K}_2\text{MnO}_8\text{Aq}$ (Pattison Muir, *C J* 29, 483, 82, 674, 33, 70, (with Robbs) *C J* 41, 1).

Chemical Relations of Bismuth—Bi is the highest known member of Group V, this group contains the following elements—

Even series	2	4	6	8	10	12
	N=14	V=51	Nb=94	Di=142	Ta=182	—
Odd series	3	5	7	9	11	13
	P=31	As=75	Sb=120	Er=166	Bi=208	—

Taken as a whole these elements are negative and their compounds with H and O react as acids. As the group is ascended the negative characters become less marked until Bi is reached, omitting N, the oxides M_2O_3 of the even series members, so far as known, are salt forming in their reactions with acids, but in the odd series members these oxides, on the whole, are salt forming only in their reactions with bases, until Series 9 is reached, when the character of the oxides M_2O_3 becomes decidedly basic. The oxides M_2O_3 , on the whole, are acid forming, but the acidic functions of Bi_2O_3 are very feeble. Salts formed from acids by replacement of H are obtained in the cases of V, Di, Er, and Bi, but most of the salts of vanadium, and many of those of Bi, seem to contain groups of the form M_2O_7 , acting as the more positive part of the salt, several salts of the normal type, e.g. $\text{Bi}(\text{NO}_3)_3$, are however known and several normal Er and Di salts have been prepared. Vanadium is characterised by the great number of complex compounds into which it enters, sometimes as part of the positive, sometimes as part of the negative, group of the salt. Considering the compositions of the haloid, and oxyhaloid compounds, we find that, so far as investigation has gone, compounds of the form MX_3 and MOX_3 , where X = a halogen element, exist when M is any member of the group except Bi or As (N is omitted as there is much doubt concerning the composition of its haloid compounds), and in the case of As compounds of AsF_3 , with KF , &c., seem to exist, the compounds $\text{BiBr}_3(\text{C}_2\text{H}_5)_3$, and $\text{BiCl}_3(\text{C}_2\text{H}_5)_3$ are known as solids (Michaels, *B* 20, 52). The haloid compounds BiX_3 are less easily oxidised than the corresponding compounds of P, As, or Sb. The basic character of the oxides of bismuth, the existence of many salts in which Bi acts as the metallic element, the stability of the haloid compounds BiX_3 and the non existence of BiX_5 , the non existence of any compound in which Bi_2S_3 acts as the negative radicle, these, among other properties, show that Bi must be classed as the distinctly metallic element of Group V. But the feeble acidic functions of Bi_2O_3 towards strong alkalis, the readiness with which so called basic salts of bismuth are formed, the fact that Bi_2O_3 and

Bi_2O_5 form no corresponding salts, the existence of several complex oxyhaloid compounds, these, among other properties, show that the general non metallic character of Group V to some extent belongs to Bi.

Bismuth, Alloys of Bismuth alloys with many metals when melted with them, these alloys are characterised by low melting points, and, many of them, by the expansion which they undergo as they cool after being melted. The most technically important alloys are—*Newton's metal*, 8 parts Bi, 5 Pb, and 3 Zn, $\text{M P} = 94^\circ 5$; *Rose's metal*, 5 Bi, 3 Pb, 2 Sn, $\text{M P} = 91^\circ 6$; *Wood's metal*, 15 Bi, 8 Pb, 4 Sn, 3 Cd, $\text{M P} = 68^\circ$; *Fusible metal*, 2 parts Bi, 1 Pb, 1 Sn, $\text{M P} = 93^\circ 7$, this alloy expands from 32° to 95° , contracts gradually to 131° when its volume is less than at 32° , then expands to 174° , after which its expansion is uniform.

Amalgams of Bi are easily formed at ordinary temperatures. Alloys with copper are formed below the melting point of Cu, an alloy of 2 parts Bi with 1 part Cu begins to expand after solidification (Marx, *S* 58, 470). An alloy of 3 parts Bi with 1 part iron is magnetic. Alloys of Bi and palladium are hard as steel, with $\frac{1}{2}$ part spongy platinum Bi forms an easily fusible alloy which separates into Pt and Bi when fused at a low red heat. Bi does not alloy with zinc, on mixing melted Zn and Bi two layers are formed, one containing a little Bi and much Zn, the other much Bi and little Zn.

Bismuth, Bromides of Only one bromide, BiBr_3 , has been obtained with certainty, but many facts point to the existence of a lower bromide, probably BiBr_2 .

TRIBROMIDE BiBr_3 (Bismuthous bromide) Mol w unknown, but probably as represented by formula $[210^\circ-215^\circ]$ (Pattison Muir, *C J* 29, 144) (Between 454° & 498°) (Carnelley a. Williams, *C J* 33, 283).

Formation—1 By heating powdered Bi in CO_2 charged with Br vapour—2 By adding powdered Bi to a solution of Br in dry ether, and evaporating *in vacuo*.

Preparation— $1\frac{1}{2}$ parts Br are allowed to flow, in small successive quantities, into 1 part powdered Bi in a small retort with the beak tilted upwards, when the mass is cool, the retort is very gently warmed for some days, and from time to time a few drops of Br are poured into the retort, the bromide forms in yellow crystals a little distance above the heated mass.

Properties and Reactions—Golden yellow crystals, *S G* $\frac{200}{200}$ 54, very deliquescent, soluble in dry ether, decomposed by water to BiOBr and HBrAq , partially reduced to Bi by heating in hydrogen, heated with Bi_2O_3 forms BiOBr , by action of nitrogen oxides obtained by heating starch with HNO_3Aq the oxybromide $\text{Bi}_2\text{O}_5\text{Br}_2$ is produced, unchanged when heated in CO_2 or SO_2 , reacts with ammonia, when heated in that gas, to form (1) $\text{BiBr}_3 \cdot 8\text{NH}_3$, which is a straw yellow powder, soluble in HClAq and yielding $\text{BiBr}_3 \cdot 8\text{NH}_3 \cdot \text{Cl H}_2\text{O}$ by evaporation over H_2SO_4 , (2) probably $\text{BiBr}_3 \cdot 2\text{NH}_3$, an olive-green solid, (3) an ash grey, crystalline, infusible, solid, probably BiNBr . The compound $2\text{BiBr}_3 \cdot 5\text{NH}_3$ is

obtained (along with Bi), as a grayish-green powder, by heating $\text{Bi}_2\text{O}_3\text{Br}_2$ to dull redness in dry NH_3 (Pattison Muir, *C J* 29, 144, 16, 27). A solution of BiBr_3 in saturated KClAq deposits crystals of $\text{BiCl}_2\text{Br}_2\text{K}_2 \cdot 1\frac{1}{2}\text{H}_2\text{O}$ (Atkinson, *C J* 43, 292). Does not combine with Cl.

DIBROMIDE—Probably BiBr_2 or Bi_2Br_4 . In preparing BiBr_3 , dark gray crystals are formed if there is a deficit of Br, these contain Br nearly agreeing with the formula BiBr_2 , on heating they give Bi and BiBr_3 . Weber (*P* 107, 599) obtained a brown mass—probably a lower bromide than BiBr_3 —by heating BiBr_3 with Bi, Macivor (*C N* 30, 190) obtained a dark gray solid, melting at $198^\circ\text{--}200^\circ$, by heating Bi and Br.

Bismuth, Chlorides of Two chlorides are known, BiCl_2 and Bi_2Cl_4 . All attempts to form a chloride with more Cl than BiCl_2 have failed. Both may be obtained by the direct combination of Bi and Cl, Bi_2Cl_4 is separated into BiCl_2 , Bi, and Cl, by heating, BiCl_2 is reduced to Bi_2Cl_4 by heating with Bi, or with Hg Cl.

TRICHLORIDE— BiCl_3 (*Bismuthous chloride*) Mol w 314 [227°] (Pattison Muir, *C J* 29, 144) ($427^\circ\text{--}439^\circ$) (Carnelley & Williams, *C J* 33, 281).

Formation—1 By heating 1 part powdered Bi with 2 parts HgCl_2 in a retort—2 By dissolving Bi_2O_3 in HClAq , evaporating to dryness, heating in air and then in a retort—3 By heating Bi_2O_3 in dry Cl.

Preparation—Powdered Bi is heated in a current of dry Cl, in a retort with the beak tilted upwards and furnished with an exit tube passing into conc. H_2SO_4 , when a light yellow liquid has been formed, the stream of Cl is slackened and the retort is very gently heated for some time, crystals of BiCl_3 sublime on to the upper parts of the vessel. The crystals may be distilled into small tubes in a current of dry N, the tubes are at once sealed.

Properties and Reactions—White, very deliquescent, crystals, melting in Cl to a pale yellow liquid, SG 4.66 , soluble in dry alcohol. Heated in air between two watch glasses part sublimes and an oxychloride— $\text{Bi}_2\text{O}_2\text{Cl}_2$ or $\text{Bi}_2\text{O}_3\text{Cl}_2$ —remains. The same oxychloride is obtained by the action of *nitrogen oxides* (from starch and HNO_3Aq) on BiCl_3 . Heated in *hydrogen* Bi_2Cl_4 and Bi are formed, at a higher temperature all the Cl is removed. Decomposed by *water* to BiOCl and HClAq , the amount of change depends on the relative masses of BiCl_3 , HCl, and H_2O , and on the time, when the reacting bodies are mixed in the ratio BiCl_3 26HCl 10,000 H_2O a little BiCl_3 remains unchanged even after 14 days action (v Pattison Muir, *C J* 35, 311, Ostwald, *J pr* [2] 12, 264). Heated with *sulphur* Bi_2S_3 is formed (v BISMUTH SULPHOCHLORIDE). Not acted on by CrO_2Cl_2 , scarcely acted on by SO_2 , does not combine with Br (P M, *C J* 39, 33).

Combinations—With *ammonia* to form (1) $2\text{BiCl}_2\text{NH}_3$, a red, fusible, crystalline, solid, (2) $\text{BiCl}_2 \cdot 2\text{NH}_3$, a greenish solid, (3) $\text{BiCl}_3 \cdot 8\text{NH}_3$, a white, volatile solid (Déhérain, *C R* 54, 724). These ammonio-chlorides by treatment with HClAq yield compounds of the form $x\text{BiCl}_2, y\text{NH}_4\text{Cl}$, where x varies from 1 to 2,

and y from 1 to 5. With *potassium chloride* forms $\text{BiCl}_2 \cdot 2\text{KCl} \cdot 2\frac{1}{2}\text{H}_2\text{O}$, also with *sodium chloride* forms corresponding salt with $3\text{H}_2\text{O}$, a solution of BiCl_3 in *hydrochloric acid* when evaporated gives needles of $\text{BiCl}_3 \cdot 2\text{HCl}$ (Jacquelin, *A Ch* [2] 62, 363).

DICHLORIDE—Probably Bi_2Cl_4 . Mol w unknown.

Formation—1 By gently heating BiCl in H, but the product is mixed with Bi and BiCl_2 . 2 By heating BiCl_2 with Bi (Weber, *P* 107, 596)—3 By heating $\text{BiCl}_2 \cdot x\text{NH}_4\text{Cl}$ in H to 300° (Schneider, *P* 96, 130).

Preparation—A very intimate mixture of 2 parts HgCl_2 with 1 part extremely finely powdered Bi is heated to $230^\circ\text{--}250^\circ$ in a closed tube for some time, the mixture melts to a dark brownish black liquid, and Hg (with a little Bi) collects at the bottom of the tube, the sides of the tube are tapped from time to time to make the Hg settle, after cooling the Bi_2Cl_4 solidifies over the Hg, it is removed as quickly as possible to another tube—which is at once closed—and again melted, this process is repeated several times, nearly pure Bi_2Cl_4 , containing a very little Hg and Bi, is finally obtained (Schneider *P* 96, 130).

Properties and Reactions—Black, or nearly black, extremely deliquescent, solid, with *water* forms BiOCl , with *potash* gives Bi_2O_3 , which is quickly oxidised to $\text{Bi}_2\text{O}_3 \cdot x\text{H}_2\text{O}$, with dilute mineral acids gives Bi salts and Bi, heated to about 300° gives BiCl_2 and Bi.

Bismuth, Cyanides and Ferrocyanides of, v CYANIDES

Bismuth, Fluoride of Only one fluoride of Bi has as yet been prepared (Pattison Muir, Hoffmeister and Robbs, *C J* 39, 33), BiF_3 , Mol w unknown.

Preparation—1 Bi_2O_3 is added in small successive quantities to HFAq heated in a Pt dish until the oxide ceases to be dissolved, the liquid is decanted and evaporated at 100° , the residue, $\text{BiF}_3 \cdot 8\text{HF}$, is warmed at about $110^\circ\text{--}120^\circ$ in a closed Pt crucible until dry, and is then heated (in the closed crucible) so long as HF is evolved—2 Excess of saturated KFAq is added to a solution of $\text{Bi(NO}_3)_3$ in the minimum quantity of dilute HNO_3Aq , the pp is thoroughly washed with boiling water, dried at 100° , and heated to dull redness in a closed Pt crucible.

Properties—Grey, heavy, crystalline, solid SG 5.33 . Unacted on by *water*, insoluble in *alcohol*, scarcely changed or volatilised by heating to redness in open Pt dish, not oxidised by heating in nitrous oxides (from starch and HNO_3Aq), dissolved, with decomposition, by hot HCl, HNO_3 , or $\text{H}_2\text{SO}_4\text{Aq}$. Combines with HF to form $\text{BiF}_3 \cdot 8\text{HF}$ (v *supra*) which is a crystalline, greyish white, deliquescent solid, decomposed by boiling water to BiOF (v BISMUTH OXYFLUORIDE).

Bismuth, Haloid Compounds of BiF_3 ; BiCl_3 , Bi_2Cl_4 , BiBr_3 (? Bi_2Br_4), BiI_3 The V D of BiCl_3 only has been determined, the other formulæ are probably molecular Bi_2Cl_4 and Bi_2Br_4 are decomposed by heat to Bi and BiX_3 , the others are unchanged when heated out of air, heated in air all except BiF_3 are more or less oxidised, BiCl_2 to the greatest, and BiI_2 to the least, extent. BiI_3 is a very stable com-

pound (v BISMUTH, FLUORIDES OF, CHLORIDES OF, BROMIDES OF, and IODIDE OF)

Bismuth, Hydrated oxides, or hydroxides of, v Bismuth, oxides of

Bismuth, Iodide of BiI₃ Mol w unknown, probably as represented by formula

Formation—1 By heating an intimate mixture of 1 part Bi₂S₃ with 1½ parts I, in a large, loosely covered flask, and then heating the sublimed BiI₃ at 100° to remove I (Schneider, P 99, 470)—2 By dropping Bi₃NO₃ in dilute HNO₃Aq into conc KIAq, dissolving the brown pp in fairly conc HIAq, and ppg BiI, by as little water as possible (Rammelsberg, P 48, 166), drying pp at 100°, and removing free I by one or two washings with absolute alcohol—3 By the action of HIAq on Bi₂O₃

Preparation—An intimate mixture of 1 part Bi with 2 parts I is gently heated in a flask with a long neck passing into another flask, the sublimate is finely powdered and again heated in the same way as before, this is repeated once or twice, and finally the mass is distilled in a fairly rapid current of dry CO₂ (Weber, P 14, 113 [slightly modified])

Properties and Reactions—(Pattison Muir, Hoffmeister a Robbs, C J 39, 33) Dark grey, metal like, lustrous, crystals (probably hexagonal, Nicklès, C R 50, 872), SG 5.65 S (alcohol at 20°) c 3.5 Unchanged in air, heated in air a very little Bi₂O₃ is formed Unchanged by heating in hydrogen, or with sulphur, or in sulphur dioxide Slowly changed to BiOI by a large quantity of cold water, more quickly by boiling water Very partially converted into BiOI by heating in N oxides (from starch and HNO₃Aq) BiI₃ is much more stable than either BiCl₃ or BiBr₃

Combinations—With HI to form BiI, HI 4H₂O (Arppe, P 44, 248) With MI (M = Na, K, NH₄), and M₂ (M = Ca, Ba, Mg, Zn), to form double compounds isomorphous with the corresponding compounds of SbI₃ obtained by direct combination of the iodides, or by acting on Bi with I in presence of the iodide MI or M₂, they are all deliquescent, and are easily resolved by water into their component iodides (Nicklès, C R 51, 1097, Lunan, P 111, 240)

Bismuth, Oxides and hydrated oxides of Four oxides are known, Bi₂O₃, Bi₂O₅, Bi₂O₆, Bi₂O₈, as none has been gasified, the V D and hence the molecular weight of none is known These oxides all react with acids to form the same series of salts, BiX₃, where X = NO₂, SO₄, CO₃, &c, if much water is present, $\frac{2}{2}$

basic salts, usually of the form BiOX, are produced, in the reactions of Bi₂O₃ with acids Bi is separated as metal, in the reactions of Bi₂O₅ and Bi₂O₆ oxygen is evolved Bi₂O₃.xH₂O is slightly soluble in very conc boiling KOHAq, but no salts have been certainly obtained in which the acid radicle is composed of Bi and O Bi₂O₃ is easily oxidised to Bi₂O₅, Bi₂O₅ and Bi₂O₆ are deoxidised to Bi₂O₃ by heating in air or oxygen to about 820° and 250° respectively, Bi₂O₅ is unchanged when heated in air or oxygen Bi₂O₃ is not hydrated by contact with water, Bi₂O₅ and Bi₂O₆ are hydrated in moist air, in contact with water they are partially and slowly deoxidised to hydrates of Bi₂O₃

VOL. I.

The more important papers on the oxides and hydrated oxides of Bi are as follows—1 On oxides containing less O than Bi₂O₃—Thomson (*Proc Glasgow Phil Soc* 1841-42, 4), Heintz (P 63, 55, 559), Schneider (P 88, 49, 97, 480), Arppe (P 64, 237), Vogel (*Kastner's Archiv*, 23, 86), Berzelius (*Lehrbuch*, 2, 574 [5th ed]), Schiff (A 119, 331), Pattison Muir (C J 32, 128)—2 On oxides containing more O than Bi₂O₃—Jacquelin [1838] (J p 14, 1), Heintz [1844] (P 63, 559), Arppe [1845] (P 64, 237); Böttger [1858] (J p 73, 494), Schröder [1862] (A 121, 204), Boedeker [1862] (A 123, 61), Wernicke [1870] (P 141, 109), C Hoffmann, [1884] (A 223, 110), Pattison Muir [1876 to 1886] (C J 29, 144, 31, 24, 32, 128, *ibid* 39, 21 [with Hoffmeister a Robbs], 51, 77 [with Carnegie]), Hasebrock [1887] (B 20, 213)—3 On Bi₂O₅—Bonsdorff (P 41, 305), Fuchs (S 67, 429), Stromeyer (P 26, 558), Liebig (*Mag Pharm* 35, 114), Pattison Muir (l c)

HYPOBISMUTHOUS OXIDE Bi₂O₂ (Bismuth suboxide Bismuth dioxide Black oxide of bismuth)

Preparation—A mixture of 1 part SnCl₄ and 2.5 parts Bi₂O₃ is dissolved in as little fairly conc HClAq as possible, the solution is poured into an excess of KOHAq (about 1 KOH in 10Aq) in a stoppered flask so that the flask is nearly filled with the liquid, the stopper is placed in the flask, and the black pp is allowed to settle, the pp is washed with cold KOHAq (in air free water) less concentrated than that used in the ppn the flask being each time nearly filled with the liquid, and then with air free water, it is then quickly dried by pressing between filter paper, and placed over H₂SO₄ *in vacuo* (Schneider, P 88, 45)

Properties and Reactions—Black, crystal line, powder, begins to oxidise in air at about 180°, at red heat quickly oxidised to Bi₂O₃, oxidised to Bi₂O₅.xH₂O and Bi₂O₆.xH₂O by boiling with KOHAq and Br, oxidised to Bi₂O₆.xH₂O by K₂Mn₂O₈Aq, when moist, Bi₂O₂ is rapidly oxidised in air to Bi₂O₃.2H₂O, oxidised by contact with a very little HNO₃Aq, decomposed to Bi₂6NO₃ and Bi by more HNO₃Aq, dissolved entirely by a considerable quantity of the same acid, decomposed by HClAq or H₂SO₄Aq to BiCl₃, or Bi sulphate, and Bi, deoxidised, to Bi, by heating in H or CO, decomposed by boiling KOHAq with formation of Bi (Schneider, l c, Pattison Muir, l c) No hydrate of Bi₂O₂ has been definitely obtained Solution of Bi₂O₂ in tartaric acid is said to give Bi₂S₂ by reaction with H₂S (Schneider), v BISMUTH DISULPHIDE

Bismuthous oxide Bi₂O₃ (Bismuth trioxide) SH (12°-97°) 0609 (Regnault, A Ch [3] 1,129) SG = 8.21 (Herapath, P M 64, 321), 8.03 (Playfair a Joule, C J Mem 3, 57) Occurs native generally associated with oxide of iron.

Formation—1 By heating Bi in air or O—2 By ppg Bi nitrate or chloride solution by excess of alkali and boiling, thus prepared always contains some oxynitrate or oxychloride

Preparation—1 Basic Bi nitrate, obtained by ppg solution of Bi in HNO₃Aq by large excess of water, is heated in a Pt dish with constant agitation until oxides of N are no longer evolved If this oxide is fused with KOH it crystallises on cooling in rhombic

L L

prisms α $d_s = 8165$ 11 064 (Nordenskiöld, *P* 114, 512) — 2 BiOCl (*q v*) is shaken for some time with very conc KOHAq, until the change to Bi_2O_3 and KCl is complete, the Bi_2O_3 is washed with cold water until quite free from KOH and KCl and dried the oxide may be thus obtained in distinct crystals.

Properties and Reactions — Heavy, yellowish white, solid, unchanged by heating in air or oxygen. Dissolves in acids to form Bi salts (*v* BISMUTH, SALTS OF). HFAq heated with Bi_2O_3 dissolves part of it as $\text{BiF}_3 \cdot 3\text{HF}$ and converts the rest into $\text{BiOF} \cdot 2\text{HF}$, HXAq ($\text{X} = \text{Cl}$ or Br) added to Bi_2O_3 little by little converts the whole of the Bi into BiOX , on addition of more HXAq the BiOX dissolves as BiX_3 , with a little HIAq BiI_3 is alone formed, if very dilute HIAq is added and the temperature is raised BiOI only is produced, with considerable excess of fairly conc HIAq BiI_3 is formed and dissolved. Heated in chlorine, BiCl_3 is formed, with bromine BiBr_3 and $\text{Bi}_2\text{O}_3 \cdot \text{Br}_2$ are produced. Heated in carbon monoxide reduction begins at about 200° , and in hydrogen at about 240° . Bi_2O_3 is not hydrated in moist air, nor is it altered by contact with water. Unchanged by heating in nitrogen. Oxidised to Bi_2O_5 and Bi_2O_6 by action of chlorine in presence of much hot KOHAq, scarcely oxidised by $\text{K}_2\text{Mn}_2\text{O}_8\text{Aq}$ (*v* further HYPOBISMUTHIC, and BISMUTHIC, OXIDE).

HYDRATED BISMUTHOUS OXIDE $\text{Bi}_2\text{O}_3 \cdot x\text{H}_2\text{O}$, $x=1, 2$, and 3 . The hydrate with $2\text{H}_2\text{O}$ is obtained by dissolving $\text{Bi}_2\text{O}_3 \cdot x\text{H}_2\text{O}$ in conc HClAq, ppg by KOHAq, and drying over H_2SO_4 , *in vacuo* the hydrate with H_2O is obtained by dissolving $\text{Bi}_2\text{O}_3 \cdot x\text{H}_2\text{O}$ in conc H_2SO_4 , reducing by SO_2 , ppg by KOHAq, and drying as before (*P M, C J* 32, 131). $\text{Bi}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ is very difficult to obtain quite free from oxy salts and Bi_2O_3 , pps formed by adding KOHAq to Bi_2O_3 in HCl, HNO_3 , or H_2SO_4 , and washing with cold water, always contain basic chloride, &c., if washed with hot water they contain Bi_2O_3 . Nearly pure $\text{Bi}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ is obtained by dissolving Bi_2O_3 in the minimum of HNO_3Aq , pouring into excess of conc NH_3Aq , washing with cold water until the washings contain no nitrates, then repeatedly agitating with very dilute $\text{Na}_2\text{CO}_3\text{Aq}$ (to decompose traces of basic nitrates), again washing repeatedly with cold water, and drying *in vacuo* over H_2SO_4 . The hydrates of Bi_2O_3 are white solids, easily dehydrated by heat, partially even by contact with hot water, Bi_2O_3 does not directly combine with water. The hydrates behave towards acids and oxidisers similarly to Bi_2O_3 . None of these hydrates shows the slightest indications of acidic functions. Thomsen gives the thermal values [Bi° , O° , $3\text{H}^\circ\text{O}$] = 137,740, [$\text{BiO}^\circ\text{H}^\circ\text{H}^\circ\text{ClAq}$] = 14,180, with formation of $\text{BiOCl} + 2\text{H}_2\text{OAq}$ (*Th* 2, 244).

HYPOBISMUTHIC OXIDE, AND HYDRATES, Bi_2O_3 , $\text{Bi}_2\text{O}_5 \cdot \text{H}_2\text{O}$, $\text{Bi}_2\text{O}_5 \cdot 2\text{H}_2\text{O}$ (Arppe, Schröder, Böttger, Wermicke, Pattison Muir). **Preparation of Bi_2O_5** — Bi_2O_3 is suspended in KOHAq, SG abt 1.85, the liquid is kept nearly boiling, and Cl is passed in until the solid is dark chocolate-red and quite homogeneous to the eye, the solid is washed with hot water until the washings are neutral to litmus, kept in contact with dilute HNO_3Aq (1 conc. acid to abt 20 water) until the

colour of the solid has become brownish-yellow (12-16 hours) (to dissolve any Bi_2O_3 and reduce any Bi_2O_5), washed free from acid, and boiled with conc NaClO_4Aq (to reoxidise any traces of Bi_2O_3) until a heavy, yellow brown, powder is formed which settles quickly, this powder is washed with hot water until quite free from alkali and Cl, and dried at 180° .

Hydrates — If the drying is conducted over H_2SO_4 the hydrate $\text{Bi}_2\text{O}_5 \cdot \text{H}_2\text{O}$ is obtained. If $\text{Bi}_2\text{O}_5 \cdot x\text{H}_2\text{O}$ (*v infra*) is treated with warm HNO_3Aq until the colour is orange-yellow, washed, and dried over H_2SO_4 , the hydrate $\text{Bi}_2\text{O}_5 \cdot 2\text{H}_2\text{O}$ is obtained. These hydrates are also formed, the first by the action of ordinary air on Bi_2O_5 , and the second (with $2\text{H}_2\text{O}$) by the action of moist air on Bi_2O_5 , they part with their water of hydration at about 150° .

Properties and Reactions — Bi_2O_5 is a brownish yellow solid, SG $\frac{200}{200} = 5.6$, deoxidised (to Bi_2O_3) and dissolved by fairly conc HNO_3Aq , or HClAq , more slowly by conc H_2SO_4 , slightly deoxidised by contact with water in direct sunlight, oxidised to $\text{Bi}_2\text{O}_5 \cdot x\text{H}_2\text{O}$ by Cl in presence of hot conc KOHAq, is not oxidised by ozonised O at 100° - 140° , heated in Cl gives BiCl_5 and a little $\text{Bi}_2\text{O}_5 \cdot \text{Cl}_2$, heated in Br gives BiBr_5 and considerable quantity of $\text{Bi}_2\text{O}_5 \cdot \text{Br}_2$. Heated in CO reduction begins at abt 105° and the change to Bi_2O_3 is complete at about 245° - 250° , with H the corresponding temperatures are abt 200° and 265° , respectively, heated in air or in O the temperatures are abt 240° and 320° , respectively. Neither of the hydrates exhibits any decided acidic functions.

BISMUTHIC OXIDE, AND HYDRATE, Bi_2O_5 (*Bismuth peroxide*) $\text{Bi}_2\text{O}_5 \cdot \text{H}_2\text{O}$ (*Bismuthic acid*) SG Bi_2O_5 5.917 (Brauner a Watts, *P M* 1881 62) S V S 42 SG $\text{Bi}_2\text{O}_5 \cdot \text{H}_2\text{O}$ 5.75

Preparation — Bi_2O_5 , or $\text{Bi}_2\text{O}_5 \cdot \text{H}_2\text{O}$, or BiOCl , is suspended in about 10 parts of conc KOHAq, SG about 1.38, the liquid is kept nearly boiling and Cl is passed in until a dark red homogeneous solid is formed, this solid is washed with hot water until the washings do not change the colour of red litmus paper and every trace of chloride is removed, it is then warmed for a very short time with a little conc HNO_3Aq until its colour is scarlet, washed repeatedly and quickly with dilute HNO_3Aq , each quantity of acid being more dilute than the preceding, and then with cold water until every trace of acid is removed. If the solid is now dried over H_2SO_4 , $\text{Bi}_2\text{O}_5 \cdot \text{H}_2\text{O}$ is obtained, if this is dried at 120° Bi_2O_5 remains (Pattison Muir, *C J* 89, 22).

Properties and Reactions — A red, heavy powder, combines with water to form $\text{Bi}_2\text{O}_5 \cdot \text{H}_2\text{O}$, in contact with much water is slowly deoxidised with production of hydrates of Bi_2O_3 and Bi_2O_5 , also deoxidised by hot dilute HNO_3Aq , giving first $\text{Bi}_2\text{O}_3 \cdot 2\text{H}_2\text{O}$, and then hydrates of Bi_2O_3 . Deoxidised to Bi_2O_3 by heating in current of air or oxygen at about 250° , and to Bi_2O_3 by heating in the same gases to about 805° , reduction in CO begins at about 70° , in H at about 100° , reduction to Bi_2O_3 is complete in H current at about 215° , and to Bi_2O_3 at about 255° . Reacts with Cl and Br, to give BiCl_5 and a little $\text{Bi}_2\text{O}_5 \cdot \text{Cl}_2$, and BiBr_5 and a little $\text{Bi}_2\text{O}_5 \cdot \text{Br}_2$.

respectively. Does not exhibit any decided acidic functions. $\text{Bi}_2\text{O}_3 \cdot \text{H}_2\text{O}$, however, dissolves in about 100 parts of boiling KOHAq so concentrated that solidification begins the moment the lamp is removed, on cooling, dissolving in as little water as possible, and nearly neutralising by HClAq (or by exposure to air) yellowish-white solids are obtained from which all potash is removed only by very long continued washing with boiling water. The solids dried at 100° contain a little water, Bi, and generally rather more O than is required by Bi_2O_3 . Solutions of $\text{Bi}_2\text{O}_3 \cdot \text{H}_2\text{O}$ in very conc boiling KOHAq, therefore, probably contain compounds of the form $x\text{Bi}_2\text{O}_3 \cdot y\text{K}_2\text{O}$. In the preparation of Bi_2O_3 , the very conc KOHAq dissolves a little of the Bi_2O_3 , as this is formed, on nearly neutralising with HClAq a white pp is obtained, which, after long-continued washing with boiling water, consists of $\text{Bi}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$ (Pattison Muir, *C J* 51, 77). In the preparation of Bi_2O_3 , a portion of the potash is very obstinately retained, the whole of the potash can scarcely be removed by washing with boiling water compounds of the form $x\text{Bi}_2\text{O}_3 \cdot y\text{K}_2\text{O}$ are probably formed, but every attempt to isolate these bodies has failed.

Bismuth, Oxyhaloid compounds of. Oxy bromides, oxychlorides, oxyiodides, and an oxy fluoride, of bismuth have been prepared. All the haloid compounds BiX_3 , where $\text{X} = \text{Cl}, \text{Br}, \text{or I}$, are oxidised by heating in air, only a very little BiOI is produced by long continued heating BiI_3 , BiBr_3 gives $\text{Bi}_2\text{O}_3 \cdot \text{Br}_2$, as BiCl_3 gives $\text{Bi}_2\text{O}_3 \cdot \text{Cl}_2$. The same oxyhaloid compounds are formed by the reaction between N oxides, (from starch and hot HNO_3Aq) and hot BiX_3 , the oxidation is carried furthest in the case of BiBr_3 , in this case the whole or nearly the whole of the haloid compound may be oxidised. The most stable haloid compounds towards oxidisers are BiF_3 and BiI_3 .

Oxybromides. Three oxybromides are known BiOBr , $\text{Bi}_2\text{O}_3 \cdot \text{Br}_2$, and $\text{Bi}_4\text{O}_7 \cdot \text{Br}_2$.

Bismuthyl bromide, BiOBr , is produced by the action of water on BiBr_3 , or by heating together Bi_2O_3 and BiBr_3 , or by dissolving Bi_2O_3 in HBrAq (BiBr_3 is formed in solution) and adding Bi_2O_3 little by little. It is a white amorphous powder, SG $\frac{300}{300}$ 67, insoluble in water, unchanged when heated to redness, mixed with charcoal and heated in dry Cl, BiCl_3 is formed, reacts with cold HClAq to form BiCl_3 and BiBr_3 , with cold HIAq to form BiI_3 and HBrAq, and with hot HFAq to form BiBr_3 , BiOF and $\text{BiF}_3 \cdot 3\text{HF}$. BiOBr heated in NH_3 is reduced to Bi, and a little $x\text{BiBr}_3 \cdot y\text{NH}_3$ is formed, x probably = 2 and y probably = 5 (Pattison Muir, *C J* 29, 144).

The oxybromide $\text{Bi}_2\text{O}_3 \cdot \text{Br}_2$ is produced by heating dry Bi_2O_3 with excess of Br for some hours and removing uncombined Br by warming in free contact with air. It is a cream coloured, non deliquescent, amorphous powder unchanged by heating in air, unacted on by water, dissolved by warm HClAq and HNO_3Aq (P M, *C J* 31, 24).

The oxybromide $\text{Bi}_4\text{O}_7 \cdot \text{Br}_2$ is produced (1) by slowly subliming BiBr_3 in contact with a little air, (2) by passing N oxides (obtained by heating starch and HNO_3Aq) into melted BiBr_3 ,

in the first reaction only a little of the BiBr_3 is oxidised, in the second reaction most of the BiBr_3 is oxidised. In either case the product is washed with water and dried at 100° . This oxybromide is a grey, lustrous, crystalline powder, unchanged by water, or by heating to redness, soluble in HClAq and conc HNO_3Aq , slowly reduced by H, finally giving Bi, heated in dry NH_3 , Bi remains, and a greyish green sublimate of $2\text{BiBr}_3 \cdot 5\text{NH}_3$ is formed (P M, *C J* 30, 12, 31, 24, 32, 40).

Oxychlorides. Three oxychlorides, BiOCl , $\text{Bi}_2\text{O}_3 \cdot \text{Cl}_2$, $\text{Bi}_4\text{O}_7 \cdot \text{Cl}_2$ (or $\text{Bi}_4\text{O}_7 \cdot \text{Cl}_2$), are known.

Bismuthyl chloride, BiOCl , is formed by adding water to BiCl_3 in a little HClAq, or by pouring Bi_2NO_3 in HNO_3Aq into dilute NaClAq, or by reacting on excess of Bi_2O_3 with very dilute HClAq, or by digesting a solution of BiCl_3 in HClAq with excess of Bi_2O_3 . The pp is washed with cold water and dried at 100° . This compound is a white, lustrous, crystalline powder (known commercially as 'pearl white') SG $\frac{300}{300}$ 72. Reacts with cold HBrAq to give BiCl_3 and BiBr_3 , with cold HIAq to give BiCl_3 and BiI_3 , with hot HFAq to form BiCl_3 , BiOF, and $\text{BiF}_3 \cdot 3\text{HF}$. Reduced to BiCl_3 by heating with charcoal in dry Cl (Jacquelin, *J pr* 14, 1, Arppe, *P* 64, 237. Oesten, *P* 110, 428, Heintz, *P* 63, 55, Pattison Muir, *C J* 39, 37).

The oxychloride $\text{Bi}_2\text{O}_3 \cdot \text{Cl}_2$ is said to be produced by heating BiOCl to redness (Arppe).

The oxychloride $\text{Bi}_4\text{O}_7 \cdot \text{Cl}_2$ is formed in small quantities by slowly subliming BiCl_3 in contact with a little air, and in large quantities by passing N oxides (by heating starch with HNO_3Aq) into melted BiCl_3 . The analytical numbers agree fairly with $\text{Bi}_2\text{O}_3 \cdot \text{Cl}_2$, and also with $\text{Bi}_4\text{O}_7 \cdot \text{Cl}_2$. The compound is a yellowish-white, hard, crystalline, solid, unchanged in air, or by water, or by heating to redness, soluble in hot HClAq or HNO_3Aq , boiled with NaOHAg, Bi_2O_3 and NaClAq are formed (P M, *C J* 32, 40).

Oxyfluoride. Only one is known. **Bismuthyl fluoride, BiOF,** is obtained by heating Bi_2O_3 with large excess of HFAq so long as any reaction occurs, boiling the residue with water until every trace of acid is removed, and drying at 100° , if the washing is conducted with cold water until nearly neutral, BiOF 2HF remains, when this is strongly heated in a closed Pt crucible, BiOF is obtained in crystalline form. The liquid obtained by boiling Bi_2O_3 with HFAq evaporated at 100° gives $\text{BiF}_3 \cdot 3\text{HF}$, when this salt is boiled with water it is slowly decomposed to BiOF. BiOF is a heavy, white, crystalline powder, SG $\frac{33}{33}$ 755. With HF it forms the double compound BiOF 2HF . Reacts with cold HClAq to form BiCl_3 and HFAq, with HBrAq to form BiBr_3 and HFAq, with HIAq to form BiI_3 and HFAq (P M, Hoffmeister, a Robbs, *C J* 39, 21).

Oxyiodides. **Bismuthyl iodide, BiOI,** is produced by boiling BiI_3 with H_2O in small quantities, by subliming BiI_3 in air, or, also in small quantities only, by reacting with N oxides (from starch and hot HNO_3Aq) on hot BiI_3 . BiOI is a heavy, red, crystalline powder, unchanged by water, or by heating in air, by long continued heating to bright redness in air a very little Bi_2O_3 is formed, reacts with HClAq, HBrAq, and HFAq, similarly to bismuthyl chloride

and bromide (Schneider, *J pr* 74, 424, P M, H a R, lc)

Another *oxyiodide*, probably $3\text{BiOI} \cdot 4\text{Bi}_2\text{O}_3$, is obtained as a yellow powder by pouring a dilute solution of Bi_3NO_3 into KIAq mixed with $\text{NaC}_2\text{H}_3\text{O}_2\text{Aq}$ (Fletcher a Cooper, *Ph* 1882)

Bismuth, Oxy sulphide of According to Hermann (*J pr* 75, 462) the compound $\text{Bi}_2\text{O}_3\text{S}$, is formed by heating 1 part S with 3.55 parts Bi_2O_3 to low redness in a retort, SG 6.3 A compound of Bi, S, and O, occurs as *Karelnite* (said to be $\text{Bi}_2\text{O}_3\text{S}$)

Bismuth, Phosphide of No definite compound has been isolated Berzelius (*Lehrbuch*, 2, 582 [5th ed]) says the two elements do not unite directly, but that a phosphide is formed by leading PH_3 into Bi_3NO_3 solution

Bismuth, Salts of These compounds are obtained in a few cases by the reaction between Bi and an acid, e.g. Bi_3NO_3 , but more generally by using Bi_2O_3 or Bi_2O_3 in place of Bi, or by double decomposition from Bi_3NO_3 in HNO_3Aq or BiCl_3 in HClAq Bismuth salts are insoluble in water, they are decomposed by water with production of so called basic salts the salts of Bi may indeed be arranged in two classes, normal and basic, as types of which may be taken the nitrates Bi_3NO_3 and BiONO_2 , respectively Many of these basic salts are most simply regarded as derived from acids by replacement of H by BiO , they are often called bismuthyl salts other basic salts, however, at present at any rate, are best represented as compounds of acid forming oxides with Bi_2O_3 . All the basic nitrates for instance, and many of these salts are known, belong to the general form $x\text{Bi}_2\text{O}_3 \cdot y\text{N}_2\text{O}_5 \cdot \text{H}_2\text{O}$ The salts obtained by reactions between acids and the oxides Bi_2O_3 and Bi_2O_3 are the same as those which are formed when Bi_2O_3 is used The more important salts of Bi are the *nitrates* and *sulphates*, also *bromate*, *chlorate*, *oxalates*, *phosphates*, *tartrates*, &c (v NITRATES, SULPHATES, &c &c)

Bismuth, Selenide of Bi_2Se_3 Black, lustrous, metal like, powder, SG 6.82 Obtained by passing H_2Se into Bi_3NO_3 in as little HNO_3Aq as possible, or by heating together 1 part Se and 1.8 parts Bi, and repeatedly melting the product in contact with Se Insoluble in solutions of alkalis or alkali sulphides, decomposed by HNO_3Aq , gives up Se when heated Combines with BiCl_3 (v *infra*) (Berzelius, Schneider, *P* 94, 628)

Bismuth, Selenochloride of BiSeCl ($= \text{Bi}_2\text{Se}_3 \cdot \text{BiCl}_3$) Formed by adding powdered Bi_2Se_3 to molten $2\text{NH}_4\text{Cl} \cdot \text{BiCl}_3$ Steel grey, needle shaped, crystals Heated in CO_2 is separated into Bi_2Se_3 and BiCl_3 (Schneider, lc)

Bismuth, Sulphides of One well marked sulphide of Bi, Bi_2S_3 , is known, another, Bi_2S_5 , corresponding to the oxide Bi_2O_5 , probably exists Attempts to prepare a sulphide with more S than Bi_2S_5 have failed (Pattison Muir, *C J* 83, 192) Sulphide of bismuth does not react with more positive sulphides as a salt forming compound (comp Schneider, *Z* [2] 5, 680 with P M, *C J* 83, 192)

Bismuth Trisulphide Bi_2S_6 Occurs native as *bismuth glance* SG 6.5 Rhombic forms, $a \cdot b = 1.9884$, isomorphous with As_2S_6 and

Sb_2S_6 Obtained by heating a mixture of 1 part S with 4.4 parts Bi till a grey crystalline mass is formed, and then repeatedly heating this with a little S also by passing H_2S into an acid solution of a Bi salt If the pp thus obtained is heated with an alkali-sulphide solution to 200° the Bi_2S_6 is said to become crystalline Steel grey, crystalline, lustrous, solid strongly heated it is separated into Bi and S, unacted on by alkali or alkali sulphide solutions

BISMUTH DISULPHIDE $2\text{Bi}_2\text{S}_5 \cdot \text{H}_2\text{O}$ Said to be p'd by H_2S from alkaline solutions of Bi_2O_3 Schneider (*P* 97, 480) dissolved 8 grams Bi tartrate in the necessary quantity of KOH Aq , added air free water to make up to 1500 cc, then 2 grams SnCl_4 in KOH Aq , and passed in air free H_2S until the liquid became colourless He washed the black pp with KOH Aq and then with H_2O (air free), and dried at 100° A black powder, becomes lustrous by compression, decomposed by heating into Bi and Bi_2S_5 , by HCl Aq into Bi , BiCl_3 , and H_2S

Bismuth, Sulphochloride of, v BISMUTH, THIO HALOID COMPOUNDS OF

Bismuth, Sulphiodide of, v BISMUTH, THIO HALOID COMPOUNDS OF

Bismuth, Sulphocyanide of, $\text{Bi}(\text{SCN})_3$, v CYANIDES

Bismuth, Telluride of No definite compound has been isolated, *telluric bismuth*, approximately $\text{Bi}_2\text{S}_3 \cdot 2\text{Bi}_2\text{Te}_3$, occurs native According to Berzelius (*Lehrbuch*, 2, 583 [5th ed]) the two elements may be melted together in all proportions

Bismuth, Thiohaloid compounds of Only two are known $\text{Bi}_2\text{S}_3\text{Cl}$ and $\text{Bi}_2\text{S}_3\text{I}$ The former is obtained by the direct reaction between BiCl_3 and S, but BiI_3 and S do not react together, when BiBr_3 and S are heated together there are indications of the formation of a thio compound, but none has yet been isolated (v P M, H a R, *C J* 89, 21) The thio compounds are much less stable than the corresponding oxy-compounds, v BISMUTH, OXYHALOID COMPOUNDS OF

BISMUTH THIOCHLORIDE (sulphochloride) $\text{Bi}_2\text{S}_3\text{Cl}$ Obtained by heating S with BiCl_3 , or by adding powdered Bi_2S_3 to molten $2\text{NH}_4\text{Cl} \cdot \text{BiCl}_3$, and washing the product with very dilute HCl Aq Small, metal like, greyish, needles, easily decomposed into its constituents, e.g. by heating in CO_2 , by H_2 , by HCl Aq or HNO_3Aq , and by alkalis (Schneider, *P* 93, 464)

BISMUTH THIO IODIDE (sulpho iodide), $\text{Bi}_2\text{S}_3\text{I}$ said to be formed, as long needles, by strongly heating I, S, and Bi_2S_3 , placed in alternate layers in a large crucible (*P* 110, 147)

Bismuthic Acid and Bismuthates (so called) $\text{Bi}_2\text{O}_5 \cdot \text{H}_2\text{O}$ is sometimes called bismuthic acid, bodies obtained by dissolving Bi_2O_3 in much molten KOH , or by saturating with Cl conc KOH Aq holding Bi_2O_3 in suspension, have been described as bismuthates But later experiments have shown that these bodies cannot be isolated although they probably exist in presence of much potash The acidic functions of $\text{Bi}_2\text{O}_5 \cdot \text{H}_2\text{O}$ are extremely feeble, v BISMUTHIC OXIDE under BISMUTH, OXIDES OF, p 516.

M M P M.

BISMUTH, ORGANIC DERIVATIVES**Bismuth mono-methyl compounds**

Di-chloride BiMeCl_2 , [242°] Obtained by adding BiMe_3 to an acetic acid solution of BiCl_3 . White plates. M sol alcohol and acetic acid, insol ether (Marquardt, *B* 20, 1520)

Di-bromide BiMeBr_2 , [214°] Formed by mixing ethereal solutions of BiMe_3 and BiBr_3 . Yellow powder. Sl sol alcohol, benzene, and acetic acid, insol ether (M)

Di-iodide BiMeI_2 , [225°] Formed by heating BiMe_3 with methyl iodide at 200° (M). Glistening red crystals. Sol alcohol, sl sol acetic acid, insol ether

Oxide BiMeO Formed by adding NH_3 to an alcoholic solution of the double compound of BiMeBr and BiBr_3 , which is obtained as a yellow crystalline pp on mixing ethereal solutions of BiMe_3 (1 mol) and BiBr_3 (2 mols) (Marquardt, *B* 20, 1522). White powder. Insol water. Dis solves in NaOH and in dilute HNO_3 . Ignites in the air if gently warmed

Bismuth di-methyl compounds

Chloride BiMe_2Cl , [116°] Formed by passing chlorine into a solution of BiMe_3 in petroleum ether, cooled in a freezing mixture. White micro crystalline powder. V sol alcohol, insol ether (Marquardt, *B* 20, 1519)

Hydroxide $\text{BiMe}_2(\text{OH})$ Formed by the action of water upon the double compound of BiBr_3 and BiMe_2Br , which is ppd as an oily liquid by mixing ethereal solutions of equal mols of BiBr_3 and BiMe_3 . Crystalline solid. Ignites in the air spontaneously. Dissolves in aqueous NaOH . Decomposed by aqueous HCl with evolution of CH_4 (Marquardt, *B* 20, 1523)

Bismuth tri-methide BiMe_3 , *Tri methyl bismuthine* (110°) SG 2.3 at 18° Obtained by slowly adding an ethereal solution of bismuth bromide (2 mols) to an ethereal solution of zinc methide (rather more than 3 mols). Mobile refractive liquid, of unpleasant pungent odour. In the air it fumes and rapidly oxidises, when heated in the air it explodes violently. Volatile with steam, but decomposes on long boiling with water. Dilute H_2SO_4 or HNO_3 have little action upon it, but conc HCl decomposes it with evolution of CH_4 and production of BiCl_3 . It does not combine with alkyl haloids or with halogens. The latter replace Me forming BiMe_2Cl , &c (Marquardt, *B* 20, 1517)

Bismuth mono-ethyl compounds

Chloride BiEtCl , Prepared by adding alcoholic HgCl_2 to alcoholic BiEt_3 , (g v)

Iodide BiEtI , From the chloride and KI. Golden, six sided plates

Oxide BiEtO From the iodide and potash. Yellow amorphous powder, takes fire in air

Nitrate $\text{BiEt}(\text{NO}_3)_2$, From the oxide and HNO_3 . Crystalline tufts

Bismuth di-ethyl bromide BiEt_2Br Formed by dropping bromine into a cooled solution of BiEt_3 in petroleum ether. White powder. V sol alcohol, insol ether. Ignites in the air on warming (Marquardt, *B* 20, 1520)

Bismuth tri-ethylide BiEt_3 , *Tri ethyl-bismuthine* (107°) at 79 mm SG 1.82

Preparation.—1 An alloy of Bi and K is made by strongly heating bismuth (5 pts) with cream of tartar (4 pts). This alloy is treated with EtI (Breed, *A* 82, 106).—2 Obtained by slowly

adding an ethereal solution of bismuth bromide (2 mols) to an ethereal solution of ZnEt_2 (rather more than 8 mols) (Marquardt, *B* 20, 1519)

Properties.—Smoking oil. It cannot be distilled at ordinary atmospheric pressure, for on heating to 150° it detonates violently, volatile with steam. Fumes and takes fire in air. V sol alcohol, ether, and acetic acid. Its ethereal solution exposed to air deposits $\text{Bi}_2\text{O}_3 \cdot \text{H}_2\text{O}$. Forms unstable compounds with non-metals. $\text{BiEt}_3 \cdot \text{S} \cdot \text{Bi}_2\text{S}_3$ is a yellow solid, insoluble in water, soluble in yellow ammonium sulphide. BiEt_3 throws down calomel from alcoholic HgCl_2 , but when alcoholic HgCl_2 is added to alcoholic BiEt_3 , crystals of BiEtCl_2 may be got. $\text{BiEt}_3 + 2\text{HgCl}_2 = 2\text{HgEtCl} + \text{BiEtCl}_2$ (Dunhaupt, *A* 92, 371)

Bismuth-tri-phenyl $\text{Bi}(\text{C}_6\text{H}_5)_3$, *Tri phenyl-bismuthine* [82°] SG 1.5851 at 20° Formed by heating bromo benzene containing some acetic ether with an alloy of sodium and bismuth (10 p.c. Na). Colourless needles or tablets. Sol hot alcohol, sparingly in cold, v sol ether and petroleum ether. By boiling with conc HCl it is completely decomposed into benzene and bismuth chloride. It combines with Cl_2 forming the *chloride* $(\text{C}_6\text{H}_5)_2\text{BiCl}$, which crystallises in thick prisms, [140°], sol hot alcohol, sl sol ether and cold alcohol, v sol benzene, not decomposed by conc HCl . The *bromide* $(\text{C}_6\text{H}_5)_2\text{BiBr}$ forms long prisms, [119°], v sol benzene, sl sol alcohol and ether (Michaëlis & Weitz, *B* 20, 54)

BITTER ALMOND OIL v ALMONDS and BENZOIC ALDEHYDE

BIURET $\text{C}_2\text{H}_5\text{N}_3\text{O}_2 + \text{NH}_3$, $\text{CO} \cdot \text{NH} \cdot \text{CO} \cdot \text{NH}_2$, *Allophanamide*. Mol w 103 [190°] S 1.25 at 0°, 1.54 at 15°, 45 at 100°

Formation.—1 Urea is heated at 150°–170° until the melted mass becomes pasty and ceases to give off NH_3 . The product is extracted with hot water (Wiedemann, *P* 74, 67, Hofmann, *B* 4, 262).—2 By passing the vapour of cyanic acid into melted urea (Finck, *A* 124, 331).—3 Urea is treated with chlorine till the mass becomes pasty (Hoppert & Dogel, *Z* [2] 3, 691, *B* 4, 475).—4 By the action of NH_3 on allophanic ether (H & D).—5 By heating 'amido dicyanic acid' (p 163) with H_2SO_4 (1 pt) and water (3 pts) at 60°–70° (Baumann, *B* 8, 708).—6 By the action of NH_3 upon tri bromo acetyl-urea (Baeyer, *A* 130, 154).—7 By heating urea with PCl_5 at 100° (Weitz, *B* 10, 1743).—8 By mixing dilute solutions of urea and potassium cyanate, acidifying with acetic acid, evaporating, adding a little H_2SO_4 and extracting with alcohol (Drechsel, *J pr* 128, 472).—9 By electrolysis of a solution of NH_3 , using carbon electrodes (Millot, *Bl* [2] 46, 244)

Properties.—Long needles (containing aq), or long anhydrous laminae (from alcohol). Split up by heat into NH_3 and cyanuric acid. Dissolves unchanged in cold conc H_2SO_4 . Its solution is not ppd by salts of lead or silver or by tannin. A little CaSO_4 followed by KOH gives a deep violet solution

Reactions.—1 At 120° it absorbs HCl forming $\text{Bi} \cdot \text{HCl}$ which at 160°–170° in a current of HCl gives H_2O , CO , guanidine, cyanuric acid, and urea.—2 Boiling conc HClAq forms NH_3 , urea, and guanidine.—3 Boiling *baryta water*

forms CO_2 , NH_3 , and urea — 4 With NaClO it evolves $\frac{1}{2}$ of its nitrogen, with NaBrO it evolves $\frac{3}{4}$ (Fenton, *C* 85, 14) — 5 HNO_3 gives CO_2 and N_2O in equal volumes (Franchimont, *R T C* 6, 216) — 6 COCl_2 at 60° forms carbonyl di-biuret ($\text{C}_4\text{H}_4\text{N}_4\text{O}_2$), CO (E Schmidt, *J pr* [2] 5, 47), a crystalline powder, v sol cold water, insol alcohol and ether. This solid is converted by boiling baryta water into urea and cyanuric acid, and by COCl_2 at 140° into cyanuric acid, $\text{Hg}(\text{NO}_3)_2$ gives, in hot dilute solution, a pp of $\text{C}_4\text{H}_4\text{N}_4\text{O}_2 \cdot 3\text{HgO}$

Salts — $\text{B}'\text{HCl}$, decomposed by water — $\text{Ag}_2\text{C}_4\text{H}_4\text{N}_4\text{O}_2$ ppd. by adding AgNO_3 (2 mols) and NH_4Aq to a saturated aqueous solution of biuret (1 mol), sol HNO_3 and NH_4Aq (Bonné a Goldenberg, *B* 7, 287) — Cyanurate $\text{B}'\text{C}_3\text{N}_3\text{H}_3\text{O}_3$, needles, formed on crystallising biuret from water. It has probably been mistaken for urea cyanurate from which it differs in yielding with baryta water, barium cyanurate and biuret, in giving off 3 atoms of nitrogen as ammonia when heated with barium hydrate (urea cyanurate yields 2 atoms), in giving off 14.8 p.c. nitrogen with sodium hypobromite, (while urea cyanurate gives 11.5 p.c., both results corresponding to 2 atoms nitrogen) (Herzig, *M* 2, 411)

Biuret dicyanamide $\text{C}_4\text{H}_4\text{N}_4\text{O}_2$, $\text{NH}(\text{CO}\text{NH}(\text{CNH})\text{NH})_2$. From acetyl urea (2 pts) and guanidine carbonate (5 pts) at 110° – 150° (Rasinski, *J pr* [2] 27, 157) Amorphous substance v sol acids and fixed alkalis, insol NH_4Aq . Does not give the biuret reaction with CuSO_4 .

BIXIN $\text{C}_{25}\text{H}_{31}\text{O}_5$ [176°] A colouring matter contained in annatto seeds (*Bixa orellana*) (Preissner, *A* 52, 382, Girardin, *J Ph* [3] 21, 174, Bolley a. Mylius, *Bl* [2] 3, 230, Stein, *J pr* 102, 175)

Preparation.—Annatto (1,500 g) is digested at 80° with alcohol (2,500 g of 80 p.c) with addition of Na CO_3 (150 g), after filtration, the residue is again digested with alcohol (1,500 g of 60 p.c). The mixed filtrates are ppd by adding half their bulk of water and conc $\text{Na}_2\text{CO}_3\text{Aq}$, the ppd sodium bixin is dissolved in alcohol (60 p.c) and re ppd with $\text{Na}_2\text{CO}_3\text{Aq}$. The sodium bixin is then decomposed by HCl (Ett, *B* 11, 864, 7, 446)

Properties — Minute red leaflets, insol water, al sol alcohol, benzene, CS_2 , and acetic acid, v e sol ether. Conc H_2SO_4 forms a bright blue solution, whence water gives a dark green pp. It reduces cold Fehling's solution

Reactions — 1 Distillation with zinc dust gives *m* xylene, ethyl toluene, and an oil $\text{C}_{11}\text{H}_{14}$ (270° – 280°) Reduced by sodium amalgam to $\text{C}_{25}\text{H}_{40}\text{O}$.

Salts — $\text{C}_{25}\text{H}_{31}\text{NaO}_5$ 2aq lustrous red crystals, v sol water, insol alcohol, and ether — $\text{C}_{25}\text{H}_{31}\text{Na}_2\text{O}_5$ 2aq dull red powder — $\text{C}_{25}\text{H}_{31}\text{K}_2\text{O}_5$ 2aq — $\text{C}_{25}\text{H}_{31}\text{K}_2\text{O}_5$ 2aq.

BLEACHING-POWDER v **HYPOCHLORITES**, under **CHLORINE**, **OXYACIDS** of

BLOOD In vertebrates, the blood is a somewhat viscous, and to the naked eye homogeneous, red liquid. The blood which leaves the lungs or gills is of a bright scarlet colour, and that in the systemic veins of a purplish hue, which on exposure to the air, or on shaking

with oxygen, becomes of the bright arterial scarlet colour. This difference in tint is due to the amount of oxygen present in combination with the red pigment hæmoglobin, in the lungs a loose combination called oxy hæmoglobin is formed which is scarlet, in the tissues this oxygen is given up, and the blood returning to the heart is of the purplish colour due to hæmoglobin.

Specific Gravity Roy (*Proc Physiol Soc* 1884) has introduced a method for ascertaining the specific gravity of living blood. A drop of blood is introduced into a mixture of glycerin and water of known specific gravity, if the drop tends to rise or sink, it is assumed that it is of lower or higher specific gravity than the liquid in which it is placed. The average specific gravity of human blood thus found was 1.060. Defibrinated human blood has an average specific gravity of 1.055. Pfleger (*Pflüger's Archiv*, 175) found the specific gravity of dog's blood to be 1.060, and Gschleiden that of rabbit's blood 1.048.

Characters — Blood is always feebly alkaline in reaction (Kühne, *Verehows Archiv*, 33, 65, Liebreich, *B* 1, 48, Schafer, *Journal of Physiology*, 3, 292). Under the microscope the blood is seen not to be a homogeneous red liquid, but to consist of a nearly colourless liquid, the plasma or liquor sanguinis, holding in suspension large numbers of solid bodies, the corpuscles. These corpuscles are of two kinds, the coloured and the colourless.

Red corpuscles These owe their colour to hæmoglobin, and are much more numerous than the white corpuscles. They vary in size and structure in different groups of the vertebrate sub kingdom. In Mammalia, with the exception of the Camelids, they are biconcave, circular discs, they have no nucleus except during embryonic life, and they have a tendency to run into rouleaux when the blood is at rest, but if it is disturbed they readily become separated. In the Camel tribe they have an elliptical outline. Their average diameter in mammals is .007–.008 millimetre and about one fourth of that in thickness, there are very slight variations in different classes of mammals. In birds, reptiles, amphibians, and fishes, the red corpuscles are biconvex, oval discs, with a nucleus, they are largest in the amphibia. C Schmidt gives the specific gravity of red blood corpuscles as 1.089, Welcker as 1.105.

According to C Schmidt, 1,000 parts of moist red corpuscles contain—

Water	688 parts
Solids {	Organic 303.88 „
	Mineral 8.12 „

According to Hoppe Seyler and Judell (*Med Chem Untersuchungen*, Heft m p 386) 100 parts of dried corpuscles contain—

	Human blood	II	Dog's blood	Goose's blood
Proteids	12.24	5.10	12.55	86.41
Hæmoglobin	86.79	94.30	86.50	62.65
Lecithin	0.72	0.35	0.59	0.46
Cholesterolin	0.25	0.25	0.36	0.48

The nuclei of the red corpuscles consist mainly, according to Lauder Brunton, of nuclein, a substance very akin in its properties to mucin (*Journal of Anat. and Physiology*, 2nd series,

vol 8, p 91) The mineral constituents of the red corpuscles have been investigated by O Schmidt, and the following tables contrast those of the red corpuscles with those of the plasma in man

1000 parts of moist corpuscles yield—

Mineral matter (exclusive of iron, which is contained in the hæmoglobin	8 120
Chlorine	1 686
Sulphuric anhydride	0 066
Phosphorus pentoxide	1 134
Potassium	3 328
Sodium	1 052
Calcium phosphate	0 114
Magnesium phosphate	0 073

1000 parts of plasma yield—

Mineral matter	8 550
Chlorine	3 640
Sulphuric anhydride	0 115
Phosphorus pentoxide	0 191
Potassium	0 323
Sodium	3 341
Calcium phosphate	0 311
Magnesium phosphate	0 222

The remarkable difference in the distribution of potassium and sodium seen in the above does not, however, hold for most animals as the following table shows (Gamble, *Physiological Chemistry*, p 122)

	Blood Cells		
	K	Na	Cl
Man	40 89	9 71	21 00
Dog	6 07	36 17	24 88
Cat	7 85	35 02	27 59
Sheep	14 57	38 07	27 21
Goat	37 41	14 98	31 73

	Liquor Sanguinis		
	K	Na	Cl
Man	5 19	37 74	40 68
Dog	3 25	39 68	37 31
Cat	5 17	37 64	41 70
Sheep	6 56	38 56	40 89
Goat	8 55	37 89	40 41

Probably the only gaseous constituent of the red blood corpuscles not in a state of chemical combination is carbonic acid.

Blood tablets Besides the red corpuscles, a number of colourless discs of 002–008 millimetre diameter are also seen; they are also called hæmatoblasts (*Blutplättchen* of Bizzozero). By some they are supposed to be stages in the development of red corpuscles, by others to take part in the formation of fibrin. Wooldridge considers them to be identical with the proteid he calls fibrinogen A, which can be precipitated from liquor sanguinis by exposure to cold.

Colourless corpuscles or leucocytes These are animal cells, and consist of nucleated masses of protoplasm, more or less granular, and exhibiting during life contractility, the movements so produced being called amoeboid. They are not constant in size, but in man they average about 0.01 millimetre, they are somewhat larger in the lower vertebrate groups. In mammals there is on the average one white or colourless corpuscle to 880 or 850 red ones.

Our knowledge of the chemical constituents of the white corpuscles is meagre, they are lighter than the red ones, the great mass of the protoplasm is undoubtedly proteid in nature, and the nucleus consists mainly of nuclein

(Miescher, *Med Chem Untersuch.*, Heft iv, p 441). By micro chemical investigation, the presence of glycogen can often be demonstrated by iodine, and of fat granules by osmic acid.

Coagulation of blood Within a few minutes after having been shed, blood passes first into the state of a soft red jelly, which gradually acquires greater consistence, and by the contraction of one of its constituents expresses a fluid, the serum, in which the clot or *crassamentum* ultimately floats.

Coagulation is due to the separation from the blood plasma of a solid proteid substance called fibrin. The clot consists of fibrin entangling the corpuscles. By stirring blood, or whipping it with twigs immediately after it is shed, fibrin free from corpuscles adheres to the twigs as a yellowish stringy mass. Under the microscope, coagulation is seen to consist of the separation of fine filaments from the plasma, which start from or entangle the blood plates, and corpuscles.

Coagulation of the blood is hastened by exposure to a temperature rather above that of the body, by contact with foreign matter, or by agitation, and by dilution with not more than twice its volume of water. Coagulation is hindered or prevented by exposure to a low temperature, by contact with living tissues, or by the addition of large quantities of neutral salts such as sodium chloride, sodium sulphate, or magnesium sulphate. When these precautions are taken, the corpuscles sink, and the plasma can be drawn off in the last case mixed however with salt solution, the inhibitory influence of which on coagulation can be removed by diluting the mixture with water, fibrin is then formed.

Many theories have been held with regard to the cause of the coagulation of the blood. Nearly up to the end of the last century, the clot was believed to be simply a mass of adherent corpuscles. Hewson, 1772 (*v Hewson's works*, edited by Gulliver, *Sydenham Soc.*), was the first to show that it was really due to the separation of some substance from the plasma. Buchanan (*London Medical Gazette*, vol 18) showed that squeezed blood clot had the power of hastening the coagulation of the liquor pericardii, and as this power was especially shown by the buffy coat, he supposed that it was due to the white corpuscles, he compared the action of these corpuscles to that of rennet on milk. Denis (*Mémoire sur le sang*, 1859, p 32), by saturating the liquor sanguinis with sodium chloride, obtained a proteid pp, which after being redissolved in water underwent coagulation. To this precursor of fibrin he gave the name *plasmine*. A Schmidt (*Archiv f Anat u Physiol* 1861, 545) separated plasmine into its two constituents, both proteids of the globulin class, to which he gave the names fibrinogen and fibrinoplastin or paraglobulin (now called serum globulin). He thought both of these substances were necessary for coagulation, and that they united to form fibrin under the influence of a ferment. This *fibrin ferment* he prepared from serum, by ppg it with the serum proteids by means of absolute alcohol, after leaving the pp some months under alcohol, the proteids were by this means rendered insoluble, while the ferment could be extracted with water.

Gamgee (*Journal of Physiology*, 1879) obtained fibrin-ferment by extracting blood clot with 8 p.c. sodium chloride solution. The extract contained a small quantity of a globulin like proteid, and had very marked power in inducing coagulation. Hammarsten (*Pflüger's Archiv*, 14, 211, 17, 413, 18, 38, 19, 563) modified Schmidt's theory by showing that paraglobulin is not necessary for the formation of fibrin, but that fibrinogen is the only true fibrin precursor which under the influence of the fibrin ferment is converted into fibrin. The presence of paraglobulin, however, hastens coagulation perhaps by its combining with alkaline carbonates which otherwise would impede the action of the ferment. Other proteids such as casein, or even salts such as calcium chloride, will, however, take its place.

The source of the fibrin ferment seems to be the white corpuscles. Rauschenbach has pointed out (*Ueber die Wechselwirkungen zwischen Protoplasma und Blutplasma*, Inaug. Diss. Dorpat, 1883) that leucocytes are of two kinds: a leucocyte which are acted upon and disintegrated by the plasma when the blood is shed, two of the products of such action being paraglobulin and fibrin ferment, and β leucocytes which remain unaltered.

The latest theory of the coagulation of the blood is that of L. C. Wooldridge (*Beiträge zur Physiologie*, Leipzig, 1887, 221). He injects peptone into the circulation of an animal, and kills it by bleeding; the blood remains uncoagulated for many hours, and the corpuscles are removed by centrifugalising, if a substance containing lecithin be then added to the peptone plasma, coagulation occurs. By cooling peptone plasma, a pp is produced, this consists of little rounded discs similar to blood tablets, this is called fibrinogen α , after its removal from the plasma coagulation does not occur. The formation of fibrin is supposed to be due to the lecithin contained in fibrinogen α combining with fibrinogen β (Hammarsten and Schmidt's fibrinogen).

Human blood yields from 2.2 to 2.8 parts of fibrin per 1,000.

Serum. This is the plasma, minus the elements of fibrin. It contains three classes of constituents, proteids, extractives, and salts. The proteids consist of globulin and albumin. Owing to the disintegration of the white corpuscles the globulin is rather more abundant than in the plasma. The following table of Hammarsten's (*Pflüger's Archiv*, 1878) represents the percentage of these substances in the serum of some of the commoner mammals.

	Total Solids	Total Proteids	Serum Globulin	Serum Albumin
Serum from Horse	8.507	7.257	4.565	2.677
" " Ox	8.965	7.499	4.169	3.329
" " Man	9.207	7.619	3.103	4.516
" " Rabbit	7.625	6.225	1.788	4.436

The globulin appears to be a single substance, it is coagulated by heat at 75° C. by fractional heat-coagulation, however, the serum albumin can be differentiated in some animals into two, in some into three proteids (Halliburton, *Journal of Physiology*, 5, 152, Kauder, *Arch f exp Path u Pharmac*, 20, 411), in the cold blooded animals the total quantity of proteids in the

serum is much lower, the serum globulin is always greatly in excess of the serum albumin, and the latter substance is not differentiable into several proteids by fractional heat-coagulation (Halliburton, *Journal of Physiology*, 8, 319).

The extractives of serum are organic substances present in small quantities, which are extracted by various liquids, especially by alcohol or ether. There is about 0.2 p.c. of fats and cholesterol, about 0.8 to 0.12 p.c. of glucose (Pavy, *Croonian Lectures on Diabetes*, London, 1878), urea 0.02 to 0.04 p.c., and creatine, creatinine, xanthine, hypoxanthine, uric acid, and hippuric acid in still smaller quantities. A yellow pigment is found dissolved in varying quantities in the serum of most animals, Hammarsten (*Maly's Jahrbuch*, 1878, 129), MacMunn (*Pr* 31, 231) and others have described this as a biliary pigment, Krukenberg (*Sitzungsber der Jenaischen Gesellsch f Med*, 1885) and Halliburton (*Journal of Physiology*, 8, 324) have described it as a lipochrome.

The salts of serum amount to 0.7 to 0.9 p.c. **Gases of the blood.** From the blood as a whole, or from the plasma, coloured corpuscles, or serum, a mixture of carbonic acid, oxygen and nitrogen can be separated. Oxygen is present in much larger quantities than could be held in simple solution in the blood, and is, in fact, held in feeble combination with hæmoglobin, only a small part being in solution in the liquor sanguinis. Carbon dioxide is partly in a state of chemical combination, but chiefly in a state of simple solution. It is contained in great part in the liquor sanguinis, but in part also in the corpuscles. The nitrogen is held in simple solution in the liquor sanguinis. Arterial blood of the dog yields for every 100 volumes 58.3 vols of mixed gases composed of 22.2 vols of oxygen, 34.3 vols of carbonic anhydride, and 1.8 vols of nitrogen. The maximum amount of oxygen observed has been 25.4 vols (Pflüger, *Centralbl f d med Wissensch* 1868). In venous blood, the nitrogen is the same as in arterial, the oxygen is less in amount (from 8 to 12 vols per 100 of blood), and the CO₂ greater (from 40-50 vols per 100 of blood).

Lymph. This is the name applied to that portion of the blood that transudes through the walls of the blood vessels, and after supplying the tissues with nutritive materials and receiving the products of their combustion returns to the large veins by means of the lymphatic vessels.

Lymph is a transparent liquid, which during digestion is more or less milky, owing to the suspension in it of fatty matters absorbed from the alimentary canal. Its specific gravity varies between 1.012 and 1.022, and its reaction is alkaline.

Under the microscope, the lymph is seen to contain colourless corpuscles. In a time varying from 3 to 20 minutes after it has left the vessels, lymph undergoes coagulation, fibrin being formed. The amount of fibrin which separates is between 0.4 and 0.8 per 1000, being less than that which separates from blood. Lymph is, in fact, simply dilute blood plasma, urea and carbonic acid, however, are rather more abundant in lymph than in blood.

The Blood in Disease

Anæmia The chief change is a reduction in the number of red corpuscles, and the diminution of the amount of hæmoglobin they contain. In severe cases there is also a reduction in the solid constituents of the plasma.

Leucocythæmia This is associated with great increase in the number of white corpuscles, which may become nearly as numerous as the red. The blood is poor in hæmoglobin, and rich in hypoxanthine and lactic acid (Scherer). Charcot found in the blood, spleen, and liver of patients suffering from leucocythæmia colourless elongated crystals, which he and Vulpian were inclined to consider as proteid in nature, while they were regarded by Salkowski as consisting of a mucin like substance. Schreiner states that they consist of the phosphate of a base, to the hydrochloride of which he gives the formula $C_2H_5N \cdot HCl$ (*A* 194:68).

Gout In this disease uric acid accumulates in the blood, probably owing to non elimination by the urine, there is also a large quantity of oxalic acid (Garrod, *Médecine Chirurg Trans*, 31, 83, 37, 54).

Rheumatism The fibrin is much increased in amount the same is, however, true for other inflammatory conditions. There is no excess of uric acid in the blood. Lactic acid is said to be the *materies morbi* by some, but this has never been satisfactorily demonstrated.

Fevers—In various zymotic fevers, and septic diseases, the presence of different forms of bacteria has been described, or in some cases only presumed to exist in the blood. The best known of these are the spirillum of relapsing fever, the bacillus anthracis of splenic fever, and the bacillus malarie of Klebs and Crudeli of intermittent fever. Pigment granules of a dark colour are also said to occur in the blood of ague patients. It is probably a derivative of hæmoglobin (Marchiafava).

Diseases of the liver In jaundice, bilirubin and in some cases the bile salts also accumulate in the blood, in acute yellow atrophy the blood contains leucine and tyrosine.

Diabetes mellitus In this disease the most marked feature is an increase in the amount of glucose in the blood. The peculiar odour of the breath in diabetics is stated to be due to acetone, and death is often said to result from acetonæmia. It is probable that acetone does not exist free in the blood, but is derived from the splitting up of aceto acetic ether.

In some cases of diabetes a lipæmic (fat in the blood) condition has been described. But there is no doubt that this may occur without evidence of disease, and also in other diseases than diabetes.

Bright's disease In addition to an anæmic condition, there is an increase in the amount of urea in the blood. The convulsions and coma that are apt to supervene when the elimination of urea is defective have been designated evidences of uræmic poisoning. It is probable, however, that in these cases it is not urea itself which is the poison, but probably some substance or substances antecedent to urea. Frerichs' theory that the poison is ammonium carbonate is now given up as untenable.

The Blood of Invertebrate Animals

Our knowledge concerning the blood of invertebrate animals is much less complete than that of the vertebrates. In certain marine animals the circulating fluid is chiefly sea water in which a number of corpuscles are suspended (*e.g.* echinoderms) in other invertebrates such as crustacea the blood is a highly organised fluid, and rich in proteid constituents, but even in these the amount of saline matters varies with the habitat, being much more abundant in marine than in fresh water animals. There is never any distinction into blood proper and lymph in invertebrate animals, hence the name *hæmolymph* is sometimes given to their circulating fluid, the term *hydrolymph* is applied in those cases in which the blood is chiefly water, and contains but few organic constituents.

Hæmoglobin is contained in the blood of many invertebrates (Lankester, *Pflüger's Archiv*, 4, 315), chiefly worms, but also in a few crustaceans, insects, molluscs, leeches, and echinoderms. With the exception of four worms and two molluscs, however, it does not occur in special corpuscles as in the blood of vertebrates, but dissolved in the liquor sanguinis, colourless corpuscles only being found in the blood. In other invertebrates this red pigment is replaced by others, which apparently have a similar respiratory function, the most important of these other respiratory proteids are (1) hæmocyanin, a blue pigment occurring in various crustaceans, arachnids, and molluscs (Fredericq, *C R* 87, 996). This contains copper as one of its constituent elements, when oxidised it is blue, when reduced it is colourless. (2) Chlorocruorin, a green pigment, closely related to hæmoglobin, found in the blood of certain worms (Lankester, *Journ of Anat and Physiol*, 2, 144). (3) Hæmerythrin, a purplish red pigment found in a few gephyrean worms (Krukenberg, *Vergl phys Studien*, 1ste Reihe, 8te Abth p 82). In all these cases, the pigment is dissolved in the blood plasma, which has thus a respiratory in addition to a nutritive function. In addition to these pigments, others occur which have apparently no respiratory function, thus chlorophyll appears in the blood plasma of many moths and butterflies (Poulton, *Pr* 38, 269), tetronerythrin, a red lipochrome in the blood plasma of certain crustacea (Halliburton, *Journ of Physiol*, 6, 800). Various coloured granules are described in the corpuscles of holothurians and sea urchins (Geddes, *v Gamgee's Physiol Chem*, 134), and the blood of the limpet is described by Krukenberg as being of an orange colour.

The blood of most invertebrates is alkaline in reaction, the only known exception being that of moths and butterflies which is acid (Poulton).

With regard to the coagulation in the blood of invertebrates Halliburton (*Journ of Physiol*, 6, 800) was able, in the case of the crustacea, to separate crustacean fibrin, and to show that as in vertebrate blood it was formed from a previously soluble fibrinogen under the influence of a ferment. Crustacean fibrinogen and fibrin differ but little from that of vertebrate blood and the fibrin ferment is identical with that

obtained by Schmidt from vertebrate blood. The coagulation of crustacean blood is also hindered by cold, or admixture with neutral salts. The coagulum formed when the blood of cephalopods is shed is stated by Fredericq to be only a plasma medium of cells.

[The foregoing article has only discussed blood from a general point of view. The various constituents will be described under their proper headings, the proteids including hemoglobin and the other blood pigments will be described under the heading *Proteids*.] W D H

BLOWPIPE ANALYSIS

BOHEIC ACID $C_8H_{10}O_2$ [100°] Occurs (to the extent of 2 p.c.), together with quercitanic acid, in black tea (*Thea bohea*) (Rochleder, A 63, 202). Yellow amorphous resin, v sol water and alcohol, ppd by alcoholic or ammoniacal lead acetate. —BaA"aq —PbA"aq —PbA"PbO

BOILING-POINTS v PHYSICAL METHODS, SEC THERMAL

BOLDIN $C_{18}H_{26}O_6$. A glucoside which may be extracted by boiling alcohol from the leaves of *Boldoa fragrans*, in which it occurs to the extent of 3 p.c. It is a syrup, volatile with steam, and decomposed by hot dilute HCl into glucose, MeCl, and an oil $C_{18}H_{26}O_6$ (?) sol alcohol, insol water (Chapoteaut, C R 98, 1052). According to Bourgon a Verne (Bl [2] 18, 481) the leaves of *Boldoa* contain an alkaloid, *boldine*.

BOLETUS v AGARICUS

BONE OIL (Anderson, Tr E 16 4, 20, 11 247, 21, 1 219, 21, iv 571, A 70, 32, 80, 44, 94, 358, 105, 335). The following substances have been isolated from the tar obtained in the dry distillation of bones

Chief Constituents

By products

Butyronitrile	Methylamine
Valeronitrile	Aniline
Hexonitrile	Pyridine
Isobutyronitrile	Methyl pyridine
Deconitrile	Di methyl pyridine
Palmtonitrile	*Quinoline
Stearonitrile	Phenol
Pyrrrol	Propionitrile
Methylpyrrrol	Valeramide
Dimethylpyrrrol	Toluene
Hydrocarbons	Ethyl benzene
C_8H_{10} (Dihydro m ethyl-toluene?)	Naphthalene
$C_{10}H_{12}$ (Dihydro m-methyl-cumene?)	
$C_{11}H_{14}$	

Weidel & Ciamician (B 13, 65) consider that the nitriles are formed by the action of NH_3 at the high temperature on the fatty acids contained in the bones, the pyridine bases they believe to be formed by the combination of the acrolein (from the glycerin in the fats) with ammonia, methylamine, &c whilst pyrrrol and its homologues are products of the decomposition of gelatin.

BORATES. Salts of boric acid v BORON, OXYACIDS OF, p 528

BORAX v *Borate of sodium*. under BORON, OXYACIDS OF, p 529

BORIC ACID v BORON, OXYACIDS OF, p 528

BORIC ANHYDRIDE v BORON, OXIDE OF, p 521

BORIDES Compounds of boron with one other more positive element — Very few of these compounds exist, manganese forms a crystalline boride probably Mn_2B_3 , platinum easily combines with boron to form PtB_2 (?), and aluminium and boron appear to form a kind of alloy, the proportion of the elements in which varies within very wide limits. Two definite borides of Al are also known (v IRIDIUM, IRON, MANGANESE, PALLADIUM, PLATINUM, ALUMINIUM, BORIDES OF).

BORNEENE A mixture of terpenes (q v), exuding from *Dryobalanops camphora*, holding borneol in solution (Gerhardt, Traité, 3, 628, 641).

BORNEOL $C_{10}H_{18}O$ v $C_{10}H_{17}OH$ *Borneo camphor*, *Tetrahydride* of (1, 4, 6) *methyl-propyl phenol* (?) Mol w 154 [193°] (P), [207°] (W) (212°) R ∞ 75 30° in 2-25 p.c. alcoholic solution (Kanonnikoff).

Occurrence — In *Dryobalanops camphora*, being extracted from hollow cavities in the trunk of old trees (Pelouze, A 40, 326). In the essential oil of valerian (Gerhardt, A 45, 34, Bruylants, B 11, 451). To the extent of 4 or 5 p.c. in oil of rosemary (Bruylants, J 1879, 944, Weber, A 233, 89).

Formation — 1 By heating camphor with alcoholic KOH (Berthelot, A Ch [3] 56, 78). — 2 By the action of sodium on camphor (Baubigny, Z [2] 3, 71, Haller, C R 105, 227).

Preparation from camphor — (Jackson & Menke, Am 5, 270, 6, 404, Kachler & Spitzer, M 5, 50, B 15, 16, 2730, Immendorff, B 17, 1036). Camphor (50g) is dissolved in alcohol (500 cc of 96 p.c.), and sodium (60g) added slowly. Towards the end of the operation water (50 cc) is added (O Wallach, A 230, 225).

Properties — Regular crystals, very readily sublimes in plates. Smells like camphor, but more peppery. Has a burning taste. The alcoholic solution is dextrorotatory, artificial borneol has a somewhat higher rotatory power (c 43°) than the natural borneol ($[\alpha]_D = 33^\circ$, (Biot, Kachler). V sol water, sol alcohol and ether. Lighter than water. The rate of etherification of borneol resembles that of primary alcohols (Menschutkin, J R 13, 162).

Reactions — 1 P_2O_5 converts it into one or more terpenes (borneene). — 2 Boiling HNO_3 (SG 142) gives camphor and its oxidation products. — 3 Behaves as an alcohol with regard to PCl_5 . — 4 $HClO$ converts it into camphor. *Sodium borneol* $C_{10}H_{17}ONa$ six sided plates (from benzene). Combines with CO_2 forming $C_{10}H_{17}O(CO_2Na)$ (Kachler & Spitzer, M 2, 235).

Bromide — Bromine added to an ethereal solution of borneol forms crystals of a mixture of bromides ($C_{10}H_{17}OBr$ and $(C_{10}H_{17}O)_2Br_2$).

Hydrobromide $(C_{10}H_{17}O)_2HBr$ Crystalline pp got by passing HBr into a solution of borneol in light petroleum. The compound is unstable and is decomposed both by water and by alcohol.

Hydriodide $(C_{10}H_{17}O)_2HI$ Prepared similarly.

Methyl derivative $C_{10}H_{17}OMe$ (194° cor). From sodium borneol and MeI (Baubigny, Z, 1868, 299).

Ethyl derivative $C_{10}H_{17}OEt$ (202°) (B)
Formyl derivative $C_{10}H_{15}OCHO$ (225°–280°) In oil of valerian (Bruylants)

Acetyl derivative $C_{10}H_{15}OAc$ (221°) (K & S), (227°) (M) Occurs in oil of valerian (Bruylants, *B* 11, 456), and may be formed by the action of Ac_2O upon borneol (Montgolfier, *A Ch* [5] 14, 50), or of $AgOAc$ upon bornyl chloride (Kachler & Spitzer, *A* 200, 352) On standing it becomes crystalline [24°] Fusion with $NaOH$ gives $NaOAc$ and borneol

Isovaleryl derivative $C_{10}H_{17}O(C_3H_7O)$ (255°–260°)

Stearyl derivative $C_{10}H_{17}O(C_{18}H_{35}O)$ From borneol and stearic acid at 200° (Berthelot, *A* 112, 366) Oil

Benzoyl derivative $C_{10}H_{15}OBz$ Oil
Lævorotatory borneol $C_{10}H_{17}OH$ [35°] (210°) (Perrot, *A* 165, 67) $[\alpha]_D = -33^\circ$ Occurs in the alcohol produced by fermentation of the sugar of madder root (Jeanjean, *A* 101, 95) Small regular crystals, sl sol water, rotating upon it HNO_3 forms lævorotatory camphor

Lævorotatory borneol $C_{10}H_{17}OH$ [204°] SG 1.02 From Ngai camphor (Hanbury, *J* 1874, 537)

Lævorotatory borneol $C_{10}H_{17}OH$ [201°] $[\alpha]_D = -37^\circ$ 21' in alcohol of 82 p.c. at 22° From thymene picrate and boiling $NaOHAq$ (Lextrait, *J Ph* [5] 13, 265) HNO_3 converts it into a lævorotatory camphor [176°] (204°)

Lævorotatory borneol $C_{10}H_{17}OH$ Formed, together with ordinary borneol, by the action of Na on dextro or lævorotatory camphor (Montgolfier, *A Ch* [5] 14, 21, *C R* 89, 101)

Inactive borneol $C_{10}H_{17}O$ [199°] (210°) Among the products of the distillation of colophene (*q v*) Also from its acetyl derivative
Properties — Differs from dextrorotatory borneol only in being inactive The crystals float on water, but when pressed into a solid cake they sink (unlike camphor) Oxidised by HNO_3 to inactive camphor (Armstrong's Tilden, *C J* 35, 752) Heated with a large quantity of HCl it forms $C_{10}H_{15}HCl$

Acetyl derivative $C_{10}H_{15}OAc$ (215°) From terebene and $HOAc$ at 100° (Bouchardat & Lafont, *Bl* [2] 45, 164, *C R* 102, 171)

According to Haller there are two true borneols $[\alpha]_D = +$ or -37° , and the others are molecular compounds of these (*v* CAMPHOR and CINNEOL)

BORNYLAMINE $C_{10}H_{17}N$ probably

$C_{10}H_{17} \begin{cases} CH_2 \\ CHNH_2 \end{cases}$ [160°] (200°) V.D. 5.5 (for 5.8) $\alpha_D = -18^\circ 35' 41''$

Formation — 1 By reduction of camphor oxim in alcoholic solution by means of sodium 2 By saponification of its formyl derivative obtained by heating camphor with ammonium formate at 220°–240°

Properties — Crystalline solid, having an odour resembling both camphor and piperidine In its physical properties it greatly resembles camphor Very volatile with steam Sublimable even at the ordinary temperature V sol also hot, ether, &c, nearly insol water Alkaline reaction to litmus Takes up CO_2 from the air Primary base. Gives the carbamine reaction Lævorotatory. Isomeric with camphylamine.

Salts — $BHCl$ easily soluble white needles [α 280°] — $B'Cl_2H.PtCl_6$ golden-yellow plates, v sol hot water or alcohol — $B'H_2SO_4$, easily soluble rhombic tables — $B'H_2Cl_2HgCl_2$

Formyl derivative $C_{10}H_{15}NHCHO$; [61°], colourless glistening plates

Acetyl derivative $C_{10}H_{15}NHAc$ [141°] colourless plates

Benzoyl derivative $C_{10}H_{15}NHBz$ [181°], colourless plates, insol water and cold ligroin (Leuchart & Bach *B* 20, 104)

BORNYL BROMIDE $C_{10}H_{17}Br$ [75°] From borneol and HBr (Kachler, *A* 197, 98)

BORNYL CARBAMATE $C_{10}H_{17}NO_2$ &c $C_{10}H_{17}OCONH_2$ [115°] From sodium-borneol in toluene by the action of cyanogen (Haller, *C R* 93, 1511, 94, 869) Monoclinic needles (containing aq) Sl sol hot water, sublimates partially at 100° Dextrorotatory Benzoin aldehyde and HCl form $CHPh(NHCOOC_{10}H_{17})$ [187°] Cf CINNEOL

BORNYL CARBONATE $(C_{10}H_{17})_2CO_3$ [215°] Extracted by boiling alcohol from the residue left in the preparation of cyano borneol from sodium borneol and cyanogen (Haller, *C R* 94, 86) White plates or hexagonal tables, insol water and alkalis, sl sol cold alcohol, sol ether May be sublimed The rotatory power varies with that of the borneol from which it is prepared Boiling alcoholic KOH gives K_2CO_3 and borneol

BORNYL-CARBONIC ACID $C_{10}H_{17}O_3CO_2H$ Borneol carboxylic acid From sodium borneol and CO_2 (Baubigny, *Z* 1868, 299, Kachler & Spitzer, *M* 2, 236, *C C* 1881, 359) — NaA' crystalline, v sol water, slowly decomposed by water with separation of borneol

BORNYL CHLORIDE $C_{10}H_{17}Cl$ [157°] **Formation** — From borneol (1 pt) and HCl (9 pts) at 100° (Berthelot, *A* 112, 366)

Preparation — From PCl_5 (60g), light petroleum, and borneol (45g added in portions of 6g) The product is shaken with water and the petroleum allowed to evaporate in the cold, when bornyl chloride separates (Wallach, *A* 230, 231, Kachler, *A* 197, 93, *B* 11, 460)

Properties — Crystals V sol light petroleum, m sol alcohol Lævorotatory

Reactions — 1 Converted into HCl and camphene $C_{10}H_{16}$ [52°] (α 160°), by heating with water (40 pts) at 95° (Kachler, *A* 197, 96), better by warming with aniline (W) A little borneol is also formed by the action of water on bornyl chloride (Kachler, *A* 200, 342, Riban, *A Ch* [5] 6, 382) — 2 Sodium acting as a solution in benzene forms camphene $C_{10}H_{16}$ and hydrocamphene $C_{10}H_{18}$

BORNYL-METHYL-UREA

$C_{10}H_{17}NHCONHMe$ [200°] Formed by the action of methyl cyanate upon bornylamine in ethereal solution Plates V sol ether and hot water (Leuchart & Bach, *B* 20, 108)

BORNYL OXIDE $C_{10}H_{17}O_2$ &c $(C_{10}H_{17})_2O$ (?) (285°–290°) Occurs in the essential oil of valerian (Bruylants, *B* 11, 456) Not attacked by melted KOH

BORNYL PHENYL-CARBAMATE

$OC \begin{cases} NHCO_2H \\ OC_6H_5 \end{cases}$ Bornyl - phenyl - urethane. [133°] Formed by the action of phenyl cyanate upon borneol. Needles. Sparingly sol. cold

ligroin and alcohol, ∇ sol other solvents (Leuchart, *B* 20, 115)

BORNYL-PHENYL-THIOUREA

$C_{10}H_7, NHCSNHC_6H_5$, [170°] Formed by the action of phenyl mustard oil upon bornyl amine in ethereal solution Colourless needles Nearly insol ligroin (Leuchart & Bach, *B* 20, 109)

BORNYL PHENYL UREA

$C_{10}H_7, NHCO NHC_6H_5$, [248°] Formed by the action of phenyl cyanate upon bornylamine in ethereal solution Silvery plates or fine needles Sparingly soluble in ether and cold alcohol, easily in hot alcohol, insoluble in water (Leuchart & Bach, *B* 20, 108)

BORNYL-UREA $C_{10}H_7, NHCO NH_2$, [164°]

Formed by boiling bornylamine hydrochloride with potassium cyanate Colourless needles Easily soluble in hot water and alcohol (Leuchart & Bach *B* 20, 108)

BORNESITE C_6H_5, O_8 , [175°] $[a]_D = 32^\circ$

Methyl dambose A volatile substance occurring in the caoutchouc of Borneo Sublimes at 205° Sweet taste, does not ferment After boiling with dilute acids it reduces Fehling's solution At 120° it is split up by fuming HI into MeI and dambose (Girard, *C* 73, 426)

BOROFLUORIDES, *v* under BORON, FLUORIDE OF, *p* 526

BORON *B* At w 10.97 Mol w unknown, as *V*D has not been determined SG—amorphous not determined, but greater than 1.84—cryst 2.53–2.68 (Wöhler, *A* 141, 268, Hampe, *A* 183, 75) SH about 37 at 250°, probably about 5 at 1000° (*v post*, *p* 525) Crystallises in dimetric forms, $a:c=1:5762$ (Sella, *P* 100, 646), but crystals probably contained C and Al (*v post*) SVS about 4.4 Combines directly with O and Cl with production of much heat $[B_2O_3] = 317,200$, $[B_2Cl_2] = 104,000$ (Troost & Hautefeuille, *A Ch* [5] 9, 70) Chief lines in emission spectrum are 2496.2, 2497, 3450.1 (Hartley, *T* 175, 49)

Occurrence—Not as boron, chiefly as borax and boric acid in volcanic districts, also as borate of Mg with $MgCl_2$ (*Boracite*), as borate of Ca with Ca silicate (*Dalolite*), &c Borax, or *tincal*, has been known in commerce for many centuries, boric acid was prepared from borax in 1702 by Homberg, the element was obtained by Gay Lussac and Thénard in 1808 by de oxidising boric acid by potassium, which metal had been obtained by Davy the year before

Formation—1 By reduction of B_2O_3 by K (Gay Lussac & Thénard, *G* 30, 363)—2 By reduction of BF_3 by K (Berzelius, *P* 2, 118)—3 By electrolysis of fused B_2O_3 (Davy, *G* 35, 440)—4 By reduction of BCl_3 by H at a red heat (Dumas, *A Ch* 31, 876)—5 By fusing dry borax with amorphous P (Dragendorff, *C C* 1861 865)—6 By heating BF_3 , KF or BF_3 , NaF with Mg (Wöhler & Deville, *A Ch* [3] 52, 62, Geuther, *J Z* 2, 209)—7 By heating B_2O_3 with Mg and treating the product with $HClAq$ (Jones, *C J* 35, 42)

Preparation.—AMORPHOUS 10 parts fused B_2O_3 in coarse powder are mixed with 6 parts Na in small pieces, the mixture is placed in an iron crucible heated to full redness, 4 to 5 parts of fused NaCl are added, and the crucible is covered. When all action has ceased the

molten mass is stirred with an iron rod, and the contents of the crucible, while still hot, are poured into water containing a little HCl The NaCl, borax, and B_2O_3 dissolve, and the boron remains The boron is washed with very dilute $HClAq$, then with alcohol, and then with ether, it is then dried at a very gentle heat (Wöhler & Deville, *A* 101, 118 & 347, 105, 67)

CRYSTALLINE Amorphous *B* is pressed as tightly as possible into a small Hessian crucible, a hole is then made in the mass and a rod of Al (4–6 grams) is placed in the hole the crucible is covered and placed in another, larger, covered, crucible, the space between is filled with powdered charcoal, and the crucibles are heated to 1500° or 1600° for 1½ to 2 hours, after cooling the mass is treated with dilute $HClAq$ which dissolves Al, and BN formed in the process (Wöhler & Deville, *A* 105, 67) According to Hampe (*A* 183, 75) the crystals obtained by this process, or by any process said to yield crystalline *B*, contain Al, and some of them also *C*, Hampe gives the formula AlB_{12} to the black crystals, and $C_2Al_3B_{10}$ to the reddish yellow crystals, obtained by the foregoing method (*v* ALUMINIUM, BORIDES OF, and ALUMINIUM, BOROCARBIDE OF)

Properties—Amorphous boron is a greenish-brown, opaque powder, tasteless, odourless, non conductor of electricity, very infusible, but melts when placed between the poles of a battery of 600 Bunsen cells Said to be slightly soluble in water, Remitzer (*Sitz* W 82, 736) supposes that the body which dissolves is a hydride of *B* (*v* BORON, HYDRIDE OF) Insoluble in alcohol or ether Heated *in vacuo* or in an inactive gas, *e.g.* *H*, *B* becomes darker in colour, heavier, and more compact Heated in *O*, burns to B_2O_3 , $[B_2O_3] = 317,200$ heated in air, B_2O_3 and BN are produced Oxidised by heating with KNO_3 , K_2CO_3 , KOH, conc HNO_3Aq , or *aqua regia* Combines directly with many elements *e.g.* S, Cl, Br, N The properties assigned by Wöhler & Deville and others to crystalline *B*, are, according to Hampe's experiments, the properties of AlB_{12} , AlB_{10} , and $C_2Al_3B_{10}$ (*v* ALUMINIUM, BORIDE OF, and BOROCARBIDE OF) The atom of *B* is trivalent in gaseous molecules (data BCl_3 , BBr_3 , BF_3) The atomic weight of *B* has been determined (i) by finding the *V*D of BCl_3 and BBr_3 , and estimating the Cl and Br respectively in these compounds (Deville & Dumas, *A Ch* [3] 55, 180), (ii) by dehydrating borax (Berzelius, *P* 2, 129, 8, 19), (iii) by converting dehydrated borax into Na_2SO_4 by action of $HFAq$ and H_2SO_4Aq (Berzelius, *P* 2, 128, also Arfvedson, *P* 2, 127), (iv) by determining the S H of boron (*v infra*) Boron is a non-metallic element in its chemical reactions, its oxide, B_2O_3 , is an anhydride, boric acid, H_3BO_3 , corresponds in composition to nitrous acid, but thermal data show that boric acid is dibasic, the acids H_2BO_3 and H_3BO_3 (and several salts derived from the latter) are also known (*v* BORON, OXYACIDS OF) B_2O_3 seems to form compounds with P_2O_5 , SO_3 , and WO_3 In some respects *B* shows analogies with *C* and *Si*—physical properties, existence of acid containing *F* ($HB F_4$), direct combination with *N*, existence of many borotungstates, probable existence of a gaseous hydride, &c In many points *B* resem-

bles N and P—trivalency of B atom, composition of compounds (B_2O_3 , $H_3B_3O_6$, BCl_3 , $BOCl_2$, &c), B_2S_3 not a salt forming sulphide in reactions with sulphides of very positive metals, existence of a B analogue of tartar emetic, &c. Boron is the first member of Group III (periodic law), the succeeding members of this group are all decidedly metallic, but $Al_2O_3 \cdot 3H_2O$ dissolves in KOH aq, and forms aluminates ($q\ v$), Al_2S_3 is also somewhat analogous to B_2S_3 , the compositions of several B compounds are similar to those of the corresponding compounds of members of Group III, e.g. M_2O_3 , MX_3 [$X=Cl, Br$], $AlCl_3$, and BCl_3 combine directly with $POCl_3$. The differences between the chemical functions of B and the other elements of the group to which B belongs seem to be wider than is usual between the first and the following elements of the same group. The boron group comprises the following

GROUP III

Even Series	2	4	6	8	10	12
	B(11)	Bo(44)	Y(89)	La(139)	Yb(173)	—
Odd Series	3	5	7	9	11	13
	Al(27)	Ga(69)	In(114)	—	Tl(204)	—

These elements are all metallic with the exception of B, in the reactions of B_2O_3 towards certain acids (p 527) B shows that it may act as a feebly metal like element. Boric acid is an extremely weak acid, its affinity is very small. The borates are very unstable salts, easily decomposed, even by water, to boric acid and basic oxides. The last member of the group, Tl, shows distinct analogies with the 11th series member of the next group, viz Pb. B shows distinct analogies with the 2nd series member of the next group, viz C. B occurs in Series 2, all the succeeding members of this series—C, N, O, F—are very negative and non metallic, the general character of the series to which it belongs is stamped upon B, and the group character is but feebly marked. It must, however, be remembered that very few compounds of B, except the borates and their derivatives, have been fully studied.

Specific heat The SH of B as determined by Kopp, Regnault, and Mixer a Dana (*A* 126, 362, *Suppl* 3, 1, 289, *J* 1861 29, *A* 169, 388) varied from 225 to 262 for the temperature interval 30° – 70° . In 1873–4 Weber carefully determined the SH of crystallised boron (*v P M* [4] 49, 161, 276), the following table summarises his results

SH of crystallised boron

t	SH	SH \times At w
-40°	1915	2.11
+77	2737	3.01
177	3378	3.72
233	3668	4.03

The SH increases as temperature rises, but the rate of increase per 1° is much smaller at high than at low temperatures. The variations in the rate of increase are almost identical with those observed in the case of carbon ($q\ v$); assuming that this identity remains at temperatures above 233° , the value which the SH of crystallised boron will attain at about 1000° is approximately 5. Weber did not analyse the crystals of boron used, they were prepared by heating boric acid with Al. Accord-

ing to Hampe's investigation crystals thus prepared are a definite compound of B and Al (*ante*, p 524).

Reactions—1 Heated in air, B_2O_3 and BN are formed—2 Heated in oxygen, B burns to B_2O_3 —3 Heated to redness in N, BN is formed—4 B combines directly with many elements, e.g. Cl, Br, S, and some metals (*v BORIDES*)—5 Water is not decomposed by B at 100° but at a red heat. Steam reacts with B to form boric acid and H—6 B is oxidised by heating with nitric acid, conc sulphuric acid, or aqua regia, or by the action of molten nitre, or various oxides of heavy metals—7 B is also oxidised by heating with potash (H is evolved), or with alkaline carbonates (C is separated, Berzelius, *P* 8, 19), or with phosphoric acid (P is separated, Wöhler a Deville, *A Ch* [3] 52, 63)—8 B burns when heated in nitric oxide forming B_2O_3 and BN, N_2O is without action on B—9 At a red heat B decomposes sulphuretted hydrogen, hydrogen chloride, and ammonia, forming respectively B_2S_3 and H, BCl_3 and H, BN and H—10 Many metallic chlorides and sulphides, e.g. $PbCl_2$, $AgCl$, PbS , are reduced to metal when heated with B—11 From aqueous solutions of gold chloride B pps Au—12 Aqueous solutions of caustic alkalis do not react with B—13 So called crystalline boron reacts similarly to amorphous boron, but the reactions occur only at high temperatures, it is oxidised with much difficulty.

References—Gay Lussac a Thénard, *G A* 30, 363, Davy, *G A* 35, 440, Berzelius, *P* 2, 113, Wöhler a Deville, *A* 101, 113, 103, 347, 105, 67.

Boron, Bromide of BBr_3 , Mol w 250.22 (90.5°) (Wöhler a Deville, *A Ch* [3] 52, 69) SG 2.69 (W a D *lc*) V D 127.

Formation—1 By action of Br on B_2O_3 and C at red heat (Poggiale, *C R* 22, 127)—2 By heating B_2O_3 with PBr_3 (Gustafson, *B* 2, 661).

Preparation—Amorphous B is loosely packed into a glass tube, the tube is gently warmed and H is passed through it until every trace of moisture is removed, the H stream is stopped, the corks of the tube are removed for a moment or two, and then the B is gently heated in a stream of dry Br vapour, and the liquid BBr_3 is led into a dry flask surrounded by ice cold water. The BBr_3 is freed from Br by digestion with Hg, and distillation.

Properties and Reactions—Colourless, strongly fuming, liquid. Reacts with H_2O to form HBr aq and H_3BO_3 aq. Forms a compound with dry NH_3 (*v* also Nickles, *C R* 60, 800, Gautier, *C R* 63, 920).

Boron, Chloride of BCl_3 , Mol w 117.08 ($18^\circ 23'$) at 760 mm (Regnault, *Acad* 26, 658) SG 1.35 (Wöhler a Deville, *A Ch* [3] 52, 63) V D 58.2 H F [B, Cl]=104,000 (Troost a Hautefeuille, *C R* 70, 185).

Formation—1 By direct combination of B and Cl (Berzelius, *P* 2, 147)—2 By the reaction of Cl with B_2O_3 and C at a red heat (Dumas, *A Ch* [2] 31, 436, 33, 376)—3 By the reaction of B with dry HCl —4 By reaction between $HgCl_2$, $PbCl_2$, or $AgCl$, and amorphous B—5 By heating B_2O_3 with PCl_5 to 150° for some days (Gustafson, *B* 3, 426, 4, 975).

Preparation—Amorphous B is heated in H until quite dry, then in dry Cl (details v Boron, bromine or), the exit-end of the tube is connected with a Y tube, the upper part of which is surrounded with a mixture of snow and salt, and the lower limb passes into a dry tube also surrounded by snow and salt.

Properties—Colourless, highly refractive, liquid. Very expandable by heat. Fumes in air with decomposition.

Reactions—1 With water forms $H_2BO_3.Aq$ and $HCl.Aq$, $[BCl_3.Aq] = 79,200$ (Troost & Hautesfeuille, *A Ch.* [5] 9, 70)—2 Not decomposed by heating with zinc dust to 200° , or with sodium below 150° , at 150° B is separated. 3 Heated for some time with superficially oxidised sodium amalgam at 150° B is separated (Gustavson, *B* 8, 426)—4 Heated with P_2O_5 , the compound $BCl_3.POCl_3$ is formed (v *infra*) (Gustavson, *B* 4, 975)—5 Heated with sulphur trioxide, B_2O_3 and SO_2Cl_2 are formed (Gustavson, *lc*)—6 With alcohol forms $B(OEt)_3$ and HCl —7 With NO_2 reacts to produce BCl_3 , $NOCl$, B_2O_3 , and O (Geuther, *J pr* [2] 8, 854).

Combinations—1 BCl_3 vapour passed into $POCl_3$ forms crystals of $BCl_3.POCl_3$ (Gustavson, *B* 4, 976). This compound melts at 73° in a closed tube, by sublimation it separates into BCl_3 and $POCl_3$, it is decomposed by water, or moist air, into $H_3PO_4.Aq$, $H_2BO_3.Aq$, and $HCl.Aq$. The same compound is produced by the reaction of BCl_3 with P_2O_5 , and of B_2O_3 with $POCl_3$ (*gc*)—2 With ammonia gas gives $2BCl_3.3NH_3$, with production of much heat (Berzelius, *P* 2, 147). 3 The compounds $BCl_3.CNCl$ and $BCl_3.CNH_3$ are known (Martius, *A* 109, 80; Gautier, *C R* 68, 920).

Boron, Fluoride of BF_3 , Mol w 68.27
V D 33.7 S (0°) 1043

Formation—1 By reaction, at white heat, of an intimate mixture of 1 part B_2O_3 with 2 parts CaF_2 , free from silica, Gay Lussac & Thénard (*A Ch.* 69, 204) prepared BF_3 by this method, in 1810, using vessels of flint, and collecting the gas over Hg—2 By heating 1 part B_2O_3 with 2 parts CaF_2 and 12 parts conc $H_2SO_4.Aq$ in glass vessels (J Davy, *T* 1812 365), or 1 part B_2O_3 , 1 part CaF_2 , and 20 parts H_2SO_4 (Ferrari, *J Ph* 19, 48). Prepared thus, the gas always contains SiF_4 (Berzelius, *P* 2, 116).

Preparation—100 parts KBF_4 are mixed with 15–20 parts fused and finely powdered B_2O_3 , and the mixture is heated with conc H_2SO_4 , the gas is collected over Hg (Schiff, *A Suppl* 5, 172).

Properties—Colourless gas, with suffocating odour, condensed to a limpid liquid at -110° and strong pressure (Faraday, *A* 56, 152). Acts on organic matter like conc H_2SO_4 , incombustible, not decomposed by electric sparks, does not act on glass, is very stable, not decomposed by Fe at red heat.

Reactions—1 with water forms borofluorhydric acid $HBFAq$ (v *infra*), or fluoboric acid $HBO_3.3HF$ (v p 530), according as the BF_3 is passed into water until the reaction is acid, or until the water is saturated (v *infra*) $[BF_3.Aq] = 24,510$ (Hammer, *C R* 90, 812)—2 Conc sulphuric acid absorbs BF_3 (about 50 vols), on adding water boric acid is ppd (J Davy, *T* 1812 365)—3 Alkali, and alkalis

earth, metals react at red heat, forming borofluorides and B (Berzelius, *P* 2, 138)—4 With alcohol boric acid and ether are formed.

Combinations—With ammonia to form $BF_3.NH_3$, a solid body not decomposed by sublimation, also $BF_3.2NH_3$ and $BF_3.3NH_3$, liquids, decomposed by heat, by exposure to air, or by dry CO_2 , giving NH_3 and $BF_3.NH_3$ (J Davy, *T* 1812 368). According to Kuhlmann (*A* 39, 320) BF_3 also combines with the oxides of N.

BOROFLUORHYDRIC ACID, and BOROFLUORIDES $HBFAq$, $MBFAq$ (*Hydrofluoboric acid*). When BF_3 is led into water until the liquid shows a strongly acid reaction, and the liquid is cooled, $\frac{1}{2}$ of the B of the BF_3 separates as $H_2B_2O_4$, and the rest remains in solution in combination with H and F. By neutralising the liquid with $KOHAq$, and evaporating, a salt having the composition KBF_4 is obtained. If the acid liquid is evaporated, HF is evolved, and $H_2B_2O_4.6HF$ remains in solution (v FLUOBORIC ACID under BORON, OXYACIDS OF). According to Landolph (*C R* 86, 608) the acid $HBFAq$ may be obtained as a colourless liquid, boiling at 130° with partial decomposition, by the reaction between BF_3 and anethol ($C_6H_5.OCH_3.C_6H_5$), the acid reacts with a little water to produce $HBFAq$ and $HBO_3.Aq$. A solution of $HBFAq$ is also obtained by dissolving crystallised boric acid in dilute, cooled, $HFAq$.

BOROFLUORIDES These salts have been chiefly studied by Berzelius (*P* 2, 113). They are obtained by the reactions between (1) metallic oxides or carbonates and $HBFAq$, (2) BF_3 or $HBO_3.3HFAq$ and metallic fluorides, (3) $HFAq$ and metallic fluorides mixed with HBO_3 , in the last case half the metal of the fluoride usually forms an oxide. Most borofluorides are crystalline, soluble in water, decomposed by heat to BF_3 and metallic fluoride, heated with conc H_2SO_4 , BF_3 , $HBFAq$, and metallic sulphate, are produced, fused with alkali carbonates they form a mixture of alkali metal fluoride and alkali borate, this reaction affords the basis of a method for analysing the borofluorides (v Maignac, *Fr* 1, 405). Many borofluorides are partially decomposed by water forming so called basic salts, e.g. $Ba(BF_4)_2.2H_2O$, $Ca(BF_4)_2$, $Pb(BF_4)_2$, some—e.g. the Ba or Pb salt—are partially decomposed by alcohol, the aqueous solutions of several—e.g. NH_4BF_4 , $Ca(BF_4)_2$ —reddden blue litmus.

Potassium borofluoride KBF_4 . Obtained as a gelatinous pp by adding $HBFAq$ to a soluble K salt. Prepared by Stolba (*C C* 1872 395) by heating to boiling 1 part crystallised boric acid, $2\frac{1}{2}$ parts powdered CaF_2 , and $5\frac{1}{2}$ parts conc H_2SO_4 , cooling, filtering, ppg KBF_4 by addition of a soluble K salt, crystallising from hot water—S (cold) 70—The salt forms white lustrous six sided tables, may be crystallised from alcohol or alkali carbonate solutions, melts when heated, and at a high temperature decomposes to BF_3 and KF .

The other borofluorides are $Al(BF_4)_3$, NH_4BF_4 , $Ba(BF_4)_2.2H_2O$, $Ca(BF_4)_2$, $Cu(BF_4)_2$, $Pb(BF_4)_2$, $LiBF_4$, $Mg(BF_4)_2$, $NaBF_4$, $Y_2(BF_4)_3$, $Zn(BF_4)_2$.

Boron hydride No hydride of B has been obtained free from H, but the experiments of Jones (*C J* 35, 41), and of Jones & Taylor

(*C J* 39, 213), leave little doubt that a gaseous hydride exists and show that its composition is probably BH_x .

Preparation—An intimate mixture of 1 part recently heated B_2O_3 and 2 parts Mg dust is placed in a Hessian or iron crucible, the lid is firmly wired down, and the crucible is heated in an ordinary fire, a violent reaction occurs, the crucible is at once removed from the fire, the fused mass—a mixture of B , Mg , Mg_3B_2 , Mg_3N_2 , and MgO —is placed in a small flask along with a little H_2O , and conc $HClAq$ is allowed to drop into the flask from a stoppered funnel tube, the gas is collected over water, or is dried by $CaCl_2$ and collected over Hg . Mg_3B_2 may also be prepared by direct combination of B and Mg , or by heating Mg in BCl_3 vapour (*J A T, C J* 39, 214)*. The gas consists of H mixed with a very small quantity of B hydride.

Analysis—A known volume of pure H was burnt, by hot CuO , to H_2O , and the H_2O was weighed, an equal volume of the gas prepared as above was burnt in the same apparatus, and the H_2O was weighed, the excess of H_2O in the second experiment over that in the first gave a measure of the H combined with B as B hydride. The results showed the composition of the hydride to be BH_x where $x > 2$ and is approximately 3.

Properties and Reactions—Colourless, very disagreeable odour, sparingly soluble in water, solution seems to be unchanged on keeping. Gas burns with bright green flame producing H_2O and B_2O_3 . Decomposed by passing through a hot tube to B and H . Reacts with $AgNO_3Aq$ producing small quantity of a black pp containing B and Ag , and decomposed by H_2O giving B hydride. Reacts with $KMnO_4Aq$ giving MnO_2 and H_2BO_3Aq . Combines with NH_3 (conc NH_4Aq) to form a crystalline compound, of unknown composition, decomposed by acids.

References—Older attempts to prepare hydride of boron: Wohler & Deville (*A Ch* [3] 52, 88), Geuther (*J* 1865 125), Gustavson (*Z* 1870 521) (v also Reinitzer, *Sitz W* 82, 736). Compounds of B with paraffin radicles are known, e.g. BEt_3 (v BORON, ORGANIC DERIVATIVES OF).

Boron, Hydroxides of, v BORON, OXYACIDS OF

Boron, Iodide of Not known. Wohler & Deville (*A Ch* [3] 52, 90), by the action of I on B at a high temperature, obtained a body which they regarded as an oxyiodide. AgI does not react with B even at the melting point of Ag .

Boron, Nitride of BN Mol w unknown, as compound has not been gashed. Obtained in 1842 by Balmain by melting B_2O_3 with KCN (*I M* [3] 21, 170, 22, 467, 23, 71, 24, 191). Composition determined by Wohler in 1850 (*A* 74, 70).

Formation—1 By heating B in N , or in NH_3 .—2 By heating to whiteness a mixture of 4 parts B_2O_3 and 1 part charcoal powder in N . 8 By heating borax (Wöhler, *l c*), or boric acid (*H Rose, P* 80, 265), with NH_4Cl , or K_2FeCy_4 (*W l c*), or KCN , or $Hg(CN)_2$, or urea (Darmstadt, *A* 151, 255).—4 By heating $2BCl_3.3NH_3$, and passing the vapour, along with NH_3 , through a hot tube (Marius, *A* 109, 80).

5 By heating the compound of BCl_3 with NH_4Et to 200° (Gustavson, *Z* [2] 6, 521).

Preparation—A mixture of 1 part dehydrated borax and 2 parts NH_4Cl —or 7 parts B_2O_3 with 9 parts urea (Darmstadt, *l c*)—is strongly heated in a covered Pt crucible, the finely powdered mass is boiled with much water containing a little HCl , washed with hot water, B_2O_3 is removed by careful treatment with $HFAq$ (Wöhler, *l c*, could not remove all B_2O_3 , thus), and the BN is washed and dried.

Properties—White, light, amorphous, powder, insoluble in water, infusible, soft (like talc) to the touch, heated in the edge of a flame exhibits greenish white phosphorescence, very stable and very slightly acted on by most reagents, e.g. by heating in air, O , I , H , CO_2 , or CS_2 , or with conc $HClAq$ or HNO_3Aq or KOH .

Reactions—1 At a very high temperature reacts with chlorine, to give BCl_3 (Darmstadt, *A* 151, 255).—2 Heated to redness in steam, or to 200° in a closed tube with water, NH_3 and H_3BO_3 are formed.—3 With molten potash, NH_3 and K borate are produced.—4 With molten potassium carbonate $KCNO$ and KBO_2 are formed, if much BN is used KCN is also produced.—5 Oxides of Pb , Cu , or Hg are reduced by heating with BN , with formation of NO or N_2O (Wöhler, *A* 74, 70).—6 Heated with conc sulphuric acid, or with conc hydrochloric acid to 200° in closed tubes, NH_3 and H_3BO_3 are formed.—7 With conc hydrofluoric acid NH_3BF_4 is formed.—8 Heated in an alcohol-flame fed with oxygen, BN burns to B_2O_3 .

Boron, Oxide of B_2O_3 (Boric anhydride) Mol w unknown, as compound has not been gashed [577*] (Carnelley, *C J* 33, 278) *S G* 175-183 (Playfair a Joule, *C S Mem* 8, 57, v also Ditte, *A Ch* [5] 13, 67) *S H* ($16^\circ-98^\circ$) 2374 (Regnault, *A Ch* [3] 1, 129) *H F* [B_2O_3] = 317,200 (Troost & Hautefeuille, *A Ch* [5] 9, 70).

Preparation—By heating B in O , or by strongly heating boric acid (*q v*).

Properties—Semi transparent, colourless, brittle, inodorous, glass like, solid, volatilised at a very high temperature (Ebelmen, *A Ch* [3] 22, 211), volatilised in steam or alcohol vapour, non conductor of electricity (Lapschin & Tichanowitsch, *P M* [4] 22, 308, Bowoin, *C R* 67, 798).

Reactions— B_2O_3 is a very stable compound, it is not decomposed by heating with powdered charcoal or with P vapour. It is an anhydride, but appears to show a feebly basic character in its reactions with certain acids (*infra* 6-8). 1 Heated with potassium, sodium, or aluminium, metallic oxide and B are formed.—2 Mixed with charcoal and heated in nitrogen, chlorine, bromine, or carbon disulphide, BN , BCl_3 , BBr_3 , or BS_3 is formed.—3 Salts of most acids, e.g. sulphates, nitrates, carbonates, are decomposed by heating with B_2O_3 to a high temperature, with production of borates and volatilisation of the acid (*v Tate, C J* 12, 160).—4 Reacts with most metallic oxides at high temperatures to form borates.—5 With water forms boric acid (*q v*).—6 B_2O_3 is said to react with fuming sulphuric acid to form a compound $x B_2O_3.y SO_3.z H_2O$, the values given to x , y , and z by different chemists vary, thus Merz gives the for-

mula $5B_2O_3 \cdot 2SO_3 \cdot 2H_2O$ (*J pr* 99, 181), and Schultz-Sellack gives the formula $B_2O_3 \cdot 8SO_3 \cdot H_2O$ (*B* 4, 15). This compound is easily decomposed by heat to B_2O_3 and SO_3 —7 B_2O_3 is said to form a compound with phosphoric anhydride, $B_2O_3 \cdot P_2O_5$, this body is produced by heating together H_3BO_3 and conc H_3PO_4 (Vogel, *Z* 1870 125), and removing excess of the latter by hot water, it is also formed, according to Gustavson (*B* 3, 426, 4, 975), by heating B_2O_3 with PCl_5 to 140° for 3-4 days, and also by heating B_2O_3 with $POCl_3$ to 150° – 170° for 8 to 10 hours, distilling off the $POCl_3$, BCl_3 formed (*v* BORON, CHLORIDE or, *Combinations*, No 1) and strongly heating the residual solid $B_2O_3 \cdot P_2O_5$ is said to be insoluble in hot water, to be unacted on by acids, dissolved by boiling $KOHAq$, and to be decomposed by heating with Na, giving Na phosphide, and probably phosphide of B—8 A compound of B_2O_3 with tungstic anhydride ($B_2O_3 \cdot 9WO_3 \cdot xH_2O$) is described by Klein (*Bl* [2] 86, 205), *v* TUNGSTOBORATES, under TUNGSTEN—9 B_2O_3 dissolves in hydrofluoric acid, forming $B_2O_3 \cdot 6HF \cdot H_2O$ ($= H_2B_2O_3 \cdot 6HF$) (*v* FLUOBORIC ACID, under BORON, OXYACIDS or, p 530)—10 When a solution of 1 part B_2O_3 and 2 parts $KH C_2H_3O_2$ in 24 parts H_2O is evaporated to dryness at 100° , and the residue is treated with alcohol, a white, amorphous solid remains, insoluble in alcohol but very soluble in water. This solid has the composition $C_2H_3KBO_3$, its reactions are similar to those of tartar emetic, probably it is the K salt of an acid $B C_2H_3O_2$, OH analogous to the acid $Sb C_2H_3O_2$, OH obtained by Clarke a Stallo (*B* 13, 1787) (*v* Meyrac, *J Ph* 3, 8, Soubeiran, *J Ph* 3, 399, 11, 560, 25, 741, 35, 241, Duflos, *S* 44, 333, Vogel, *J Ph* 3, 1, Robiquet, *J Ph* [3] 21, 197, Wackenroder, *Ar Ph* [2] 58, 4, Wittstein, *R P* [3] 6, 1, 177, Duve, *J* 1869 540, Biot, *A Ch* [3] 11, 82, *v* also under TARTRATES).

Boron, Oxyacids of, and their Salts Three definite hydrates of B_2O_3 appear to be known, orthoboric acid $B_2O_3 \cdot 3H_2O$ ($= H_3BO_3$), metaboric acid $B_2O_3 \cdot H_2O$ ($= H_2B_2O_3$), and pyroboric (or tetraboric) acid $2B_2O_3 \cdot H_2O$ ($= H_4B_4O_7$). Another hydrate $2B_2O_3 \cdot 3H_2O$ was described by Berzelius (*S* 23, 161) as obtained by heating H_3BO_3 'considerably over 100° '. Most metallic borates may be regarded as derived from H_3BO_3 , some—*eg* borax—from $H_2B_2O_3$, a few are perhaps derived from $H_4B_4O_7$, *eg* $Ca_2B_4O_7$, and in addition to these several borates exist which at present must be regarded simply as compounds of B_2O_3 with metallic oxides (*v* *infra*). All the boric acids are 'weak' acids, their salts are easily decomposed by reactions with other acids, the affinity of boric acid is extremely small, $Na_2B_4O_7$ in solution is entirely decomposed by an equivalent of H_2SO_4 (*Th* 1, 209). Borates of the less positive metals are usually formed only by fusing together B_2O_3 and the metallic oxides. Many of these borates are decomposed by water, some of them are partially converted into carbonates when exposed to the action of moist air, borates even of the very positive metals readily combine with boric acid to form acid salts, but these salts, although containing excess of boric acid, usually turn red litmus blue, even alkali borates are partially decomposed by water. Thomsen's thermal inves-

tigation of boric acid proves that the acid obtained by dissolving B_2O_3 in water is dibasic; thus.—

$m[mNaOHAq \cdot B^{\circ}O^{\circ}Aq]$

1	11,101
2	20,010
3	20,460
6	20,640

The normal Na borate is therefore $Na_2B_4O_7$. When boric acid is added to a solution of this salt heat is produced, thus—

$m[Na^{\circ}B^{\circ}O^{\circ}Aq \cdot mB^{\circ}O^{\circ}Aq]$

1	2,192
4	4,944

Acid salts are therefore probably formed, but the reaction of the solution towards litmus is still alkaline (*Th* 1, 206).

Orthoboric Acid H_3BO_3 (*Boracic Acid*, *Boric Acid*) [184° – 186°] (Carnell, *C J* 33, 275).

Occurrence—In the waters of many volcanic districts, *eg* in Tuscany, in many mineral springs, in combination with Na—as borax—in the waters of certain lakes in S America, Thibet, Ceylon, &c., in several minerals, *eg* boracite (borate of Mg), boronatrocalcite (borate of Ca and Na).

Formation—1 By oxidising B with *aqua regia*, evaporating, dissolving in water, and recrystallising—2 By dissolving B_2O_3 in water.

Preparation—3 parts crystallised borax are dissolved in 12 parts boiling water, and (after filtering if necessary) 1 part conc H_2SO_4 is added, boric acid separates on cooling. The crystals are gently heated, recrystallised from water, dried, fused in a Pt crucible (to remove all H_2SO_4), again recrystallised from water, and dried by pressure between filter paper.

Properties—White, semi-transparent laminae, triclinic (Miller, *P* 23, 558), monoclinic (Kengott, *Sitz W* 12, 26) SG 15 1434 (Stolba, *J pr* 90, 457) *S* (19°) 8.9, (25°) 6.72, (27.5°) 7.9, (50°) 9.84, (62.5°) 16.34, (75°) 21.15, (87.5°) 28.17, (100°) 33.67 (Brandes a Fimhaber, *Ar Ph* 7, 50, *v* also Ditte, *C R* 85, 1069) SG of H_3BO_3 Aq saturated at 15° = 1.0249 (Stolba, *J pr* 90, 457) Heat of solution, $[H^{\circ}BO^{\circ}Aq]$ = -5395 (*Th* 3, 196) Soluble in alcohol and several oils (Rose, *P* 80, 262); soluble in warm conc H_2SO_4 , HCl , or HNO_3 Aq, but most of the boric acid separates on cooling. Aqueous solution turns blue litmus wine red, and turmeric paper cherry red, alcoholic solution burns with green edged flame.

Reactions—1 Heated to 100° H_3BO_3 is produced (Schaffgotsch, *P* 107, 427, Bloxam, *C J* 12, 177, Merz, *J pr* 99, 179), heated to 140° for a long time, or to 160° in a current of dry air, $H_2B_2O_3$ is formed (Merz, *lc*, Ebelmen a Bouquet, *A Ch* [3] 17, 63), heated to about 300° the oxide B_2O_3 remains. Berzelius (*S* 23, 161) said that $H_2B_2O_3$ ($= 2B_2O_3 \cdot 3H_2O$) is formed by heating H_3BO_3 to a temperature 'considerably above 100° '. Merz (*lc*) affirmed the production of $8B_2O_3 \cdot H_2O$ at 270° —2 Boiling conc $H_2B_2O_3$ Aq dissolves a few metallic sulphides and oxides (Tissier, *C R* 39, 192, 45, 411), decomposes alkali and alkaline earth carbonates (Popp, *A Suppl* 8, 10)—3 With alkalis and alkali carbonates salts of the form

$M_2B_2O_6$ or $M_2B_2O_6 \cdot xH_2O$, are generally produced, few metallic salts of the form $M_2B_2O_6$ are certainly known, hence $H_2B_2O_4$ reacts as $H_2B_2O_4 \cdot Aq$ (v also BORATES) Etheral salts of $H_2B_2O_6$ —e.g. Et_2BO_3 , Me_2BO_3 —are known, but none of them is directly formed from $H_2B_2O_6$ (p 530)

METABORIC ACID, $H_2B_2O_6$, and PYROBORIC OR TETRABORIC ACID, $H_2B_4O_7$. Formed by heating H_2BO_3 (v *supra*), glass like, amorphous solids. Some salts of $H_2B_2O_6$ are obtained by the reaction between $H_2B_2O_4 \cdot Aq$ and alkalis, salts of $H_2B_4O_7$ are obtained indirectly (v *infra*)

BORATES No borate is quite insoluble in water, the alkali borates are very soluble. The less soluble borates are easily decomposed by water, the easily soluble salts are also decomposed, but less quickly, an alkali borate, for instance, in conc. aqueous solution slightly reddens litmus, but when much water is added the litmus becomes blue. Solutions of alkali borates absorb CO_2 and H_2S , they decompose NH_4 salts when boiled with them, dilute solutions react with Hg and Ag salts similarly to alkali solutions. A few borates can be obtained as definite, fairly stable, salts by precipitation from solutions, $KHB_2O_4 \cdot 2H_2O$ separates from a solution of K_2CO_3 in excess of $B_2O_3 \cdot Aq$ to which much $KOH \cdot Aq$ has been added, $MgB_2O_4 \cdot 4H_2O$ is said to be formed by the reaction between borax solution and $Mg_2NO_3 \cdot Aq$. The more definite borates are generally obtained by melting together B_2O_3 and basic oxides. As a class the borates very readily undergo change, the composition of very many is therefore extremely doubtful. H. Rose, who investigated many borates, did not attempt to wash his preparations, but pressed them between filter paper till dry, and then determined the quantities of the admixed foreign salts. Most borates seem to belong to the two forms $M_2B_2O_6$ and $M_2B_4O_7$, many may be represented as $M_2B_2O_6 \cdot xH_2B_2O_4$ and $M_2B_2O_6 \cdot xH_2B_4O_7$, a few—e.g. $3MgO \cdot B_2O_3$ —may be regarded as derivatives of H_2BO_3 . The best marked borates are the salts of K and Na .

Potassium borates—(1) *Normal metaborate*, $K_2B_2O_6$. Monoclinic crystals ($a b c = 2.744 : 1.2676$), by melting, at white heat, 1 part B_2O_3 with 1.95 parts K_2CO_3 , dissolving in water, evaporating to a syrup out of contact with air, and crystallising (Schabus, *Bestimmung der Krystalgestalten* &c (Wien, 1855), 31)—(2) *Acid metaborate*, $K_2B_4O_7 \cdot H_2O$, $4H_2O$. Regular six-sided prisms, by saturating boiling $K_2CO_3 \cdot Aq$ with $B_2O_3 \cdot Aq$, adding $KOH \cdot Aq$ to strongly alkaline reaction, evaporating, and crystallising (Laurent, *A Ch* [2] 67, 215). Said to sometimes crystallise with $5H_2O$ in rhombic prisms, and to lose H_2O when heated in a closed vessel—(3) *Other acid salts* $K_2B_2O_4 \cdot 2H_2B_2O_4 \cdot 6H_2O$, obtained like (2), but using less $KOH \cdot Aq$ $2K_2B_2O_4 \cdot 4H_2B_2O_4 \cdot 5H_2O$ (or $4H_2O$), by adding $B_2O_3 \cdot Aq$ to boiling $K_2CO_3 \cdot Aq$ until solution has a slightly acid reaction (Rammelsberg, *P* 95, 199, Reissig, *A* 127, 33).

Sodium borates—(1) *Normal metaborate*, $Na_2B_2O_6 \cdot 4H_2O$. Large monoclinic prisms, by fusing 1 part dry Na_2CO_3 with 1.17 parts B_2O_3 (or with 8.6 parts crystallised borax), dissolving in water, and crystallising

out of contact with air. Melts at 57° , salt with $3H_2O$ separates on cooling. Mixed with NaF in solution, and crystallised, the salt $Na_2B_2O_6 \cdot 6NaF \cdot H_2O$ separates (v FLUOBORIC ACID) (Hahn, *J* 1859, 128)—(2) *Acid metaborates*. $Na_2B_2O_6 \cdot 3H_2B_2O_4 \cdot 7H_2O$, lustrous, hard, crystalline crust, obtained by boiling solution of 2 equivalents borax with 1 equiv NH_4Cl so long as NH_3 is evolved, and crystallising (Bolley, *A* 68, 122). $Na_2B_2O_6 \cdot 4H_2B_2O_4 \cdot 7H_2O$, small crystals, obtained by dissolving in water 1 equiv borax with 3 equivalents $H_2B_2O_4$, and crystallising (Laurent, *C R* 29, 5)—(3) *Orthoborate* Na_2BO_3 . Said to be formed by fusing B_2O_3 with excess of $NaOH$ (Bloxam, *C J* 14, 143)—(4) *Tetra, or pyro, borates*. (a) Borax $Na_2B_4O_7 \cdot 10H_2O$, ordinary or prismatic borax, $Na_2B_4O_7 \cdot 5H_2O$, octahedral borax. The former occurs native, it is obtained by purifying crude borax, or by fusing 1 part dry Na_2CO_3 with 2.34 parts H_2BO_3 , dissolving in warm water, and slowly crystallising from a solution of SG 1.14–1.15 ($B P$ 104°), stopping when the temperature has fallen to 25° – 30° . The salt with $5H_2O$ separates from aqueous solutions of ordinary borax of SG 1.246 at temperatures between 56° and 79° , or from super-saturated solutions of the same salt protected from dust, or from aqueous solutions of any strength evaporated at 10° to 12° (Gernez, *C R* 78, 68). *Ordinary borax* crystallises in large, transparent, colourless, doubly refractive, monoclinic prisms ($a b c = 1.0995 : 1.5629$ $\beta = 73^\circ 25'$) SG 1.69 (Fihlth, *A Ch* [3] 21, 415) S (0°) 2.8, (20°) 7.9, (40°) 17.9, (60°) 40.4, (80°) 76.2, (90°) 119.7, (100°) 201.4 (Poggiale, *A Ch* [3] 8, 463) SG of solution saturated at $15^\circ = 1.0199$ (contains 38.494 borax) (Michel, *A Kraft*, *A Ch* [3] 41, 471). Insol in alcohol. Heat disappears during solution, $[Na^+ B^+ O^{1-} 10H^+ O, Aq] = -25.860$ (Thomsen). $S.H$ (19° – 50°) 385 (Kopp, *T* 155, 71). Refractive indices (23° , Na light) for $\alpha = 1.4663$, for $\beta = 1.4682$, for $\gamma = 1.4712$ (Kohlrausch, *W* 4, 1). The crystals effloresce in air (according to Sims only when they contain sodium carbonate), when heated they melt and give off $10H_2O$, leaving *burnt borax* ($Na_2B_4O_7$), which melts at a red heat to a glass like mass (*vitrified borax*) of SG 2.36; exposed to moist air this takes up $10H_2O$. Solution of borax in water is alkaline to litmus, it dissolves many organic compounds more readily than water, e.g. benzoic acid and gallic acid, some compounds insoluble in water dissolve in borax solution, e.g. stearic acid, various gums, resins, and oils, As_2O_3 dissolves easily, silicic acid only very slightly. Molten borax dissolves many metallic oxides and salts forming fusible double salts, hence its use as a flux, and also in analysis. Crystals of *corundum* were obtained by Ebelmen (*A* 80, 205) by dissolving Al_2O_3 in molten borax, and crystals of *rubile* and *tridymite* by dissolving TiO_2 and SiO_2 , respectively, in the same solvent (G. Rose, *J pr* 101, 228, 108, 208). *Octahedral borax* crystallises in hard, transparent, regular octahedra SG 1.8. Unchanged in dry air, but in moist air changed to prismatic borax. Melts to a glass-like mass.

(b) *Amorphous tetraborate*. $Na_2B_4O_7 \cdot 4H_2O$. Obtained according to Schweizer (*A* 76, 267) by evaporating aqueous borax

solution at 100° and drying the residue at the same temperature for a long time

(c) $\text{Na}_2\text{B}_2\text{O}_4 \cdot 6\text{H}_2\text{O}$ was found by Bechi (*Am S* [2] 17, 129, 19, 120) in an old lagoon, it has not been prepared artificially

The remaining borates have been chiefly investigated by Berzelius (*S* 23, 160, *P* 2, 113, 9, 483, 83, 98, 34, 561), Arvedson (*Gm K* 6th ed.), Gmelin (*v Gm*), H. Rose (*P* 9, 176, 19, 153, 86, 561, 87, 1, 470, 587, 88, 299, 482, 89, 473, 91, 452), Wöhler (*P* 28, 525), Rammelsberg (*P* 49, 445), Ebelmen (*A Ch* [3] 16, 129, 17, 54, 33, 34), Bouquet (*A Ch* [3] 17, 54), Bolley (*A* 68, 122), Herapath (*P M* [8] 34, 375), Laurent (*A Ch* [2] 67, 215), Tissier (*C R* 39, 192, 45, 411), Bloxam (*C J* 12, 177, 14, 143) For an account of various supposed compounds of MO with B_2O_3 , v Ditte (*A Ch* [5] 30, 248) The following are the salts which have been chiefly examined, but the composition of many is not settled

Aluminium — $2\text{Al}_2\text{O}_3 \cdot \text{B}_2\text{O}_3 \cdot 3\text{H}_2\text{O}$, $8\text{Al}_2\text{O}_3 \cdot 2\text{B}_2\text{O}_3 \cdot 7\text{H}_2\text{O}$ (H Rose) — $3\text{Al}_2\text{O}_3 \cdot \text{B}_2\text{O}_3$ (Ebelmen)

Ammonium — $(\text{NH}_4)_2\text{B}_4\text{O}_7 \cdot \text{H}_2\text{B}_4\text{O}_7 \cdot 2\text{H}_2\text{O}$ (also $8\text{H}_2\text{O}$) (Arvedson) — $(\text{NH}_4)_2\text{B}_4\text{O}_7 \cdot 5\text{H}_2\text{B}_4\text{O}_7 \cdot 4\text{H}_2\text{O}$ (Bechi, *Am S* [2] 17, 129, 19, 120)

$(\text{NH}_4)_2\text{B}_4\text{O}_7 \cdot 3\text{H}_2\text{B}_4\text{O}_7 \cdot 3\text{H}_2\text{O}$ (Gmelin) — $(\text{NH}_4)_2\text{B}_4\text{O}_7 \cdot 4\text{H}_2\text{B}_4\text{O}_7 \cdot 2\text{H}_2\text{O}$ (Rammelsberg)

Barium — $\text{BaB}_2\text{O}_4 \cdot 10\text{H}_2\text{O}$ (Berzelius) — $\text{BaB}_2\text{O}_4 \cdot \text{H}_2\text{O}$ (Rose) — $\text{BaB}_2\text{O}_4 \cdot \text{H}_2\text{B}_4\text{O}_7 \cdot 4\text{H}_2\text{O}$, $\text{BaB}_2\text{O}_4 \cdot 2\text{H}_2\text{B}_4\text{O}_7 \cdot 12\text{H}_2\text{O}$, $2\text{BaB}_2\text{O}_4 \cdot \text{H}_2\text{B}_4\text{O}_7 \cdot 14\text{H}_2\text{O}$ (Laurent) — $\text{Ba}_2(\text{BO}_3)_2 \cdot 2\text{BaO} \cdot \text{B}_2\text{O}_3$, $5\text{BaO} \cdot 2\text{B}_2\text{O}_3$ (Bloxam) — $2\text{BaO} \cdot 3\text{B}_2\text{O}_3$, BaB_2O_4 (Ditte, *C R* 77, 788)

Cadmium — CdB_2O_4 , $2\text{CdB}_2\text{O}_4 \cdot \text{CdO} \cdot \text{H}_2\text{O} \cdot 2\text{H}_2\text{O}$ (Rose)

Calcium —

$\text{CaB}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$, $2\text{CaB}_2\text{O}_4 \cdot \text{H}_2\text{B}_4\text{O}_7 \cdot 4\text{H}_2\text{O}$ (Rose) —

$\text{CaB}_2\text{O}_4 \cdot \text{H}_2\text{B}_4\text{O}_7$ (Tunnersmann) —

$\text{CaB}_2\text{O}_4 \cdot 3\text{H}_2\text{B}_4\text{O}_7 \cdot 6\text{H}_2\text{O}$ (Laurent) —

$\text{CaB}_2\text{O}_4 \cdot 3\text{CaO} \cdot 2\text{B}_2\text{O}_3$, $2\text{CaO} \cdot 3\text{B}_2\text{O}_3$, $3\text{CaO} \cdot 3\text{MgO} \cdot 4\text{B}_2\text{O}_3$ (Ditte)

Cobalt — $2\text{CoB}_2\text{O}_4 \cdot \text{CoO} \cdot \text{H}_2\text{O} \cdot 3\text{H}_2\text{O}$ (Rose)

Copper — Composition very uncertain (v Tunnersmann, Rose, Laurent, Bolley, also le Roux, *C R* 64, 126, Pasternack, *A* 151, 227, Poussier, *B* 6, 1138)

Didymium — DiB_2O_4 (Clève, *Bl* [2] 43, 364)

Iron — $\text{Fe}(\text{B}_2\text{O}_4) \cdot 3\text{H}_2\text{O}$, found in a lagoon-crater (Bechi, *Am S* [2] 17, 129, 19, 120) Basic salts of uncertain composition are formed by the reactions between alkali borates and solutions of ferric salts, borates of Fe and Na seem to be produced by ppg iron alum with alkali borates (Rose)

Lead — $\text{PbB}_2\text{O}_4 \cdot \text{H}_2\text{O}$, $2\text{PbB}_2\text{O}_4 \cdot \text{H}_2\text{B}_4\text{O}_7 \cdot 8\text{H}_2\text{O}$, $\text{PbB}_2\text{O}_4 \cdot \text{H}_2\text{B}_4\text{O}_7 \cdot 3\text{H}_2\text{O}$ (Herapath, v also Rose) Double salts $\text{PbB}_2\text{O}_4 \cdot \text{Pb}(\text{NO}_3)_2 \cdot \text{H}_2\text{O}$, $\text{PbB}_2\text{O}_4 \cdot \text{PbCl}_2 \cdot \text{H}_2\text{O}$ (Herapath)

Magnesium — $\text{MgB}_2\text{O}_4 \cdot 4\text{H}_2\text{O}$,

$\text{MgB}_2\text{O}_4 \cdot 2\text{H}_2\text{B}_4\text{O}_7 \cdot 6\text{H}_2\text{O}$, $\text{MgB}_2\text{O}_4 \cdot 3\text{H}_2\text{B}_4\text{O}_7 \cdot 8\text{H}_2\text{O}$, $\text{MgB}_2\text{O}_4 \cdot 5\text{H}_2\text{B}_4\text{O}_7 \cdot 18\text{H}_2\text{O}$ (Laurent, Rammelsberg) — $\text{MgB}_2\text{O}_4 \cdot 8\text{H}_2\text{O}$ (Wöhler) — $\text{Mg}_2(\text{BO}_3)_2$ (Ebelmen)

Double salts $6\text{MgO} \cdot 8\text{X}_2\text{O}_3 \cdot 2\text{B}_2\text{O}_3$ (X = Cr or Fe) (Ebelmen) Ditte describes various compounds of the form $x\text{MgO} \cdot y\text{CaO} \cdot z\text{B}_2\text{O}_3$.

Nickel — $\text{NiB}_2\text{O}_4 \cdot 2\text{H}_2\text{O}$ (Rose) also various vague basic salts

Rubidium — $\text{RbB}_2\text{O}_4 \cdot 6\text{H}_2\text{O}$ (Reissig, *A* 127, 88).

Silver — $\text{Ag}_2\text{B}_2\text{O}_4 \cdot \text{H}_2\text{O}$, $8\text{Ag}_2\text{O} \cdot 4\text{B}_2\text{O}_3$ (Rose).

Strontium — SrB_2O_4 , $\text{SrB}_2\text{O}_4 \cdot 8\text{SrO} \cdot 2\text{B}_2\text{O}_3$, $2\text{SrO} \cdot 8\text{B}_2\text{O}_3$ (Ditte) — $8\text{SrB}_2\text{O}_4 \cdot 2\text{H}_2\text{B}_4\text{O}_7 \cdot 5\text{H}_2\text{O}$ (Rose) — $\text{SrB}_2\text{O}_4 \cdot \text{H}_2\text{B}_4\text{O}_7 \cdot 3\text{H}_2\text{O}$,

$\text{SrB}_2\text{O}_4 \cdot 8\text{H}_2\text{B}_4\text{O}_7 \cdot 8\text{H}_2\text{O}$ (Laurent)

Zinc — Very vague (v Rose) Buscher (*A* 151, 234) describes the double salt

$\text{ZnO} \cdot 4\text{NH}_3 \cdot 2\text{B}_2\text{O}_3 \cdot 6\text{H}_2\text{O}$

[? *Samarium borate* — SmBO_3 (Clève, *Bl* [2] 43, 170)]

FLUOBORIC ACID, AND FLUOBORATES B_2O_3 appears to react as a feebly basic oxide towards the anhydrides of a few acids, e.g. SO_3 and P_2O_5 (v BORON, oxide or, *Reactions*, Nos 6, 7) H_2BO_3 dissolves in conc. HFAq , by concentration, and cooling over H_2SO_4 , a thick syrup like liquid is obtained (S G 1 584) containing $\text{H}_2\text{B}_4\text{O}_7$ and HF in the ratio $\text{H}_2\text{B}_4\text{O}_7$ 6HF This liquid is generally regarded as a definite acid, called *fluoboric acid* This liquid c-ars organic matter like H_2SO_4 The same liquid is obtained by saturating water with BF_3 and distilling (Gay Lussac a Thénard, *Recherches physico chimiques*, 2, 38, Berzelius, *P* 58, 503, 59, 644) The liquid is decomposed by waterto HBF_4aq and $\text{H}_2\text{B}_4\text{O}_7$ (v BOROFUORHYDRIC ACID, under BORON, FLUORIDE OF) If this liquid is neutralised by NaOHAq or KOHAg , and the solution is evaporated, the salts $\text{M}_2\text{B}_4\text{O}_7 \cdot 6\text{MF} \cdot \text{H}_2\text{O}$ (M = Na or K) are obtained (Berzelius) The same salts are also formed, when M = K by fusing KF with H_2BO_3 , and when M = Na by crystallising mixed solutions of $\text{Na}_2\text{B}_4\text{O}_7$ and NaF It is very doubtful whether the so called fluoboric acid is a definite compound or not According to Basarow (*C R* 78, 1698) the liquid prepared as described is decomposed by distillation, at 140° BF_3 is given off, at 160° to 170° a thick, heavy, fuming liquid (S G 1 77) comes over, at 175°-185° a less fuming liquid is produced, and as the temperature rises the distillate becomes lighter and fumes less in air The heavy distillates are decomposed by water with separation of H_2BO_3 The salts obtained by Berzelius are separated by crystallisation into MF, which crystallises out first, and a mixture of MF with $\text{M}_2\text{B}_4\text{O}_7$ (Basarow) Solution of the so called acid reacts with AgNO_3aq to give $\text{Ag}_2\text{B}_4\text{O}_7$ and Ag_2O Basarow regards fluoboric acid as a mixture of $\text{H}_2\text{B}_4\text{O}_7$ with HBF_4 and HF Landolph (*B* 12, 1583) describes the bodies $\text{H}_2\text{B}_4\text{O}_7$ 3HF and $\text{H}_2\text{B}_4\text{O}_7$ 2HF, the first is obtained in small quantities by the reaction between BF_3 and $\text{C}_2\text{H}_5\text{H}$, the second is one of the products of the action of BF_3 on hot anethol Both bodies are fuming, acid, liquids, they seem to be fairly stable, the first is unchanged by distillation

BOROTUNGSTATES Many compounds of the form $x\text{B}_2\text{O}_3 \cdot y\text{WO}_3 \cdot z\text{MO}$ (MO = metallic oxide) have been obtained the acid $\text{B}_2\text{O}_3 \cdot 9\text{WO}_3 \cdot 2\text{H}_2\text{O}$ 18aq has been prepared The principal borotung states will be described under TUNGSTEN as TUNGSTOBORATES

Detection and Estimation of Boric Acid Free boric acid is detected by its action on turmeric paper, or by the green colour which it imparts to the flame of burning alcohol, borates do not give these reactions, therefore they must be decomposed by $\text{H}_2\text{SO}_4\text{aq}$ before applying the alcohol test, or by HClAg before applying the

turmeric paper test There is no very satisfactory method for estimating boric acid. The most insoluble salt is KBF_4 , it is obtained from boric acid or borates by adding excess of KOH aq, then evaporating with excess of HFA aq, dissolving out sulphate, nitrate, &c of K, by $\text{KC}_2\text{H}_3\text{O}_2$ aq, washing with alcohol, and drying at 100° . Marignac (*Fr* 1, 405) evaporates the solution of the borate with excess of NH_4Cl aq and MgCl_2 aq, with various precautions, and finally obtains a mixture of MgO and Mg borate in which he then estimates the amount of MgO and so gets the amount of boric acid (*v* also Ditte, *C R* 80 490 a 561). As boric acid interferes with estimation of some other bodies, *e.g.* phosphoric acid, it is sometimes necessary to remove it, this may be done either by boiling with alcohol and H_2SO_4 aq (Et_2BO_3 goes off), or with HF and H_2SO_4 aq (BF_3 goes off). Rosenbladt (*Fr* 26, 18) describes a method based on the volatilisation of boric acid by distillation with methylic alcohol, the method gives good results (*v* also Gooch, *C N* 55, 7).

Boron, oxychlorides of Two are known, BOCl and BOCl_2 , neither exists as a gas, both are decomposed by heat. BOCl is a white gelatinous solid, obtained by heating B_2O_3 with BCl_3 , in the ratio B_2O_3 2BCl_3 , to 150° , at a high temperature it is decomposed to BCl_3 and B_2O_3 (Gustavson, *Z* 1870 521). BOCl_2 is described as a yellowish green liquid, it was obtained, along with BCl_3 , by passing Cl over a heated mixture of B_2O_3 and C , removing Cl from the gaseous products by Cu turnings, condensing, and removing BCl_3 by evaporation (Counciler, *J pr* [2] 18, 399). The conditions under which BOCl_2 is formed are not definitely known, Counciler obtained the best result when relatively little carbon was used, and a fairly rapid stream of Cl was passed through the tube. BOCl_2 is decomposed by heat into BCl_3 , B_2O_3 , and Cl_2 , and by water to H_2BO_3 , HCl , and Cl_2 . No oxychloride of B is formed by the action of ozone on BCl_3 , or by passing electric sparks through a mixture of BCl_3 and O (Michaelis a Becker, *B* 14, 914).

Boron, sulphide of B_2S_3 . Mol w unknown, as compound has not been gasified.

Formation—1 By heating B in S vapour to white heat (Berzelius, *P* 2, 145)—2 By gently heating B in dry H_2S (Wöhler a Deville, *A* 105, 72).

Preparation—Small pellets are made by mixing powdered B_2O_3 with soot and oil and heating out of contact with air, these are heated to full redness in a porcelain tube, in a stream of dry CS_2 , the tube is connected with two small flasks surrounded by snow and salt. The B_2S_3 collects on the surface of the condensed CS_2 , it is separated from CS_2 and dried in an atmosphere of H (Fremy, *A Ch* [3] 88, 812). B_2S_3 is a white solid (with a yellowish tinge, Fremy), consisting of groups of small crystals, it smells strongly, and its vapour acts on the eyes, it is rapidly decomposed by moisture to B_2O_3 and H_2S , it may be melted in an atmosphere of H , and volatilised in a current of H_2S .

M M P M

BORON, ORGANIC DERIVATIVES OF

Boron tri-methide $\text{C}_3\text{H}_3\text{B}$ $\approx \text{BMe}_3$. V D 191 (calc 1.93). From ethyl borate and ZnMe_2 , thus.

$2\text{B}(\text{OEt})_3 + 8\text{ZnMe}_2 \rightarrow 2\text{BMe}_3 + 3\text{Zn}(\text{OEt})_2$ (Frankland, *C J* 15, 373). Pungent gas. V al sol water, v sol alcohol and ether. Takes fire in air, burning with a green flame. Not affected by conc H_2SO_4 or by HI . Combines with potash forming BMe_3KOH . Combines with ammonia forming BMe_3NH_3 [56°] (110°). Combines also with NaOH , CaO , and BaO .

Boron tri-ethide BEt_3 . Mol w 98 (95°). S G 22 696 V D 340 (calc 340). From BCl_3 or $\text{B}(\text{OEt})_3$ and ZnEt_2 (Frankland, *Tr* 1862, 167, *Pr* 25, 165). Pungent oil. Takes fire in air. Slowly decomposed by HCl , evolving C_2H_2 . Violently attacked by chlorine.

Combinations—1 With ammonia it forms a liquid BEt_3NH_3 —2 By careful oxidation, first in air, then in oxygen, it forms an oxide BEt_3O_2 (125°). Water decomposes this oxide, forming ethyl boric acid, $\text{BEt}(\text{OH})_2$. Ethyl boric acid is crystalline, and may be sublimed, its solutions are acid, but it does not form salts. A compound $\text{BEt}(\text{OEt})_2\text{B}(\text{OEt})_2$ (*c* 112°) appears to be formed by the action of ZnEt_2 (1 mol) on boric ether, it is decomposed by water into alcohol, $\text{BEt}(\text{OH})_2$, and $\text{B}(\text{OH})_3$, and by ZnEt_2 it is converted into $\text{BEt}(\text{OEt})_2$ (103°), which absorbs oxygen, becoming $\text{BEt}(\text{OEt})_3$. Diethyl boric ether, $\text{BEt}_2(\text{OEt})$ is saponified by water, and the acid absorbs oxygen, becoming crystalline $\text{BEt}(\text{OEt})_2(\text{OH})$, which is converted by water into ethyl boric acid $\text{BEt}(\text{OH})_2$.

Boron-phenyl-di-chloride $\text{C}_6\text{H}_5\text{BCl}_2$ [about 0°] (175°). Prepared by heating boron tri-chloride with mercury di-phenyl at 200° (Michaelis a Becker, *B* 15, 180). Colourless fuming fluid. By the action of water it gives phenyl boric acid, and by the action of alcohol, phenyl boric ether.

Boron-p tolyl-dichloride $\text{C}_6\text{H}_4(\text{CH}_3)\text{BCl}_2$ [27°]. Colourless crystals. Prepared by heating boron tri-chloride with mercury di-p tolyl (Michaelis a Becker, *B* 15, 185).

BORO TARTAR EMETIC *v* BORON, OXIDE OF, *Reactions*, No 10, also under TARTRATES. **BOROTUNGSTATES** Compounds of the form $x\text{B}_2\text{O}_3 \cdot y\text{WO}_3 \cdot z\text{MO}$ (M =metal), *v*. TUNGSTOBORATES, under TUNGSTEN.

BRASILEIN *v* BRAZILEIN

BRASS *v* COPPER, ALLOYS OF

BRASSIC ACID $\text{C}_{22}\text{H}_{39}\text{O}_2$ [60°]. Prepared by just melting its isomeric, erucic acid, with dilute HNO_3 , and adding sodium nitrite. Laminæ (from alcohol). Combines with bromine. Potash fusion gives arachic acid.

Salts— NaA laminæ (from alcohol).

Ethyl ether EtA [30°], (above 860°), glistening plates, obtained by etherifying the acid or by the action of nitrous acid upon ethyl erucate.

Glycerin-di-brassic ether $\text{C}_{22}\text{H}_{41}\text{O}_4\text{A}_2$ (di-brassinin) [65°], crystals, sl sol ether. Formed from glycerin di erucic ether by nitrous acid.

Glycerin-tri brassic ether $\text{C}_{22}\text{H}_{41}\text{O}_6\text{A}_3$ (tri-brassinin) [47°], after heating [36°], colourless crystalline powder, v sol ether, nearly insol. alcohol. Obtained by the action of nitrous acid upon rape seed oil, and crystallisation of the solid product from ether.

Amide $\text{C}_{22}\text{H}_{41}\text{CONH}_2$ [90°], colourless

x x 2

needles, formed by the action of NH_3 gas upon the anhydride

Anhydride $\text{C}_{11}\text{H}_{11}\text{CONHPh}$ [78°]

Anhydride $(\text{C}_{11}\text{H}_{11}\text{CO})_2\text{O}$ [29°], glistening tables, v sol ether and benzene, insol alcohol and water, formed by the action of PCl_5 upon brassic acid and subsequent addition of alcohol (Reimer & Will, *B* 19, 3320, cf Wesky, *J pr* 58, 449, Haussknecht, *A* 143, 40, Fitz, *B* 4, 444, Goldschmidt, *Sitz B* 74, 394)

BRASSYLIC ACID $\text{C}_{11}\text{H}_{19}\text{O}_2$ Mol w 216 [109°] Formed, together with its aldehyde and dioxybenzoic acid, by the action of fuming HNO_3 on behenic acid (Haussknecht, *A* 143, 45) Crystalline, v al sol cold water, v sol alcohol and ether

Salts — CaA^{\cdot} 3aq — AgA^{\cdot}

BRASSYLIC ALDEHYDE $\text{C}_{11}\text{H}_{17}\text{O}$ The chief product of the action of fuming HNO_3 on behenic acid (*v supra*) Oil, lighter than water, volatile with steam Sol NaOHAq and reppd by HCl Oxidised by bromine to brassylic acid

BRAZILEIN $\text{C}_{16}\text{H}_{22}\text{O}_3\text{H}_2\text{O}$

Formation — By the oxidation of brazilin by air in presence of alkalis or in ethereal solution by HNO_3 (Reim, *B* 4, 334, E Kopp, *B* 6, 446, Liebermann & Burg, *B* 9, 1883, Buchka & Erck, *B* 18, 1142)

Preparation — Extract of Brazil wood is dissolved in hot water and, after cooling, NH_3 in slight excess is added The solution is exposed to air, when a pp is formed which is crystallised from hot dilute acetic acid (Hummel & A G Perkin, *C J* 41, 373)

Properties — Minute crystals with grey lustre Reddish brown when powdered Very slightly soluble in cold water, more so in hot water The solution is yellowish pink with greenish orange fluorescence Alkaline solutions are carmine red, but slowly turn brown in air

Reactions — 1 If hot glacial acetic acid be slowly added to a solution in cold conc H_2SO_4 , minute orange needles of *iso* brazilin sulphate, $\text{C}_{16}\text{H}_{22}\text{O}_3\text{H}_2\text{SO}_4$, are got Its alkaline solutions are carmine red quickly turning brown in air Alcohol turns *iso* brazilin sulphate scarlet, forming the basic salt $\text{C}_{16}\text{H}_{22}\text{O}_3\cdot 2(\text{C}_{16}\text{H}_{21}\text{O}_3\text{SO}_3\text{H})$ 2 Conc HCl at 100° forms $\text{C}_{16}\text{H}_{21}\text{O}_3\text{Cl}$ Minute red prisms with violet lustre, called *iso* brazilin chlorhydrin of its aqueous solution is orange — 3 HBr at 100° forms, similarly, $\text{C}_{16}\text{H}_{21}\text{O}_3\text{Br}$ Brazilin resembles hæmatein (*q v*) in these reactions

BRAZILIN $\text{C}_{16}\text{H}_{22}\text{O}_3$ Occurs in Brazil wood (the wood of *Cesalpinia crassa*) and in Sapanwood (from *Cesalpinia v Sapan*) (Chevreul, *A Ch* 66, 226, E Kopp, *B* 4, 447, Bolley, *J pr* 93, 461)

Preparation — The dark brownish red crusts deposited during the preparation and storage of commercial extract of Brazil wood consist of brazilin and its lime compound The crusts are washed with dilute (5 p.c.) HCl and then extracted with very dilute (12 p.c.) alcohol

Properties — Colourless crystals (containing aq) Sol. water, alcohol, and ether Turns orange in air Forms a carmine solution in aqueous NaOH in air, this solution is bleached by sun-dust, but re-oxidised to brazilin by air

Aqueous solutions are also turned red by NH_3 , or baryta when exposed to air

Reactions — 1 Resorcin is among the products of its dry distillation — 2 KClO_4 and HCl give *iso* tri chloro glyceric acid (Benedikt, *A* 178, 100)

Salt — PbA^{\cdot} aq small colourless needles

Tri acetyl derivative $\text{C}_{16}\text{H}_{11}(\text{OAc})_3\text{O}_2$ [106°], slender colourless needles

Tetra acetyl derivative $\text{C}_{16}\text{H}_8(\text{OAc})_4\text{O}$ [151°], glistening needles (Buchka & Erck, *B* 18, 1138)

BREIDIN *v* ARDOL & BREA.

BRIMSTONE *v* SULPHUR

BRIFANNIA METAL *v* TIN, ALLOYS OF

BRITISH GUM *v* DEXTRIN

BROMAL *v* BROMO ACETIC ALDEHYDE

BROMALIDE $\text{C}_2\text{H}_3\text{Br}_2\text{O}_2$ *re*

$\text{CBR}_2\text{CH} < \text{CO} > \text{CH CBR}_2$, *Tri bromo-ethylidene tri bromo lactale* [158°] Formed by heating bromal hydrate with H_2SO_4 , or by warming a mixture of bromal and tri bromo lactic acid (Wallach, *A* 193, 1, Wallach & Reinecke, *B* 10, 2128) Monoclinic crystals, insol water, sol ether Decomposed by alcohol.

BROMANIL is TETRA BROMO QUINONE (*q v*)

BROMATES AND PERBROMATES — Salts of bromic and perbromic acids, *v* BROMINE, OXYACIDS OF

BROMHYDRIC ACID HBr (*Hydrobromic acid Hydrogen bromide*) Mol w 80.75 [−73°] (−69°) (Faraday, *T* 1823 189) *V D* 89.1 *S* (−25° to 0° at 760 mm) about 690, *S* (−25° to 0° at 2 mm) about 345 (Roozeboom, *R T C* 4, 102) *H F* [H,Br] = 8.440, [H,Br,Aq] = 28.376, [H,Br,Aq] = 27.837 (*Th* 2, 29)

$\frac{A-1}{d} \times \text{At wt} = 20.6$ (Gladstone, *T* 1870 9)

H and Br do not combine at ordinary temperatures even in direct sunlight

Formation — 1 By burning H charged with Br vapour — 2 By passing a mixture of H and Br over hot Pt, for details of method *v* Harding, *B* 14, 2085 — 3 By the action of electric sparks on H and Br — 4 By the action of Br on H_2O , more quickly in presence of oxidisable bodies such as P , S , As , or lower oxides of these elements — 5 By passing H_2O and Br through a hot tube (Bourson, *C R* 13, 1154) — 6 By passing H_2S into Br and H_2O (Naumann, *B* 9, 1577) — 7 By passing HI into Br (Haute feuille, *C R* 64, 705) — 8 By the mutual action of Na_2SO_3 (Mène, *C R* 23, 478), or $\text{Na}_2\text{S}_2\text{O}_3$ (Gladstone, *P M* [8] 35, 345), Br , and H_2O , $(\text{Na}_2\text{SO}_3\text{Aq} + \text{H}_2\text{O} + \text{Br}_2 = \text{Na}_2\text{SO}_4\text{Aq} + 2\text{HBrAq})$, $(\text{Na}_2\text{S}_2\text{O}_3\text{Aq} + \text{H}_2\text{O} + \text{Br}_2 = \text{Na}_2\text{SO}_4\text{Aq} + \text{S} + 2\text{HBrAq})$

9 By leading Br into melted paraffin at 185° (Champion & Pellet, *C R* 70, 620)

Preparation — 1 When small quantities are required, HBr may be prepared by the action of P and Br on H_2O ($4\text{H}_2\text{O} + \text{P} + 5\text{Br} = \text{H}_3\text{PO}_4 + 5\text{HBr}$) A glass tube is bent 3 times at about a right angle, a little Br is placed in one bend and a few pieces of P in the other, pieces of glass moistened with a very little water are placed in the limb of the tube above the P , a cork with delivery tube is fitted into the open end of the tube above the glass, and the other end of the

tube is closed by a cork. The Br is then *very gently* warmed, the reaction occurs when the Br vapour reaches the moist P, and the HBr passes off through the delivery tube—2 When larger quantities of HBr are required it is advisable to use amorphous P. In a flask fitted with a cork carrying an exit tube and a small stoppered separating funnel, is placed 1 part amorphous P mixed with some dry sand, the P is moistened and then covered with a layer of dry sand (Linnemann, *A* 161, 198 *note*), the exit tube is connected with a U tube nearly filled with glass beads moistened with conc HBrAq and pieces of ordinary P (any Br which may come over is converted into HBr in this tube), this is followed by a drying tube containing CaCl_2 or P_2O_5 , and from this a delivery tube passes into a dry cylinder filled with dry Hg standing in a Hg trough. Ten parts of Br are placed in the separating funnel and allowed to drop slowly into the flask, HBr is evolved. Towards the close of the operation the flask is gently warmed. If it is desired to prepare an aqueous solution of HBr, the U tube is fitted with an exit tube passing into the tubulus of a retort placed vertically and arranged so that the beak dips a little way under the surface of water in a bottle, should the flow of HBr slacken, the water rises into the body of the retort but cannot flow back into the generating vessel—3 By the action of conc H_3PO_4 Aq on KBr, 1 part KBr, 1 part H_3PO_4 , and 3 parts H_2O being used (Bertrand, *C* 82, 96)—4 By decomposing the bromide of an alkaline earth metal by H_2SO_4 Aq, Bertrand (*lc*) employs two parts CaBr_2 , 2 parts conc H_2SO_4 , and 1 part H_2O . If an alkali bromide is used, the HBr contains much Br and some SO_2 —5 An aqueous solution of HBr may be obtained by slowly adding P in small pieces to Br mixed with a considerable quantity of water in a vessel surrounded by ice, then adding a little more Br and then a few pieces of P (repeating if a strong solution is required), and distilling from H_3PO_4 Aq (*v* Topsøe, *B* 3, 400).

Properties—HBr is a colourless gas, with pungent, acid, very irritating, odour, excites inflammation when applied to the skin, fumes in moist air, dissolves very largely in water, (*v infra*) is absorbed by, and melts, ice, at -73° liquefies, and then crystallises. Melsens (*C* 77, 781) obtained liquid HBr by saturating wood charcoal with the gas (15,500 gram units of heat are produced for every 81 grams HBr absorbed, Favre, *A Ch.* [5] 1, 209), placing the charcoal in one end of a closed glass tube bent to an obtuse angle, the other end of which was well cooled, and heating the charcoal in a water bath. An aqueous solution of HBr forms a colourless, strongly acid liquid, the affinity is a very little less than that of HClAq *v AFFINITY*.

The conc solution fumes in, but is not decomposed by exposure to air. SG of solution saturated at $0^\circ = 1.78$, 1 cc contains 1.46 grams HBr ($= 82.02$ p.c. HBr by weight) which almost agrees with the composition calculated from the formula $\text{HBr} \cdot \text{H}_2\text{O}$ (Bineau, *A* 44, 237). Roozeboom (*R T C* 5, 363) has obtained the hydrate $\text{HBr} \cdot \text{H}_2\text{O}$ as a solid at low temperatures and under a pressure of 8 atmos. If conc. HBrAq is distilled at 760 mm pressure HBr is evolved, if HBrAq containing less

than 47 p.c. HBr is distilled at 760 mm. H_2O is evolved, in each case the B P becomes constant at 126° and the solution contains 47.38–47.86 p.c. HBr, the composition of this liquid is almost exactly that expressed by the formula $\text{HBr} \cdot 5\text{H}_2\text{O}$ (*V D* = 14.1 agreeing with *V D* calculated for $\text{HBr} + 5\text{H}_2\text{O}$), but it is not probable that the liquid consists of a true hydrate, as the composition varies with the pressure, thus if the pressure is 1,952 mm the constant B P is 153° and the liquid contains 46.3 p.c. HBr (*v* Roscoe, *A* 116, 203). If dry air is passed through HBrAq at a constant temperature, either HBr or H_2O is removed, and the composition becomes constant, at 16° the liquid finally contains 51.65, and at 100° 49.35, p.c. HBr (Roscoe, *lc*). The SG and p.c. composition of HBrAq are given in the following tables (Topsøe, *B* 3, 404, Wright, *C* N 23, 242).

Temp	SG	P.c. HBr	Temp	SG	P.c. HBr.
14°	1.055	7.67	13°	1.302	83.84

1.080	10.4
1.190	23.5
1.248	30.0
1.385	40.8
1.475	48.5
1.515	49.8

Reactions—1 Not decomposed by heat alone, even at 700° (Hautefeuille, *C* R 64, 705)—2 Decomposed by heating with many metals, e.g. K, Na, Na amalgam, Sn, &c with formation of metallic bromide and H—3 Chlorine forms HCl and Br—4. Conc nitric or sulphuric acid forms Br, H_2O , and NO_2 or SO_2 —5 Lead or silver oxide forms metallic bromide and H_2O at ordinary temperatures, most of the other metallic oxides decompose HBr in a similar way on warming—6 Metallic peroxides, and acids containing metals (e.g. HSbO_3), form metallic bromides and Br—7 Aqueous solution of HBr is decomposed by most metals with formation of metallic bromide and H, most metallic oxides dissolve in HBrAq forming bromides. The heat of neutralisation of HBrAq by MOHAq or $\text{M(OH)}_2\text{Aq}$, when M = an alkali or alkaline earth metal, is the same as the heat of neutralisation of HClAq , viz 13,750, but the quantity of heat produced by the action of HBrAq on the hydrated oxides of Pt and Au, and on HgO , is much greater than the quantity of heat produced by the action of HClAq on the same compounds, the differences are

for AuO_2H_2	13,810
" PtO_2H_2	11,890
" PtO_2H_2	16,800
" HgO	12,290.

The action of HBrAq on these hydrated oxides is very different from the action of the same

acid on the hydrated oxides of K, Ca, Mg, &c., in the former cases there is little doubt that acids of the form H_2HgBr , H_2PtBr , H_2AuBr , and $HAuBr$, are formed in the solutions (v Thomsen, *Th* 3, 538). Many double bromides of Au, Hg, and Pt—*e.g.* $PtBr_2 \cdot 2KBr$ —are rather to be regarded as alkali salts of these acids than as double salts (v *Th* 3, 417, also GOLD, MERCURY, PALLADIUM, PLATINUM)—8 $HBrAq$ is decomposed by bromic acid solution, $HBrO_3Aq + 5HBrAq = 3H_2OAq + 6BrAq$ —9 Conc sulphuric acid heated with $HBrAq$ forms H_2O , SO_2 , and Br, dilute H_2SO_4Aq does not decompose $HBrAq$ at ordinary temperatures 10 Chlorine sets free Br from $HBrAq$ —11 $HBrAq$ is partly decomposed by potassium permanganate solution in the cold, quickly and completely on heating—12 By electrolysis of $HBrAq$, $HBrO_3Aq$ is produced (Ruche, *C R* 46, 348)—13 Bromine dissolves in $HBrAq$ forming a dark coloured liquid

Combinations—1 With ammonia and phosphine, Ogier (*C R* 89, 705) gives the thermal data, $[NH_4HBr] = 45,600$, $[PH_4HBr] = 23,000$, using gaseous constituents and forming solid MH_2Br —2 With water probably to form the hydrate $HBr \cdot H_2O$ (v *Properties*) The heats of solution and dilution of HBr have been measured by Thomsen (*Th* 3, 13 and 72), the results indicate the existence in the solution of the hydrate $HBr \cdot H_2O$, but do not suggest the formation of any other definite hydrate on dilution The heat of dilution appears to be a continuous hyperbolic function of the quantity of water added, provided the composition of the acid to start with is $HBr \cdot H_2O$, the results cannot, however, be expressed by quite so simple a formula, involving a single constant, as is applicable in the case of chlorhydric acid (*q v*) It is quite possible that the reactions of $HBrAq$ are the reactions of the acid $HBr \cdot H_2O$ ($= H_2BrOH$), and that HBr itself is not an acid (v Presidential Address to Section B by Prof Armstrong, B A Meeting, 1895) Berthelot (*BZ* [2] 19, 385, *C R* 64, 414, 66, 742) thinks that $HBrAq$ contains a number of hydrates, some partially dissociated, and also the compound HBr (v CHLORHYDRIC ACID) Roozeboom (*R T C* 4, 108, 331, 5, 351, 363, also Van't Hoff, *ibid* 4, 414) has determined the relations between vapour pressure and temperature of solutions of hydrated HBr M M P M

BROMIC ACID $HBrO_3$, v BROMINE, OXYACIDS OF

BROMIDES Binary compounds of Br with more positive elements *i.e.* with any element except F, Cl, or O Br forms binary compounds with most of the elements The greater number may be produced by direct combination The formation of metallic bromides is usually accompanied with production of much heat, thus, $[K^+, Br^-] = 190,620$, $[Ca, Br^-] = 140,850$, $[Zn, Br^-] = 75,930$, $[Hg, Br^-] = 50,550$, $[Au, Br^-] = 8,850$ (Liquid Br was used.) Some metallic bromides are formed by the action of Br on the oxides, *e.g.* $AgBr$ by Br on Ag_2O Alkalis and alkaline earths in aqueous solutions are decomposed by Br, giving bromides and bromates, certain metallic salts, in aqueous solutions, form bromides and peroxides, *e.g.* salts of Mn, Ni, Co, and Pb. Metallic iodides

are decomposed wholly or in part by Br, giving metallic bromides and free I Many metallic chlorides are partly decomposed when heated in closed tubes to about 300° with equivalent quantities of Br, after a time equilibrium is established in the system consisting of chloride, bromide, Cl, and Br, this equilibrium is not overthrown by increasing the mass of Br, the temperature, or the time (Potlitzin, *B* 14, 1044, 15, 918, 16, 3051) Metallic bromides are usually formed by the action of $HBrAq$ on the oxides (comp BROMHYDRIC ACID, *Reactions*, No 7) Most metallic bromides are white, they are generally isomorphous with the corresponding chlorides, most of them are not decomposed by heat alone, but some, *e.g.* those of Au and Pt, give up all their Br when heated Some metallic bromides are decomposed by H_2O , *e.g.* those of Bi and Sb, others are decomposed when their aqueous solutions are evaporated, *e.g.* $AlBr_3$, most are decomposed by heating in air in presence of steam Metallic bromides are decomposed by certain peroxides and oxidising agents, *e.g.* MnO_2 , $K_2Mn_2O_8Aq$, $K_2Cr_2O_8Aq$, HNO_3Aq , with separation of Br, conc H_2SO_4Aq sets free a little HBr , but decomposes most of the bromides to sulphate and Br with simultaneous formation of SO_2 , HCl and $HClAq$ form HBr and metallic chloride When a metallic bromide is heated with solid $K_2Cr_2O_8$ and conc H_2SO_4 , free Br is obtained (distinction from chlorides) Aqueous solutions of alkali bromides dissolve large quantities of Br, probably with formation of perbromides in solution, Berthelot (*C R* 91, 195 and 706) gives the numbers (using gaseous Br) $[KBrAq, Br^-] = 11,500$ Aqueous solutions of alkali, alkaline earth, and magnesian bromides partly decompose $AgCl$ when the salts are shaken together for a few minutes at the ordinary temperature, the percentage of $AgBr$ formed varies from 95 when $LiBrAq$ is used, to 84.8 when $CdBrAq$ is employed (Potlitzin, *B* 18, 1522) The binary compounds of Br with the non metals are fairly stable bodies, they are usually produced by direct combination Bromides of B, P, C, and Si are stable as gases Br forms definite, stable, compounds only with the more metallic and positive members of the oxygen group of elements, bromides of Te are gaseous, Se_2Br_2 is fairly stable, but is decomposed by heat, S_2Br_2 is a feebly marked body, and no oxide of Br is known Bromide of iodine is a fairly well marked compound, $[I, Br^-] = 2,500$ (Berthelot, *C R* 90, 841, using liquid Br and solid I) Bromine chloride is very easily decomposed, and no compound of Br and F is definitely known If N bromide exists it is extremely unstable (v also HALOGEN ELEMENTS, BINARY COMPOUNDS OF for the individual bromides v the articles on the various elements) M M P M

Emission spectrum, marked lines are 3980, 6356, and lines beginning with 6999 (Salet, *A Ch* [4] 28, 26). Absorption spectrum characterised by many bands between 6801.5 in the red and 5244.1 in the green (Roscoe & Thorpe, *T* 1877 207)

Bromine was discovered by Balard in 1826 (*B J* 7, 102), it was previously obtained by Liebig, but supposed by him to be iodine chloride (*v* Hofman's *Life Work of Liebig*), and by Joss, but regarded by him as selenium (*J pr* 1, 123)

Occurrence — Never free, widely distributed, but not in large quantities, chiefly in combination with K, Na, and Mg. In sea water (for quantities, *v* Berglund, *B* 18, 2888), sea weed, saline springs, and many marine plants and animals (Kindt & Wöhler, *P* 10, 509, Strohmeier, *S* 49, 249, Hembstadt, *B J* 7, 110). According to Marchand (*C R* 31, 495) all waters, including rain and snow, contain traces of bromides. In various minerals, chiefly as AgBr in Mexico and Chili (Berthier, *A Ch* 77, 417, 79, 164), in minute quantities in Silesian zinc ores (Hollander, *B J* 8, 82), in Chili salt petre (Grüneberg, *J pr* 60, 172), &c, &c

Preparation — The starting point is the concentrated liquor of certain saline springs, the residual liquor obtained in working the salt deposits at Stassfurt, or the solution of the ash of sea plants. The liquid is freed from the less soluble salts, chiefly chlorides and sulphates, by concentration and crystallisation, mixed with MnO_2 and $HClAq$, and distilled. The quantities of the reacting materials are arranged so that there is always an excess of bromide, in order to prevent formation of bromine chloride (*v* Mohr, *A* 22, 66). In some cases the concentrated liquor is heated with H_2SO_4Aq sulphates are then removed by crystallisation, and the mother liquor is distilled with MnO_2 and H_2SO_4Aq (*v* Herrmann, *P* 13, 175, 14, 613). The Br is condensed in water and converted into NaBr and $NaBrO_3$ by treatment with $NaOHAq$, the liquid is evaporated to dryness, the residue heated to decompose $NaBrO_3$, and the NaBr is decomposed by pure MnO_2 and H_2SO_4Aq . Iodine may be removed from the original liquor before decomposing by MnO_2 and acid, by the action of Cl, or by ppg as Cu_2I_2 (Bussy, *B J* 18, 117, Balard, *B J* 7, 102). Chlorine may be removed by decomposing the

distillate from the first action of MnO_2 and acid by BaO_2Aq , evaporating to dryness and heating, dissolving out BaBr, in alcohol, filtering from insoluble $BaCl_2$, evaporating to dryness, and decomposing by MnO_2 and H_2SO_4Aq (Piria, *B J* 19, 277). Adrian (*J* 1870 248) removes Cl by washing the distillate with water and small successive quantities of ether, he then digests with starch paste to remove I, and again distils. Stas (*Fr* 25, 213) frees from I and Cl by dissolving in $KBrAq$, adding ZnO and distilling. Cyanogen is occasionally found in samples of Br, it may be detected by conversion into $K_3Fe(CN)_6$ by digesting with iron filings, and rapidly filtering (Phipson, *C N* 28, 51). Bromoform is another impurity, it is detected by its odour, after addition of $KIAq$ sufficient to convert all the Br into KBr, and removal of the I by the action of $Na_2S_2O_3Aq$ (Reymann, *B* 8, 790). Bromine is prepared from laboratory residues containing Br compounds by making alkaline with $KOHAq$, and distillation with solid $K_2Cr_2O_7$ and excess of H_2SO_4Aq (2 parts strong acid to 1 part water by weight) added gradually through a funnel tube (Bolas & Groves, *C J* [2] 9, 784). To prepare pure Br for atomic weight determination, Stas removed I from commercial KBr by dissolving in water, adding $BrAq$ to $\frac{1}{2}$ of the liquid till the I which at first separated redissolved forming a clear orange-yellow coloured liquid, adding the other $\frac{1}{2}$ of the liquid and shaking repeatedly with pure CS_2 . The liquid was then warmed to remove all CS_2 , the KBr was oxidised to $KBrO_3$ by the action of Cl in presence of pure $KOHAq$ (for details *v* Stas, *Nouv R* 159, or pp 159-160 of Aronstein's German translation *Untersuchungen über die Gesetze der chem. Proportionen*, &c.), the $KBrO_3$ was purified by repeated crystallisation, and a part of it was converted back to KBr by heating in a porcelain vessel in small successive quantities. By decomposing a mixture of KBr and $KBrO_3$ (in the ratio 5KBr $KBrO_3$) with pure H_2SO_4Aq , Br was obtained. A portion of this Br was then digested with milk of lime and NH_3Aq , whereby $CaBr_2Aq$ was obtained, this liquid was saturated with another portion of the purified Br, water was added to pp Br, the ppd Br was separated, and digested several times with pure dry $CaBr_2$ (prepared by the action of part of the purified Br on CaO), the Br was then shaken in contact with pure P_2O_5 , then allowed to remain in contact for 12 hours with pure BaO which had been strongly heated, and finally poured off and distilled. All operations were conducted in apparatus made wholly of glass.

Properties — At ordinary temperatures a dark brown red volatile liquid with most irritating odour (*σπῆμα* = a stench), in thick layers almost black, vapour is yellowish red, and becomes less transparent as temperature is increased (*v* Andrews, *B A* 1871 (Sec) 66), solidifies to a grey brown crystalline mass with semi-metallic lustre. Very poisonous. Vapour acts on mucous membrane and causes violent irritation. Non conductor of electricity, but an aqueous solution of Br is a better conductor than pure water (such a solution contains some HBr) (Balard, *A Ch* [2] 82, 871, De la Rive, *B J* 8, 88; Solly, *A* 20, 124). "Dissolves"

sparingly in water (*v supra*), solutions of x parts Br by weight in 1,000 parts H_2O have following SG (Slessor, *J* 1858 100) —

x	SG	x	SG	x	SG
107	1.009	123	1.0122	209	1.018
117	1.0093	187	1.0149	31-317	1.0236
120	1.0099	195	1.0158		

Solution in water is attended with production of heat [Br, Aq] = 1080 (*Th* 2, 25), solution is pale orange yellow. Dissolves more readily in alcohol, and in all proportions in ether, CS_2 , and $CHCl_3$, solution is accompanied by chemical change, soluble also in conc aqueous solutions of KBr and many other metallic bromides, frequently with formation of perbromides, also in conc $HClAq$ and $HBrAq$, and in liquid SO_2 (Sestini, *Z* 1868 718) Br is absorbed by wood charcoal with considerable rise of temperature (Melsens, *C* R 77, 781). In presence of H_2O , acts as a bleacher and disinfectant.

The atomic weight of Br has been determined (1) by analyses, and determinations of V D, of many gaseous compounds, *e.g.* BrH , Br, Cd , Br, Br , Sn , &c., (2) by determination of S H of solid Br, (3) by comparison of bromides &c with isomorphous chlorides and iodides &c., (4) by syntheses of $AgBr$ by Margnac (*B J* 24, 193), by syntheses of $AgBr$ by Stas (*Nouv R* 158, 171), by reduction of $AgBrO_3$ by Stas (*Nouv R* 199), by conversion of KBr to $AgBr$ by Stas (*l.c.* 303), by conversion of $AgBr$ to $AgCl$ by Dumas (*A Ch* [3] 55, 162). In gaseous molecules containing Br the atom of Br is monovalent. Br acts as a strongly negative non metallic element, it combines directly with most metals forming salts, its compounds with non metals one of which is H are acids. The substitution of H by Br in carbon acids seems to increase the relative affinity of the acids (*v AFFINITY*, p 83), generally speaking, the introduction of Br in place of H in carbon compounds is accompanied by the production of more or less acidic properties.

In its chemical relations Br stands between Cl and I, the heat of formation, in solution of a metallic bromide is usually about π 11,000 gram-units less than that of the chloride, and about π 26,000 gram units more than that of the iodide, of the same metal, where π is a whole number, usually 1, 2, 3, or 4, metallic bromides are wholly or partly decomposed by Cl, and metallic iodides by Br, metallic chlorides are partially decomposed by Br (*v Reactions*, No 12). The relative affinities of the acids HCl , HBr , and HI in aqueous solution are, however, nearly the same (*v AFFINITY*, p 77). In its compounds, Br appears to be positive to Cl, F, and O. No oxide of Br is at present known, the oxyacids of Br exist only in presence of water, they are much less stable than the oxyacids of iodine. One of the oxyacids of Cl ($HClO_4$) has been obtained in separate and definite forms, although it is an extremely unstable compound, oxides of Cl are known as gases, and an oxide of I (I_2O_5) exists as a solid body. No oxide or oxyacid of F is known (*v BROMIDES, HALOGEN ELEMENTS, and HALOGEN ELEMENTS, BINARY COMPOUNDS* of).

The SG of Br gas at 99° was found by Mitscherlich to be 5.64 ($\text{air} = 1$) and by Meyer & Zühlke to be 5.58 at 100° , the S.G., calcu-

lated on the assumption that $2 \times 79.75 = 159.50$ parts by weight of Br occupy 2 volumes, is 5.61. At very high temperatures (approximately 1570°) the SG is less than the calculated, Meyers & Zublin (*B* 18, 405) obtained values lying between those calculated from the formulae Br_2 and $\frac{1}{2} Br_2$, when the Br was obtained by decomposing $PtBr_4$ at high temperatures. The SG at 1570° nearly agreed with that calculated for $\frac{1}{2} Br_2$ (8.66). The SG of Br vapour diluted with 10 volumes air, at 50° under the B P of Br, was determined by Langer & Meyer to be 5.52 (*B* 15, 2769). Jahn's determinations (*B* 15, 1238) show that bromine does not attain the SG calculated for Br_2 until it is heated about 160° above its B P, the deviations are small, the SG at any temperature up to about 220° may be approximately found by the formula $SG = a + bt$, where $a = 5.8691$ and $b = -.00153$ (For SG of Cl and I gases *v* these elements, *v* also HALOGEN ELEMENTS).

Reactions — 1 Br dissolves in water with production of heat [Br, Aq] = 1080 (*Th* [2] 25), the water is slowly decomposed, more quickly in direct sunlight, with formation of HBr and O. Bromine water, therefore, acts as an oxidiser, *e.g.* HNO_2Aq is oxidised to HNO_3Aq (Schonbein, *J pr* 37, 144), $Mn(C_2H_3O_2)_2Aq$ to MnO , (Kammerer, *B* 4, 218), sugar, mannite, benzene, &c., &c., to various oxidised derivatives (Blomstrand, *A* 123, 248). If NO is led into Br cooled below 0° the gas is absorbed, and on adding water HBr and higher oxides of N are formed (Landolt, *A* 116, 177) — 2 Steam mixed with Br and passed through a red hot tube yields HBr and O — 3 Hydrogen peroxide evolves O, and HBr is formed (Schonbein, *A* 108, 169) — 4 Aqueous solutions of potash or soda are decomposed by Br forming $KBrAq$ (or $NaBrAq$) and $KBrO_3Aq$ (or $NaBrO_3Aq$). CaO and BaO form bromides and O — 5 Aqueous ammonia yields NH_4BrAq and N — 6 Urea is decomposed by $BrAq$ with evolution of N — 7 Hydroiodic acid and iodides in solutions are decomposed by Br with formation of $HBrAq$, or $MBrAq$, and I — 8 Sulphuretted hydrogen yields HBr , and S which partly combines to form S_2Br_2 , this decomposition proceeds either in presence or absence of water (Naumann, *B* 9, 1574) — 9 In contact with excess of silver nitrate solution, $AgBr$ and $HBrO_3Aq$ are produced (Spiller, *J* 1859 67) — 10 With carbon disulphide, crystalline $C_2S_2Br_2$ is formed (Hell & Urech, *B* 15, 987) — 11 Carbon compounds are usually acted on by Br, sometimes H is withdrawn, sometimes this is accompanied by substitution of Br, and sometimes more complete decomposition results — 12 Br partly decomposes metallic chlorides when heated in equivalent quantities to 270° – 300° , if the mass of Br is increased, the amount of decomposition increases up to a limit which is not passed by increasing the mass of Br, the temperature, or the time of action (Potilitzin, *B* 14, 1044, 15, 918, 16, 8051). According to Humpidge (*B* 17, 1838) $AgCl$ is partly decomposed by contact with water and an equivalent quantity of Br, thus 5.2 p c Cl was removed from $AgCl$ after 24 hours' action at 11° , and 14.68 p c after 12 hours' action at 44° .

Combinations — 1 With water at 4° forming red octahedral crystals of $Br.10H_2O$ which are

decomposed to Br and H_2O at 15° (Löwig, *P* 14, 114, 16, 375) For dissociation-pressures v Roozeboom (*R T C* 4, 65)—2 Combines directly with most of the elements, especially the metals, often with production of much heat and sometimes light (v BROMIDES) Does not combine directly with C or O According to Merz & Weith (*B* 6, 1518) dry Br and Na do not combine even at 200° Combines with liquid Cl at -90° (Donny & Mareska, *C R* 20, 817) No oxide of Br is at present known

Detection—The physical properties of Br enable this body to be easily detected when uncombined Bromides are decomposed by $ClAq$, giving Br and chloride of the metal Solution of N_2O_5 in conc H_2SO_4Aq does not decompose bromides, but does decompose iodides with production of I, on this reaction is based a method for detecting bromides in presence of iodides Solid bromides are decomposed by heating with $K_2Cr_2O_7$ and conc H_2SO_4Aq , with formation of Br, chlorides yield CrO_2Cl_2

Estimation—Free Br may be estimated volumetrically by measuring the I set free by it from $KIAq$, or by finding the mass of As_2O_3 , which it oxidises to As_2O_5 in an alkaline solution, Br may also be combined with H to form $HBrAq$, by treatment with H S, or SO, in aqueous solutions, the HBr may then be estimated by ppg with $AgNO_3Aq$ Br in bromides is usually estimated as $AgBr$, ppn being accomplished by addition of $AgNO_3Aq$, insoluble bromides may be fused with Na_2CO_3 , dissolved and acidulated with HNO_3Aq In presence of chlorides, or iodides, Br in bromides must be determined by indirect methods (v Manuals of Analysis)

Bromine, Chloride of $BrCl$ Mol w unknown Chlorine is absorbed by Br with formation of a red yellow, mobile, very volatile, liquid, which gives off a dark yellow, very irritating, vapour with strong bleaching properties, many metals burn in this vapour to chloride and bromide (Balard, *A Ch* [2] 82, 371) If the Br is cooled to 0° the liquid finally contains Br and Cl in the proportion $BrCl$, at ordinary temperatures less Cl than is required by the composition $BrCl$ is absorbed (Bornemann, *A* 189, 183) At temperatures above $+10^\circ$ the compound $BrCl$ decomposes with evolution of Cl By adding a little H_2O to $BrCl$, and cooling to 0° , yellow brown crystals of $BrCl \cdot 10H_2O$ separate (Bornemann, *lc*), these melt at 7° and are decomposed by NH_3 to N, NH_4Br , and N chloride (Löwig, *Das Brom und seine chemischen Verhältnisse*, Heidelberg, 1829, p 64) An aqueous solution of $BrCl$, obtained by dissolving Br in $ClAq$, is decomposed by alkalis giving alkali bromate and chloride, in sunlight $HBrO_3Aq$ and $HClAq$ are formed, reducing agents, e.g. SO_2Aq , Zn powder, Fe filings, P, NO, &c., withdraw Cl, and set Br free (Schönbein, *J pr* 88, 483)

Bromine, Cyanide of better called Cyanogen Bromide Obtained by action of Br on $Hg(CN)_2$, KCN, or HCN, v CYANIC ACIDS, vol II p 313

Bromine, Hydrate of $Br \cdot 10H_2O$ Obtained by cooling a saturated solution of Br in H_2O , v BROMINE, *Combinations*, No 1

Bromine, Iodide of, better called Bromide of Iodine, v IODINE.

Bromine, Oxyacids of No oxide of Br is known The acids $HBrO$ and $HBrO_3$ exist in aqueous solutions only, both solutions are decomposed on heating, $HBrO_3Aq$ even at 30° . Perbromic acid, $HBrO_4$, was said by Kammerer to be produced by the action of Br gas on $HClO_4Aq$ (*J pr* 90, 190), but later experiments have shown that this acid has not yet been obtained (v Pattison Murr, *C J* 30, 469, MacIvor, *C N* 33, 35, Wolfram, *A* 198, 95). $BrAq$ is not oxidised by such reagents as $KMnO_4Aq$, $K_2Cr_2O_7Aq$, HNO_3Aq , or $HClO_4Aq$, but the action of $HClO_4Aq$ or $HClO_3Aq$ produces $HBrO_3Aq$ Dilute solutions of $HBrO$ and $HBrO_3$ are also formed by electrolysis $HBrAq$, $MBrAq$, or $BrAq$, also by the action of metallic oxides on $BrAq$ No salts of $HBrO$ are known except in aqueous solutions, salts of $HBrO_3$ exist as solids, they are all easily decomposed by heat with evolution of O , and frequently also of Br The addition of O to $KBrAq$ would be attended by disappearance of much heat, Thomsen gives these numbers [$KBrAq, O$] = -15,930, also [Br_2O, Aq] = -16,200 The following data show that the heat of formation of the oxyacids of Br is less than that of HBr , and is also less the more O the acid contains — [H, Br, Aq] = 23,380, [H, Br, O, Aq] = 26,080, [H, Br, O^2, Aq] = 12,420 (*Zh* 2, 400) These data are analogous with those for the corresponding compounds of Cl, but differ from the data for the similar compounds of I (v HALOGEN ELEMENTS)

I HYPOBROMOUS ACID, and HYPOBROMITES. $HBrOAq$ and $MBrOAq$ Gay Lussac obtained a gas by the action of Br on dry HgO and supposed it to be an oxide of Br, Pelouze, and more recently Dancer (*C J* 15, 477), proved that only O is thus produced An aqueous solution of $HBrO$ is obtained by the action of $BrAq$ on the oxide, or nitrate, of Hg, or Ag, HgO and PbO do not oxidise $BrAq$ (Spiller, *C N* 6, 249)

Formation—By the action of $BrAq$ on HgO —repeating several times— Hg_2OBr_2 , $HBrOAq$, and $HgBrOAq$, are formed, by distilling *in vacuo*, a liquid containing 62 p.c. Br as $HBrO$ is obtained, but it cannot be quite freed from $HgBrO$ (Balard, *A Ch* 32, 337)

Preparation—Pure $BrAq$ is shaken with excess of $AgNO_3Aq$ until the colour and odour of Br have gone, the straw coloured liquid is then at once distilled *in vacuo*, at 50 mm pressure it boils at 40° The distillate gets richer in $HBrO$ until 736 p.c. Br is present as $HBrO$ (then it gets poorer in the acid), about 46½ p.c. of the Br used is changed to $HBrO$

Properties and Reactions—Solution with 62 p.c. Br as $HBrO$ decomposes at 30° giving Br and $HBrO_3Aq$, solution with 736 Br as $HBrO$ decomposes, into same products, at 60° $HBrOAq$ is a strongly bleaching liquid, it is decomposed by Ag_2O (and slowly by contact with $AgNO_3Aq$) with formation of O and $AgBr$, by H_2O_2Aq with evolution of O , and by $HClAq$, $HBrAq$, and $HIAq$, with formation of Br (Schönbein, *J pr* 88, 475)

No hypobromites have been obtained except in dilute aqueous solutions. By the action of alkalis, alkali carbonates, or phosphates (Fritzsche, *A* 40, 251), on $BrAq$, yellow, strongly bleaching, liquids are produced, these

liquids are very unstable, decomposing in air, quickly at 30°. They decompose urea with evolution of N₂.— $\text{CON}_2\text{H}_4 + 3\text{HBrO}_2\text{Aq} = \text{CO}_2 + \text{N}_2 + 3\text{HBrAq} + 2\text{H}_2\text{OAq}$ (E Knop, *C C* 1870 132) Balard (*A Ch* 32, 337, *J pr* 4, 166) described bodies resembling bleaching powder, obtained by the action of BrAq on CaO_2H_2 and BaO_2H_2 , by the addition of water and filtration, bleaching solutions were produced, very unstable, and easily decomposed, even by CO_2 .

II BROMIC ACID AND BROMATES HBrO_3Aq and MBrO_3 . Bromic acid, HBrO_3 , is known only in aqueous solution.

Formation—1 By electrolysis of HBrAq (Riche, *C R* 46, 348)—2 By action of heat on hypobromites in solution.

Preparation— BaBrO_3 is prepared by adding Br little by little to conc $\text{BaO}_2\text{H}_2\text{Aq}$ until the liquid is slightly red, when BaBrO_3 pps and BaBr_2 remains in solution. The BaBrO_3 is crystallised from hot water, dried, and ground to fine powder, 100 parts are digested for some time in the cold or at a very gentle heat, with 24 parts conc H_2SO_4 mixed with 240 parts H_2O , excess of H_2SO_4 is removed from the liquid by gradual addition of $\text{BaO}_2\text{H}_2\text{Aq}$, the acid liquid is evaporated *in vacuo* (Rammelsberg, *A* 40, 147). Kammerer passes Cl_2O into Br under H_2O until the colour of the Br has disappeared, $5\text{Cl}_2\text{O} + \text{Br}_2\text{Aq} + \text{H}_2\text{O} = 2\text{HBrO}_3\text{Aq} + 10\text{ClAq}$ (*J pr* 85, 452).

Properties and Reactions— HBrO_3Aq may be concentrated *in vacuo* until the liquid contains 50.59 p.c. HBrO_3 , the composition then nearly agrees with the formula $\text{HBrO}_3 \cdot 7\text{H}_2\text{O}$. When concentrated by heating in an open vessel decomposition begins when the liquid contains 4.27 p.c. HBrO_3 , with production of Br, O, and H_2O . HBrO_3Aq is a colourless, acid liquid, with a bromine like smell. Oxidisable bodies decompose HBrO_3Aq with separation of Br, e.g. $5\text{SO}_2 + 2\text{HBrO}_3\text{Aq} + 4\text{H}_2\text{O} = 5\text{H}_2\text{SO}_4\text{Aq} + \text{Br}_2\text{Aq}$, $5\text{H}_2\text{S} + 2\text{HBrO}_3\text{Aq} = 6\text{H}_2\text{OAq} + 5\text{S} + \text{Br}_2\text{Aq}$. Iodine quickly decomposes HBrO_3Aq , forming HIO_3 (Kammerer, *J pr* 86, 452), Cl_2 , dilute $\text{H}_2\text{SO}_4\text{Aq}$, and dilute HNO_3Aq , are without action. HBrAq decomposes HBrO_3Aq , forming H_2O and Br, HClAq and HIAq form H_2O and HBrCl or IBr . The heat of neutralisation of HBrO_3Aq is the same as the mean value for the stronger monobasic acids, $[\text{HBrO}_3\text{Aq}, \text{NaOHAq}] = 13,780$ (*Th* 1, 240). Bromic acid is monobasic and forms one series of salts, the bromates, MBrO_3 and $\text{M}^{1/2}\text{BrO}_3$, these salts are formed by the action of HBrO_3Aq on the oxides, hydroxides, or carbonates, of the metals, the alkali and alkaline earth salts are also formed, always with bromides, by the action of Br on aqueous solutions of the alkali or alkaline earth hydroxides (For special methods *v* individual salts, also Kammerer, *J pr* 85, 452). The bromates crystallise well, they are all soluble in water, the least soluble are AgBrO_3 and HgBrO_3 . They are decomposed by heat, sometimes O is evolved and metallic bromide remains, e.g. bromates of alkalis, Hg, and Ag, sometimes Br and O are evolved, and oxide remains, e.g. bromates of Mg, Al, Zn, or a mixture of oxide and bromide remains, e.g. bromates of Pb, Cu, &c. Dilute HNO_3Aq , $\text{H}_2\text{SO}_4\text{Aq}$, or

$\text{H}_3\text{PO}_4\text{Aq}$, decomposes bromates giving HBrO_3Aq , most of which decomposes to Br, O, and H₂O. Solutions of bromates react similarly to solution of HBrO_3 towards SO_2 , H_2S , HClAq , HBrAq , and HIAq . The bromates have been chiefly investigated by Rammelsberg (*A* 40, 147, *P* 90, 16), Löwig (*B J* 12, 120), and Marignac (*C R* 45, 650, *J* 1857 127). The following are the better studied salts.

Barium bromate $\text{Ba}(\text{BrO}_3)_2 \cdot \text{H}_2\text{O}$. Prismatic, monoclinic, crystals, isomorphous with $\text{Ba}(\text{ClO}_3)_2$ (Marignac & Rammelsberg), *S* (100°) 42, (15°–18°) 77. Prepared by decomposing KBrO_3Aq by $\text{Ba}(\text{C}_2\text{H}_3\text{O}_2)_2\text{Aq}$.

Cadmium bromate $\text{Cd}(\text{BrO}_3)_2 \cdot \text{H}_2\text{O}$. Columnar trimetric crystals, prepared by $\text{CdSO}_4\text{Aq} + \text{BaBrO}_3\text{Aq}$ *S* (15°–18°) 125. On heating leaves CdO and CdBr_2 (Rammelsberg).

Calcium bromate $\text{Ca}(\text{BrO}_3)_2 \cdot \text{H}_2\text{O}$. Monoclinic plates (Marignac), prepared by $\text{CaO}_2\text{H}_2\text{Aq} + \text{HBrO}_3\text{Aq}$ *S* (15°–18°) 99. Heated to 180° loses H_2O , at higher temperature gives O and CaCl_2 (Rammelsberg).

Cobalt bromate $\text{Co}(\text{BrO}_3)_2 \cdot 6\text{H}_2\text{O}$. Transparent, hyacinth coloured, monometric octahedra, prepared by $\text{HBrO}_3\text{Aq} + \text{CoCO}_3$, or $\text{Ba}(\text{BrO}_3)_2\text{Aq} + \text{CoSO}_4\text{Aq}$ *S* (15°–18°) 45.5. Heated gives CoO (Rammelsberg).

Copper bromate $\text{Cu}(\text{BrO}_3)_2 \cdot 5\text{H}_2\text{O}$. Blue-green crystals, efflorescing over H_2SO_4 *in vacuo*, very soluble, lose H_2O completely, and a little Br also at 200°. Prepared similarly to $\text{Co}(\text{BrO}_3)_2$.

Lead bromate $\text{Pb}(\text{BrO}_3)_2 \cdot \text{H}_2\text{O}$. Small, lustrous, monoclinic prisms, isomorphous with $\text{Sr}(\text{BrO}_3)_2 \cdot \text{H}_2\text{O}$ (Rammelsberg) *S* (15°–18°) 133. Prepared by $\text{HBrO}_3\text{Aq} + \text{PbCO}_3$, or conc $\text{Pb}(\text{C}_2\text{H}_3\text{O}_2)_2\text{Aq} + \text{KBrO}_3\text{Aq}$. Heated over 180° gives Br, PbO_2 , and PbBr_2 at higher temperatures gives PbO_2 , Br, and PbBr_2 .

Magnesium bromate $\text{Mg}(\text{BrO}_3)_2 \cdot 6\text{H}_2\text{O}$. Large efflorescent, monometric octahedra, *S* (15°–18°) 71.5, loses all H_2O above 200°. Prepared by $\text{MgO} + \text{HBrO}_3\text{Aq}$, or $\text{MgSiF}_6\text{Aq} + \text{KBrO}_3\text{Aq}$.

Mercury bromates $\text{Hg}_2(\text{BrO}_3)_2$, and $\text{Hg}(\text{BrO}_3)_2 \cdot 2\text{H}_2\text{O}$. Mercurous bromate is prepared by $\text{Hg}(\text{NO}_3)_2\text{Aq} + \text{KBrO}_3\text{Aq}$ or $\text{HBrO}_3\text{Aq} + \text{Hg}_2\text{O}$, mercuric bromate by $\text{HBrO}_3\text{Aq} +$ freshly ppd HgO . Both form small white crystals, the mercurous salt forms yellow basic $\text{Hg}_2(\text{BrO}_3)_2 \cdot \text{Hg}_2\text{O}$ by the action of H_2O , when heated it decomposes with detonation (Rammelsberg). The mercuric salt decomposes at 130°–140°, with slight explosion, to HgO , HgBr_2 , and HgBr_2 *S* (15°–18°) 17, (100°) 16.

Nickel bromate $\text{Ni}(\text{BrO}_3)_2 \cdot 6\text{H}_2\text{O}$. Prepared as, is isomorphous with, and generally resembles, the Co salt (*q v*) *S* (15°–18°) 28 (Rammelsberg, *v* also Marbach, *P* 94, 412).

Potassium bromate KBrO_3 . Prepared by adding Br, or BrCl , to conc KOH_2Aq , or by adding Br to $\text{K}_2\text{CO}_3\text{Aq}$ which has been previously saturated with Cl_2 . Rhombohedra (Rammelsberg, Marignac, *J* 1859 139, *v* also for crystalline forms, Löwig, *B J* 12, 120, Fritzsche, *A* 40, 251, Marbach, *P* 94, 412). *S* $\frac{17.5^\circ}{17.5^\circ}$ 8.271 (Kremers, *P* 99, 448). *S* (0°) 8.1, (20°) 6.9, (40°) 13.2, (100°) 50 (Kremers, *P* 97, 1). Insol.

in alcohol B P of saturated $\text{KBrO}_3\text{Aq} = 104^\circ$ KBrO_3 , when heated, melts at 350° , then begins to decompose, at first slowly, then rapidly and explosively, with evolution of O and a little Br. According to Fritzsche (*A* 40, 251), crystals of KBrO_3 prepared from exactly neutral solutions, or from solutions containing a little acetic acid, decrepitate before decomposing, and lose 1.3 p.c. of their mass (chiefly water), if the resulting powder is placed in warm water, O is evolved at the surfaces of the undissolved particles, but most of the O is again absorbed by the liquid, on evaporation, pure KBrO_3 crystallises out. Fritzsche supposes that KBrO_3 is partly decomposed by heat to hypobromite and perbromate, that the latter acts on water, evolving O and forming KBrO_3Aq , and that the O is absorbed by the KBrO_3Aq with formation of KBrO_3Aq . KBrO_3 is decomposed by conc $\text{H}_2\text{SO}_4\text{Aq}$, with evolution of O and Br (Löwig), by HNO_3Aq , with production of KNO_3Aq , Br, and O (Penny, *A* 37, 206). KBrO_3Aq decomposes H_2S , separating S, and forming HBrAq , and $\text{H}_2\text{SO}_4\text{Aq}$. Heated with combustible bodies, KBrO_3 evolves O rapidly and explosively.

Silver bromate AgBrO_3 . Dimetric prisms (Mariñac). Prepared by $\text{AgNO}_3\text{Aq} + \text{HBrO}_3\text{Aq}$ or KBrO_3Aq , and crystallising from hot water. Stable in air free from organic matter. Decomposes on heating.

Sodium bromate NaBrO_3 . Prepared as KBrO_3 . At 4° crystallises with $2\text{H}_2\text{O}$ forming efflorescent needles (Löwig), above 4° the anhydrous salt separates, isomorphous with KBrO_3 , according to Löwig (*B* 12, 120). S G $\frac{17.50}{17.50}$ 3.339 S (0°) 28, (20°) 38.5, (60°) 62.5, (100°) 99 (Kremers, *P* 97, 1). B P of saturated $\text{NaBrO}_3\text{Aq} = 109^\circ$. Decomposes when heated as KBrO_3 (*q* v).

Strontium bromate $\text{Sr}(\text{BrO}_3)_2 \cdot \text{H}_2\text{O}$. Monoclinic prisms. Is amorphous with the Ba salt (Rammelsberg). S (15° – 18°) 33. Loses H_2O at 120° . Prepared by $\text{SrCO}_3 + \text{HBrO}_3\text{Aq}$.

Zinc bromate $\text{Zn}(\text{BrO}_3)_2 \cdot 6\text{H}_2\text{O}$. Monometric octahedra, isomorphous with the Mg salt, prepared as $\text{Co}(\text{BrO}_3)_2 \cdot 6\text{H}_2\text{O}$. Melts at 100° , loses $6\text{H}_2\text{O}$ at 200° with partial decomposition to ZnO , Br, and O. S (15° – 18°) 100. Soluble in NH_3Aq (Rammelsberg).

Besides the foregoing, bromates of Ce, La, and Pr of the form $\text{M}(\text{BrO}_3)_2 \cdot 6\text{H}_2\text{O}$ have been prepared (Rammelsberg, Mariñac, Herrmann *J* 82, 885). Bromates of Al, Cr, Fe, and V, of Pd, and Pt, of Bi, and of Sn, seem to exist. They have, however, either not been obtained in definite form, or have been very slightly examined.

Bromine, Sulphide of better called Sulphur Bromide (*v* SULPHUR). M M P M.

BROMINE, ACTION ON ORGANIC BODIES
v BROMO COMPOUNDS

BROMO Use of this prefix applied to inorganic compounds for bromo compounds and bromo salts *v* the element the bromo-compound of which is sought for, or the salts to the names of which bromo- is prefixed. Thus bromochloride of carbon will be found under CARBON, bromo-chromate of potassium under CHROMATES.

BROMO-ACENAPHTHENE *v* ACENAPHTHENE

BROMO-ACENAPHTHYLENE *v* ACENAPHTHENE

TYLENE

BROMO ACETAL *v* BROMO ACETIC ALDEHYDE

BROMO-ACETAMIDE *v* BROMO ACETIC ACID

v BROMO-ACETAMIDE *v* Aceto-bromo amide, p 5

BROMO ACETAMIDO- *v* BROMO AMIDO-

BROMO ACETANILIDE *v* BROMO ANILINE

BROMO ACETIC ACID $\text{C}_2\text{H}_3\text{BrO}_2$ *1,2*
 $\text{CH}_3\text{BrCO}_2\text{H}$ [51°] (208°)

Formation—1 By bromination of acetic acid (Perkin a Duppa, *A* 108, 106, Hell a Muhlhauser, *B* 11, 241, 12, 735) —2 By heating ethyl acetate with bromine at 150° (Crafts, *A* 129, 50) —3 From glycollic acid and HBr (Kekulé, *A* 130, 11) —4 By atmospheric oxidation of an alcoholic solution of bromo ethylene (Glockner, *A* Suppl 7, 107) —5 By the action of bromine on dry glycerin (Barth, *A* 124, 341) 6 From chloro acetic acid and HBr (Demole, *B* 9, 561) —7 From ethylene bromide and fuming HNO_3 (Kachler, *M* 2, 259)

Preparation—Br, glacial acetic acid, and some CS, are boiled with inverted condenser, the yield is nearly theoretical (Michael, *Am* 5, 202)

Properties—Deliquescent rhombohedra, *v* sol water. Blisters the skin

Reactions—1 Heated with zinc it yields $\text{Zn}(\text{OAc})_2$ and ZnBr_2 —2 NH_3 forms glycooll 3 Silver benzoate forms glycolide, benzoic acid and AgBr —4 Silver powder at 180° forms succinic acid —5 Benzyl sulphide $(\text{C}_6\text{H}_5)_2\text{S}$ forms benzyl bromide and $\text{S}(\text{CH}_2\text{CO}_2\text{H})_2$ (Letts, *Tr* E 28, 612) Allyl sulphide acts similarly —6 Bromo acetic acid and its ethyl salt unite directly with Me_2S and its homologues, forming hydrobromides of 'thetines' (Crum Brown a. Letts, *B* 7, 695)

Salts—The NH_4 , K, Ba, and Ca salts are *v* sol water — PbA' , laminae, sl sol cold water — AgA' , crystalline, explodes at 90° — $\text{Ur}_2\text{O}_3\text{NaA}'$, (Clarke a Owens, *B* 14, 35)

Methyl ether MeA' (144°) (*P* a D)

Ethyl ether EtA' (159°) Converted by Na into aconitic ether (*v* p 2)

Chloro ethyl ether $\text{CH}_3\text{ClCH}_2\text{A}'$ (214°) S G $\frac{11.4}{1.65}$ From chloro ethyl chloro acetate and Br (Henry, *C* R 97, 1308) Decomposed by heating with water into glycol chlorhydrin and bromo acetic acid

Bromo ethyl ether

$\text{CH}_3\text{CHBrO CO CH}_2\text{Br}$ (185°) at 370 mm S G $\frac{12.1}{1.962}$ From $\text{CH}_3\text{CHClOAc}$ (*v* p 105) and Br at 100° (Kessel *B* 10, 1599, 11, 1916) Oil. Boiling alcoholic KOH forms bromo acetic ether, EtBr , acetal, and crotonic aldehyde

Di bromo ethyl ether

$\text{C}_2\text{H}_3\text{Br}_2\text{O CO CH}_2\text{Br}$ A non volatile oil, obtained by heating the preceding (1 mol) with Br (1 mol) at 120°

Tri bromo ethyl ether

$\text{C}_2\text{H}_3\text{Br}_3\text{O CO CH}_2\text{Br}$ An oil formed by heating bromo ethyl bromo acetate (1 mol) with Br (2 mols) at 160°

Tetra bromo ethyl ether

$\text{C}_2\text{H}_3\text{Br}_4\text{O CO CH}_2\text{Br}$ (177°) From the preceding (1 mol) and Br (1 mol) at 170° Decomposed by alcohol into EtBr and bromo and di-bromo-acetic ethers

Penta bromo ethyl ether

$\text{C}_2\text{H}_3\text{Br}_5\text{O CO CH}_2\text{Br}$ (a. 197°) Formed by brominating the preceding

Isomyl ether, $C_5H_{11}A'$ (207°)

Chloride v Bromo acetyl chloride.

Bromide v Bromo acetyl bromide

Anhydride $(CH_2BrCO)_2O$ (245°) Obtained by distilling $AcOCH_2Br$ which is formed by the action of $AcONa$ on $BrCOCH_2Br$ (Naumann, *A* 129, 273, *Gal*, *C R* 71, 273)

Amide $CH_2BrCONH_2$ [165°] From bromo acetic ether and 20 p.c. NH_3 at 0° (Kessel, *B* 11, 2116) *V* sol water, *sl* sol alcohol, *insol* ether

Nitrile CH_2BrCN (149°) *SG* 121 771 *V D* 4 06 Bromo acetonitrile is formed by the action of bromine water on iodo acetonitrile (Henry, *C R* 103, 413) The dibromide of acetonitrile (p 35) may be looked upon as a hydrobromide of bromo acetonitrile, when water is added to its alcoholic solution needles of the imide $(CH_2BrCO)_2NH$ [98°] gradually separate (Engler, *A* 133, 137, 142, 69)

Di-bromo-acetic acid $CHBrCO_2H$ [45°-50°] (233°) Formed, together with CH_2BrCO_2H , when a mixture of bromine and acetic acid is exposed to sunlight (Perkin & Duppa, *C J* 11, 22, Schaffer, *B* 4, 368) Formed also by the action of Br on acetic ether at 130° (Carius *B* 3, 336), and as a by product in the preparation of tri bromo acetic aldehyde by passing bromine vapour into alcohol Crystalline mass, *v* sol alcohol and ether, its vapour is very pungent

Salts—Excepting Ag and mercurous salts, the dibromo acetates dissolve readily in water— NH_4A' — KA' — BaA' — CaA' — NaA' (Benedikt, *A* 189, 160)— PbA' , stellate groups of needles— AgA' needles, decomposed by boiling water into $AgBr$, glyoxylic acid, and dibromo acetic acid, decomposed by ether at 100° into $AgBr$ and an oil, $C_2H_3BrO_2$, whence water forms di bromo acetic and glyoxylic acids (Perkin, *C J* 32, 91)

Ethylether $CHBr_2CO_2Et$ (193°) Formed by heating the acid with alcohol or by adding bromal hydrate (4 pts) to an alcoholic solution of KCy (1 pt) (Remi, *J R* 7 263)

Amide $CHBr_2CONH_2$ [156°] *Formation*

—1 From di bromo acetic ether and NH_3 (Schaffer, *B* 4, 369, Kessel, *B* 11, 2116)

—2 From penta-bromo aceto acetic amide $CBBr_2COCH_2BrCONH_2$ and boiling water (Stokes & V Pechmann, *Am* 8, 375)—3 From penta-bromo acetone and NH_3 (Cloeze, *A* 122, 121)—4 From asparagine and bromine (Guareschi, *B* 9, 1435) *Properties*—Needles, may be sublimed, *m* sol cold, *v* sol hot, water, alcohol, and ether

Nitrile $CHBr_2CN$ [142°] Formed, together with bromoform and CO_2 , by the action of Br on aqueous cyano acetic acid (Hoff, *B* 7, 1571)

Tri-bromo-acetic acid $CBBr_2CO_2H$ [130°] (*S*), [135°] (*Gal*, *C R* 77, 786) (250°)

Formation—1 By the action of water on tri-bromo acetyl bromide—2 By heating aqueous malonic acid with bromine (Petrieff, *B* 8, 730)—3 By heating tri bromo acetic aldehyde with HNO_3 (Schaffer, *B* 4, 370)

Properties—Monochlomic tables, *v* sol water, its vapour is pungent Decomposed by boiling, giving off Br and HBr The salts, excepting the silver and mercurous salts, are *v* sol water and alcohol, but decomposed by heat, both when dry and when in solution, into bromoform and a metallic carbonate.

Salts— NaA' 2½ aq lustrous laminae— BaA' , 3 aq tables— PbA' , stellate groups of needles— AgA' very unstable laminae

Ethyl ether EtA' (225°)

Amide $CBBr_2CONH_2$ [121°] Formed, together with the preceding by the action of bromine on asparagine suspended in water (Guareschi, *G* 6, 375) Formed also by treating hexa bromo acetone with ammonia (Weidel & Gruber, *B* 10, 1148) Monochlomic laminae, may be sublimed, *sl* sol alcohol, ether, and cold water Split up by boiling alkalis into bromo form, CO , and NH_3

BROMO-ACETIC ALDEHYDES

Bromo-acetic ortho-aldehyde

Ethyl ether $CH_2BrCH(OEt)_2$ Bromo acetal (171°) From acetal and bromine (Pinner, *B* 5, 149) or by treating vinyl ethyl oxide with Br and decomposing the product $CH_2BrCHBrOEt$ with $NaOEt$ (Wislicenus, *A* 192 112) Alcoholic KOH at 170° converts it into $CH_2OHCH(OEt)$ while $NaOEt$ forms at 100° $CH(OEt)CH(OEt)$

Di bromo acetic aldehyde $CHBr_2CHO$ (142°) Formed by dropping Br (2 mols) into a solution of paraldehyde (1 mol) in acetic ether (Hagemann, *B* 3 758, Pinner, *A* 179, 67) Liquid, *v* sol water and alcohol Blisters the skin. Slowly changes to an isomeric modification, *insol* water Combines with water, forming the solid hydrate $CHBr_2CH(OH)_2$

Tri-bromo-acetic aldehyde $CBBr_2CHO$

Bromal Mol w 281 (174) *SG* 3 34

Formation—1 By the action of Br on alcohol (Lowig, *A* 3, 280, Schaffer, *B* 4 366)—2 Together with the preceding by the bromination of paraldehyde

Properties—Pungent liquid, decomposed by aqueous alkalis into bromoform and formic acid

Reactions—1 Fuming HNO_3 forms tri bromo acetic acid—2 Alcoholic KCy forms di bromo acetic ether and HCy (Remi, *B* 8, 695)—3 Conc H_2SO_4 forms bromalide $C_2H_3Br_3O_2$ or tri bromo ethylidene tri bromo lactate

$CBBr_2CH \begin{matrix} \diagup OCO \\ | \\ \diagdown OCHBr_2 \end{matrix}$ [158°] This body is

also formed by the action of tri bromo lactic acid on bromal (Wallach, *A* 193, 52) It is *insol* water, and decomposed by alcohol—4 *Tri chloro lactic acid* forms the corresponding

$CBBr_2CH \begin{matrix} \diagup OCO \\ | \\ \diagdown OCHCCl_2 \end{matrix}$ [150°]—5 *Lactic acid*

forms $CBBr_2CH \begin{matrix} \diagup OCO \\ | \\ \diagdown OCHCH_3 \end{matrix}$ [97°] (Klimenko,

B 9, 968)

Combinations—1 With water *Tri bromo-acetic orthoaldehyde* or *Bromal hydrate* $CBBr_2CH(OH)_2$ [54°] Crystallises on evaporating an aqueous solution of bromal Decomposed by distillation into H_2O and bromal—2 With alcohol $CBBr_2CH(OH)(OEt)$ *Bromal alcoholate* [44°] Thick needles, *sl* sol water, resolved by distillation into its components—3. With sodium bisulphite $CBBr_2CH(OH)SO_3Na$ laminae—4 With ammonia $CBBr_2CH(OH)NH_2$ crystals, *insol* water, decomposed at 85° (Schiessl, *Tassinari*, *B* 10, 1786)—5 With acetamide $CBBr_2CH(OH)NHAc$ [160°] (*S. & T.*)—6. With

ethyl carbamate $\text{CBr}_3\text{CH}(\text{OH})\text{NHCO}_2\text{Et}$
Bromal urethane [132°] (Blaschov, B 7, 632)

BROMO-ACETIC BROMIDE v BROMO ACETYL

BROMIDE

BROMO-ACETIC CHLORIDE v BROMO ACETYL CHLORIDE

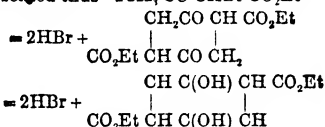

BROMO-ACETIC OXIDE v *Anhydride of BROMO ACETIC ACID*

BROMO-ACETO-ACETIC ACID *Ethyl ether* $\text{C}_6\text{H}_5\text{BrO}_2$, i.e. $\text{CH}_3\text{COCHBrCO}_2\text{Et}$
 SG 28 1511

Formation—By addition of Br (1 mol) to an ethereal solution of aceto acetic ether (Duisberg, B 15, 137), A 213, 138)

Properties—Pungent brown liquid, sl sol water, v sol ether and alcohol. Gradually decomposes on standing, giving off HBr. FeCl_3 turns its aqueous solution deep red. It is dissolved by baryta water, and on adding $\text{Cu}(\text{OAc})_2$ the solution gives a sap green crystalline pp $\text{Cu}(\text{C}_6\text{H}_5\text{BrO}_2)_2$, which on recrystallisation from alcohol or CS_2 separates as dark green needles.

Reactions—1 Alcoholic NH_3 forms succinyl succinic ether—2 Na added to its ethereal solution also produces succinyl succinic ether (dihydride of di oxy terephthalic ether)—3 NaOEt produces succinyl succinic acid (Wedel, A 219, 92). These reactions may be represented thus

Anilide $\text{CH}_3\text{COCHBrCONHPh}$ [138°]

Bromine added to the anilide of aceto acetic ether in chloroform forms an additive product which on warming yields bromo aceto acetic anilide (Knorr, A 236, 79). Pearly plates (from alcohol), sl sol water. Conc H_2SO_4 produces bromo oxy methyl quinoline.

Methyl bromo-aceto-acetic ether

$\text{CH}_3\text{COCHBrCO}_2\text{Et}$ Obtained by bromination of methyl aceto acetic ether. Liquid. Converted by heat into EtBr and $\text{C}_6\text{H}_5\text{O}_2$ (Pawlow, C R 97, 99).

Ethyl bromo aceto-acetic ether

$\text{CH}_3\text{COCHBrCO}_2\text{Et}$ SG 135. Obtained by adding Br to ethyl aceto acetic ether in ethereal solution (Wedel, A 219, 102). Pungent liquid. FeCl_3 turns its alcoholic solution violet. At 100° it gives EtBr and $\text{C}_6\text{H}_5\text{O}_2$ or $\text{C}_6\text{H}_5\text{O}_3$, probably $\text{CH}_3\text{COCH}(\text{COH})\text{CHCH}_3$ (cf Demarcay, A Ch [5] 20, 465).

Iso butyl-bromo-aceto-acetic ether

$\text{CH}_3\text{COCHBrCO}_2\text{Et}$ From iso butyl aceto acetic ether and Br at -5° (Demarcay, Bl [2] 31, 513, 33, 516, A Ch [5] 20, 433, C R 86, 1085, 1135). Alcoholic KOH converts it, according to Demarcay, into hexoic, methyl-isobutyl glyceric, heptic, oxyheptic, and glycolic acids, according to Pawlow (C R 97, 99) alcoholic KOH forms an acid $\text{C}_6\text{H}_5\text{O}_2$ or $\text{CH}_3\text{COCH}(\text{COH})\text{CHCH}_3$ with evolution of EtBr.

Di-bromo aceto-acetic ether

$\text{CH}_3\text{COCH}_2\text{CO}_2\text{Et}$ SG 21 1884. From aceto-acetic ether (10 g) in ether (10 g) treated with Br (24 g) (Duisberg, A 213, 143). Pungent oil.

Reactions—1 Aqueous FeCl_3 gives a deep

red colour—2 *Baryta-water* gives a claret colour, but $\text{Cu}(\text{OAc})_2$ gives no pp in this solution. A sap green pp $\text{Cu}(\text{C}_6\text{H}_5\text{BrO}_2)_2$, is, however, formed when conc $\text{Cu}(\text{OAc})_2$ is added to an alcoholic solution of the ether, it crystallises in needles (from alcohol)—3 Diluted with ether and treated with Na, di bromo-aceto acetic ether (80 g) gives di oxy terephthalic ether (2 g). NaOEt may be used instead of Na (Wedel, A 219, 74).

Ethyl-di-bromo-aceto-acetic ether

$\text{C}_6\text{H}_5\text{Br}_2\text{EtO}_2$, i.e. $\text{CHBrCOCHBrEtCO}_2\text{Et}$ (?) SG 164. A yellowish oil, got by bromination of ethyl aceto acetic ether. FeCl_3 colours its alcoholic solution wine red (Wedel, A 219, 102).

Tri-bromo-aceto-acetic ether

$\text{CH}_2\text{BrCOCHBr}_2\text{CO}_2\text{Et}$ SG 22 2144. From aceto acetic ether (10 g) in chloroform (20 g) by addition of bromine (38 g) (Duisberg, A 213, 145). Yellow liquid, slightly pungent. V sl sol water. When heated, it gives off HBr.

Reactions—1 Aqueous FeCl_3 gives after some time a slight red pp—2 Gives in alcoholic solution with cupric acetate a green pp $\text{Cu}(\text{C}_6\text{H}_5\text{BrO}_2)_2$ (Wedel, A 219, 93).

Ethyl-tri-bromo-aceto-acetic ether

$\text{C}_6\text{H}_5\text{Br}_3\text{EtO}_2$, i.e. $\text{CHBr}_2\text{COCHBrEtCO}_2\text{Et}$ (?) SG 186. Its alcoholic solution is turned wine-red by FeCl_3 .

Tetra- and Penta-bromo-aceto-acetic ethers, so called, are mixtures of tri with per bromo-aceto acetic ether.

Penta bromo aceto acetamide

$\text{CBr}_3\text{COCHBr}_2\text{CONH}$ [c 148°]. From di oxy amido pyridine and bromine water (Stokes, A V Pechmann, Am 8, 375). Needles or prisms, converted by boiling water into di bromo acetamide and CHBr_3 . Alcoholic NH_3 gives di bromo malonamide and CHBr_3 .

Per-bromo-aceto-acetic ether $\text{C}_6\text{H}_5\text{Br}_5\text{O}_2$, i.e. $\text{CBr}_3\text{COCHBr}_2\text{COCHBr}_2$ [69°-70°]. From tri-bromo aceto acetic ether and bromine at 80° for 2 days. Colourless crystalline mass. Not affected by air. Gives no colour with FeCl_3 and no copper pp (Wedel, A 219, 97).

BROMO-ACETO-AMIDO- v BROMO AMIDO-

TRI-BROMO-ACETO-GUANAMIDINE

$\text{C}_6\text{H}_5\text{Br}_3\text{N}_2\text{O}_2$. From bromine and aqueous acetoguanamide (Nencki, B 9, 236). Minute needles, insol water, alcohol, and ether. Split up by boiling with water into bromoform and cyanuric acid.

BROMO-ACETOL v DI BROMO PROPANE

BROMO-ACETONE CH_3COCHBr SG 199

Formation—1 By adding 1 mol bromine to acetone, either pure or mixed with water or with CS_2 (Linnemann, A 125, 307, Emmerling, B 6, 22)—2 By the action of a weak electric current on a mixture of acetone and HBr (Riche, C R 49, 276).

Preparation—1 A stream of dry air saturated with bromine (138 g) is passed through 100 g cooled acetone (Emmerling & Wagner, A 204, 27)—2 Bromine (1 mol) is passed through a solution of 1 mol acetone in 10 vol. water (Sokolowsky, B 9, 1687).

Properties—Yellow, very pungent-smelling oil, quickly turning violet when dry, more permanent when mixed with a little water. Ag_2O oxidises it to formic and acetic acids (Linnemann, Sts. B 68, 437). Aqueous K_2CO_3 forms

a syrupy acid $C_2H_3O_2$ (?) Bromo acetone combines with $NaHSO_4$.

u Di-bromo-acetone $CH_3COCHBr_2$. SG 2 5 Prepared by adding bromine (2 mols) to acetone (1 mol) mixed with a large quantity of water. Liquid, volatile with steam. Not very pungent. Combines with $NaHSO_4$.

s Di-bromo acetone $CHBrCOCH_2Br$ [24°] From diiodo acetone and $AgBr$ at 150° , or from di chloro acetone and aqueous KBr . Long needles with pungent smell (Volker, A 192, 96). Reduced by Zn and H_2SO_4 to acetone.

Tri bromo acetone $CBBr_3COCH_3$. Formed by the action of alkalis upon hexa bromo methyl methenyl di ketone NH_2 , gives bromoform (Combes, A Ch [6] 12, 241).

Tetra-bromo acetone hydrate $C_2H_2Br_4O_2aq$ [43°] From Ba (10 pts) and acetone (1 pt) in the cold, when the resulting solid mass is re-crystallised from dilute alcohol a mixture of tetra and penta bromo acetone is first deposited, and afterwards prisms of tetra bromo acetone hydrate $C_2H_2Br_4O_2aq$. The hydrate is insol water, sol alcohol (Mulder J 1864, 330). Perhaps this body is $(C_2H_2Br_4O)HOEt$.

Penta bromo acetone C_2HBr_5O [76°]

Formation—1 From Br (12 pts) and acetone (1 pt) (Mulder, J 1864, 330, cf Steiner, B 7, 505, 1284)—2 Separates on adding water to an alcoholic solution of 'phlobromin,' that has stood some time (Benedikt, C C 1578, 101, A 189, 168)—3 From potassic citrate and Br (Cahours, A 64, 351, Grimaux, J 1874, 522)—4 From chelidonic acid and Br (Wilde, A 127, 167)—5 From aqueous pyruvic acid and Br at 100° (Wichelhaus, A 152, 260).

Properties—Trimetric needles (from dilute alcohol), $a b c = 0.98$ 1 686 (Ditscheiner a Friedlander, Z Kryst 3, 103). Converted by aqueous or alcoholic NH_3 into di bromo acetamide. Aqueous KOH forms bromoform, HBr , CO_2 , and formic acid.

Hexa bromo acetone $CBBr_3COCBBr_3$ [112°]

Formation—1 By the action of Br on an aqueous solution of tri amido phenol hydrochloride or hydrobromide, or on 'bromo di chromazin' the first product of the action of bromine on these salts—2 From bromanilic acid and Br (Hantzsch a Schniter, B 20, 2040). 3 From di amido guaiacol hydrochloride and Br (Herzig, M 3, 825).

Properties—Monoclinic prisms (from chloroform), insol water. Decomposed by alcohol.

Reactions—1 Boiling $NaOHaq$ or water at 180° form bromoform and CO_2 .—2 Boiling conc HNO_3 has no action, but at 150° it produces bromo picrin $CBBr_2NO_2$.—3 Dry NH_3 gives rise to tri-bromo acetamide and $CBBr_3H$.—4 Sodium amalgam reduces it to iso propyl alcohol.

BROMO-ACETONITRILE v **NITRILE OF BROMO ACETIC ACID**

u BROMO ACETOPHENONE C_6H_5BrO i.e. $C_6H_5COCH_2Br$. Phenyl bromo methyl ketone. Phenacyl bromide [50°]

Formation—1 From acetophenone and Br (Emmerling a Engler, B 4, 143, Hunnius, B 10, 2006, Staedel, B 13, 837)—2 Formed, together with CO_2 and HBr , by boiling a phenyl- α -oxy- β -dibromo propionic acid with water (Böttger, B 14, 1288).

Preparation—183½ pts of bromine are slowly run into a mixture of 100 pts of acetophenone and 500 pts of glacial acetic acid. After standing an hour it is gently heated on a water bath till colourless, when it is at once poured into a large quantity of cold water, the yield is 133 pts or 80 p.c. of the theoretical (Mohlau, B 15, 2464).

Properties—Trimetric prisms (from dilute alcohol), pungent, v sol alcohol and ether, insol water.

Reactions—1 $KMnO_4$ forms benzoic acid.—2 Alcoholic NH_3 forms iso indole C_8H_7N .—3 With *sodio malonic ether* it forms $C_6H_5COCH_2CH(CO_2H)_2$.—4 With *sodio acetoacetic ether* it forms acetophenone acetoacetic ether (v p 36).—5 *Aniline* forms phenyl amido acetophenone (Mohlau, B 14, 172).—6 Reacts with *hydroxylamine hydrochloride* with production of *iso nitroso acetophenone oxim*, $C_6H_5C(NO)CHNH_2$ [163°] (Schramm, B 16, 2183).—7 An alcoholic solution of phenyl hydrazine reacts thus $PhCOCH_2Br + N_2H_4Ph = HBr + H_2O + PhC_2H_4N_2Ph$. The product forms yellow needles (from alcohol) [137°]. It is very soluble in ether, chloroform, and CS_2 , less in alcohol or light petroleum. It is decomposed by acids (O Hess, A 232, 234).

u-Di bromo acetophenone $C_6H_4COCHBr_2$ [37°] Prepared by adding bromine (2 mols) to a cold solution of acetophenone (1 mol) in acetic acid, warming to 65° – 70° , and pouring into water, the yield is c 80 p.c. of the theoretical (Engler a Hassenkamp, B 18, 2240, cf Hunnius, B 10, 2010, Fittig a Wurster, A 195, 161).

Properties—Trimetric tables (from CS_2), insol water. Oxidised by $KMnO_4$ to benzoic acid.

Reactions—1 Alcoholic $KOAc$ forms $PhCOCH(OAc)_2$.—2 Alcoholic *hydroxylamine* forms phenyl glyoxim $PhC(NO)CH(NO)H$ [152°].—3 By treatment with NH_3 , a portion breaks up into benzamide and CH_2Br , whilst another part yields isonitroleucine $C_6H_7N_2O$.

u TRI-BROMO-ACETOPHENONE-o-CARBOXYLIC ACID $CBBr_3CO_2C_6H_4CO_2H$ [160°] From phthalyl acetic acid and Br . Resolved by alkalis into $CHBr_3$ and phthalic acid (Gabriel a Michael, B 10, 1551, 2199, 11, 1007).

BROMO ACETOTHIENONE v **THIENYL BROMO METHYL KETONE** and **BROMO THIENYL METHYL KETONE**

HEXA-BROMO ACETYL-ACETONE v **HEXA-BROMO DI METHYL METHYLENE DI KETONE**

BROMO-ACETYL-BENZENE is **BROMO ACETOPHENONE** (q v)

BROMO-ACETYL BROMIDE $CH_2BrCOBr$ (150°) SG 21 2 317

Formation—1 From $AcBr$ and Br at 100° (Gal, A 129, 54).—2 From $AcBr$ and PBr_3 at 150° (Samoadsky, Z [?] 6, 105).—3 From $AcCl$ (64 pts) and Br (120 pts) at 100° (Hübner, A 124, 315, Naumann, A 129, 257, Gal, A 132, 179).—4 By direct combination of *u*-di-bromo ethylene $CBBr_2CH_2$ with oxygen (Demole, C R 86, 542).

Properties—Pungent liquid blisters the skin.

Reactions—1 Aqueous Na_2CO_3 forms sodium bromo-acetate and sodium glycolate.—2 Distillation with $NaOAc$ produces Ac_2O , bromo-acetic anhydride and glycolide.—3 $ZnMe_2$ gives a compound whence water liberates

methyl isopropyl carbinol, acetone, and methyl ethyl ketone (Winogradov, *A* 191, 127)

Di-bromo-acetyl bromide CHBr_2COBr (194°) From the preceding and Br at 150° (G) Formed also by the action of oxygen on tri bromo ethylene (D) Fuming liquid, converted by alcohol into di bromo acetic ether

Tri-bromo-acetyl bromide CBr_3COBr (220°-225°) From the preceding and Br at 220° (G) Slowly converted by water into tri bromo acetic acid

BROMO-ACETYL CHLORIDE CHBrCOCl SG 2 191 Pungent liquid, produced by the action of PCl_5 on bromo acetic acid (Wilde, *A* 132, 171)

BROMO ACETYL CYANIDE CHBrCON [79°] *Formed, together with CH_3CNCOBr by the action of AgCy on bromo acetyl bromide (Hubner, *A* 131, 68) Monoclinic tables, decomposed by water into HCN and CHBrCO_2H

BROMO-ACETYLENE CBrCH Formed by the action of alcoholic KOH on CHBrCBr_2 (Reboul, *A* 125, 81), on CHBrCHBr_2 (Alexejeff, *Z* 6, 644), or on CHBrCHBr (Sawitsch, *A* 119, 183, Fontaine, *C R* 70, 1361, Sabanéeff, *Bl* [2] 45, 245)

Preparation—Acetylene dibromide is heated with NaOH and dilute alcohol in an apparatus filled with nitrogen The gas is condensed by a freezing mixture (S)

Properties—Gas at ordinary temperatures, m sol water In the liquid form it is decomposed by light into s tri bromo benzene and other products It takes fire in air, when slowly mixed with air bromo acetic acid is formed Ammoniacal cuprous chloride gives a red pp of cuprous acetylde Br forms CHBr_2CBr ,

β BROMO β ACETYL PROPIONIC ACID CHBrO_2 i.e. $\text{CH}_3\text{COCHBrCH}_2\text{CO}_2\text{H}$ Bromolevulinic acid [59°] Crystallised from CS_2

Formation—1 By bromination of a solution of β acetyl propionic acid in conc HCl below 0° 2 By the action of water upon (a) angelico lactone dibromide (Wolff, *A* 229, 266, v Di BROMO OXY VALERIC ACID)

Properties—White needles (from CS_2) Sol alcohol, ether, and water

Reactions—By the action of aqueous Na CO, it yields oxy acetyl propionic acid and acetyl acrylic acid By heating with conc aqueous NH_3 at 110°-120° di methyl ketone (tetra methyl pyrazine) $\text{C}_4\text{Me}_6\text{N}_2$ is formed, with evolution of CO With aniline it gives di-phenyl tetramethyl di hydro pyrazine $\text{C}_4\text{Me}_6\text{N}_2\text{Ph}_2$ (Wolff, *B* 20, 425)

Ethylether EtA' (240°) SG 12 1 439 From Br and ethyl β acetyl propionate (Conrad a Guthzeit, *B* 17, 2285) Malonic ether and NaOEt convert it into methyl propyl ketone tricarboxylic ether $(\text{CO}_2\text{Et})_2\text{CHCHAcCH}_2\text{CO}_2\text{Et}$ (c 283°) SG 12 1 097

Di-bromo- β -acetyl propionic acid $\text{C}_4\text{H}_4\text{Br}_2\text{O}_2$ [116°] Solidifies about 94° From β -acetyl-propionic acid, chloroform and Br From bromo β acetyl propionic acid and bromine Long thin needles (Wolff, *A* 229, 266, Hell a. Kehrer, *B* 17, 1981)

Tri-bromo- β -acetyl-propionic acid $\text{C}_4\text{H}_3\text{Br}_3\text{O}_2$ [82°] From β acetyl-propionic acid, Br and chloroform (Wolff, *A* 229, 267).

BROMO-pseudo-ACETYL-PYRROL v BROMO-PYRROL METHYL KETONE

BROMO-ACETYL-UREA v UREA

BROMO-ACIDS v BROMO COMPOUNDS

BROMO-METACROLEIN $(\text{C}_4\text{H}_5\text{BrO})_n$ [78°]

Acrolein takes up Br forming di bromo propionic aldehyde, a liquid which polymerises, becoming a gummy mass, which may also be obtained by the action of Br on metacrolein NaOEt converts this gummy metacrolein dibromide into bromo metacrolein (Grimaux a Adam, *Bl* [2] 36, 136) Needles (from alcohol) Has no smell, does not reduce Fehling's solution When distilled with H_2SO_4 (1 vol) diluted with water (1 vol) it gives off extremely pungent vapours which may be condensed to a liquid, sol water, which is probably bromo acrolein By heating with NaOEt it is converted into $\text{C}_4\text{H}_5\text{BrO}_2$ [140°].

α BROMO-ACRYLIC ACID $\text{C}_3\text{H}_3\text{BrO}_2$ i.e. $\text{CHCBrCO}_2\text{H}$ [70°] From $\alpha\alpha$ or $\alpha\beta$ di bromo propionic acid and alcoholic KOH (Philippi a Tollens, *A* 171, 333, Wagner a Tollens, *A* 171, 340, Erlenmeyer, *B* 14, 1867)

Properties—Rectangular monoclinic plates, v sol water and alcohol Decomposed by distillation or exposure to light Combines with HBr forming $\alpha\beta$ di bromo propionic acid

Salts— AgA' — BaA' 4aq— CaA' , 4aq— KA' — NaA' aq— $\text{NH}_4\text{A}'$ — ZnA'_2

Ethyl ether EtA' (c 157°) (77°) at 30 mm With sodium malonic ether it gives $\text{CO}_2\text{EtC}(\text{CH}_3)\text{CH}(\text{CO}_2\text{Et})_2$ identical with the compound from $\alpha\beta$ di bromo propionic ether and di sodium malonic ether (Michael, *J pr* [2] 35, 134)

β Bromo-acrylic acid $\text{CHBrCHCO}_2\text{H}$ [116°] From bromalide or from tri chloro ethylidene tri bromo lactate by reduction with Zn and HCl (Wallach, *A* 193, 55) Formed also by the addition of HBr to propiolic acid (Bandrowski, *B* 15, 2702, Stolz, *B* 19, 540) Plates or needles, sol water and chloroform, explodes on heating

Acryl colloids This name is applied by Wagner a Tollens to three bodies having the composition $(\text{C}_3\text{H}_3\text{O}_2)_x$

α Acryl colloid Is formed in the preparation of a bromo acrylic acid from $\alpha\beta$ -dibromo propionic acid, especially when the action becomes violent Insol water, alcohol, and ether, sol NH_4Aq and not reppd by HCl

β Acryl colloid is formed when α -bromo-acrylic acid is left over H_2SO_4 It is a porous mass, sol NH_4Aq and reppd by HCl

γ Acryl colloid is formed with separation of EtBr, by heating ethyl α bromo acrylate Amorphous, insol NH_4Aq , but becoming gummy thereon

$\alpha\beta$ Di-bromo acrylic acid $\text{CHBrCBrCO}_2\text{H}$ [86°] SG 5 19 at 18°

Formation—1 From mucro bromic acid and cold baryta water (Jackson a Hill, *B* 11, 1673, *Am* 3, 111, 4, 169, 273, Hill a Andrews, *P Am* *A* 16, 192, 17, 133)—2 From alcoholic KOH and $\alpha\alpha\beta$ tri-bromo-propionic acid (Michael a Norton, *Am* 2, 18, Mauthner a Suida, *Sitz B* 83, 273, *M* 1, 104)—3 From $\alpha\beta\beta$ tri-bromo propionic acid and alcoholic KOH

Properties—Pearly plates (from alcohol) Sol ether and chloroform, sl sol benzene and CS_2 Boiling baryta water forms bromo-acetylene,

CO₂, formic, malonic, and bromo propiolic acids Heated with Br in a sealed tube it forms tetra-bromo propionic acid

Salts —AgA', slender needles —PbA', sq pearly plates, sl sol cold water —BaA', sq 6.28 at 18° —CaA', 3aq long needles —KA'

β Di bromo acrylic acid CBr₂CHCO₂H [86°] S 8.06 at 20° From tri bromo succinic acid by heating with water (Fittig a Petri, A 195, 70) Formed also by the union of HBr with bromo propiolic acid (Hill, B 12, 660, Hill a Mabery, P Am A 16, 211)

Properties — Large plates, boils with partial decomposition at 243°–250° V sol alcohol, and ether, m sol cold water Does not combine with HBr in the cold Does not combine with Br in the cold, but at 100° it forms tetra bromo propionic acid (Mabery a Robinson, Am 5, 251)

Salts —BaA', 2aq S 12.64 —CaA', 3½aq

Ethyl ether EtA' (213°)

Tri-bromo-acrylic acid CBr CBr CO H

[18°] S 1.37 at 20° From $\alpha\beta\delta$ tetra bromo-propionic acid and alcoholic KOH at 60° (Mauthner a Suida, M 2, 109) Formed also by treating bromo propiolic acid with bromine water (Hill, Am 3, 178), and from di bromo iodo acrylic acid and Br at 100° (Mabery a Lloyd, Am 4, 92) Monoclinic prisms, a b c = 502 1 559 (Melville, P Am A 17, 154) Triclinic pyramids, a b c = 1.128 1 1.150, α = 89° 13', β = 62° 26', γ = 91° 14' (Becke, M 2, 111) V sol alcohol and ether Does not combine with bromine, even at 200° The Ba salt yields tri bromo ethylene when boiled with water

Salts —BaA', 5aq —BaA', 3aq S (of BaA') 80.6 —CaA', 3aq —AgA'

BROMO ADIPIC ACID C₆H₄BrO₄ From adipic acid and Br (1 mol) at 160° (Gal a Gay Lussac, C R 70, 1175) Dark brown mass, smelling like camphor, converted by boiling alkalis into adipomalic (or oxyadipic) acid (v p 64)

(α) di-bromo-adipic acid C₆H₄Br₂O₄ From adipic acid Br (2 mols) at 160° (G a G) Powder, decomposed by water Water at 150° forms adipotartaric (or di oxy adipic) acid (v p 64)

(β) di-bromo adipic acid C₆H₄Br₂O₄ [115°–122°] Formed together with bromo hydromuconic acid, by the action of Br on a solution of hydromuconic acid (Lumprecht, A 165, 265) Needles Converted by moist Ag O or baryta into di oxy adipic acid

(γ) di-bromo-adipic acid C₆H₄Br₂O₄ [175°–190°] Formed by adding Br to a warm solution of hydromuconic acid in glacial HOAc (L) Small needles Converted by moist Ag₂O into muconic acid, and by sodium amalgam to hydromuconic acid

Tri bromo adipic acid C₆H₄Br₃O₄ [177°–180°] Formed by treating a hot solution of hydromuconic acid with excess of Br (L) Small needles Converted by boiling baryta-water into tri-oxy-adipic acid.

Tetra-bromo-adipic acid C₆H₄Br₄O₄ [211°] Formed by heating hydromuconic acid with Br and water at 100° Crystalline V sl sol. water, v sol. alcohol. H. W

BROMO-ESCULETIN s. ESCULETIN, p 65.

BROMO-ALDEHYDE v **BROMO-ACETIC ALDEHYDE**

BROMO-ALIZARIN v **BROMO DI-OXY-ANTHRAQUINONE**

DI BROMO DIALLYL v **Di BROMO HEXINENE**

BROMO ALLYL ACETATE C₄H₇BrOAc α CHBr CH CH₂ O Ac (?) (164°) S G 12 1.57 From bromo allyl bromide (β -epidibromhydrin) and alcoholic KOAc (Henry, B 5, 453) Irritant liquid, not attacked by PCl₅, H W

α **BROMO ALLYL ALCOHOL** C₄H₇BrO α CH₂ CBr CH₂ OH (152°) From a bromo allyl bromide (α epidibromhydrin) and water at 130° (Henry, B 14, 403) Liquid, converted by aqueous KOH into propargyl alcohol

β Bromo-allyl alcohol CHBr CH CH₂ OH (?) (155°) S G 12 1.6 From β bromo allyl acetate (v sup) by distillation with solid NaOH (Henry, B 5, 453) Is perhaps identical with the preceding

DI BROMO DI ALLYL AMINE C₄H₈Br₂N α (C₄H₈Br) NH From α tri bromo propane (tri bromhydrin) and alcoholic NH₃ at 100° (Maxwell Simpson, P M [4] 16, 257) Also from bromo allyl bromide and alcoholic NH₃ (Reboul, A Suppl 1, 232) Alkaline liquid, v sl sol water Converted by alcoholic NH₃ at 250° into methyl pyridine —B'H PtCl₃ —B'HgCl₂

BROMO ALLYL BROMIDE v **DI BROMO-PROPYLENE**

BROMO ALLYLENE v **PROPARGYL BROMIDE**

Bromo diallylene v **HEXONYL BROMIDE**

BROMO ALLYL ETHYL OXIDE v **ETHYL**

BROMO ALLYL OXIDE

BROMO ALLYL NITRATE

CHBr CH CH₂ O NO₂ (?) (140°–150°) S G 12 1.5 From β bromo allyl bromide and AgNO₃ (Henry, B 5, 452)

BROMO ALLYL OXIDE C₄H₇BrO α (CHBr CH CH₂) O (?) Bromo allyl ether (c 214°) S G 12 1.7 Formed together with propargyl alcohol from β bromo allyl alcohol and solid KOH (Henry, B 6, 729)

BROMO ALLYL THIO-CARBIMIDE

C₄H₇BrN CS (c 200°) From bromo allyl bromide and alcoholic potassium sulphocyanide (Henry, B 5, 188)

BROMO-ALLYL-THIO-UREA

(C₄H₇Br)NH CS NH₂ [111°] From the preceding and ammonia (H)

TRI-BROMO-ALOIN v **ALOIN**, p 141

BROMO-AMIDO-ACETOPHENONE

[5.2 1] C₆H₄Br(NH₂) CO CH₃

Acetyl derivative

C₆H₄Br(NHAc) CO CH₃ [160°] Obtained by bromination of acetyl o amido acetophenone in acetic acid solution (Baeyer a Bloem, B 17, 965) Slender felted colourless needles, sol hot, sl sol cold, alcohol, v sl sol cold water By KMnO₄ it is oxidised to bromo isatin [255°]. By boiling with KOH it yields bromo indigo

o **Tri bromo o amido acetophenone** [5.2 1]

C₆H₄Br(NH₂) CO CHBr₂ [c 145°] Fine felted orange yellow needles V sl alcohol and ether, sl sol water Obtained by saponification of the acetyl derivative by boiling it with a mixture of alcohol and aqueous HBr

Acetyl derivative

C₆H₄Br(NHAc) CO CHBr₂ [185°], yellowish granular crystals, v sol chloroform, sl sol.

alcohol. Formed by the action of bromine vapour on dry acetyl-*o*-amido acetophenone mixed with a little iodine. By boiling with HCl it yields *o*-di-chloro *m*-bromo-*o*-amido acetophenone. By KMnO_4 it is oxidised to bromo isatin. By boiling with dilute NaOH and exposure to the air it gives bromo indigo (Baeyer & Bloem, *B* 17, 966).

DI BROMO-AMIDO ANTHRAQUINONE

$\text{C}_{14}\text{H}_8\text{Br}_2(\text{NH}_2)_2\text{O}_2$ [170° uncorr.] Prepared by reduction of dibromo nitro anthraquinone with stannous chloride (Claus & Diernfelner, *B* 14, 1934). Slender red needles. Sol all solvents. Has no basic properties.

BROMO AMIDO BENZENE *o* BROMO ANILINE

(1, 2, 4) BROMO AMIDO BENZENE SULPHONIC ACID $\text{C}_6\text{H}_3\text{BrN}(\text{SO}_3\text{H})_2$
 $\text{C}_6\text{H}_3\text{Br}(\text{NH}_2)\text{SO}_3\text{H}$ [1 2 4] *Bromo aniline sulphonic acid* S 14 $\frac{1}{2}$ at 11° (S), 261 at 20° (A), 131 at 4° (La).

Formation—1 By reduction of (1, 2, 4) bromo nitro benzene sulphonic acid (Goslich, *A* 180, 100)—2 By sulphonation of *o*-bromo aniline (Andrews, *B* 13, 2126)—3 From bromo benzene *p* sulphonic acid by nitration and reduction—4 From very dilute aqueous amido-benzene *m* sulphonic acid and bromine water (Langfyrth, *A* 191, 176)—5 From (1, 3, 4, 6) di-bromo *m*-amido benzene sulphonic acid, fuming HCl, and red P at 150° (Limpricht, *B* 10, 1542). 6 By heating the same acid with water at 250° (L).

Properties—Anhydrous needles (from conc aqueous solution) or four and six sided columns containing aq (from dilute solution). Sol all alcohol. Reduced by HI and P, or by water at 120°, to amido benzene *m* sulphonic acid.

Salts— $\text{KA}'\frac{1}{2}\text{aq}$ (La)— $\text{KA}'\text{aq}$ (Spiegelberg, *A* 197, 257)— $\text{BaA}'_2\text{aq}$ — $\text{BaA}'_3\text{aq}$ S (of BaA'_2) 622 at 17°— PbA'_2 — $\text{CaA}'_2\text{aq}$ — $\text{AgA}'\frac{1}{2}\text{aq}$.

(1, 4, 8) Bromo-amido-benzene sulphonic acid $\text{C}_6\text{H}_3\text{Br}(\text{NH}_2)\text{SO}_3\text{H}$ [1 4 3] S 47 at 15°.

Formation—1 By heating *p*-bromo aniline ethyl sulphate (Nöling, *B* 8, 1095)—2 By adding bromine to a cold aqueous solution of barium aniline *o* sulphate (Limpricht, *A* 181, 196)—3 By nitration and reduction of bromo benzene *m* sulphonic acid (Thomas, *A* 186, 126). 4 From acetyl *p*-bromo aniline and fuming H_2SO_4 (Borns, *A* 187, 368).

Properties—Slender silky needles (containing aq) or large efflorescent prisms (with 2 aq). Sol cold water, v sol alcohol. Converted by Br into tri-bromo aniline. HI and P form aniline *o* sulphonic acid.

Salts— $\text{NH}_4\text{A}'$ — KA' — $\text{BaA}'_2\text{aq}$ — $\text{CaA}'_2\text{aq}$ — $\text{PbA}'_2\text{aq}$.

(1, 4, 2) Bromo-amido-benzene sulphonic acid $\text{C}_6\text{H}_3\text{Br}(\text{NH}_2)\text{SO}_3\text{H}$ [1 4 2] S 114 at 18°. From bromo benzene *o* sulphonic acid by nitration and reduction (Bahlmann, *A* 181, 203, 186, 818). Needles (from conc aqueous solutions) or rhombohedra (?) containing 2 aq (from dilute aqueous solution), v sol hot water, insol alcohol and ether. Reduced by HI and P to aniline *m* sulphonic acid. **Salts**— $\text{BaA}'_2\text{aq}$, needles, v. e. sol. water— PbA'_2 — AgA' .

Bromo amido-benzene sulphonic acid $\text{C}_6\text{H}_3\text{Br}(\text{NH}_2)(\text{SO}_3\text{H})$ [1 α 2] S 74 at 8°.

Formed in smaller quantity in the preparation
 Vol. I.

of the preceding (B). Prisms, sol cold water— $\text{BaA}'_2\text{aq}$, laminae, v sol water.

Bromo-amido-benzene sulphonic acid

$\text{C}_6\text{H}_3\text{Br}(\text{NH}_2)(\text{SO}_3\text{H})$ [1 3 α] From acetyl *m*-bromo aniline and fuming H_2SO_4 (Borns, *B* 8, 1072). Needles— $\text{BaA}'_2\text{aq}$.

(1, 2, 3, 5) Bromo-amido-benzene disulphonic acid $\text{C}_6\text{H}_3\text{Br}(\text{NH}_2)(\text{SO}_3\text{H})_2$ [1 2 3 5] Formed by bromination of (1, 2, 4) amido benzene disulphonic acid (Zander, *A* 198, 1). Needles (containing aq), v sol water, sol alcohol.

Salts—The acid salts are less soluble than the normal ones— $(\text{NH}_4)\text{A}'\frac{1}{2}\text{aq}$ — $\text{BaA}'_2\text{aq}$ — $\text{BaH}_2\text{A}'\frac{1}{2}\text{aq}$ — $\text{PbH}_2\text{A}'\frac{1}{2}\text{aq}$ — $\text{KA}'\frac{1}{2}\text{aq}$.

Bromo-amido-benzene disulphonic acid

$\text{C}_6\text{H}_3\text{Br}(\text{NH}_2)(\text{SO}_3\text{H})_2$ [1 4 3 5] or [4 1 3 5] or [2 1 3 5] Formed by adding bromine to an aqueous solution of (1 or 4, 3, 5) amido benzene disulphonic acid (Heinzelmann, *A* 188, 179). Prisms (containing 2 aq), v e sol. water— $\text{BaA}'_2\text{aq}$ — $\text{PbA}'_2\text{aq}$.

Bromo-di-amido-benzene sulphonic acid

$\text{C}_6\text{H}_3\text{Br}(\text{NH}_2)_2\text{SO}_3\text{H}$ [1 2 6 4] *Bromo m phenylene diamine sulphonic acid* S 51 at 17°. Got by reducing $\text{C}_6\text{H}_3\text{Br}(\text{NO})_2\text{SO}_3\text{H}$ with SnCl_4 (Bassmann, *A* 191, 244). Long white needles (containing aq), turns yellow in air. When pure it is sol water, when impure it is very soluble. Insol alcohol. Paper moistened with its solution turns red in air. The aqueous solutions of its salts turn blue or red when evaporated. Converted by diazo reaction into *p*-bromo benzene sulphonic acid— $\text{BaA}'_2\text{aq}$.

(1, 3, 2, 5) Di-bromo-amido-benzene sulphonic acid $\text{C}_6\text{H}_3\text{Br}_2(\text{NH}_2)(\text{SO}_3\text{H})$ [1 3 2 5] Formed by adding bromine to an aqueous solution of aniline *p* sulphonic acid (Schmitt, *A* 120, 138, Lenz, *B* 8, 1066, *A* 181, 24). Formed also by brominating (1, 2, 4) amido benzene disulphonic acid (Zander, *A* 198, 16). Needles or prisms (containing 2 aq), v sol water and hot alcohol, ppd by conc H_2SO_4 from its aqueous solution. Br forms tri-bromo aniline— $\text{BaA}'_2\text{aq}$ — $\text{BaA}'_3\text{aq}$ S (of BaA'_2) 16 at 11°— $\text{PbA}'_2\text{aq}$ — AgA' .

Reactions— PCl_5 forms a product (probably $\text{C}_6\text{H}_3\text{Br}_2(\text{NH POCl}_2)(\text{SO}_2\text{Cl})$) from which alcohol produces $\text{C}_6\text{H}_3\text{Br}_2(\text{SO}_2\text{Cl})\text{NH PO}(\text{OEt})$. [170°] (Laar, *J* pr 128, 256). V also di-METHYL-AMIDO BENZENE SULPHONIC ACID.

(1, 3, 4, 6) Di-bromo-amido-benzene sulphonic acid $\text{C}_6\text{H}_3\text{Br}_2(\text{NH}_2)\text{SO}_3\text{H}$ [1 3 4 6] S 252 at 10°, 249 at 7°, 194 at 4° (Berndsen, *A* 177, 84, Beckurts, *A* 181, 213, Renke, *A* 186, 286; Knuth, *A* 186, 301, Langfyrth, *A* 191, 180, Bassmann, *A* 191, 229, 238, Spiegelberg, *A* 197, 266).

Formation—1 From amido benzene *m* sulphonic acid and bromine—2 From (1, 2, 4)-bromo amido benzene sulphonic acid and Br—3 From the corresponding $\text{C}_6\text{H}_3\text{Br}_2(\text{NO}_2)\text{SO}_3\text{H}$ —4 From (1, 3, 5, 2, 6) tribromo nitro benzene sulphonic acid, Sn, and HCl—5 From tribromo-amido benzene sulphonic acid by treating with water at 150°, or by treating with Sn and HCl.

Properties—Needles (from hot water), sol water, insol alcohol.

Reactions—1 Water at 250° forms *o*-bromo-aniline sulphonic acid and aniline *m*-sulphonic acid—2 *Diazo*-reaction gives (1, 3, 4)-di-bromo benzene sulphonic acid.—3. Warmed with

strong alcohol and KNO_3 , a yellow crystalline body, possibly $\text{C}_6\text{H}_4\text{Br}_2(\text{SO}_3\text{H})\text{N}_2\text{H}$. $\text{C}_6\text{H}_4\text{Br}_2\text{SO}_3\text{K}$, is formed. Heated in sealed tubes with alcohol, it splits up into dibromo benzene sulphonic acid and amido-dibromo benzene sulphonic acid (Bassmann).

Salts— BaA'_2 , 6aq S (of BaA'_2) 2.99 at 7° , 8.12 at 9° , 8.9 at 23° — KA'_2 aq— $\text{NH}_4\text{A}'$ — CaA'_2 , 2aq— CaA'_2 , 6aq— PbA'_2 , S 2.9 at 22.5° .

(1,2,4,5)-Di-bromo-amido-benzene sulphonic acid $\text{C}_6\text{H}_2\text{Br}_2(\text{NH}_2)(\text{SO}_3\text{H})$ [1 2 4 5] S 109 at 10° , 153 at 24° . From (1,2,4) di bromo benzene sulphonic acid by nitration and reduction (Spiegelberg, A 197, 279). Trimetric tables, v sl. sol. alcohol— $\text{NH}_4\text{A}'$ aq— KA'_2 2aq— BaA'_2 aq S (of BaA'_2) 67 at 11° — PbA'_2 aq S (of PbA'_2) 11 at 11° — CaA'_2 , 8aq— CaA'_2 , 4aq— AgA' S 053 at 11° .

(1,3,4,5)-Di-bromo-amido-benzene sulphonic acid $\text{C}_6\text{H}_2\text{Br}_2(\text{NH}_2)(\text{SO}_3\text{H})$ [1 3 4 5] S 3.13 at 10.5° . From amido benzene o sulphonic acid by bromination (Limprieth, A 181, 198, B 8, 1429), or from (1,3,5) di bromo benzene sulphonic acid by nitration and reduction (Lenz, A 181, 36). Trimetric tables (anhydrous) or 4 sided prisms (with aq). Converted by Br into tri bromo aniline.

Salts— KA'_2 aq— NaA'_2 aq S (of NaA'_2) 3.7 at 12° — BaA'_2 , 1.1aq S (of BaA'_2) 20 at 11° — PbA'_2 aq.

Di-bromo-amido-benzene sulphonic acid $\text{C}_6\text{H}_2\text{Br}_2(\text{NH}_2)(\text{SO}_3\text{H})$ [1 4 2? 6] S 62 at 10.5° . From (1,4,2) di bromo benzene sulphonic acid by nitration and reduction (Born, A 187, 362). Needles or prisms— KA'_2 — BaA'_2 aq.

Di-bromo-amido benzene disulphonic acid $\text{C}_6\text{H}_2\text{Br}_2(\text{NH}_2)(\text{SO}_3\text{H})_2$ [1 4 3 7 2 6?]. From p di bromo benzene disulphonic acid by nitration and reduction (Born, A 187, 367). Crystals, v sol water— KA'_2 — BaA'_2 .

Di-bromo-amido-benzene di sulphonic acid $\text{C}_6\text{H}_2\text{Br}_2(\text{NH}_2)(\text{SO}_3\text{H})_2$ [1 4 0 6 2 3 5]. From (1,2,4) amido benzene disulphonic acid and Br (Heinzelmann, A 188, 182). Prisms (containing 4aq), v sol water— $\text{d}(\text{NH}_4)_2\text{A}''$ — $\text{K}_2\text{A}''$ — BaA'' , 8aq— PbA'' , 3aq.

Di bromo di-amido-benzene sulphonic acid $\text{C}_6\text{H}_2\text{Br}_2(\text{NH}_2)_2\text{SO}_3\text{H}$ [1 3 2 6 4]. One of the products of the reduction of $\text{C}_6\text{Br}_3(\text{NH}_2)_2\text{SO}_3\text{H}$ (Bassmann, A 191, 244, 248). Tablets (containing aq), v sl sol water.

Tri-bromo amido benzene sulphonic acid $\text{C}_6\text{H}_2\text{Br}_3(\text{NH}_2)\text{SO}_3\text{H}$ [1 3 5 4 6] S 13.7 at 14° , 16.6 at 7° (B).

Formation—1 From amido benzene m sulphonic acid and Br (Berndsen, A 177, 86)—2 From the corresponding nitro acid, by Sn and HCl, some di bromo amido benzene sulphonic acid being also formed (Rencke, A 186, 282, Knuth, A 186, 298, Langfurth, A 191, 198)—3 From (1,2,4) bromo amido benzene sulphonic acid by bromination (Spiegelberg, A 197, 275).

Properties—Thin needles (containing aq). Sol cold water and alcohol. Heated with water at 145° it becomes $\text{C}_6\text{H}_2\text{Br}_3(\text{NH}_2)\text{SO}_3\text{H}$.

Salts— BaA'_2 , 9aq S (dry) 43 at 7° (L), 34 at 5° (Bassmann, A 191, 221)— KA'_2 aq 935 at 4° (B)— PbA'_2 , 9aq S (of PbA'_2) 73 at 14° .

Tri bromo amido-benzene sulphonic acid $\text{C}_6\text{H}_2\text{Br}_3(\text{NH}_2)(\text{SO}_3\text{H})$ [1 2 3 4 5]. From (1, 2, 3, 5) tri bromo-benzene sulphonic acid by nitration

and reduction (Lenz, A 181, 43). Tufts of slender needles (containing aq), v sol water and 95 p.c. alcohol— BaA'_2 , 1.1aq.

Tri bromo-amido-benzene sulphonic acid $\text{C}_6\text{H}_2\text{Br}_3(\text{NH}_2)(\text{SO}_3\text{H})$ [1 2 5 4 6]. From the corresponding nitro acid (Spiegelberg, A 197, 288). Long prisms (containing 1.1aq) or slender needles (with aq). V sol water and alcohol— KA'_2 aq S (of KA'_2) 2.09 at 1° — $\text{NH}_4\text{A}'$ — CaA'_2 , 8.1aq— BaA'_2 S 096 at 1° — PbA'_2 , 2aq S 40 at 3.5° — AgA' , 1.1aq S (of AgA') 46 at 10° .

Tri bromo di amido benzene sulphonic acid $\text{C}_6\text{Br}_3(\text{NH}_2)_2\text{SO}_3\text{H}$ [1 3 5 2 4 6]. A product of reduction of $\text{C}_6\text{Br}_3(\text{NO}_2)_2\text{SO}_3\text{H}$ (Bassmann, A 191, 249)— BaA'_2 , 1.1aq.

Tetra bromo amido benzene sulphonic acid $\text{C}_6\text{Br}_4(\text{NH}_2)\text{SO}_3\text{H}$ [1 2 3 5 4 6] S 2.25 at 11° (Beckurts, A 181, 223). Got by reducing $\text{C}_6\text{Br}_4(\text{NO}_2)\text{SO}_3\text{H}$ with Sn and HCl, not allowing the temperature to rise to 100° , or Br_2 will be displaced by H_2 . Needles (containing 2aq). V sol alcohol and water.

Salts—(Langfurth, A 191, 204) BaA'_2 aq S (of BaA'_2) 4 at 10° — CaA'_2 , 7aq, KA'_2 1.1aq S (of KA'_2) 1.71 at 15° .

Tetra bromo amido benzene sulphonic acid $\text{C}_6\text{Br}_4(\text{NH}_2)(\text{SO}_3\text{H})$ [1 2 3 4 5 6] S 03 at 11° . From the nitro acid (Spiegelberg, A 197, 302). Needles (containing 2aq). V sol alcohol— KA'_2 aq S (of KA'_2) 106 at 11° — CaA'_2 , 2aq S (of CaA'_2) 107 at 11.5° — BaA'_2 aq S (of BaA'_2) 0155 at 11.5° .

(a) **BROMO o AMIDO - BENZOIC ACID** $\text{C}_6\text{H}_4\text{Br}(\text{NH})\text{CO}_2\text{H}$ [1 2 3] *Bromo anthranilic acid* [170°]. From the corresponding nitro-compound by Sn and HCl (Hubner, A 222, 104, cf A 143, 244, 149, 184). Needles, m sol water. Sodium amalgam reduces it to o-amido benzoic acid [144°]. Nitrous acids forms the diazo derivative $\text{C}_6\text{H}_4\text{BrCO}_2\text{H N}_2\text{N}$, $\text{N}_2\text{H C}_6\text{H}_4\text{BrCO}_2\text{H}$ —**Salts**— AgA' — BaA'_2 aq— CuA'_2 .

Acetyl derivative $\text{C}_6\text{H}_4\text{Br}(\text{NHAc})(\text{CO}_2\text{H})$ [1? 2 3? [215°]. Obtained by brominating acetyl-o amido benzoic acid (Jackson, B 14, 879).

(b) **Bromo-o amido benzoic acid** *Bromo anthranilic acid* $\text{C}_6\text{H}_4\text{Br}(\text{NH}_2)\text{CO}_2\text{H}$ [1 4 3] [208°].

Formation—1 By reducing (1, 4, 3) bromo nitro benzoic acid (Hubner, Ohly a Philipp, A 143, 242, Mecker, Hubner a Petermann, A 149, 133)—2 By boiling bromo isatoic acid with conc HCl (Dorsch, J pr [2] 83, 85).

Properties—V sol acetone, sol alcohol, ether, chloroform, benzene, and glacial acetic acid, sl sol boiling water. Sodium amalgam reduces it to o amido benzoic acid [144°].

Salts— BaA'_2 4aq needles, v sol water.

Amide $\text{C}_6\text{H}_4\text{Br}(\text{NH}_2)\text{CONH}_2$ [177°]. From bromo isatoic acid and NH_3 aq. Flat needles. V sol alcohol, acetone and glacial acetic acid, m. sol water and benzene. Insol ether.

(1,2,4)-**Bromo-m-amido-benzoic acid** $\text{C}_6\text{H}_3\text{Br}(\text{NH}_2)\text{CO}_2\text{H}$ [1 2 4] [225°]. By reducing the nitro-acid by Sn and HCl. Small colourless needles (from water), becomes reddish in air (Hubner, A 222, 179, Burghard, B 8, 558, Ravell, B 10, 1707). Reduced by sodium-amalgam to m amido benzoic acid— $\text{HA}'\text{HCl}$ — CuA'_2 — PbA'_2 .

(1,3,5)-**Bromo-m-amido-benzoic acid** $\text{C}_6\text{H}_3\text{Br}(\text{NH}_2)\text{CO}_2\text{H}$ [1 3 5] [215°]. From the

corresponding nitro acid by Sn and HCl (Hesemann a Köhler, *A* 222, 169) Needles (from alcohol) Turns red in light Salts —HA'HCl—(HA')₂H₂SO₄ —BaA', 4aq —CaA', 5aq

(1,4,2) Bromo *m*-amido-benzoic acid
C₆H₃Br(NH₂)CO₂H [1 4 2] [180°] From (1,4,2) bromo nitro benzoic acid, Sn, and glacial HOAc (Burgard, *B* 8, 560) Flat needles (Smith, *B* 10, 1706)

(1,2,4,5)-Di-bromo-*o*-amido-benzoic acid
C₆H₂Br₂(NH₂)CO₂H [1 2or6 5 4] *Di bromo-anthranilic acid* [226°–228°]

Formation—1 From di bromo nitro benzoic acid (Smith, *B* 10, 1706)—2 From *o* nitro toluene and bromine at 170° (Wachendorff, *A* 185, 281, Grieff, *B* 13, 288)—3 From isatoic acid (*q* v) and bromine (Dorsch, *J pr* [2] 33, 37)

Properties—Clumps of needles (from alcohol) Long needles (when sublimed) Sol alcohol, acetone and glacial acetic acid, sl sol chloroform, benzene, ether, and water

Amide C₆H₂Br₂(NH₂)CO NH₂ [197°] Pearly tablets (from alcohol acetone) Formed from di bromo isatoic acid and NH₃Aq at 100°

Di-bromo-*o* amido-benzoic acid
C₆H₂Br₂(NH₂)CO₂H [1 2or6 5 4]? *Di bromo anthranilic acid* [225°] S 1, S (HOAc) 3 By reduction of the nitro-acid by Sn and HCl (Hesemann a Köhler, *A* 222, 189) Colourless needles Reduced by sodium amalgam to *o* amido benzoic acid —BaA', 4aq —CaA', 4aq —SrA', 2aq —CuA'. This acid is probably identical with the preceding

(1,3,4,5) **Di bromo-*o*-amido-benzoic acid**
C₆H₂Br₂(NH₂)CO₂H [1 3 4 5] *Di bromo anthranilic acid* [225°] S 1, S (HOAc) 3 By reduction of the nitro-acid by Sn and HCl (Hesemann a Köhler, *A* 222, 175) Reduced by sodium amalgam to *o* amido benzoic acid Needles (from alcohol) —BaA', 4aq —CaA', 4aq —CuA'.

(1,3,5,4)-**Di-bromo-*o*-amido-benzoic acid**
C₆H₂Br₂(NH₂)(CO₂H) *Di bromo-anthranilic acid* [196°] From benzoic acid by bromination, nitration, and reduction (Angerstein, *A* 158, 16) Needles (from dilute alcohol) Reduced by sodium amalgam to *o* amido benzoic acid

Di-bromo-*p* amido-benzoic acid
C₆H₂Br₂(NH₂)CO₂H [1 3 2 5] Obtained by adding bromine water to an acidified solution of *p* amido benzoic acid (Beilstein a Geitner, *Z* [2] 1, 505, *A* 139, 1) Needles (from alcohol) —NH₃A' 2aq —NaA' 6aq —CaA', 6aq —BaA', 4aq

Tri-bromo *o* amido benzoic acid
C₆HBr₃(NH₂)CO₂H [1 2 x 4 5] *Tri bromo-anthranilic acid* [c 119°] From isatoic acid and bromine (Dorsch, *J pr* [2] 33, 37)

Properties—Slender needles May be sublimed Very soluble in glacial acetic acid, alcohol and acetone, sol ether and chloroform, less soluble in benzene, sl sol hot water

Tri bromo *m*-amido benzoic acid
C₆HBr₃(NH₂)CO₂H [1 3 5 4 6] [170°] From *m* amido benzoic acid and bromine water (Beilstein a Geitner, *Z* [2] 1, 505, *A* 139, 6, Vollbrecht, *B* 10, 1708) Needles, m sol hot water On dry distillation it gives tri-bromo-aniline —NaA' 4aq —BaA', 6aq

Tri bromo *o*-amido-benzoic acid
C₆Br₃(NH₂)(CO₂H) [1 3 5 2 4 6] From *s* di-amido benzoic acid and bromine water (Gress,

A 154, 832) Long needles (from dilute alcohol) Sl sol cold water —AgA'.

Tetra bromo *o*-amido benzoic acid
C₆Br₄(NH₂)CO₂H [1 2 3 4 5 6] [115°] From isatoic acid and excess of Br (in glacial acetic acid) (Dorsch, *J pr* [2] 83, 88) White needles At 100° it sublimes in long slender needles

BROMO-AMIDO-HYDROCARBOSTYRIL v p 164

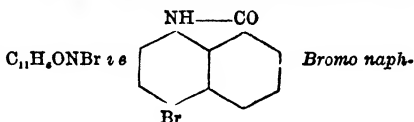

BROMO-AMIDO-HYDROCINNAMIC ACID

v **BROMO AMIDO β PHENYL PROPIONIC ACID**

BROMO AMIDO NAPHTHALENE v **Bromo**

NAPHTHYLAMINE

BROMO-AMIDO-NAPHTHOIC ANHYDRIDE

thostyryl [257°] By reduction of bromo nitro (a) naphthoic acid with FeSO₄ and aqueous NH₃ and ppn with acetic acid the amido acid is obtained, and by boiling with alcohol it is converted into the anhydride, which crystallises out on cooling in brown needles (Ekstrand, *B* 19, 1136)

Di-bromo-amido-naphthoic anhydride

Prepared by heating amido naphthoic anhydride

C₁₀H₄  suspended in water with a large excess of bromine Yellow needles (from alcohol) M sol hot acetic acid

Acetyl derivative C₁₁H₅ONBr₂Ac [185°], small yellow needles (Ekstrand, *B* 19, 1136)

BROMO-AMIDO-(a)-NAPHTHOQUINONE

C₆H₃  [205°] Formed by boiling bromo amido (a) naphthoquinone imide

C₆H₄  with dilute acids Orange

silky needles Sublimable By boiling with dilute alkalis it is converted into bromo-oxy (a)-naphthoquinone

Acetyl derivative [187°], sulphur-yellow needles (Zincke a Gerland, *B* 20, 1514)

BROMO-AMIDO-(a)-NAPHTHOQUINONE-

IMIDE C₆H₃  [200°] Obtained

by adding bromine (5 cc) to di amido (a) naphthol or its stanno chloride (10 g) suspended in acetic acid Orange yellow needles (from alcohol) V sol hot alcohol and hot benzene By SnCl₂ it is reduced to bromo di amido (a)-naphthol By boiling with dilute acids it is converted into bromo amido (a) naphthoquinone

C₆H₄  . By boiling with dilute NaOH

it is converted into bromo oxy naphthoquinone-

imide C₆H₃  . The latter body

when treated with conc HCl or alcoholic NaOH is converted into bromo oxy naphthoquinone $C_6H_4 \begin{smallmatrix} CO \\ \diagup \\ C(OH) \\ \diagdown \\ CO \end{smallmatrix} CBr$ which is also formed by boiling the bromo amido naphthoquinone with dilute alkalis (Zincke & Gerland, *B* 20, 1510)

BROMO-*o* AMIDO-PHENOL

$C_6H_4Br(NH_2)(OH)$ [1 3 4] [128°] Formed by reducing bromo nitro phenol with Sn and HCl (F Schutt, *J pr* [2] 32, 61) Thin plates (from CS₂) Needles (from alcohol) Sol ether, benzene, hot water, and hot chloroform Fe₂Cl₃ turns the aqueous solution cherry red

Salts — B'HCl* Very soluble plates — B'HB^r* Crystallises very easily — B'H₂SO₄ *Acetyl derivative* $C_6H_3(OH)(NHAc)Br$ [178] Plates or needles (from water)

Methyl ether $C_6H_3Br(NH)(OMe)$ [98°] From the nitro compound, Sn and HCl (Staedel, *A* 217, 59) Plates (from benzene) V sol benzene, ether or hot alcohol, insol water Salts — B'HCl — B'H₂SO₄ — B'H₂C₂O₄

Ethyl ether [57°] Broad needles (from alcohol) V sol benzene, alcohol or ether Salts — B'HCl — B'H₂SO₄ — B'H₂C₂O₄

Bromo-*m*-amido-phenol $C_6H_4Br(NH_2)OH$ [x 1 3] *Ethyl ether* $C_6H_4Br(NH_2)OEt$ Liquid, v sol alcohol and ether, v sl sol water The hydrochloride, sulphate, and oxalate crystallise in white plates $C_6H_4Br(OEt)NH_2$, HCl, SnCl₂ (Lindner, *B* 18, 612)

Bromo *p* amido phenol

$C_6H_4Br(NH_2)(OH)$ [1 3 6] [158°] Prepared by reducing bromo nitro phenol, or its benzyl derivative, by Sn and HCl (O Holz, *J pr* [2] 32, 65) Short needles (from dilute alcohol) Sol ether, benzene, and chloroform, sl sol cold water

Salts — B'HCl silvery plates — (B',HCl),SnCl₂ — B'HB^r

Acetyl derivative $C_6H_3(OH)(NHAc)Br$ [157°] Thick needles (from hot water) Soluble in alkalis

Methyl ether

From the nitro compound, Sn and HCl (Staedel, *A* 217, 68) Oil Insol water, v sol benzene, alcohol, or ether B'HCl — B'H₂SO₄ — B'H₂C₂O₄

Ethyl ether

From the nitro compound, Sn and HCl Oil B'HCl — B'H₂SO₄ — B'H₂C₂O₄

Di bromo-*o*-amido phenol

$C_6H_3Br_2(NH_2)(OH)$ [1 3 5 6] [92°] Formed by reducing di bromo *o* nitrophenol (Hözl, *J pr* [2] 32, 69) Slender yellow needles (from dilute alcohol) Sparingly soluble in water, v sol alcohol, ether, benzene, and chloroform

Salts — B'HCl plates — (B',HCl),SnCl₂ needles. — B'HB^r needles

Acetyl derivative $C_6H_2(OH)(NHAc)Br_2$ [186°] Yellowish needles (from hot water) Sol alkalis

Methyl ether $C_6H_2Br_2(NH_2)(OMe)$ From the nitro- compound by Sn and HCl (Staedel, *A* 217, 63) Oil Sol alcohol, ether, or dilute acids, insol cold water, sl sol hot water B'HCl — B'H₂SO₄ [177°] — B'H₂C₂O₄

Ethyl ether $C_6H_2Br_2(NH_2)(OEt)$ [92°] Quadratic crystals (from alcohol) V sol alcohol or ether — B'HCl — B'H₂SO₄ — B'H₂C₂O₄

Di bromo-*o*-amido-phenol

Ethyl ether $C_6H_2Br_2(NH_2)OEt$ [1 3 4 5] ?

[53°] *o*-Amido phenetol, $C_6H_4(NH_2)OEt$ (10 g), is boiled with glacial acetic acid (100 g) and bromine (11.7 g) The product is poured into water and the oil that separates is distilled with steam and recrystallised from alcohol Glittering prisms grouped in tufts Resembles di bromo *o* toluene in being but feebly basic (Möhlau & Oehmichen *J pr* 132, 479)

Di bromo *m* amido phenol

Ethyl ether $C_6H_3Br_2(NH)OEt$ From the nitro compound Oil The hydrochloride, sulphate, and oxalate crystallise in needles — $C_6H_3Br_2(OEt)NH_2$, HCl, SnCl₂ glistering plates (Lindner, *B* 18, 613)

Di bromo *p* amido phenol

$C_6H_3Br_2(NH_2)OH$ [1 3 5 2] [180°] (M & B), [190°] (L & G) Formed by reducing the nitro compound (Mohlau, *B* 16, 2845, Hözl, *J pr* [2] 32 67, Möhlau & Bohmer, *J pr* [2] 24, 470, Lellmann & Großmann, *B* 17, 2731) Formed also by reducing di brominated *p* diazo phenol (*q v*) with tin and HCl (Böhmer, *J pr* 132, 469)

$C_6H_3Br_2 \begin{smallmatrix} O \\ \diagup \\ N_2 \end{smallmatrix} + 2H_2 = C_6H_3Br_2(OH)NH_2 + NH_3$

Properties — Ppd by NaHCO₃ from solution of its hydrochloride as microscopically small needles grouped in tufts Turns blue in air Sl sol ether, v sol alcohol, m sol hot water

Salts — B'HCl glittering plates — (B',HCl),SnCl — B'HB^r

Reactions — When N₂O₅ is passed into an alcoholic solution of its hydrochloride, yellow crystals of diazo dibromo phenol (*q v*) are obtained, but this body is *isomeric* with that by the reduction of which the dibromo amido phenol was prepared An 'intra molecular change' must therefore have occurred somewhere

Acetyl derivative $C_6H_2Br_2(NHAc)(OH)$

[174°] Glittering plates (from dilute alcohol) *Methyl ether* From the nitro compound [127°], Sn, and HCl White porcelain like mass Extremely sol ether, benzene, or alcohol (Staedel, *A* 217, 70, Staedel & Damm, *B* 11, 1749)

Salts — B'HCl — B'H₂SO₄ — B'H₂C₂O₄ [195°]

Ethyl ether [67°]

Needles (from alcohol) V sol alcohol, ether, or benzene Salts — B'HCl — B'H₂SO₄ — B'H₂C₂O₄

Tri bromo-*o* amido phenol

Ethyl ether $C_6H_2Br_3(NH_2)OEt$ [1 3 4 5 6] ? [77°] From amido phenetol (5 g), glacial acetic acid (50 g) and bromine (17.5 g) The product is poured into water, and the pp crystallised from alcohol Long silky needles Nearly insol boiling conc HCl It is totally decomposed when heated to a temperature a little above its melting point

Tri-bromo *m* amido-phenol

$C_6H_2Br_3(NH_2)OH$ [1 3 5 2 6] [115°] Formed by reduction of tri bromo *m* nitro phenol (Dacomo, *B* 18, 1168) Colourless silky needles. Sol alcohol, ether, benzene, and hot, sl sol cold, water Fe₂Cl₃ gives a green colouration

Ethyl ether $C_6H_2Br_3(NH_2)OEt$ Solid, v sol alcohol and ether, sl sol water — B'HCl — white needles, sol alcohol — B'H₂SO₄ white needles, sol alcohol — B',HClSnCl₂ white needles (Lindner, *B* 18, 614)

BROMO AMIDO DIPHENYL

Acetyl derivative $C_{12}H_8Br(NHAc)$ [247°]. From Br and *p* amido diphenyl in glacial

HOAc (Hübner, *A* 209, 345) Needles (from alcohol)

Di bromo-di amido diphenyl $C_{12}H_8Br_2(NH_2)_2$ [89°] From di bromo di nitro-diphenyl by Sn and HCl (Fittig, *A* 132, 207) Insol water — $B''2HCl$

Di bromo di amido diphenyl [2 4 1] $C_6H_4Br(NH_2)C_6H_4Br(NH_2)$ [1 2 4] *Di bromo benzidine* [152°] Obtained from [3 1] $C_6H_4BrNHNH_2C_6H_4Br$ [1 3] and HCl (Gabriel, *B* 9, 1407) Trimetric crystals, m sol cold alcohol — $B''2HCl$ — $B''H.PtCl_3$

Di bromo di amido diphenyl $C_{12}H_8Br_2(NH_2)_2$ [1 5 2], [108° corr.] Small plates Formed by the action of an alcoholic solution of $SnCl_2$ and H_2SO_4 on *p* bromo benzene *p* azo bromo benzene Treated with nitrous acid in alcoholic solution it gives an azimido body $C_{12}H_8N_2Br_2$ which forms glistening violet needles, [206°], sl sol alcohol (Schultz, *B* 17, 465)

Tetra bromo di amido diphenyl $C_{12}H_4Br_4N_2$ *Tetra bromo benzidine* [286°] Prepared by bromination of benzidine (Claus a Rusler, *B* 14, 86) Slender colourless needles Sol alcohol, ether, CS, C_6H_6 , insol water and acids

BROMO-AMIDO-PHENYL-ACETIC ACID

$C_6H_4(Br)(NH_2)(CH_2CO_2H)$ [1 2 5] [136°] Formed by saponification of the acetyl derivative of its nitrile, or by bromination and saponification of the acetyl derivative of *p* amido phenyl acetic acid (Gabriel, *B* 15, 840) Colourless plates Sol alcohol and ether, insol CS

Acetyl derivative [165°]

Nitrile $C_6H_4(Br)(NH_2)(CH_2CN)$ *Acetyl derivative* $C_6H_4Br(NHAc)(CH_2CN)$ [129°] Long colourless needles Sol alcohol, sl sol cold water Formed by bromination of the acetyl derivative or *p* amido phenyl acetonitrile (Gabriel, *B* 15, 840)

Br-mo amido-phenyl-acetic acid

$C_6H_4Br(NH_2)CH_2CO_2H$ [1 2 or 6 4] [134°] From the nitro compound [114°] by Sn and HCl (P P Bedson, *C* J 37, 98) Silky needles (from water) Sol alcohol and $CHCl_3$ Sl sol ether — $BHCl$ aq turns red in air

(a) Bromo amido-phenyl-acetic acid

$C_6H_4Br(NH_2)CH_2CO_2H$ [167°] From the nitro acid [169°] by Sn and HCl (Bedson) White needles (from water), reddens in air Sol alcohol and chloroform, sl sol ether

Salt — $B'HCl$ aq white needles (from water)

(b) Bromo amido-phenyl-acetic acid

$C_6H_4Br(NH_2)CH_2CO_2H$ [186°] From the nitro-acid [162°] by Sn and HCl (Bedson) The hydrochloride is less soluble in water than those of the two preceding bodies.

(1 3, 2, 5) **Bromo-di-amido-phenyl-acetic acid** $C_6H_3(Br)(NH_2)_2CH_2CO_2H$ [1 3 2 5] [c 200°] Long colourless needles Formed by reduction of (1, 3, 2, 5) bromo nitro amido phenyl acetic acid (Gabriel, *B* 15, 1995)

BROMO-AMIDO-PHENYL-ETHANE

$C_6H_4BrN_2CH_2CH_2CH_2NH_2$ *Bromo-phenyl-ethyl amine* (253°) From phenyl propionamide, KOH aq, and bromine (Hofmann, *B* 18, 2740) Pearly plates (from water) — $B'HCl$

(1, 2, 5) **BROMO-AMIDO-*p* PHENYL-PRO-
PIONIC ACID** $C_6H_4(Br)(NH_2)C_6H_4CO_2H$ [1 2 5]. *Bromo amido hydrocinnamic acid* [105°] Formed by bromination of the acetyl derivative of *p* amido phenyl propionic acid, and

saponification of the product (Gabriel, *B* 15, 2292) Long glistening crystals Sol most ordinary solvents and in acids and alkalis

Acetyl derivative [160°] Long colourless needles, soluble in alcohol, ether, and benzene

Bromo *m* amido phenyl-propionic acid

$C_6H_4(Br)(NH_2)C_6H_4CO_2H$ [2 1 5] [117°–119°] Long prisms Sol water, alcohol, ether, and C_6H_6 Prepared by reduction of *p*-bromo-*m*-nitro hydrocinnamic acid with tin and HCl — $A'HCl$ glistening soluble needles (Gabriel a Zimmermann, *B* 13, 1684)

(*iso*) DI-BROMO *o*-AMIDO-PHENYL-VALERIC ACID

$C_6H_4Br_2(NH_2)CH_2CH_2CH_2CH_2CO_2H$ [96°, with aq] Long colourless needles (containing aq) Formed by reduction of an alcoholic solution of di bromo amido phenyl di bromo valeric acid $C_6H_4Br_2(NH_2)CHBrCHBrCH_2CH_2CO_2H$ with zinc and HCl V sol ordinary solvents, insol cold water It could not be converted into an inner anhydride, even by dehydrating agents

Ethyl ether $C_{18}H_{19}Br_2(NH_2)CO_2Et$, thick oil, its hydrochloride forms white needles [136°]

Acetyl derivative $C_{18}H_{19}Br_2(NHAc)CO_2H$ [206°], aggregates of thin white needles, v sol alcohol, ether, &c

Acetyl ethyl ether

$C_{18}H_{19}Br_2(NHAc)CO_2Et$ [139°], colourless crystals, v sol alcohol, ether, and acetic acid, more sparingly in benzene, insol water and ligroin, in small quantities it can be distilled undecomposed (Diehl a Einhorn, *B* 20, 380)

iso-iso **Tetra-bromo-*o*-amido-phenyl-valeric acid** $C_6H_2Br_4(NH_2)CHBrCHBrCH_2CH_2CO_2H$ [167°] Formed by bromination of *o*-amido styryl propionic acid dissolved in chloroform Small microscopic needles V sol alcohol, ether, and acetic acid, insol water and CS, (Diehl a Einhorn, *B* 20, 379)

BROMO-AMIDO-QUINOLINE

$C_8H_6N(Br)(NH_2)$ [164°] Large monoclinic prisms, or long colourless needles (containing aq) Sol alcohol and ether

Salts — $B''HN_2$, glistening yellow needles — $B'HCl$ soluble red prisms — $B''H_2Cl_2PtCl_4$ microscopic orange needles

Acetyl derivative $C_8H_6N(Br)(NHAc)$ [105°] Thin colourless plates (La Coste, *B* 15, 1920)

DI-BROMO-AMIDO-RESORCIN

$C_6H_3Br_2(NH_2)(OH)$ [1 2 4] *Di-ethyl ether* $C_6H_3Br_2(NH_2)(OEt)$ [112°], glistening needles or plates (Will a Pukall, *B* 20, 1126)

BROMO-AMIDO STYRENE

$C_6H_4Br(NH_2)C_2H_5$ *Acetyl derivative* [183°], felted needles, sol alcohol, ether, and acetic acid, formed by bromination of *p*-amido cinnamic acid dissolved in AcOH (Gabriel a Herzberg, *B* 16, 2043)

BROMO-AMIDO-SUCCINIC ACID

$C_6H_4Br(NH_2)(CO_2H)$ [140°] From di-bromo-succinic acid and alcoholic NH_3 (Claus, *B* 15, 1850) Radiating needles, v sol water and alcohol — AgA'

BROMO-AMIDO-THYMOL

$C_6H_3BrMePr(NH_2)(OH)$ Prepared by adding Na_2CO_3 to dilute solution of its hydrobromide (*v infra*) Long colourless prisms, rapidly turning deep violet

Hydrobromide. — B'HBr By adding moderately strong HBr to thymoquinone chloroimide (q v) a yellow flocculent pp is formed. Ether extracts bromo thymoquinones from this, leaving the above salt, which is soluble in water and alcohol, but is thrown down as needles when HBr is added to its concentrated aqueous solution (Andersen, *J pr* 131, 182)

Bromo-amido thymol [c 90°] From bromonitro thymol, zinc dust, and HCl (Mazzara a Discalzo, *G* 16, 196) Scales Converted by nitrous acid gas into bromo thymoquinone [48°]

BROMO-AMIDO-TOLUENE v **BROMO TOLUENEDINE**

Bromo-di-amido-toluene v **BROMO TOLYLENE DIAMINE**

BROMO-AMIDO TOLUENE SULPHONIC ACID $\text{C}_6\text{H}_4(\text{CH}_3)(\text{NH}_2)\text{BrSO}_3\text{H}$ [1 2 3 5] *Bromo toluidine sulphonic acid* From o toluidine sulphonic acid and bromine water (Neville a. Winther, *C J* 37, 627) Prisms

Reactions — 1 Converted by diazo reaction into a bromo toluene sulphonic acid whose sulphochloride melts at [56°] and whose amide at [147°] — 2 Heated with HCl at 160° it gives dibromo o -toluidine [44°] and two mono bromo toluidines, an oil and a crystalline body, [54°–57°] One of these bromo toluidines must be obtained from the acid by displacement of SO_3H by H , and must subsequently give rise to the other mono and the di bromo toluidine. Inasmuch as only bromo toluidine, $\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)\text{Br}$ [1 2 3], heated with HCl at 160° gives a substance [40°–47°] and crystals [53°–55°], while the crystalline bromo toluidine [54°–57°] is not affected by this treatment, we must suppose the sulphonic acid to be $\text{C}_6\text{H}_4(\text{CH}_3)(\text{NH})\text{BrSO}_3\text{H}$ [1 2 3 5] rather than [1 2 5 3]. When it is heated with HCl the only bromo toluidine is first formed, but this being unstable changes into its crystalline isomeride and the crystalline dibromo toluidine

Bromo-amido toluene sulphonic acid $\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)\text{Br}(\text{SO}_3\text{H})$ [1 4 2 3 or 5] S 532 at 21° From o bromo toluene by sulphonation, nitration, and reduction (Schafer, *A* 174, 360) Trimetric laminae (from hot water) or nodules (from alcohol) Converted by bromine water into tri bromo toluidine [82°]

Salts — BaA' , aq — PbA' , aq

Bromo amido toluene sulphonic acid $\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)\text{Br}(\text{SO}_3\text{H})$ [1 5 7 4 3] From (1,4,2) bromo toluene sulphonic acid by nitration, and reduction (S) Needles (from water) V sl sol water — BaA' , 4aq

Bromo amido toluene sulphonic acid $\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)\text{Br}(\text{SO}_3\text{H})$ [1 2 7 4 6] S 82 From (1,4,3)-bromo toluene sulphonic acid by nitration and reduction (Schafer, *A* 174, 360) Prisms (from water) Bromine water gives tri bromo-toluidine [72°] — BaA' , 2aq — NaA' , 2aq

Bromo-amido-toluene sulphonic acid $\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)\text{Br}(\text{SO}_3\text{H})$ [1 4 x 2] S 23 at 20° From boiling aqueous p toluidine o sulphonic acid and bromine (Jenssen, *A* 172, 230, *B* 7, 55) Needles (from water) V sl sol boiling water — KA' , aq — BaA' , 7aq

Bromo-amido-toluene sulphonic acid $\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)\text{Br}(\text{SO}_3\text{H})$ S 19 at 20° From o toluidine sulphonic acid by conversion into o -bromo toluene sulphonic acid, nitration, and re-

duction (Pagel, *A* 176, 800) Minute thin prisms — BaA' , aq

Bromo-amido-toluene sulphonic acid $\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)\text{Br}(\text{SO}_3\text{H})$ [1 4 5 7 3] Formed, together with di bromotoluidine, by passing bromine vapour into cold aqueous p toluidine m sulphonic acid (v Pechmann, *A* 173, 210, *Lam* pricht, *B* 7, 452) Clumps of needles V e sol water Converted by diazo reaction into (3 or 5, 1, 2) bromo toluene sulphonic acid — KA' — BaA' , 2aq — PbA' , — AgA'

Di bromo- o amido toluene sulphonic acid $\text{C}_6\text{HMe}(\text{NH}_2)\text{Br}_2\text{SO}_3\text{H}$ [1 2 7 7 4] S 64 at 13 5° From o toluidine p sulphonic acid $\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)(\text{SO}_3\text{H})$ [1 2 4] and bromine (Hayduck, *B* 7, 1353, *A* 172, 211) Capillary needles containing aq (from water) — BaA' , 9aq

Di bromo amido toluene sulphonic acid $\text{C}_6\text{HMe}(\text{NH}_2)\text{Br}_2(\text{SO}_3\text{H})$ [1 2 3 7 5 7] From o -toluidine by sulphonation and bromination Needles (containing aq) V sol hot water and hot alcohol Gives tri bromo toluidine [112°] when distilled with KOH — BaA' , 4aq — PbA' , 3aq (Gerver, *A* 169, 880)

Bromo di amido toluene sulphonic acid $\text{C}_6\text{HMe}(\text{NH}_2)_2\text{BrSO}_3\text{H}$ [1 2 7 6 7 3 4] From toluene p sulphonic acid by nitration and reduction (Schwanert, *A* 186, 360) Tables, sl sol water — KA' , 2aq

DI BROMO AMYL ALCOHOL $\text{C}_5\text{H}_{11}\text{Br}_2\text{O}$ v $\text{CH Br CHBr CHEt OH}$ *Di bromo di ethyl carbinol* From vinyl di ethyl carbinol and bromine (Wagner, *J R* 16, 320) Non volatile liquid

BROMO o AMYL ANTHRACENE

$\text{C}_{14}\text{H}_9\text{Br}$ v $\text{C}_6\text{H}_4\left\langle\begin{array}{c} \text{C}(\text{C}_5\text{H}_9) \\ \text{CBR} \end{array}\right\rangle\text{C}_6\text{H}_4$ [76°] Yel.

low needles Fluorescent Prepared by bromination of amyl anthracene in CS_2

Picric acid compound [110°] Orange yellow needles (Liebermann a Tobias, *B* 14, 797)

BROMO sec AMYL BENZENE $\text{C}_5\text{H}_{11}\text{Br}$ v $\text{C}_5\text{H}_9\text{CHET CHBr CH}_3$ (?) (c 79°) at 40 mm. S G 21 128 Oil Obtained by brominating sec amyl benzene (Dafert, *M* 4, 620) Decomposed slowly by boiling water into HBr and pentenyl benzene

γ -5 di bromo amyl benzene [53°–54°] Ph CHBr CHBr $\text{CH}_2\text{CH}_2\text{CH}_2$ From phenyl amylene (q v) and bromine Needles or plates

γ -5 di-bromo-isoamyl benzene Ph CHBr CHBr $\text{CH}(\text{CH}_3)_2$ [128°–129°] From phenyl iso-amylene and Br (Schramm, *A* 218, 394) Needles (from alcohol)

Tri-bromo isoamyl benzene $\text{C}_{11}\text{H}_{17}\text{Br}_3$ [140°] Obtained by brominating iso amyl benzene at 100° (Bigot a Fittig, *A* 141, 161) Needles

BROMO ISOAMYLENE $\text{C}_5\text{H}_9\text{Br}$ *Pentenyl-bromide* (100°–110°) From 'isoamylene' by successive treatment with bromine and alcoholic KOH (Bauer, *A* 120, 167) Successive treatment with conc H_2SO_4 and water forms amylene dibromide and a ketone $\text{C}_5\text{H}_{10}\text{O}$ (Bouchardat, *C R* 93, 816)

α -Bromo-iso-amylene (111°) Pr CH CHBr From isovaleric aldehyde by successive treatment with PCl_5Br and alcoholic KOH (Bryulants, *B* 8, 406)

γ -Bromo- n -amylene $\text{CH}_2\text{CBRCH}_2\text{CH}_2\text{CH}_3$ (123°) S.G. 2 1 10. From methyl propyl ketone

by successive treatment with PCl_5 , Br_2 , and alcoholic KOH (B)

Bromo amylene $\text{C}_6\text{H}_4\text{Br}$ (111°) From di-bromo-hexonic acid $\text{CH}_2\text{CHBrCBrEtCO}_2\text{H}$ and cold aqueous Na_2CO_3 (Fittig, *A* 200, 36)

Bromo amylene $\text{C}_6\text{H}_4\text{Br}$ (115°) From isovalerylene and HBr (Reboul, *Z* 1867, 173)

Bromo amylene $\text{C}_6\text{H}_4\text{Br}$ (c 106°) SG 13 1 173 From isoprene C_5H_8 and HBr (Bouchar dat, *J* 1879, 577)

Di bromo amylene $\text{C}_6\text{H}_3\text{Br}_2$ (c 170°) From isovalerylene and bromine (Reboul, *A* 135, 372)

Di bromo amylene $\text{C}_6\text{H}_3\text{Br}_2$ 1e Pr CBr CHBr (175°) From isopropyl acetylene and Br (Bruylants, *B* 8, 407)

Di bromo amylene $\text{C}_6\text{H}_3\text{Br}_2$ 1e Pr CBr CHBr (190°) From *n*-propyl acetylene and Br (B)

BROMO AMYLENE GLYCOL $\text{C}_6\text{H}_4\text{Br(OH)}_2$ From amylene dibromide by successive treatment with AgOAc and solid KOH (Bauer, *J* 1861, 664)

TRI BROMO p ISOAMYL TOLUENE $\text{C}_6\text{H}_3\text{Br}_3$ 1e $\text{C}_6\text{H}_4\text{MeBr}_3$ C_6H_4 From *p* isoamyl toluene and bromine at 100° Sticky liquid (Bigot & Fittig, *A* 141, 165)

TRI BROMO ANETHOL $\text{C}_6\text{H}_3\text{Br}_3\text{O}$ From anethol and Br Crystals (Cahours, *A* 41, 60)

BROMO-ANILIC ACID v **DI BROMO DI OX-QUINONE**

o BROMO ANILINE $\text{C}_6\text{H}_4\text{BrNH}_2$ 1e $\text{C}_6\text{H}_4\text{Br(NH}_2)$ [1 2] Mol w 172 [31°] (229° i V) • From *o*-bromo nitro benzene by reduction with tin and HCl (Fittig & Mager, *B* 7, 1175)

Acetyl derivative $\text{C}_6\text{H}_3\text{BrNHAc}$ *o* **Bromo acetanilide** [99°] Long needles (Körner, *G* 4, 330)

m Bromo aniline $\text{C}_6\text{H}_4\text{Br(NH}_2)$ [1 3] [18°] (251°) **Formation** —1 From *m* bromo nitrobenzene (Fittig & Mager, *B* 8, 364) —2 *m* nitro diazo benzene sulphate (from *m* nitraniline) is treated with a hot solution of cuprous bromide and the crude *m* bromo nitro benzene reduced with tin and HCl (Sandmeyer, *B* 18, 1495)

Acetyl derivative $\text{C}_6\text{H}_3\text{BrNHAc}$ [88°] Needles (from dilute alcohol) (Scheufelen, *A* 231, 175)

p Bromo aniline $\text{C}_6\text{H}_4\text{Br(NH}_2)$ [1 4] [62°] (Mills, *P* *M* [5] 14, 27) [66°] (Körner, *J* 1875, 342)

Formation —1 By reducing *p* bromo nitro benzene with tin and HCl (Riche & Bérard, *A* 183, 62, Fittig & Mager, *B* 7, 1175, 8, 364) —2 By bromination of acetanilide and distillation of the product with KOH (Mills, *P* *I* [4] 49, 21, *Pr* 10, 589) —3 By distilling bromo isatin with KOH (Hofmann, *A* 53, 42) —4 In small quantity by brominating aniline with Br vapour or in benzene solution (Kekulé, *Z* 1866, 687)

Properties —Trimetric crystals, insol cold water, v sol alcohol and ether Decomposed on boiling, giving aniline, and di and tri bromo aniline

Reactions —1 HCl at 160° gives aniline and di bromo-aniline (Fittig & Buchner, *A* 188, 23) 2 **Sodium** acts on it in ethereal solution forming benzene azo benzene, aniline, and NaBr (Anschütz & Schultz, *B* 9, 1398, Claus & Roques, *B* 16, 909) —3 By dissolving in cooled fuming HNO_3 it is converted into tri nitro aniline (picramide) (Hager, *B* 18, 2578) —4 By nitra-

tion of *p* bromaniline dissolved in 10 pts. of H_2SO_4 bromo-nitro-aniline $\text{C}_6\text{H}_3\text{Br(NO}_2)(\text{NH}_2)$ [43 1] is produced (Nöling & Collin, *B* 17, 266) —5 **Cyanogen** forms a compound $\text{C}_6\text{H}_3\text{BrNH(CNH)(C(NH)NHC}_2\text{H}_5)$ [245°], white plates (from alcohol) (Sent, *J* *pr* [2] 85, 530)

Salts — B^+HCl^- monoclinic — $\text{B}^+\text{H}_2\text{PtCl}_6^-$ — $\text{B}^+\text{HBr}_2\text{aq}$ monoclinic prisms (Staedel, *B* 16, 28) — $\text{B}^+\text{H}_2\text{SO}_4^-$ laminae — $\text{B}^+\text{H}_2\text{C}_2\text{O}_4^-$

Formyl derivative $\text{C}_6\text{H}_3\text{BrNH(CO H)}$ [119°] Long white needles Insol cold water, sl sol hot water, v sol alcohol and ether Prepared by heating *p* bromaniline with formic ether, or by brominating formanilide (Dennstedt, *B* 13, 234)

Thioformyl derivative $\text{C}_6\text{H}_3\text{BrNH(CS H)}$ [190°] Needles V sol hot ether and alcohol Prepared by the action of P_2S_5 on the preceding body (Dennstedt, *B* 13, 236)

Acetyl derivative [166°] From acetanilide in glacial HOAc and Br (Remmers, *B* 7, 346, Gurke, *B* 8, 1114) Also from *p* bromo aniline and AcCl (Körner, *G* 4, 329), or acetamide (Kelbe, *B* 16, 1200) Monoclinic prisms $abc = 1.538 : 1.1435$ (Panbianco, *G* 9, 357) M sol. alcohol, v sl sol water

Isobutyryl derivative $\text{C}_6\text{H}_3\text{BrNH(C}_3\text{H}_7\text{O)}$ [128°] From isobutyryl-aniline and Br vapour (Norton, *Am* 7, 117). Needles (from alcohol)

Benzoyl derivative $\text{C}_6\text{H}_3\text{Br(NHBz)}$ [202°] From benzanilide and Br (Meinecke, *B* 8, 564)

Oxalyl derivative $\text{C}_6\text{O}_2(\text{NH C}_6\text{H}_4\text{Br})_2$ [above 200°] From Br and oxanilide in HOAc (Dyer & Mixer, *Am* 8, 351)

Di bromo-aniline $\text{C}_6\text{H}_3\text{Br}_2(\text{NH}_2)$ [1 3 4] [79°] **Formation** —1 By saponifying dibrominated acetanilide (Griess, *A* 121, 266), or brominated *o*- or *p* bromo acetanilide (Körner, *G* 4, 329) —2 Together with mono and tri bromo aniline by brominating aniline (Kekulé, *K* 2, 635) —3 By distilling di bromo isatin with KOH (Hofmann, *A* 53, 47) —4 Together with mono- and tri-bromo aniline by heating nitrobenzene with conc HBrAq at 190° (Baumhauer, *B* 2, 122, *Z* [2] 5, 198) —5 By reducing di-bromo-nitrobenzene (Wurster, *B* 6, 1491)

Properties —Needles or long plates **Salts** — B^+HCl^- — $\text{B}^+\text{H}_2\text{PtCl}_6^-$ — $\text{B}^+\text{H}_2\text{SO}_4^-$

Acetyl derivative $\text{C}_6\text{H}_2\text{Br}_2\text{NHAc}$ [146°]

Benzoyl derivative $\text{C}_6\text{H}_2\text{Br}_2\text{NBz}$ [1 8 4] [184°] From benzanilide and Br (Hubner, *B* 10, 1710)

Di-bromo-aniline $\text{C}_6\text{H}_3\text{Br}_2(\text{NH}_2)$ [1 3 5]. [57°] From *p* nitro acetanilide, by successive conversion into nitro aniline, di bromo nitro-aniline, and di bromo nitro benzene, and reduction of the product (Körner, *G* 4, 368, Langer, *A* 215, 116) Needles

Di-bromo aniline $\text{C}_6\text{H}_3\text{Br}_2(\text{NH}_2)$ [1 2 4] [80°] From the corresponding di bromo-nitrobenzene [58°] (Körner, *G* 4, 370)

Di-bromo-aniline $\text{C}_6\text{H}_3\text{Br}_2(\text{NH}_2)$ [1 4 3] [52°] From the corresponding nitro-compound [85°] (Riche & Berard, *C* *R* 59, 141, Meyer & Stuber, *A* 165, 180)

Tri-bromo-aniline $\text{C}_6\text{H}_2\text{Br}_3(\text{NH}_2)$ [1.3.5.6]. [119°] (300°).

Formation—1 By the action of bromine on aniline or on an aqueous solution of a salt of aniline (Fritzsche, *A* 44, 291, *J pr* 28, 204, Hofmann, *A* 53, 50)—2 By the action of Br on *o*- or *p* bromo aniline (Körner, *G* 4, 305)—3 By reduction of tri bromo nitro benzene (K) 4 Together with aniline and di bromo aniline by the dry distillation of *p* bromo aniline or by heating it with HClAq at 160° (Bacner, *B* 8, 361)

Preparation—Bromine (500 g) is gradually added to aniline (100 g), as soon as a solid mass is formed glacial acetic acid is added and the addition of bromine continued until the mass has a red colour. The product is washed with dilute alcohol and water and crystallised from alcohol (H Silberstein, *J pr* [2] 27, 101) Yield 80 per cent

Properties—Long colourless needles

Reactions—1 N_2O_5 passed into tri bromo aniline half dissolved, half suspended in alcohol, gives a yellow pp of tribromo diazo benzene nitrate—2 Converted by diazo reactions into tri bromo benzene and into *u* tetra bromo benzene—3 Conc HNO_3 gives di bromo di nitro methane, tetra bromo quinone, *u* tetra bromo benzene, picric acid, and oxalic acid (Losanitsch, *B* 15, 472)

Salts—The salts are very unstable, and cannot be formed in aqueous solution. $BHBr$ small white needles [190°], insol ether and benzene, decomposed by water— $BHCl$ small white needles (Gattermann, *B* 16, 630)

Acetyl derivative $C_6H_3Br_3NHAc$ [232°] (Remmers, *B* 7, 349)

Diacetyl derivative $C_6H_3Br_3NAc_2$ [123°]

Tri bromo-aniline $C_6H_3Br_3(NH_2)$ [1 2 3 5] [above 130°] From tri bromo nitro benzene [112°] (Körner, *G* 4, 328) Its salts are not decomposed by water

Tetra-bromo aniline $C_6H_2Br_4(NH_2)$ [1 2 3 5 6] [115°] Formed by brominating *m* bromo aniline, or (1, 4, 3) di bromo aniline (Körner, *G* 4, 328, Wurster a Nolting, *B* 7, 1564) Is a by product in the action of bromine on nitro benzene in presence of $FeBr_3$ (Scheufelen, *A* 231, 161) Needles. Converted by the diazo reaction into *u* tetra bromo benzene

Penta-bromo aniline $C_6HBr_5NH_2$ [222°] Obtained by brominating (1, 3, 5) di bromo aniline (Körner, *G* 4, 368) Large needles (from alcohol mixed with toluene)

BROMOANILINE SULPHONIC ACID ν
BROMO AMIDO BENZENE SULPHONIC ACID

BROMO ANISIC ACID ν **Methyl derivative**
of Bromo oxy benzoic acid

BROMO ANISIDINE ν **Methyl Bromo-amido-phenol**

BROMO ANTHRACENE $C_{14}H_9Br$ [100°] Obtained by warming anthracene dibromide. Needles. Forms a red picric acid compound

(*A* 1, 2) Di-bromo-anthracene $C_{14}H_7Br_2$ [221°] From Br and anthracene in CS_2 (Graebe a Liebermann, *A Suppl* 7, 275) From triphenyl methane in CS_2 and bromine in sunlight (triphenyl-methyl bromide being also formed) (Allen a Köhler, *A* 227, 109, 228, 254) Golden needles (from toluene), may be sublimed. ν sl sol. alcohol and ether. Alcoholic KOH at 100° forms anthracene. Dilute HNO_3 gives anthra

quinone. The compound with picric acid is red. Combines with Br forming $C_{14}H_5Br_3$ [170°-180°], decomposed at 180° into tri bromo-anthracene, HBr , and Br

Di bromo anthracene $C_{14}H_7Br_2$ [*B* 1 2]? [192°] From di bromo anthraquinone, HI, and P at 150° (Miller, *A* 182, 367) Golden tables (from alcohol) Oxidises to di bromo anthraquinone.

Tri bromo anthracene $C_{14}H_5Br_3$ [*A* 1, 2, *B*] [169°] Formed by heating (*A* 1, 2) di bromo-anthracene tetrabromide (*G* a *L*) Yellow needles (from benzene) Oxidised by HNO_3 to bromo anthraquinone (Claus a Hertel, *B* 14, 979)—**Bromide** $C_{14}H_5Br_3$

Tetra bromo anthracene $C_{14}H_3Br_4$ [*A* 1, 2, *B* 1, 2]? [254°] From di bromo-anthracene tetrabromide and alcoholic KOH (Anderson, *A* 122, 301, *G* a *L*) Yellow needles (from xylene) Gives di bromo anthraquinone on oxidation—**Bromide** $C_{14}H_3Br_4$ [212°] (Hammerschlag, *B* 10, 1212)

Penta bromo anthracene $C_{14}HBr_5$ [212°] Formed by heating tetra bromo anthracene tetrabromide at 230° (*H*) Yellow powder Oxidises to tetra bromo anthraquinone

Hexa bromo-anthracene $C_{14}HBr_6$ [310°-320°] Prepared by the action of Br in presence of I on di bromo anthracene (Diehl, *B* 11, 178) Oxidised by $K_2Cr_2O_7$ and H_2SO_4 to tetra bromo-anthraquinone [*c* 300°]

Hexa bromo anthracene $C_{14}HBr_6$ [above 370°] From $C_{14}H_5Br_3$ and alcoholic NaOH (*H*) Silky yellow needles (from kerosene) Oxidation gives tetra bromo anthraquinone [above 370°]

Hepta bromo anthracene $C_{14}HBr_7$ [above 350°] Prepared by the prolonged action of Br at 200° in presence of I on di bromo anthracene (*D*) Yellow needles. Insol alcohol and ether

Octo bromo-anthracene $C_{14}HBr_8$ Formed by very prolonged action of iodine bromide at 350° on hepta bromo anthracene (*D*) Needles. Insol most ordinary solvents, sl sol nitro benzene and aniline

(*A* 1) - **BROMO - ANTHRACENE** (*A* 2) - **CARBOXYLIC ACID** $C_{14}H_7\langle\begin{smallmatrix} C(CO_2H) \\ CBr \end{smallmatrix}\rangle C_6H_5$ [266°]

Formed by the action of bromine upon anthracene (*A*) carboxylic acid in acetic acid. Long glistening yellow needles. Sublimable. Sol alcohol, ether, and acetic acid, ν sl sol benzene and water. Its solutions have a blue fluorescence. Evolves CO_2 at its melting-point leaving bromo anthracene

Salts— AgA' yellow microscopic prisms— KA' long very slender yellow needles— BaA' yellowish needles (Behla, *B* 20, 704)

DI BROMO - ANTHRACENE DISULPHONIC ACID $C_{14}H_5Br_2(SO_3H)_2$ From di bromo anthracene and fuming H_2SO_4 (Perkin, *C J* 24, 19). Oxidises to anthraquinone disulphonic acid.

Salts— Na_2A' — BaA'

BROMO ANTHRANOL $C_{14}H_9OBr$ ν

$C_6H_5\langle\begin{smallmatrix} C(OH) \\ CBr \end{smallmatrix}\rangle C_6H_5$ or $C_6H_5\langle\begin{smallmatrix} CO \\ CBrH \end{smallmatrix}\rangle C_6H_5$

[148°-151°] Formed by the action of (1 mol of) bromine upon anthranol (1 mol) dissolved in CS_2 . Yellowish crystals. Insol boiling aqueous, but converted by cold alcoholic KOH into an orange K salt (Goldmann, *B* 20, 2137)

Di-bromo-anthranol $C_{12}H_8OBr_2$, *ts.*

$C_{12}H_8O \begin{smallmatrix} CO \\ CBr_2 \end{smallmatrix} C_6H_4$ *Anthraquinone bromide*

[157°] Formed by the action of (rather more than 2 mol of) bromine upon anthranol (1 mol) dissolved in CS_2 . Large rhombic crystals. Insol. aqueous alkalis. By boiling with acetic acid it is readily converted into anthraquinone.

(B 1)-BROMO-ANTHRAQUINONE

$C_{14}H_8BrO_2$, [188°] Yellow needles. Sublimable. Prepared by heating *o* bromo benzoylbenzoic acid $C_6H_4Br CO C_6H_4 CO_2H$ with H_2SO_4 to 180°. On fusion with KOH it gives *erythro* oxy anthraquinone (Pechmann, *B* 12, 2127).

(B 2) - Bromo - anthraquinone $C_{14}H_8BrO_2$ [187°] Formed by oxidation of tri bromo anthracene with CrO_3 and HOAc (Graebe a Liebermann, *A Suppl* 7, 290). Yellow needles, may be sublimed, sl sol alcohol, m sol hot benzene. Converted by potash fusion into alizarin.

Di-bromo anthraquinone $C_{14}H_6OBr_2$, [265°]

Formation — 1 By brominating anthraquinone (Graebe a Liebermann, *A Suppl* 7, 289, Diehl, *B* 11, 181) — 2 By oxidation of tetra bromo-anthracene or di chloro di bromo anthracene with CrO_3 (G a L, Hammerschlag, *B* 19, 1107).

Properties — Boils with slight decomposition, sl sol boiling alcohol, m sol glacial HOAc. Potash-fusion at 250° gives alizarin. According to Peikin (*C J* 87, 554, *priv com*) the di bromo anthraquinone formed by the first method melts at 245° (or 250° cor) and differs from that formed by the second method, which melts at 275° (or 281.5° cor) by giving, on potash-fusion, not only alizarin but also flavo purpurin and anthrapurpurin (tri oxy anthraquinone).

Tri bromo-anthraquinone $C_{14}H_4Br_3O_2$, [186°] Prepared by the action of Br in presence of I upon anthraquinone or di bromo anthraquinone at 260° (Diehl, *B* 11, 182). Yellow needles, insol alcohol.

Tri - bromo - anthraquinone $C_{14}H_4Br_3O_2$, [365°] From penta bromo anthracene, CrO_3 , and HOAc (Hammerschlag, *B* 10, 1213). Flat needles (by sublimation).

Tetra - bromo anthraquinone $C_{14}H_2Br_4O_2$, [295°-300°] Formed by oxidising hexa bromo anthracene [320°] or by brominating tri bromo anthraquinone [186°] in presence of I (D). Yellow needles.

Tetra - bromo - anthraquinone $C_{14}H_2Br_4O_2$, [above 370°] Formed by oxidising hexa bromo anthracene [above 370°] (H). Yellow needles.

Penta - bromo anthraquinone $C_{14}H_2Br_5O_2$, Formed by oxidation of hepta bromo anthracene (D). Sublimes with difficulty without melting, sl sol boiling toluene.

DI BROMO DIANTHRYL $C_{18}H_{12}Br_2$, [far above 300°] Yellow prisms (from toluene). Formed by bromination of dianthryl dissolved in CS_2 (Liebermann a Gumbel, *B* 20, 1855).

DI - BROMO - APOPHYLLINIC ACID

$C_{12}H_8BrN_2O_4$, *ts* $C_6NH_2Br(CO H)(CO_2Me)$ or $C_6NH_2MeBr(CO_2H) \begin{smallmatrix} CO \\ CO \end{smallmatrix}$ *Methyl ether of bromo-pyridine dicarboxylic acid?* From bromo tarconine (a derivative of narconine) and Br (v Gerichten, *A* 210, 91). Hard prisms (con-

taining 2aq), sol hot water. Its solutions give no pps with salts of Pb, Ag, or Cu. Heated with conc HCl it forms CO_2 , MeCl, and a bromo pyridine carboxylic acid (?) [199°].

Salt — BaA', 3aq

DI - BROMO - APOPHYLLIN $C_{12}H_8Br_2N_2O_4$

[229°] From bromo tarconine or bromo apophyllenic acid and bromine-water (v Gerichten, *A* 210, 94). Six sided tables (containing 4aq), sol water, insol ether. Alkalis form a deep red solution. HCl at 150° gives CO_2 , MeCl, di bromo pyridine, and di bromo pyridine methyl chloride.

Salts — B"HCl — B"2HCl — B"H₂PtCl₄aq — B"HBr — B"2HBr

DI - BROMO ATROLACTIC ACID *v* $\beta\beta$ DI

BROMO α OXY- α PHENYL PROPIONIC ACID

BROMO - ATROPIC ACID $C_{12}H_8BrO_2$, *ts.*

$Ph C_6H_4Br CO_2H$ *Exo bromo α phenyl acrylic acid* [130°] From the compound of atropic acid (1 mol) with HBr (2 mols) by boiling with water (Fitting a Wurster, *A* 195, 162). Slender needles (from water).

TETRA BROMO - AURIN $C_{12}H_4Br_4O_2$

Formed by brominating aurin dissolved in HOAc (Dale a Schorlemmer, *C J* 85, 152, cf Zulkowsky, *M* 3, 465). Bronzed crystals. Alkalis form violet solutions.

Salt — A"Ag, dark violet insoluble pp

Ethyl ether A"Et, [110°-115°], microscopic reddish crystals, sol alcohol, ether, and benzene (Ackermann, *B* 17, 1626).

BROMO AZO BENZENE *v* pp 374, 379**TETRA-BROMO-AZOPHENINE** $C_{12}H_4Br_4N_2$

[243°] Formed by heating *p* nitroso di-phenylamine with *p* bromo aniline and *p* bromo aniline hydrochloride at 100°. Greatly resembles azophenine (O Fischer a Hepp, *B* 20, 2481).

BROMO AZO TOLUENE *v* p 394**DI BROMO AZOXY BENZENE** *v* p 427**BROMO AZOXY-TOLUENE** *v* p 428**BROMO - BARBITURIC ACID** $C_4H_4BrN_2O_3$

ts $CHBr \begin{smallmatrix} CO NH \\ CO NH \end{smallmatrix} CO$ *Bromo malonyl-urea*

Ureide of bromo malonic acid. From di bromo barbituric acid by reduction with Na or Zn, or by evaporating with aqueous HCN (Baeyer, *A* 130, 134). Small needles, sl sol cold water.

Salts — NH₄A' — ZnA', 8aq — ZnA', 6aq (Mulder, *B* 12, 2309).

Di bromo barbituric acid $C_4H_2Br_2N_2O_3$, *Di-bromo malonyl urea*. Formed by the action of Br on barbituric, nitro barbituric, nitroso barbituric, and hydruic acids (Baeyer, *A* 127, 199, 130, 130).

Preparation — From di bromo-oxy-methyl-uracil and fuming HNO_3 (Behrend, *A* 236, 62).

Properties — Trimetric crystals. Sol. water, v sol hot alcohol and ether.

Reactions — 1 Boiling water forms alloxan and HBr — 2 HI reduces it to hydruic and barbituric acids — 3 H_2S forms dialuric acid. — 4 Bromine water forms CO_2 and tri-bromo-acetyl urea — 5 Alkalis form CO_2 , tri bromo-acetyl urea, and bromo barbituric acid — 6 Thio urea forms so-called thio pseudo-uric acid $C_4N_2H_2O_2S$ (Trzcinski, *B* 16, 1057) — 7 Potassium sulphocyanide forms sulphocyno-barbituric acid $C_4N_2H_2SO_3$ (T).

Di bromo-di-barbituric acid $C_4H_2Br_2N_2O_4$, aq Prisms (Baeyer, A 130, 145, cf p 440) — $C_4H_2Br_2N_2O_4 \cdot HBr$ Prisms, v al. sol water

DI-BROMO-BEHENIC ACID $C_{22}H_{34}Br_2O_8$ [48°] From erucic acid $C_{22}H_{42}O_8$ and bromine (Haussknecht, A 143, 40, Otto, A 135, 226) Nodules Converted by alcoholic KOH to bromo-erucic acid, $C_{21}H_{31}BrO_8$, and behenic acid $C_{22}H_{40}O_8$. Moist Ag_2O forms oxy-erucic acid and di-oxy-behemic acid Sodium amalgam forms erucic acid Salts — BaA_2 , — PbA_2

Di bromo-behemic acid $C_{22}H_{34}Br_2O_8$ [54°] From brassic acid and bromine (H) Reduced by sodium amalgam to brassic acid. Alcoholic KOH at 220° gives behenic acid

Tri-bromo-behemic acid $C_{22}H_{31}Br_3O_8$ [32°]

From bromo-erucic acid and bromine (H)

Tetra-bromo-behemic acid $C_{22}H_{28}Br_4O_8$ [78°]

From behenic acid and bromine (H) Laminas (from alcohol)

BROMO-BENZALDEHYDE v **BROMO BENZOIC ALDEHYDE**

BROMO-BENZAMIDE v *Amide of Bromo Benzoic Acid*

BROMO BENZANILIDE v *Anilide of Bromo Benzoic Acid*

BROMO-BENZENE C_6H_5Br *Phenyl bromide* Mol w 157 (156°) SG $\frac{22}{4}$ 1.4914 μ_D 1.5736 R_D 55.81 (Bruhl) SV 119.9 (Schiff, B 13, 564) Vapour pressure Ramsay & Young, C J 47, 646

Formation —1 From bromine and benzene, either boiling or in sunlight (Couper, A Ch [3] 52, 309, Schramm, B 18, 606) The reaction is promoted by the presence of I (Ador a Rilliet, B 8, 1287) or $AlCl_3$ (Greene, C R 90, 40, Leroy, Bl [2] 48, 210) —2 Formed by running a solution of $NaNO_2$ into a hot solution of Cu_2Br_2 and aniline in dilute H_2SO_4 (Sandmeyer, B 17, 2652) —3 By heating diazobenzene with a large excess of strong HBr , the yield is 32 p.c of the theoretical (Gasiotowski & Wayss, B 18, 1938) 4 From phenol and bromide of phosphorus (Riche, A 121, 357)

Properties —Oil, not attacked by KOH, KCl, or $AgOAc$

Reactions —1 Boiling with $AlCl_3$ produces benzene and di bromo benzenes (Dumreicher, B 15, 1867) —2 Converted in the animal system into *p* bromo phenyl mercapturic acid $C_6H_4Br \cdot NRSO_3$, *p* bromo phenol, bromo pyrocatechin, and bromo hydroquinone (Baumann & Preusse, H 3, 156, Jaffé, B 12, 1092) —3 Converted by conc H_2SO_4 into di bromo benzene sulphonic acid and bromo benzene di sulphonic acid (Herzig, M 2, 192) —4 $ClSO_3H$ forms $C_6H_4Br(SO_3H)$ [14] and $C_6H_4BrSO_2 \cdot C_6H_4Br$ (Beekurts & Otto, B 11, 2061) —5 Heating with $MeONa$ gives C_6H_4OMe and phenol (Blau, M 7, 621) According to Fittica (B 17, 2634) there is a second bromo benzene [c 62°]

o-Di-bromo-benzene $C_6H_4Br_2$ [12] [−1°] (224°). SG $\frac{22}{4}$ 2.003 Formed in small quantity in preparing *p* di bromo-benzene from benzene and Br (Riese, B 2, 61, A 164, 176) Formed also from *o* nitraniline *via* *o* bromo nitro-benzene (Körner, G 4, 333) HNO_3 forms chiefly di bromo-nitro benzene [58°]

m-Di-bromo-benzene $C_6H_4Br_2$ [13]. (213°) S.G. $\frac{18.5}{4}$ 1.955.

Formation —1 From (1,3,4) di-bromo-aniline (Meyer & Stuber, A 165, 169) —2 From *s* di bromo aniline —3 From *m*-di-nitro-benzene *via* *m*-nitro aniline, *m*-bromo nitro-benzene, and *m*-bromo aniline (K) —4 Together with the *p* isomeride by the action of Br on benzene in presence of $AlCl_3$ (Leroy, Bl [2] 48, 211)

Properties —Has not been solidified Yields with HNO_3 two nitro derivatives [62°] and [83°] Sodium acting on an ethereal solution forms diphenyl, $C_{12}H_9Br_2$ [220°] and $C_{12}H_7Br_2$ [250°], (Goldschmidt, M 7, 45)

p Di-bromo-benzene $C_6H_4Br_2$ [14] [89°] (219°) SVS 127.8 (Schiff)

Formation —1 By bromination of benzene or bromo benzene (Couper, A Ch [3] 52, 309, Riche & Berard, A 133, 51, Riese, A 164, 162, Jannasch, B 10, 1355) —2 From *p* diazo bromo benzene perbromide by heating with alcohol (Griess, C J 20, 66) —3 From *p*-bromo phenol and PBr_3 (A Mayer, A 137, 219) —4 From benzene, Br, and $FeCl_3$ (Schäufelen, A 231, 188)

Preparation —1 By treating benzene with Br and a little I —2 Bromine (960 g) is added slowly to benzene (240 g) and $AlCl_3$ (30 g) On adding water in excess, the product deposited consists of crystals of the para-compound, with an oil, consisting chiefly of the meta compound This oil, however, contains some para di bromo-benzene in solution To separate this, the oil is treated with fuming H_2SO_4 The meta derivative is easily sulphonated in this way, but the para is not affected On adding a large excess of water, the solid $C_6H_4Br_2$ [14] is ppd, and the clear solution of the meta sulphonate distilled with steam gives $C_6H_4Br_2$ [13] (Leroy, Bl [2] 48, 211)

Properties —Prisms or plates, isomorphous with *p* di chloro benzene (Friedel, Bl [2] 11, 38) Sublimable Sl sol alcohol

Reactions —1 Heated for 30 minutes with $AlCl_3$ ($\frac{1}{2}$ part) gives C_6H_5Br , $C_6H_4Br_2$ [13], and two tribromobenzenes, $C_6H_3Br_3$ [124] and [135] (L) —2 HNO_3 forms a nitro derivative [85°] —3 In ethereal solution sodium forms diphenyl, di phenyl benzene, and $C_{12}H_9Br_2$ [265°] and $C_{12}H_7Br_2$ [300°] (Riese, A 164, 164, Goldschmidt, M 7, 42) —4 MeI and Na form *p*-xylene —5 $NaOEt$ at 190° gives C_6H_4BrOEt , bromo benzene, and benzene (Balbiano, G 11, 401) —6 $NaOMe$ forms C_6H_4BrOMe , $C_6H_3(OMe)_2$, and $C_6H_2(OMe)_3(OH)$ (Blau, M 7, 621) —7 Converted by conc H_2SO_4 into tetra and hexa bromo benzene (Herzig, M 2, 192)

c-Tri bromo - benzene $C_6H_3Br_3$ [123] Mol w 315 [87°] From (1,3,5,2) di bromo nitro aniline *via* tri bromo nitro benzene, and tri bromo aniline (Körner, G 4, 401) Tables (from alcohol), may be sublimed.

s Tri-bromo benzene $C_6H_3Br_3$ [135] [110°] (278°) **Formation** —1 From ordinary tri-bromo aniline (Stuber, B 4, 956, A 165, 173, Reinke, A 186, 271, Bassmann, A 191, 206, Silberstein, J pr [2] 27, 104) —2 From (1,3,5)-di bromo aniline (K) —3 In small quantity by the action of light on bromo acetylene (Sabanejeff, J R 17, 176)

Properties —Needles (from alcohol), sl sol alcohol Boiling conc H_2SO_4 forms hexa bromo benzene (Herzig, M 2, 197) $NaOMe$

forms $C_6H_4Br_2(OH)$ and $C_6H_4Br_2(OMe)$ [77°] (Blau, *M* 7, 621)

u-Tri-bromo-benzene $C_6H_3Br_3$ [1 2 4] [44°] (275°) *Formation*—1 From hexa bromo-benzene and alcoholic KOH (Mitscherlich, *P* 35, 374, Lassaigne, *Rev Scient* 5, 360)—2 From (1,3,4) di bromo-phenol and PBr_3 (Mayer, *A* 187, 224)—3 From (1,3,4)-di-bromo-aniline (Grüss, *Tr* 154, 667)—4 From *o*, *m*-, and *p*, di bromo benzene by nitration, reduction, and diazotisation (K)—5 Got from each of the dibromobenzenes by heating with water and bromine at 250° (Wroblewski, *A* 192, 220)—6 From benzene, bromine, and Fe_2Cl_6 (Scheufelen, *A* 231, 138)—7 As a by product, in the preparation of $C_6H_4Br_2$ by the action of Br_2 upon C_6H_6 in presence of Al_2Cl_6 (Leroy, *Bl* [2] 48, 213). *Properties*—Needles, v sl alcohol

t-Tetra bromo benzene $C_6H_2Br_4$ [1 2 4 5] Mol w 394 [175°] *Formation*—1 From *p* di bromo benzene and Br_2 at 150° (Riche a Bérard, *A* 133, 51)—2 From *u* tri bromo benzene and Br_2 —3 From *n* bromo benzene and Br_2 at 250° (Meyer, *B* 15, 46)—4 From benzene (30 g), Fe_2Cl_6 (5 g), and bromine (240 g), the mixture must be cooled (Scheufelen, *A* 231, 187) *Properties*—Long needles (from alcohol)

u Tetra bromo benzene $C_6H_2Br_4$ [1 2 3 5] [98 5°] (329°) *Formation*—1 From (1,3,5,2) tri bromo phenol and PBr_3 (Körner, *A* 137, 218, Mayer, *A* 137, 227)—2 From (1,3,5,2) tri bromo-aniline (Würster a Nölting, *B* 7, 1564, V v Richter, *B* 8, 1428, Silberstein, *J pr* [2] 27, 118)—3 From $C_6H_4Br_2SO_3H$ by heating with HCl (Bassmann, *A* 191, 224)—4 One of the products obtained by heating tri bromo diazo benzene nitrate with benzene (Silberstein, *J pr* [2] 27, 110) *Properties*—Long needles, v sl sol alcohol HNO_3 (S G 150) gives a nitro derivative [96°], fuming HNO_3 (S G 154) gives a di nitro derivative [228°]

Tetra bromo - benzene $C_6H_2Br_4$ [160°] From *p* nitro benzoic acid and Br_2 at 280° (Halberstadt, *B* 14, 911) Needles (from alcohol)

Tetra bromo - benzene $C_6H_2Br_4$ [138°] From *p* di-bromo benzene and boiling conc H_2SO_4 (Herzig, *M* 2, 195) One, if not both, of the two last-mentioned bodies is, doubtless, a mixture

Penta bromo benzene C_6HBr_5 Mol w 473 [260°] *Formation*—1 From Br_2 and nitro-benzene or di nitro benzene at 250° (Kekulé, *A* 137, 172)—2 From *s* tri bromo benzene and fuming H_2SO_4 at 100° (Bassmann, *A* 191, 208)—3 From alizarin and Br_2 at 200° (Diehl, *B* 11, 191) *Properties*—Silky needles, v sl sol alcohol, sol benzene

Hexa - bromo - benzene C_6Br_6 *Per bromo-benzene* [above 315°] *Formation*—1 By the action of Br_2 containing I upon benzene, toluene, or benzene azo benzene at 250°–400° (Gessner, *B* 9, 1505)—2 From tetra bromo quinone and PBr_3 at 280° (Ruoff, *B* 10, 403)—3 From *p* di-bromo benzene (or tri bromo benzene) and conc H_2SO_4 (Herzig, *M* 2, 192)—4 By heating at 360° per-bromo methane, per bromo ethane, per-bromo-butane, per bromo pentane, or per bromo-hexane (Merz a Weith, *B* 11, 2235)—5 By heating benzene with bromine and Al_2Br_6 —6 By heating pentabromo phenol with PBr_3 at 260° (Merz a Weith, *B* 16, 2890)—7 From bromine

(300 g), Fe_2Cl_6 and benzene (17 g) in the cold Good yield (110 g instead of 119 g) (Scheufelen, *A* 231, 189) *Properties*—Long needles (from toluene) V sl sol alcohol and toluene.

BROMO-BENZENE o-SULPHONIC ACID

$C_6H_4BrSO_3H$ [1 2] From *o*-amido-benzene sulphonic acid (Berndsen a Lumprecht, *A* 177, 101; Bahlmann, *A* 181, 203, 186, 315) Long deliquescent needles, v e sol alcohol.— NH_4A' — $KA'aq$ — $BaA'aq$ — BaA'_22aq — CaA'_22aq — PbA'_23aq — AgA'

Chloride $C_6H_4BrSO_3Cl$ [51°]

Amide $C_6H_4BrSO_2NH_2$ [186°]

Bromo-benzene m-sulphonic acid

$C_6H_4BrSO_3H$ [1 3] From amido benzene m-sulphonic acid (Berndsen, *A* 177, 92) Formed also by brominating benzene sulphonic acid or its silver salt (Ross Garrick, *Z* [2] 5, 549, Genz, *B* 2, 405, Nölting, *B* 8, 819, Thomas, *A* 186, 133) Very deliquescent— $KA'aq$ *S* (of KA') 4 4 at 0°— PbA'_22aq — PbA'_28aq —*S* (of PbA'_2) 5 78 at 7°— BaA'_22aq *S*. (of BaA'_2) 3 5 at 14°.

CaA'_2 — AgA'

Chloride $C_6H_4BrSO_3Cl$ Oil

Amide $C_6H_4BrSO_2NH_2$ [154°]

Bromo-benzene- p sulphonic acid

$C_6H_4BrSO_3H$ [1 4] [88°] Deliquescent needles *Formation*—1 By sulphonating bromobenzene with H_2SO_4 , $ClSO_3H$, or SO_3 (Couper, *C R* 45, 230, Ross Garrick, *Z* [2] 5, 549, Armstrong, *Z* [2] 7, 321, Nölting, *B* 8, 594)—2 From *p* amido benzene sulphonic acid (Meyer, *A* 156, 291, Berndsen, *A* 177, 92)

Reactions—The K salt distilled with K_2FeCy_4 gives terephthalonitrile

Salts—(Goslich, *B* 8, 352, *A* 180, 93)— NH_4A' — KA' — CaA'_22aq — BaA'_2 — PbA'_22aq — PbA'_2 — ZnA' — CuA'_26aq — AgA'

Chloride $C_6H_4BrSO_3Cl$ [75°]

Amide [164°] (Bassmann, *A* 191, 247)

Acetyl amide $C_6H_4BrSO_2NHAc$ [199°]

Amide $C_6H_4BrSO_2NHPH$ [119°]

Bromo-benzene di sulphonic acid

$C_6H_3Br_2(SO_3H)_2$ [1 3 4°] From the corresponding amido benzene disulphonic acid (Zander, *A* 198, 28) Deliquescent needles— BaA' 3aq— $PbA'aq$

Chloride $C_6H_3Br_2(SO_3Cl)_2$ [104°]

Amide $C_6H_3Br_2(SO_2NH_2)_2$ [210°]

Bromo benzene di-sulphonic acid

$C_6H_3Br_2(SO_3H)_2$ [1 2 4]

Formation—1 From the corresponding amido benzene disulphonic acid (Zander, *A* 198, 10)—2 From bromo benzene *p* sulphonic acid and SO_3 at 210° (Nölting, *B* 7, 1311)

Properties—Slender deliquescent needles. $K_2A'aq$ — $BaA''4aq$ *S* (of BaA'') 6 at 22°— AgA''

Chloride $C_6H_3Br_2(SO_3Cl)_2$ [108°]

Amide $C_6H_3Br_2(SO_2NH_2)_2$ [239°]

Bromo-benzene di-sulphonic acid

$C_6H_3Br_2(SO_3H)_2$ [1 or 4 5 3°] From the corresponding amido benzene disulphonic acid (Heinzelman, *A* 188, 177) Deliquescent needles *Salts*—(NH_4) A'' — $BaA''2\frac{1}{2}aq$ — $PbA''2\frac{1}{2}aq$

Chloride $C_6H_3Br_2(SO_3Cl)_2$ [99°]

Amide $C_6H_3Br_2(SO_2NH_2)_2$ [245°]

o-Di-bromo-benzene sulphonic acid

$C_6H_3Br_2(SO_3H)_2$ [1 2 3] From the corresponding di-amido-benzene sulphonic acid (Sachse, *A* 188, 153) Deliquescent prisms

Salts — $\text{KA}' - \text{BaA}', 3\text{aq}$ S (of BaA') 143 at 10° — $\text{CaA}', 2\text{aq}$ — $\text{PbA}', 3\text{aq}$

Chloride $\text{C}_6\text{H}_4\text{Br}_2\text{SO}_2\text{Cl}$ [127°]

Amide $\text{C}_6\text{H}_4\text{Br}_2\text{SO}_2\text{NH}_2$ [215°]

o Di bromo benzene sulphonic acid

$\text{C}_6\text{H}_3\text{Br}_2(\text{SO}_3\text{H})$ [1 2 4] [87°] From silver bromo benzene *m* or *p* sulphonate and bromine (Lamprecht & Gosslich, A 186, 145) From $\text{C}_6\text{H}_3\text{Br}(\text{NH}_2)\text{SO}_3\text{H}$ by diazo reaction (Langfurth, A 191, 179, Spiegelberg, A 197, 263) The free acid crystallises with 3aq [68°]

Salts — $\text{KA}' - \text{NH}_4\text{A}' - \text{BaA}', 2\text{aq}$ — $\text{BaA}', 3\text{aq}$ S (of BaA') 3 at 11° — $\text{CaA}'_2 - \text{PbA}', 2\text{aq}$ S (of PbA') 26 at 7° — AgA'

Chloride $\text{C}_6\text{H}_3\text{Br}_2\text{SO}_2\text{Cl}$ Oil

Amide $\text{C}_6\text{H}_3\text{Br}_2\text{SO}_2\text{NH}_2$ [175°]

m Di-bromo-benzene sulphonic acid

$\text{C}_6\text{H}_3\text{Br}_2(\text{SO}_3\text{H})$ [1 3 5] From dibrominated *o* or *p* amido benzene sulphonic acid by the diazo reaction (Lamprecht, B 8, 1066, A 181, 201, Schmitt, A 120, 158, Lenz, A 181, 23) It is also a product of the action of conc H_2SO_4 on bromo benzene (Herzig, M 2, 192) Crystalline

Salts — $\text{NH}_4\text{A}' - \text{KA}' - \text{BaA}', 3\frac{1}{2}\text{aq}$ S (of BaA') 28 at 18° — $\text{CaA}'_2, 3\frac{1}{2}\text{aq}$ — $\text{PbA}'_2, 1\frac{1}{2}\text{aq}$ S (of PbA') 21 at 18°

Chloride $\text{C}_6\text{H}_3\text{Br}_2\text{SO}_2\text{Cl}$ [57 5°]

Amide $\text{C}_6\text{H}_3\text{Br}_2\text{SO}_2\text{NH}_2$ [203°]

m Di bromo-benzene sulphonic acid

$\text{C}_6\text{H}_3\text{Br}_2\text{SO}_3\text{H}$ [1 3 4] [80° when hydrated], [110° anhydrous] From $\text{C}_6\text{H}_3\text{Br}(\text{NH}_2)\text{SO}_3\text{H}$ [1 3 4 6] by diazo reaction (Langfurth, A 191, 184, Bassmann, A 191, 232) Slender deliquescent needles (containing aq) Sol alcohol, insol ether With HBr at 180° gives H_2SO_4 and *m* di bromo benzene

Salts — $\text{NH}_4\text{A}' - \text{KA}' - \text{BaA}', 2\frac{1}{2}\text{aq}$ (L) — $\text{BaA}'_2, 2\text{aq}$ (B) S (anhydrous) 2 at 10° (L), 1 at 20° (B) — $\text{CaA}'_2, 3\text{aq}$ S (anhydrous) 3 34 at 10° — $\text{PbA}'_2, 3\text{aq}$ S (anhydrous) 1 43 at 8° — AgA'

Chloride $\text{C}_6\text{H}_3\text{Br}_2\text{SO}_2\text{Cl}$ [79°]

Amide $\text{C}_6\text{H}_3\text{Br}_2\text{SO}_2\text{NH}_2$ [190°] (anhydrous)

p Di bromo-benzene sulphonic acid

$\text{C}_6\text{H}_3\text{Br}_2(\text{SO}_3\text{H})$ [1 4 2] [128°]

Formation — 1 By bromination of silver *o* or *m* bromo benzene sulphonate (Bahlmann, A 181, 206, Lamprecht, A 186, 139) — 2 By sulphonation of *p* di bromo benzene (Douglas Williams, Z [2] 7, 302, Hubner & Williams, A 167, 117, Wolz, A 168, 81) — 3 From nitrated bromo benzene *o* or *m* sulphonic acid (Thomas, A 186, 129, B) — 4 From brominated amido benzene *o* sulphonic acid (B) Prisms (containing 3aq), [99°] Conc HBr at 250° gives H_2SO_4 and *p* di bromo-benzene

Salts — (cf Borns, A 187, 350) — $\text{NH}_4\text{A}' - \text{NaA}'_2, 1\frac{1}{2}\text{aq}$ — KA' aq S (of KA') 5 79 at 21° — $\text{AgA}'_2, 1\frac{1}{2}\text{aq}$ — $\text{AgA}'_2, 3\text{aq}$ S (of AgA') 1 69 at 10° — BaA'_2 S 1 01 at 16° — BaA'_2 aq — $\text{BaA}'_2, 2\text{aq}$ — $\text{BaA}'_2, 5\text{aq}$ — $\text{CaA}'_2, 4\text{aq}$ S (of CaA') 5 90 at 22° — $\text{CaA}'_2, 5\text{aq}$ — $\text{CaA}'_2, 10\text{aq}$ — $\text{PbA}'_2, 3\text{aq}$ S (of PbA') 2 56 at 21° — $\text{PbA}'_2, 4\text{aq}$ — $\text{CuA}'_2, 1\frac{1}{2}\text{aq}$

Chloride $\text{C}_6\text{H}_3\text{Br}_2\text{SO}_2\text{Cl}$ [72°]

Amide $\text{C}_6\text{H}_3\text{Br}_2\text{SO}_2\text{NH}_2$ [193°]

Anhydride $(\text{C}_6\text{H}_3\text{Br}_2\text{SO}_3)_2\text{O}$ Obtained by the action of fuming sulphuric acid upon *p* di bromo-benzene. Amorphous powder Nearly insol alcohol, ether, and benzene By boiling alkalis it is converted into salts of the acid, very slowly attacked by boiling water PCl_5 con-

verts it into the chloride (Rosenberg, B 16, 658)

m Di bromo-benzene di sulphonic acid

$\text{C}_6\text{H}_2\text{Br}_2(\text{SO}_3\text{H})_2$ From $\text{C}_6\text{H}_2(\text{NO}_2)_2(\text{SO}_3\text{H})_2$ (Lamprecht, B 8, 290) Deliquescent

p Di-bromo-benzene disulphonic acid

$\text{C}_6\text{H}_2\text{Br}_2(\text{SO}_3\text{H})_2$ Formed by sulphonating *p* di-bromo benzene (Borns, A 187, 366) Small columns — $\text{KA}' - \text{BaA}'_2, 4\frac{1}{2}\text{aq}$

Chloride $\text{C}_6\text{H}_2\text{Br}_2(\text{SO}_3\text{Cl})_2$ [161°]

Amide $\text{C}_6\text{H}_2\text{Br}_2(\text{SO}_3\text{NH}_2)_2$ [240°]

Tri-bromo benzene sulphonic acid

$\text{C}_6\text{H}_2\text{Br}_3\text{SO}_3\text{H}$ [1 3 5 6] [145°] (anhydrous) Formed by sulphonating *s* tri bromo benzene (Reinke, A 186, 271, Bassmann, A 191, 206) Also from $\text{C}_6\text{H}_2(\text{NH}_2)_2\text{Br}_2\text{SO}_3\text{H}$ [1 2 4 6 3] by diazo reaction (Langfurth, A 191, 191) Six sided tables (containing aq) [95°] Water at 180° forms H_2SO_4 and *s*-tri bromo benzene

Salts — $\text{NH}_4\text{A}'\text{aq} - \text{KA}'_2, 3\text{aq} - \text{KA}'\text{aq}$ S (of KA') 81 at $5 5$ (B) — $\text{BaA}'_2, 9\text{aq} - \text{BaA}'_2, 6\text{aq} - \text{BaA}'_2, 2\text{aq}$ S (of BaA') 41 at $5 5^\circ$ (L), 22 at $7 5^\circ$ (B) — $\text{CaA}'_2, 8\text{aq}$ S (of CaA') 1 90 at 7° (L), 3 5 at $2 5^\circ$ (B) — $\text{CaA}'_2, 4\text{aq} - \text{CaA}'_2, 7\text{aq} - \text{PbA}'_2, \text{aq} - \text{PbA}'_2, 9\text{aq} - \text{PbA}'_2, 2\text{aq}$ S (of PbA') 36 at 7° (B) — $\text{AgA}'\text{aq}$

Chloride $\text{C}_6\text{H}_2\text{Br}_3\text{SO}_2\text{Cl}$ [65°]

Amide $\text{C}_6\text{H}_2\text{Br}_3\text{SO}_2\text{NH}_2$ Decomposes above 220°

Tri bromo benzene sulphonic acid

$\text{C}_6\text{H}_2\text{Br}_3\text{SO}_3\text{H}$ [1 2 4 5] [140° anhydrous] From (1, 2, 4, 5) or (2, 4, 1, 5) di bromo amido benzene sulphonic acid by diazo reaction (Langfurth, A 191, 188, Reinke, A 186, 283, Knuth, A 186, 303, Spiegelberg A 197, 282) Needles (containing 3aq) [80°] With HBr at 200° gives H_2SO_4 and $\text{C}_6\text{H}_2\text{Br}_3$ [1 2 4]

Salts — $\text{NH}_4\text{A}'\text{aq} - \text{KA}'\text{aq} - \text{KA}'\text{aq}$ S (of KA') 1 03 at 20° (B), 77 at 22° (S) — $\text{BaA}'_2, 3\text{aq}$ S 122 at 12° — $\text{BaA}'_2, 2\text{aq} - \text{BaA}'_2, 6\text{aq} - \text{CaA}'_2, 6\text{aq} - \text{PbA}'_2, 4\text{aq} - \text{AgA}'$

Chloride — $\text{C}_6\text{H}_2\text{Br}_3\text{SO}_2\text{Cl}$ [86 5°]

Amide — $\text{C}_6\text{H}_2\text{Br}_3\text{SO}_2\text{NH}_2$ [c 225°]

Anhydride $(\text{C}_6\text{H}_2\text{Br}_3\text{SO}_3)_2\text{O}$ Obtained by the action of fuming sulphuric acid upon tri bromo benzene (1 2 4) Amorphous powder Almost insol alcohol, ether, and benzene By boiling aqueous alkalis it is converted into salts of the acid, only very slowly attacked by boiling water PCl_5 converts it into the chloride (*supra*) (Rosenberg, B 19, 654)

Tri bromo benzene sulphonic acid

$\text{C}_6\text{H}_2\text{Br}_3\text{SO}_3\text{H}$ [1 2 3 6] From di brominated amido benzene *p*-sulphonic acid (Lenz, B 8, 1067, A 181, 29) — $\text{NH}_4\text{A}' - \text{KA}' - \text{CaA}'_2, 2\frac{1}{2}\text{aq}$ S 39 at 20° — $\text{BaA}'_2, 3\text{aq}$ S (of BaA') 0 21 at 18° — $\text{PbA}'_2, 3\frac{1}{2}\text{aq}$ S 0 56 at 21°

Chloride $\text{C}_6\text{H}_2\text{Br}_3\text{SO}_2\text{Cl}$ [127°]

Amide $\text{C}_6\text{H}_2\text{Br}_3\text{SO}_2\text{NH}_2$ [210°]

Tri bromo benzene sulphonic acid

$\text{C}_6\text{H}_2\text{Br}_3\text{SO}_3\text{H}$ [1 2 3 5] From silver (1, 2, 4) di bromo benzene sulphonate and Br (Gosslich, A 186, 154) Is perhaps identical with the preceding — $\text{BaA}'_2, 3\frac{1}{2}\text{aq}$

Chloride [121°] Amide [152°]

Tri bromo-benzene sulphonic acid

$\text{C}_6\text{H}_2\text{Br}_3\text{SO}_3\text{H}$ [1 3 4 5] From nitrated (1, 3, 5) di bromo benzene sulphonic acid (Lenz, A 181, 39) — $\text{KA}'\text{aq} - \text{BaA}'_2, \text{aq}$

Chloride $\text{C}_6\text{H}_2\text{Br}_3\text{SO}_2\text{Cl}$ [80°]

Amide $\text{C}_6\text{H}_2\text{Br}_3\text{SO}_2\text{NH}_2$ Blackens at 225° .

Tri-bromo benzene sulphonic acid

C₆H₃Br₃SO₃H Possibly identical with the preceding. From nitrated (1, 4, 2) di bromo benzene sulphonic acid (Borns, *A* 187, 364) — **KA' 3½aq** — **BaA', 2aq**

Amide [above 220°]

Tri-bromo-benzene sulphonic acid

C₆H₃Br₃SO₃H From silver bromo benzene *o*-sulphonate and Br (Bahlmann, *A* 181, 207)

Chloride C₆H₃Br₃SO₃Cl [56°]

Amide C₆H₃Br₃SO₂NH₂ [202°]

Tri bromo benzene sulphonic acid

C₆H₃Br₃SO₃H Formed at the same time as the preceding (B)

Chloride C₆H₃Br₃SO₃Cl [72°]

Amide C₆H₃Br₃SO₂NH₂ [187°]

Nine tri bromo benzene sulphonic acids are here described, but only six are indicated by theory

Tri-bromo benzene di sulphonic acid

C₆HBr₃(SO₃H)₂ From benzene *m* di sulphonic acid by nitration, reduction, bromination to C₆HBr₃(NH)(SO₃H)₂ and diazotisation (Heinzelmann, *A* 183, 183) — Salt **KA'**

Tetra bromo benzene sulphonic acid

C₆HBr₄SO₃H 5aq [1 2 3 5 6]

Formation — 1 From C₆HBr₃(NH)SO₃H [1 3 5 4 6] by diazo reaction (Beckurts, *A* 181, 216, Langfurth, *A* 191, 199, Knuth, *A* 186, 229, Reincke, *A* 186, 232) — 2 From C₆HBr and H SO₃ (Bassmann, *A* 191, 223) Needles Not hygroscopic but v sol alcohol and water

Reaction — With conc HBr at 150° gives H SO₃ and (1,2,3,5) tetra bromo benzene [98 5°]

Salts — **KA'** S 63 at 6° — **BaA', 1½aq** — **CaA', 8aq** — S (of **CaA', 1½aq**) 54 at 3°, 66 at 19° (**Ba**) — **NH₄A'** — **PbA', PbO 3aq** — **PbA', 1½aq** S (of **PbA', 89** at 11° (**Ba**) — **PbA', 4aq**

Chloride C₆HBr₄SO₃Cl [96°]

Amide C₆HBr₄SO₂NH₂ Minute needles Not melted at 300°

Tetra bromo benzene sulphonic acid

C₆HBr₄(SO₃H) [1 2 3 4 5] [169°] From (1,2,3,5) tri bromo benzene sulphonic acid by nitration, reduction, and diazotisation (Lenz, *A* 181, 23) Also in the same way from (1,2,4,5) tri bromo benzene sulphonic acid (Spiegelberg, *A* 197, 292) Laminae (containing 2aq)

Salts — **KA'aq** S (of **KA'**) 194 at 11° — **NH₄A'** S 95 at 11° — **BaA', 1aq** S (of **BaA'**) 0204 at 10 5° — **CaA', 3aq** S (of **CaA', 159** at 11° — **PbA', 3aq** S (of **PbA'**) 0484 at 11° — **AgA', 1aq** S (of **AgA'**) 146 at 11° — **AgA', 4aq**

Chloride C₆HBr₄SO₃Cl [120°]

Amide C₆HBr₄SO₂NH₂ Turns brown at 240°

Penta bromo benzene sulphonic acid

C₆Br₅SO₃H S 548 at 10° From either tetra bromo amido benzene sulphonic acid by diazo reaction (Beckurts, *A* 181, 226, Heinzelmann a Spiegelberg, *A* 197, 306, Langfurth, *A* 191, 205) Needles or plates (containing 2aq)

Salts — **NH₄A'** — **KA'aq** S (of **KA'**) 116 at 10 5° — **CaA', 4aq** S (of **CaA', 78** at 14° — **BaA', 2aq** S (of **BaA', 0088** at 13° — **BaA', 1½aq** **AgA', 1½aq**

Chloride C₆Br₅SO₃Cl [154°]

Amide C₆Br₅SO₂NH₂ Decomposes at 250°

BROMO-BENZIDINE v **BROMO DI AMIDO-DIPHENYL**

o-BROMO-BENZOIC ACID C₆H₄BrO₂

C₆H₄Br CO₂H [1 2] Mol w 201 [148°] (*Z*, *J* a *W*), [150°] (*R*)

Formation — 1 From *o* amido benzoic acid (Richter, *B* 4, 465) — 2 By heating C₆H₄Br(NO₂) [1 3] with KCy at 180° (*R*) — 3 By oxidation of *o* bromo toluene (Zincke, *B* 7, 1502, Rahlus, *A* 198, 99), *o* bromo diphenyl (Schultz, *A* 207, 353), or *o* bromo benzyl alcohol (Jackson a White, *Am* 2, 316)

Properties — Long needles (from water), m sol water, v sol alcohol, and ether, slightly volatile with steam

Salts — **BaA', 2HOEt** — **CaA', 3aq** — **KA' 2aq** — **ZnA', 2** — **PbA', HOEt** — **CuA', 4aq** [257°] — **HOCA'**

Methyl ether MeA' (247°)

Ethyl ether EtA' (255°)

Anilide C₆H₄Br CONPhH [142°]

m Bromo benzoic acid C₆H₄BrCO₂H [1 3] [155°] (280°)

Formation — 1 From AgOBr and Br (Peligot, *A* 28, 246, Angerstein, *A* 158, 2) — 2 From benzoic acid and Br in the sunshine (Herzog, *N Br Arch* 23, 16) or by heating them with water at 100° or 160° (Reinecke, *Z* 1865, 116, 1869, 100, Hubner, *A* 143, 233, 149, 131) — 3 By heating benzamide with Br and water (Reinecke, *Z* 1866, 367, Friedburg, *A* 158, 26) — 4 From *m* amido benzoic acid by diazo reaction (Griess, *A* 117, 25, Hubner, *A* 222, 100) — 5 From C₆H₄Br(NO₂) [1 4], KCy, and alcohol at 200° (Richter, *B* 4, 464) — 6 By oxidation of *m* bromo toluene (Wiolewsky, *Z* [2] 5, 332, *A* 168, 156) or *m* bromo benzyl alcohol (Jackson, *Am* 1, 93) — 7 By the action of a hot solution of cuprous cyanide in potassium cyanide upon *m* bromo diazobenzene chloride (from *m* bromaniline), and saponification of the crude nitrile (Sandmeyer, *B* 18, 1496) — 8 From *m* di bromo benzene, ClCO₂Et, and Na (Wurster, *A* 176, 149)

Properties — Crystalline, very slightly volatile with steam, sl sol water, v sol alcohol

Reactions — 1 *Potash fusion* gives *m* and a little *o* oxy benzoic acid (Richter, *Z* 1869, 457, Baith, *A* 153, 236) — 2 The *K* salt fused with sodium formate gives isophthalic acid (*V Meyer* a *Ador*, *A* 159, 15)

Salts — **CaA', 3aq** — **BaA', 4aq** needles.

Methyl ether MeA' [32°]

Ethyl ether EtA' (259°)

Phenyl ether PhA' [65°]

Chloride C₆H₄Br COCl (239°)

Amide C₆H₄Br CONH₂ [150°]

Nitrile C₆H₄BrCN [38°] (225°) From the amide (Engler, *B* 4, 708) Formed also by the action of a hot solution of potassium cuprous cyanide upon *m* bromo diazo benzene chloride (from *m* bromaniline) (Sandmeyer, *B* 18, 1496)

p Bromo benzoic acid C₆H₄Br CO₂H [1 4]

[251°] *Formation* — 1 By oxidation of *p* bromo toluene (Hubner, *A* 143, 247, Jackson a Rolfe, *Am* 9, 84), *p*-bromo ethyl benzene (Fitig a König, *A* 144, 283), or *p* bromo benzyl bromide (Jackson, *Am* 1, 93) — 2 From *p*-bromoaniline *via* *p* bromo thio carbimide, the latter when heated with copper at 190° giving *p*-bromo benzotrile (Weith a Landolt, *B* 8, 715)

Properties. — Small needles (from ether) or

plates (from water) ∇ sl. sol water, v sol alcohol and ether—AgA'

Ethyl ether EtA' (236° uncol) at 715 mm Formed, together with *p* bromo benzyl alcohol, by boiling *p* bromo benzyl bromide with alcoholic KOH (Elbs, *J pr* [2] 34, 341)

Phenyl ether PhA' [117°] Scales.

Pyrogallyl ether C₆H₃A' [140°]

Chloride [30°] (246°) Needles

Amide C₆H₄Br CONH₂ [186°]

Anilide C₆H₄Br CONPhH [197°] Plates On nitration it gives a dinitro derivative [214°] (Raveill, *A* 222, 178)

Anhydride (C₆H₄BrCO)₂O [213°] From *p* bromo benzoyl chloride and sodium *p* bromo benzoate (J a R.) Minute oblong rectangular plates (from CHCl₃) Insol water Converted by hot HOEt into the ethyl ether

Di bromo benzoic acid C₆H₃Br₂CO₂H [1 2 3] [147°] From (a) bromo amido benzoic acid [1 2 3] by diazo reaction (Hubner, *A* 222, 105) From (1, 2, 3) di bromo toluene (Nevile a Winther, *B* 13, 965) Silky needles (from water) V sol hot water Heated with H₂SO₄ (3 vols) and H₂O (1 vol) at 225° it gives *o* di bromo benzene [218 5°]

Salts—BaA', 4aq S (of BaA') 444 at 16°—SrA', 4aq—A'CuOH—KA' 2aq

This acid is perhaps identical with the di-bromo benzoic acid [148°] prepared from *o* nitro benzoic acid, Br, and water at 200° (Claus a Lade, *B* 14, 1170)

Di-bromo-benzoic acid C₆H₃Br₂CO₂H [1 4 3] [153°] From (β) bromo amido benzoic acid [1 4 3] by passing nitrous acid gas into a mixture of the acid, HBr, glacial acetic acid and alcohol (Hubner, *A* 222, 108) From nitro *p* di bromo benzene and alcoholic KCy (Richter, *B* 7, 1146) From (1, 4, 3) di bromo toluene by oxidation (Nevile a Winther, *B* 13, 963) Long silky needles (from water) Volatile with steam Heated with H₂SO₄ (3 vols) and water (1 vol) at 225° gives *p*-di bromo benzene [89°]

Salts—BaA', 1½aq—SrA', 4aq—ZnA',—CaA', 3½aq—KA' aq

This acid is probably identical with the di bromo benzoic acid [153°] from *o* nitro benzoic acid, Br, and water at 200° (Claus a Lade, *B* 14, 1170)

Di bromo benzoic acid C₆H₃Br₂CO₂H [1 3 2]? [150°–167°] By oxidising di bromo toluene from di bromo *m* toluidine, [35°] (Nevile a Winther, *C J* 37, 441)

Di-bromo-benzoic acid C₆H₃Br₂CO₂H [1 3 4] [169°] By oxidising di bromo toluene from di bromo *m* toluidine [76°] (Nevile a Winther, *C J* 37, 441)

Di bromo-benzoic acid C₆H₃Br₂CO₂H [1 3 5] [207°–210°] (N a W), [209°] (B), [214°] (H)

Formation—1 By oxidation of di bromo toluene [39°] from di bromo *p* toluidine [73°] (Nevile a Winther, *C J* 37, 437)—2 From *m* di bromo benzene by nitration and treatment with alcoholic KCy at 250° (V v Richter, *B* 8, 1423)—3 From di brominated *p* amido benzoic acid (Bolstein a Gettner, *A* 139, 4)—4 From C₆H₃Br(NH₂)CO₂H, aqueous HBr (SG 148), glacial acetic acid and N₂O, at 15° (Hesemann a Köhler, *A* 222, 171)

Properties—Plates (from alcohol) Needles (from other solvents)

Salts—BaA', 4aq—CaA', 5aq—CdA', 4aq—CaA', 6aq—NaA' aq—CdA', 4aq

Di-bromo-benzoic acid C₆H₃Br₂CO₂H [1 3 x] [223°–227°] Formed by heating benzoic acid with Br and water at 220° (Angerstein, *A* 168, 10) Needles—BaA', 2aq

Di bromo benzoic acid C₆H₃Br₂CO₂H [1 2 4] [229°–230°] (B), [233°] (N a W)

Formation—1 C₆H₄Br(NH₂)CO₂H [4 3 1] is treated with ether and N₂O, and the diazo-derivative treated with HBr (Burghard a Beutnagel, *A* 222, 184)—2 By oxidising the corresponding di bromo toluene from brominated *p* toluidine (Nevile a Winther, *C J* 37, 439)—3 A product of the action of Br on *p* nitro benzene, or (1, 2, 4) di nitro benzoic acid (Halberstadt, *B* 14, 908, 2215)

Properties—Colourless needles (from water), tables (from alcohol)

Salts—BaA', 4aq—SrA', 4aq—HOCuA'—AgA'—KA' aq

Ethyl ether EtA' [38°]

Amide C₆H₃Br₂CONH₂ [151°–152°]

Tri bromo benzoic acid C₆H₂Br₃(CO₂H) [235°] From *m* bromo benzoic acid and Br (Reinecke, *Z* [2] 5, 110) Tufts of slender silky needles, v sl sol water—NH₄A'—CaA', 5aq

Tri-bromo benzoic acid C₆H₂Br₃CO₂H [1 3 5 6] [187°] From tri brominated *m* amido benzoic acid (Vollbrecht, *B* 10, 1708) Needles—BaA', 5½aq

Tri-bromo-benzoic acid C₆H₂Br₃CO₂H [195°] From (1, 2, 4) di bromo benzoic acid [229°] by nitration, reduction, and diazotisation (Smith, *B* 10, 1706) Needles (from alcohol)—BaA', 5aq

Tri-bromo benzoic acid C₆H₂Br₃CO₂H [178°] From (1, 4, 5) bromo amido benzoic acid (Lawrie, *B* 10, 1705) Needles—BaA', 3aq

Penta-bromo-benzoic acid C₆Br₅CO₂H [235°] From tri bromo benzoic acid and Br at 200° (Reinecke, *Z* [2] 5, 110) Thin plates or flat needles (from alcohol), thick needles (from benzene), v sl sol water—NH₄A'—CaA', 6aq

Nitrile C₆Br₅CN [above 300°] Obtained by brominating benzonitrile (Merz a Weith, *B* 16, 2892)

o BROMO BENZOIC ALDEHYDE

C₆H₄BrCHO [1 2] A heavy oil, formed by boiling *o* bromo benzyl bromide with aqueous lead nitrate (Jackson a White, *Am* 3, 33, *P Am* *A* 15, 269)

m Bromo benzoic aldehyde C₆H₄BrCHO [1 3]. Oil (J a W)

p Bromo benzoic aldehyde C₆H₄BrCHO [1 4]. [57°] (Jackson a White, *B* 11, 57)

BROMO BENZOIC SULPHINIDE v BROMOSULPHO BENZOIC ACID

BROMO - BENZOPHENONE C₆H₄BrO *etc* C₆H₃CO C₆H₄Br [81 5°] From benzoic acid, bromo benzene and P₂O₅ at 190° (Kollarits a Merz, *B* 6, 547)

BROMO BENZOYL CHLORIDE v Chloride of BROMO BENZOIC ACID

BROMO DI-BENZYL v BROMO-DI PHENYLETHANE

o-BROMO-BENZYL ALCOHOL C₆H₄BrO *etc* C₆H₄BrCH₂OH [80°] Prepared by digesting *o* bromo-benzyl acetate with aqueous ammonia at 160° Crystallises in white needles Sol. hot water, ligroin, alcohol, ether, benzol, and CS₂

Volatile with steam (Jackson & White, *Am.* 2, 816, *B* 13, 1218)

m-Bromo-benzyl alcohol $C_6H_4BrCH_2OH$
From *m*-bromo benzyl bromide and water at 130° (*J* & *W*)

p-Bromo-benzyl alcohol $C_6H_4BrCH_2OH$ [77°]
Prepared by boiling *p* bromo benzyl bromide with water for 3 days. Long elastic transparent needles. Sol. alcohol, ether, benzene, and CS_2 (Jackson & Lowery, *Am.* 3, 246, *B* 10, 1209)

o-BROMO BENZYL-AMINE $C_6H_4BrCH_2NH_2$
Prepared by acting on *o* bromo benzyl bromide with alcoholic ammonia at 100° for 2 hours (Jackson & White, *Am.* 2, 818). Colourless oil, sol. ether. Salts— $B'HCl$ [208°], needles— $B'_2H_2PtCl_6$ — $B'_2H_2CO_3$ [95°]

p-Bromo-benzyl amine $C_6H_4BrCH_2NH_2$
From *p* bromo benzyl bromide and cold alcoholic NH_3 (Jackson & Lowery, *Am.* 3, 251). Oil, volatile with steam— $B'HCl$ [160°]— $B'_2H_2PtCl_6$ — $B'_2H_2CO_3$ [131°–138°], small prisms

Di-o bromo di benzyl amine
($C_6H_4BrCH_2$) NH [36°]. From *o* bromo benzyl bromide and alcoholic NH_3 at 100°. Trimetric crystals, insol. water (Jackson & White, *Am.* 2, 318, *B* 13, 1219)— $B'HCl$ [166°]— $B'_2H_2PtCl_6$

Di p bromo di benzyl amine
($C_6H_4BrCH_2$) NH [50°]— $B'HCl$ [183°]— $B'_2H_2PtCl_6$ (*J* & *W*)

Tri-o bromo tri benzyl amine ($C_6H_4BrCH_2$) $_3N$ [122°]. From *o* bromo benzyl bromide and alcoholic NH_3 at 100° (*J* & *W*). Small prisms— $B'_2H_2PtCl_6$

Tri p bromo tri benzyl amine ($C_6H_4BrCH_2$) $_3N$
Crystals (from ligroin) [92°], (from ether) [78°]. Slender needles, the hydrochloride could not be obtained— $B'HBr$ [270°], insol. water— $B'_2H_2PtCl_6$ (Jackson & Lowery, *Am.* 3, 252)

o-BROMO BENZYL BROMIDE
 $C_6H_4BrCH_2Br$ [14°] [30°] (250°–260°). *Di bromo toluene*. Prepared by brominating *o*-bromo toluene (Jackson, *Am.* 1, 93, 2, 815, *B* 13, 1218). Very pungent, volatile with steam. Converted in ethereal solution by Na into an thracene, phenanthrene, *s* di phenyl ethane, and other products

m-Bromo benzyl bromide $C_6H_4BrCH_2Br$ [1 3] [41°]. From *m* bromo toluene and Br (Jackson, *Am.* 1, 93, *B* 9, 932). Pungent plates, slightly volatile with steam, very volatile with ether vapour

p-Bromo-benzyl bromide $C_6H_4BrCH_2Br$ [1 4] [62°]. Formed by brominating *p* bromo toluene or benzyl bromide (Jackson, *Am.* 1, 93, Schramm, *B* 17, 2922, 18, 350). Needles (from alcohol), volatile with steam, very pungent. Alcoholic KOH forms *p* bromo benzyl alcohol and *p* bromo benzoic ether (Elbs, *J pr* [2] 34, 340)

BROMO BENZYL CYANIDE *v Nitride* of BROMO PHENYL ACETIC ACID

BROMO BENZYLIDENE PHTHALIMIDINE
 $C_{10}H_7ONBr$ *Phthalimidylyl bromo benzyl* [210°]. Glistening needles. Formed by the action of bromine upon deoxybenzoic carboxylamide $C_6H_4(CO NH_2)CO CH_2$, C_6H_5 dissolved in chloro form (Gabriel, *B* 18, 2435)

TETRA-BROMO-BENZYLIDENE-DI-TOLYL-DIAMINE ($PhCH$)($NC_6H_4Br_2Me_2$) [160°–165°]. From benzylidene di *p* tolyl diamine and Br (Mazzara, *G* 10, 370).

p-BROMO-BENZYL MERCAPTAN

$C_6H_4BrCH_2SH$ [25°]? From *p* bromo-benzyl bromide and alcoholic KHS (Jackson & Hartshorn, *Am.* 5, 268). Crystalline mass, insol. water and glacial HOAc, sol. alcohol, ether, and benzene— $Hg(SC_2H_5)_2$, sol. hot alcohol

DI BROMO BENZYL-PHENOL $C_6H_4Br_2OH$ [175°]. From benzyl phenol in CS_2 and Br (Paterno & Fileti, *G* 3, 254). Amorphous

BROMO-o-BENZYL-PHENOL SULPHONIC ACID $C_6H_3(OH)BrSO_3H$ Salt— KA' . From Br and $C_6H_3(OH)SO_3K$ (Rennie, *C J* 49, 409)

Bromo-p benzyl-phenol sulphonic acid
 $C_6H_3(OH)BrSO_3H$ [14 x 2]

Salt— KA' (Rennie, *C J* 41, 35)

p-BROMO-BENZYL SULPHIDE
($C_6H_4BrCH_2$) S [59°]. Prepared by boiling *p* bromo benzyl bromide with alcoholic Na_2S . Large thin plates. Aromatic odour. Insol. water. Sol. ether, benzene, and CS_2 (Jackson & Hartshorn, *Am.* 5, 267)

p-Bromo-benzyl disulphide ($C_6H_4BrCH_2$) $_2S_2$ [88°]. Prepared by exposing the mercaptan to air, and also by acting on *p*-bromo-benzyl bromide with alcoholic Na_2S . Needles. Insol. water, sol. ether, benzene, and CS_2 (Jackson & Hartshorn, *Am.* 5, 269)

p-BROMO BENZYL SULPHOCYANIDE
 $C_6H_4BrCH_2SCN$ [25°]. From *p* bromo-benzyl bromide and potassium sulphocyanide. The *o* isomeride is an oil (Jackson & Lowery, *B* 10, 1209, *Am.* 3, 250)

DI p-BROMO DI BENZYL SULPHONE
($C_6H_4BrCH_2$) SO_2 [189°]. From the sulphide and CrO_3 in HOAc. Needles (Jackson & Hartshorn, *Am.* 5, 269)

BROMO-BENZYL SULPHONIC ACID *v* BROMO-TOLUENE SULPHONIC ACID

DI BROMO BETORCIN $C_6Br_2Me_2(OH)_2$ [155°]. From tetra bromo betorcin and H_2 . Also by boiling a mixture of betorcin (3 pts), bromine (8 pts) and CS_2 (100 vols). The product is re-crystallised from light petroleum (Stenhouse & Groves, *C J* 37, 401). Long needles

Tetra-bromo betorcin $C_6Br_2Me_2(OBr)_2$ [101°]. From bromine (5 pts), water (100 vols) and betorcin (1 pt). Dissolved in water (50 pts). Crystallised from light petroleum (*S* & *G*)

Large colourless prisms. *V* sol. ether, benzene and CS_2 , less so in petroleum

BROMO-BRASILIN $C_{10}H_7BrO_2$. Obtained by brominating acetyl brasilin and saponifying the product. Glistening red plates. *V* sol. water. Dissolves in KOH with a red colour

Tetra acetyl derivative
 $C_{10}H_7Br(OAc)_2O$ [204°] (Buchka & Erck, *B* 17, 685, 18, 1140)

Tri bromo brasilin $C_{10}H_7Br_3O_2$
Tetra acetyl derivative
 $C_{10}H_7Br_3(OAc)_2O$ [147°]. Small white needles, very oxidisable (*B* & *E*)

Tetra bromo brasilin $C_{10}H_7Br_4O_2$. Slender red needles. Dissolves in alkalis with a violet colour. Obtained by bromination of brasilin

Tetra acetyl derivative
 $C_{10}H_7Br_4(OAc)_2O$ [222°] (*B* & *E*)

BROMO-BUTANE *v* BUTYL BROMIDE.
o **Di-bromo-butane** $C_4H_8Br_2$, *o*
 $CH_3BrCHBrCH_2CH_3$, *Butylene bromide* (166°). *S G* 1820. Formed by the action of Br on *n*-butylene or *n* butyl bromide (Wurtz, *A.* 152, 23,

Linnemann, *A* 161, 199, Grabowsky a Saytzeff, *A* 179, 332) Na forms $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_3$,
 $\alpha\beta$ Di bromo butane $(\text{CH}_3)_2\text{CBrCH}_2\text{CH}_2\text{Br}$,
 (158°) SG 2182 From $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_3$ and
 Br Converted by PbO and excess of water at
 150° into methyl ethyl ketone (Wurtz, *A* 144,
 236, Eiteloff, *J* R 10, 219)

Di-bromo-isobutane $(\text{CH}_3)_2\text{CHBrCH}_2\text{Br}$ Iso
 butylene bromide (149°) SG 118, 145
 17434, 225 17308 M M 11890 at 147°
 (Perkin) From isobutylene and Br (Linne
 mann, *A* 162, 36) By heating with excess of
 water at 150° it is converted into isobutyric
 aldehyde, if PbO is also present some di oxy
 isobutane is also formed (Eiteloff, *J* R 10, 214)

Di - bromo - butane $\text{C}_4\text{H}_8\text{Br}_2$ (155°-162°)
 Formed by brominating butane (Carius, *A* 126,
 215)

Tri bromo isobutane $\text{C}_4\text{H}_7\text{Br}_3$ $\alpha\epsilon$
 $(\text{CH}_2\text{Br})_2\text{CBrCH}_3$ (173°-183°) at 235 mm
 SG 17215 From isobutylene and Br (Norton
 a Williams, *Am* 9, 88)

Tri bromo-isobutane $\text{C}_4\text{H}_7\text{Br}_3$ $\alpha\epsilon$
 $(\text{CH}_3)_2\text{CBrCHBr}_2$ (150°-161°) at 235 mm
 From $(\text{CH}_3)_2\text{CCHBr}$ and Br (N a W)

Tri - bromo butane $\text{C}_4\text{H}_7\text{Br}_3$ (208°-215°)
 From bromo butylene (82°-92°) (Caventou, *A*
 127, 93)

Tetra-bromo butane
 $\text{C}_4\text{H}_6\text{Br}_4$ $\alpha\epsilon\text{CH}_2\text{BrCHBrCHBrCH}_2\text{Br}$ Butinene
 or pyrrolylene tetra bromide (119°) Formed
 by combination of bromine with the butinene
 from di methyl pyrrolidine or from erythrite
 From erythrite, vinyl ethylene, or gasoils (Caven
 tou, *A* 127, 95, *B* 6, 70, Henninger, *B* 6, 70,
 Grimaux a Cloez, *C* R 104, 1446, *Bl* [2]
 48, 31) From the gas obtained by passing
 acetylene mixed with ethylene through a red hot
 tube (Prunier, *Bl* [2] 20, 72) On distillation it
 is partially converted into the following body
 Colourless needles (from alcohol) Insol cold
 petroleum ether (Ciamician a Magnaghi, *B* 19,
 569)

Tetra-bromo-butane $\text{CH}_3\text{CBr}_2\text{CBr}_2\text{CH}_3$ (?)
 [40°] Erythrene isobromide Erythrite tetra
 bromhydrin Formed, together with the iso
 meride [119°], by combining butinene from
 erythrite with bromine Large colourless tri
 metric prisms or tables, $abc = 977b \cdot 11682$
 (Ciamician a Magnaghi, *B* 19, 569) V sol
 ether, alcohol, and petroleum ether Alcoholic
 KOH converts both this and the preceding into
 the same di bromo butinene $\text{C}_4\text{H}_6\text{Br}_2$, which
 rapidly polymerises The latter absorbs Br,
 forming $\text{C}_4\text{H}_5\text{Br}$, [67°] and $\text{C}_4\text{H}_4\text{Br}$, [170°]

Tetra bromo butane $\text{C}_4\text{H}_6\text{Br}_2$ From Br and
 di bromo butylene (140°-150°) from fusel oil
 $\alpha\epsilon$ butylene (Caventou, *A* 127, 93) Crystalline,
 decomposes at 200°

Tetra-bromo butane $\text{CH}_3\text{CH}_2\text{CBr}_2\text{CHBr}_2$
 From butanene prepared from methyl ethyl
 ketone by successive treatment with PCl_5 and
 alcoholic KOH. Sublimes at 105° (Bruylants,
B 8, 410)

Tetra bromo-isobutane $\text{C}_4\text{H}_6\text{Br}_2$ [205°]
 From di bromo isobutylene (155°) (Norton a
 Williams, *Am* 9, 87)

Hexa-bromo-butane $\text{C}_4\text{H}_4\text{Br}_6$ [109°] Ob
 tained by brominating isobutyl bromide at 170°
 The yield is 90 p c of the theoretical (Merz a
 Weith, *B* 11, 2245).

Hexa bromo butane $\text{C}_4\text{H}_4\text{Br}_6$ $\alpha\epsilon$
 $\text{Br}_2\text{CHBrCHBrCH}_2\text{Br}$ SG 1229 Formed,
 together with the following, by heating erythrite
 tetrabromhydrin with Br at 180° (Colson, *Bl*
 [2] 48, 52) Liquid, v sol ether, sl sol
 alcohol Dilute KOH at 180° converts it into
 potassium erythrate

Hexa bromo butane $\text{C}_4\text{H}_4\text{Br}_6$ [170°] SG.
 34 Formed in small quantity as above (C).
 Pearly scales, sl sol ether and alcohol Fuming
 HNO_3 forms an oil $\text{C}_4\text{H}_4(\text{NO})_2\text{Br}_2(\text{NO})_2$ SG 181

DI BROMO BUTYL ALCOHOL $\text{C}_4\text{H}_9\text{Br}_2\text{O}$ $\alpha\epsilon$
 $\text{CH}_3\text{CHBrCHBrCH}_2\text{OH}$ Oil From butenyl
 alcohol $\text{CH}_3\text{CHCHCH}_2\text{OH}$ and Br (Lieben a
 Zeisel, *M* 1, 828) Boiling water forms tri oxy
 butane

$\alpha\epsilon$ DI BROMO *n*-BUTYL BENZENE
 $\text{C}_{10}\text{H}_{14}\text{Br}_2$ $\alpha\epsilon\text{C}_6\text{H}_5\text{CHCHBrCHBrCH}_3$ From
 phenyl butylene and Br (Aronheim, *A* 171, 229)
 Oil Reactions — 1 Red hot soda lime forms
 naphthalene — 2 HNO_3 forms a little bromo
 phenyl propionic acid

$\beta\gamma$ Di-bromo *n*-butyl-benzene
 $\text{C}_{10}\text{H}_{14}\text{CHBrCHBrCH}_2\text{CH}_3$ [67°] From
 butenyl benzene and Br (Perkin, *C* J 32, 608)

$\gamma\gamma$ -Di-bromo *n*-butyl benzene
 $\text{C}_{10}\text{H}_{14}\text{CBr}_2\text{CH}_2\text{CH}_2\text{CH}_3$ (?) From butyl benze
 ne and Br in sunlight Unstable oil (Schramm,
B 18, 1276)

Di-bromo *n* butyl benzene $\text{C}_{10}\text{H}_{14}\text{Br}_2$ [70°]
 From *n* butyl benzene and Br first in sunlight,
 then heated in the dark (Radziszewski, *B* 9,
 261)

$\alpha\beta$ Di-bromo-isobutyl-benzene
 $\text{C}_{10}\text{H}_{14}\text{CHBrCBrMe}_2$ From phenyl isobutylene
 and Br (Perkin, *C* J 35, 138)

Tri-bromo-isobutyl benzene $\text{C}_{10}\text{H}_{11}\text{Br}_3$ [64°]
 From the preceding by successive treatment
 with alcoholic KOH and Br (P)

BROMO-BUTYLENE $\text{C}_4\text{H}_6\text{Br}$ $\alpha\epsilon$
 $(\text{CH}_3)_2\text{CCHBr}$ (91°) Isocrotyl bromide From
 isobutylene bromide and alcoholic KOH
 (Butlerow, *Z* 1870, 524) Alcoholic KOH at
 170° forms $(\text{CH}_3)_2\text{CCH}_2\text{OEt}$ Moist Ag_2O at
 100° gives isobutyric acid NH_3 has no action

Bromo butylene $\text{C}_4\text{H}_6\text{Br}$ (82°-92°) From
 fusel oil butylene by successive treatment with
 Br and alcoholic KOH (Caventou, *A* 127, 93)

Bromo-butylene $\text{C}_4\text{H}_6\text{Br}$ (87° v) From
 di bromo methyl ethyl acetic acid and aqueous
 Na_2CO_3 (Jaffé, *A* 135, 300, Pagenstecher, *A*
 195, 126)

Bromo-butylene $\text{C}_4\text{H}_6\text{Br}$ (97°) Formed by
 boiling the di bromide of angelic acid with water
 (Jaffé, *A* 135, 300)

Di bromo - iso butylene $\text{C}_4\text{H}_6\text{Br}_2$ (155°)
 From tri bromo - iso butane (155°-161°) at
 235 mm (Norton a Williams, *Am* 9, 87)

Di bromo butylene $\text{C}_4\text{H}_6\text{Br}_2$ (140°-150°)
 From tri bromo butane (208°-215°) Forms a
 crystalline di bromide $\text{C}_4\text{H}_5\text{Br}_2$, which decomposes
 without melting at 200° (Caventou, *A* 127, 93)

Di - bromo butylene $\text{C}_4\text{H}_6\text{Br}_2$ (148°-158°)
 From crotonylene and Br (Caventou, *A* 127, 349)

Di - bromo - butylene $\text{C}_4\text{H}_6\text{Br}_2$ From tetra
 bromo butane [119°] (from erythrite) and alco
 holic KOH Rapidly polymerises Combines
 readily with bromine (Grimaux a Cloez, *Bl* [2]
 48, 81)

Di - bromo - butylene $\text{C}_4\text{H}_6\text{Br}_2$ $\alpha\epsilon$
 $\text{CH}_3\text{CHCHBrCH}_2\text{Br}$ (190°-200°) From the

oils deposited by compressed gas, by adding less than the calculated quantity of Br and fractionally distilling. Combines readily with Br, forming C_6H_5Br , [119°] (G & C)

Hexabromobutylene $C_4Br_6H_2$ [53°] Prepared by further bromination of hexabromoisobutane (Merz & Weith, B 11, 2240)

α BROMO γ BUTYRIC ACID $C_4H_7BrO_2$ *is* $CH_3CH_2CHBrCO_2H$ (214°-217°) (110°) at 8 mm SG 1.64 S 7

Formation—1 By heating butyric acid with Br at 140°, or by the action of Br on silver butyrate (Friedel & Machuca, A 120, 279, Suppl 2, 70, Gorup Besanec & Klinkseick, A 118, 248, Naumann, A 119, 115, Ley, J R 9, 129, Urech, A 165, 93, Tupoleff, A 171, 249) — 2 From crotonic acid and HBr — 3 From the bromide and water (Kaschirski, C C 1881, 278)

Properties—Oil, mixes with alcohol and ether. NEt₃, whether dry or in aqueous solution, forms a oxy butyric acid (Duvillier, Bl [2] 48, 3) NaOH aq acts similarly

Salts—PbA₂, —PbA', 2PbO —AgA', *Methyl ether* MeA' (165°-172°)

Ethyl ether EtA' (178°) (Lovén, J pr [2] 33, 102) SG 1.345 Dry NaOEt forms an ether $C_4H_7O_4(EOEt)_2$ (252°) (Krestownikoff, A 208, 348)

Bromide C_4H_7BrO Br (173°) From butyryl bromide and Br

β Bromo butyric acid $CH_3CHBrCH_2CO_2H$ Formed in small quantity in the preparation of the α acid from crotonic acid and HBr (Hemmlan, A 174, 325)

γ -Bromo butyric acid $CH_2BrCH_2CH_2CO_2H$ [33°] From butyrolactone and HBr (Henry, C R 102, 368) Tables or plates, sl sol water, v sol ether

Methyl ether MeA' (187°) SG 1.45

Ethyl ether EtA' (197°) SG 1.36

α -Bromo isobutyric acid $(CH_3)_2CBrCO_2H$ [48°] (199°) SG 1.152 From isobutyric acid and Br (Markownikoff, A 153, 229, Hell & Waldauer, B 10, 448) Tables Boiling water converts it into α oxy isobutyric acid, KHS acts similarly (Lovén, J pr [2] 33, 103), boiling baryta water forms also CH_3CMeCO_2H (Engelhorn, A 200, 68)

Ethyl ether EtA' (164° cor) SG 1.13 Oil, smelling of raspberries and peppermint (Markownikoff, A 182, 336, Hell & Wittekind, B 7, 320, Lovén, J pr [2] 33, 106)

Bromide $(CH_3)_2CBrCOBr$ (163°)

β Bromo isobutyric acid $CH_2BrCHMeCO_2H$ [22°] From α methyl acrylic acid and cold conc HBr Crystals (from CS₂). Boiling alkalis convert it into α methyl acrylic acid and a little propylene (Fittig & Engelhorn, A 200, 65)

$\alpha\alpha$ Di bromo-butyric acid $CH_3CH_2CBr_2CO_2H$ (140°) at 8 mm S 3 SG 1.96 From bromo butyric acid and bromine (Schneider, J 1861, 458, Michael & Norton, Am 2, 15, Otto & Fromme, A 239, 275) Thick oil Water or baryta water at 120° forms α bromo crotonic acid (Erlenmeyer & Müller, B 15, 49) Converted by reduced silver into di ethyl maleic or xeronic acid $CO_2H.CEt.CEt.CO_2H$, butyric acid being formed

Vol. I

$\alpha\delta$ Di bromo butyric acid

$CH_3CHBrCHBrCO_2H$ [87°]

Preparation—From Br and crotonic or isocrotonic acid dissolved in CS₂ (Körner, A 187, 234, Michael & Norton, Am 2, 12, B 14, 1202, C Kolbe, J pr 183, 886)

Properties—Large transparent prisms (from CS₂), sol alcohol, ether and hot water

Reactions—1 Boiled with water or Na₂CO₃ it gives β bromo propylene, bromo oxy-butyric acid, di oxy butyric acid, and bromo crotonic acid Water gives chiefly bromo oxy butyric acid, Na₂CO₃ gives more bromo propylene, but no propionic aldehyde — 2 Warmed with a solution of NaOH it gives bromo crotonic acid

Di bromo-iso-butyric acid

$CH_2BrCBrMeCO_2H$ [48°]

Preparation—By adding Br to methacrylic acid dissolved in CS₂ (C Kolbe, J pr [2] 25, 373) Long prisms (from CS₂) Boiling with water or Na₂CO₃ produces CO₂, acetone, some propionic aldehyde, a very little bromo methacrylic acid [63°], and bromo oxy iso butyric acid (q v) Warmed with solution of NaOH it gives bromo methacrylic acid and HBr

Tri-bromo-butyric acid $C_4H_3Br_3O_2$ *is*

$CH_3CBr_2CHBrCO_2H$? [114°] From β bromo-crotonic acid in CS₂ and Br (Michael & Norton, Am 2, 14) Rhombic plates, sol alcohol and hot water, sublimes readily

Tri-bromo-butyric acid $C_4H_3Br_3O_2$ *is*

$CH_3CHBrCBr_2CO_2H$? [111°] From α bromo-crotonic acid and Br v sol water and alcohol (M & N)

Tri bromo-isobutyric acid $C_4H_5Br_3O_2$ From bromo α methyl-acrylic acid and Br (Cahours, A Suppl 2, 349) Prisms

Tetra bromo-butyric acid $C_4H_3Br_4O_2$ [115°] From mucrobromic acid and Br (Lamprecht, A 165, 293) Monoclinic tables, sl sol water

Tetra bromo isobutyric acid $C_4H_3Br_4O_2$ From di bromo- α -methyl acrylic acid and Br (C)

BROMO ISO-BUTYRIC para ALDEHYDE

$((CH_3)_2CBrCHO)_n$ [129°] When the product of the action of NH₃ on iso butyric aldehyde (q v) is distilled a product C_4H_7N is got This must be combined with bromine, and the compound, $(CH_3)_2CHCHNCHBrCBr(CH_3)_2$, after keeping for 3 months, is decomposed by water (Lipp, A 211, 353) Needles (from alcohol) Insol water, acids or alkalis, v sol ether, m. sol alcohol Does not reduce ammoniacal AgNO₃

BROMO CATECHOL v BROMO-PYROCATECHIN

BROMO-CAFFEINE $C_8H_7BrN_3O_2$ [206°]

Caffeine combines with Br forming the orange-red bromide $C_8H_5Br_2N_3O_2$, which is decomposed at 150° into HBr and bromo caffeine (Fischer, B 14, 639, Schultzen, Z 1867, 614, Maly & Andreasch, M 3, 85) Crystals, sl sol cold water, v sol NH₄Aq Reduced by zinc dust to caffeine Alcoholic KOH forms ethoxy caffeine

BROMO-CAMPHOR v CAMPHOR

BROMO CAMPHORIC ACID v CAMPHORIC

ACID

BROMO-CAPRIC ACID v BROMO DECOIC ACID.

BROMO CAPROIC ACID v BROMO-HEXOIC

ACID

BROMO-CARBANILIC ACID v PHENYL-CARBAMIC ACID.

BROMO CARBAZOLE $C_{12}H_7BrN$ [199°]

From its acetyl derivative and alcoholic KOH. Rhombic plates, v sol. water

Acetyl derivative $C_{14}H_9AcBrN$ [128°]

From acetyl carbazole and Br₂ Laminae, v sol alcohol and boiling toluene (Ciamicani & Silber, G 12, 276)

TRI BROMO CARBOPYRROLIC ACID v **TRI-BROMO PYRROL CARBOXYLIC ACID****γ BROMO CARBOSTYRIL** C_8H_7NOBr + e

quinoline [266°] Formed by boiling α amido phenyl propionic acid with dilute HBr (Baeyer & Bloem, B 15, 2149) Prepared by the action of bromine on carbostyryl ether and saponification of the product by heating with HCl (Friedlander & Weinberg, B 15, 2682) Needles, may be sublimed The Br is not replaced by boiling with alcoholic KOH, but requires to be fused with KOH at 200°C

BROMO CARVACROL $C_{10}H_{17}BrO$ + e

$C_6H_5Me(OH)Br(C_2H_5)$ [1 2 3 or 5 4] From bromo cyminide and HNO₃ Oil (Mazzaria, G 16, 194)

BROMO CHLORAL v **DI CHLORO BROMO ALDEHYDE****HYDRE****BROMO-CHLORO-** v **CHLORO BROMO****BROMO CHLOROFORM** v **DICHLORO BROMO-****METHANE****BROMO DICHBROMAZIN** v **TRI AMIDO-PHENOL**, p 172**BROMO-CHRYSENE** v **CHRYSENE****BROMO - CHRYSOQUINONE** v **CHRYSO****QUINONE****BROMO-CINCHONINE** v **CINCHONINE****BROMO-CINNAMENE** v **BROMO STYRENE****DI - BROMO - CINNAMENYL - THIENYL -****KETONE** v **THIENYL DI BROMO STYRYL KETONE****α BROMO CINNAMIC ACID** $C_9H_7BrO_2$ + e

C_6H_5, CH, CBr, CO_2H [131°]

Formation—1 Together with *allo α* bromo cinnamic acid by the action of alcoholic KOH on the di bromide of cinnamic acid $C_6H_5, CHBr, CHBr, CO_2H$ (Glaser, A 143, 325) — 2 From *exo* tri bromo β phenyl propionic acid and water at 100° (Kinnicutt & Palmer, Am 4, 26, 5, 386)

Preparation—Dibromide of cinnamic acid (50 grms) is dissolved in hot alcohol and mixed with the calculated quantity (2 equivalents) of potash dissolved in alcohol The liquid is neutralised with HCl and the alcohol boiled off The solution of the mixed potassium salts is filtered from bromo styrene [128°] The two acids are separated by partial precipitation with HCl, the α acid coming down first (Barisch, J pr 128, 178)

Properties—Long needles (from water or chloroform) V e sol alcohol

Salts— NH_4A' arborescent groups of flat needles, sl sol cold water— AgA' sl sol water— BaA' , thin rhombic laminae S 12 at 6° Insol alcohol

Reactions—1 Sodium amalgam reduces it to β phenyl propionic acid — 2 Alcoholic KOH gives phenyl propionic acid. — 3 Br gives a tri-bromo phenyl propionic acid [132°] — 4 Both α and *allo-α* bromo-cinnamic acids may be reduced by zinc-dust and glacial acetic acid to cinnamic acid, which seems to be the same in both cases

(Michael, J pr [2] 85, 357) — 5 Is not altered by dissolving in H_2SO_4 and pouring into water

Methyl ether $A'Me$ (159°) at 14 mm

Formed by distillation of the isomeric methyl ether corresponding to the acid [120°] under ordinary atmospheric pressure (A & S)

Ethyl ether $A'Et$ (290°), (202°) at 80 mm, (160°) at 10 mm, (188°) at 30 mm V D = 8.715 (obs) (Michael & Browne, B 20, 551)

Formed by distillation of the isomeric ethyl-ether corresponding to the acid [120°] under ordinary atmospheric pressure (Anschutz & Selden, B 20, 1384) Prepared by passing HCl into a solution of the acid in alcohol (4 pts) (Barisch, loc cit) By cold conc H_2SO_4 it is converted into benzoyl acetic ether (Michael & Browne, B 19, 1392)

Chloride (153°) at 12 mm, clear oily liquid Formed by the action of PCl₅ upon salts of the acid [131°] or of its isomeride [120°]

Amide [119°], very thin pearly plates, sl sol hot water

Anilide [80°], small white needles, which change into six sided plates (A & S)

Exo Bromo cinnamic acid $C_9H_7BrO_2$ [134°]

Formed, together with the isomeride [159°] by the addition of HBr to phenyl propionic acid Long needles (from water) Thick rhombic prisms (from chloroform) V sol alcohol and hot benzene, sl sol CS_2 , hot petroleum ether and hot water— ANH_4^+ flat needles, sol hot water, sl sol cold— Ba glistening rhombic plates, S 776 at 6°, m sol hot water It is doubtful whether this acid is a distinct isomeride or is identical with the preceding acid, the solubility of the barium salt appears to point to the former conclusion (Michael & Browne, B 20, 550)

Allo α Bromo-cinnamic acid

C_6H_5, CH, CBr, CO_2H [120°] Formed, together with a bromo cinnamic acid (v *Preparation*) by boiling the dibromide of cinnamic acid with alcoholic KOH (Glaser, A 143, 330) Six sided laminae (from water) or thick prisms (from ether) V sol boiling water

Salts— KA' deliquescent needles— AgA' The ammonium salt is deliquescent and v sol water (difference from α acid)

Reactions—1 *Reactions* 1, 2, and 4 described under a bromo cinnamic acid are also exhibited by the *allo α* acid *Reaction* 3 gives, however, a different tri-bromo phenyl propionic acid [45°-48°] — 2 On dissolving in H_2SO_4 and pouring into water two products are obtained

(a) A substance $C_{10}H_{11}O_4$, yellow needles [above 260°], sol alkalis, alcohol, ether and benzene (b) A substance $C_{10}H_{11}Br_2O_4$, large pearly plates [above 260°], sol alkalis, sol. phenol, nitro benzene and aniline, insol most other solvents, forms a crystalline molecular compound with phenol, on reduction with zinc-dust and acetic acid it gives a substance $C_{10}H_{11}O_4$ which forms colourless crystals, [127°], sol alcohol, sl sol hot water (Leuckart, B 15, 16)

Methyl ether $A'Me$ (146°) at 11 mm, from AAg and MeI, by distillation at ordinary pressure it is converted into the methyl ether of the isomeric acid [131°] (Anschutz & Selden, B 20, 1383)

Ethyl ether $A'Et$ (174°) at 80 mm, (177°) at 80 mm, V D = 8.828 (obs) (Michael &

Browne, *B* 20, 551) From A'Ag and EtI By distillation under ordinary pressure it is converted into the ethyl ether of the isomeric acid [131°] (Anschütz & Selden, *B* 20, 1384)

? *β*-Bromo-cinnamic acid

$C_6H_5.CBr.CH.CO_2H$ (?) [159°] Formed, together with the acid [134°], by the action of aqueous HBr upon phenyl propionic acid at 0° Long flat needles (from water), or rhombic plates (from alcohol) Sl sol cold alcohol and benzene By cold conc KOH or NH_3 it is at once converted into an indifferent insoluble oil Heating with HBr forms phenyl acetic aldehyde and acetophenone It combines with Br forming a tri bromo hydro cinnamic acid [148°]

Salts— NH_4A' long soluble needles— BaA'_2 soluble concentric prisms— PbA'_2 amorphous pp— CaA'_2 concentric needles (Michael & Browne, *B* 19, 1378)

Ethyl ether $A'E'$ (151°) at 15 mm, $V D = 8.948$ (obs) (*M* & *B*, *B* 20, 551)

Bromo-cinnamic acid [153°] This was obtained by Erlenmeyer & Stockmeier by the addition of HBr to phenyl propionic acid Aqueous Na_2CO_3 converted it into phenyl acetylene, a bromo styrene $C_6H_5.CBr.CH$, and phenyl propionic acid Successive treatment with conc H_2SO_4 and water gave benzoyl acetic acid and bromo acetophenone Heating with HBr gave acetophenone and a little phenyl acetic aldehyde (Erlenmeyer, *B* 19, 1936) According to Michael & Browne this acid is a mixture of the two acids [159°] and [134°]

o-Bromo-cinnamic acid [12]

$C_6H_4(Br).CH.CH.CO_2H$ *Bromo β phenyl acrylic acid* [213°] Formed by diazotising *o* amido cinnamic acid and boiling the diazo compound with HBr (Gabriel, *B* 15, 2294) Flat colourless needles or scales Sol alcohol, ether and acetic acid; sl sol chloroform, benzene and CS_2

m-Bromo-cinnamic acid

[13] $C_6H_4(Br).CH.CH.CO_2H$ [179°] Formed like the preceding from *m* amido cinnamic acid (Gabriel, *B* 15, 2296) Long needles Sol alcohol, acetic acid, hot benzene, chloroform, and CS_2

p-Bromo-cinnamic acid

[14] $C_6H_4(Br).CH_2.CO_2H$ [c 253°] Fine needles From *p* amido cinnamic acid (Gabriel, *B* 15, 2300)

Di bromo cinnamic acids $C_6H_3Br_2O_2$ *tc* $C_6H_3Br_2.CBr.CO_2H$ Bromine unites with phenyl propionic acid producing di bromo cinnamic [139°] and also di bromo cinnamic acid [100°] The acid [139°] is not converted into an indonaphthene derivative by conc H_2SO_4 , whereas the acid [100°] forms $C_6H_4 < \begin{smallmatrix} CO \\ C.Br \end{smallmatrix} >$

[123°] (whence hydroxylamine forms an oxim [195°], and aniline forms an anilide [170°]) (W Roser, *B* 20, 1274, 1576)

***α*-BROMO-CINNAMIC ALDEHYDE** $C_6H_4Br.OH$ *tc* $C_6H_4.CH.CBr.CHO$ [73°] Formed from cinnamic aldehyde di bromide by splitting off HBr (Zincke & Hagen, *B* 17, 1815) Thick tables or large monoclinic prisms. CrO_3 gives bromo-cinnamic acid [181°]

Phenyl-hydrasido

$C_6H_5.C_2HBr.CH.N_2.HCl$ [180°], glistening yellow plates

BROMO-CITRACONIC ACID $C_6H_5Br.O_2$ *tc* $CH_2.C(CO_2H).CBr.CO_2H$ (?)

Formation—1 From its anhydride by boiling with water—2 From *citra* di-bromo pyrotartaric acid, water, and Ag O in presence of a trace of HCl $C_6H_5Br.O_2 + HBr + C_6H_5Br.O_2$ (Bourgois, *C R* 88, 342, 89, 418, *A Ch* [5] 19, 285)

Properties—Very unstable, giving off water even over H_2SO_4 and changing to the anhydride.

Reactions—1 Sodium amalgam forms pyrotartaric acid—2 Boiling KOH forms a syrupy dibasic acid $C_6H_5O_2$ —3 Evaporation of its solution produces bromo citraconic anhydride and, at a low temperature, the acid $C_6H_5O_2$, but at a high temperature 'bromo citronic acid' $C_6H_5Br.O_2$ (B)—4 The aqueous solution treated with the equivalent of aniline gives a crystalline pp of the acid aniline salt [121°] Standing under water for a few hours, or heating the aqueous solution for a minute, converts it into the

$C(CH_3)_2-CO > NPh$ [145°] This phenylimide || $CBr-CO$

forms stellate groups of prismatic needles Sl sol hot water, v sol hot alcohol, insol dilute HCl (Michael, *Am* 9, 180) An intermediate body is the acid anilide $C_6H_5Br(CO_2H).CONPh$ [212°] (Michael, *B* 19, 1373)

Salts— $(NH_4)A' - K_2A' - CaA'_2$ aq— CaA'_2 14aq— BaA'_2 aq— AgA' Decomposed by water at 130° giving off CO_2 and allylene

Anhydride $C_6H_5Br.O_2$ [100°] (220°) $SG \frac{2}{3}$ 1935 (Kekulé, *A Suppl* 1, 130, 2, 97, Lagermark, *Z* 1870, 299, Fittig & Krusemark, *A* 206, 19, Bourgoin, *Bl* [2] 31, 252, 32, 388)

Formation—1 From citraconic anhydride and Br at 140°—2 By distilling *citra*-dibromo tartaric acid—3 From pyrotartaric acid, Br, and water at 120° **Properties**—Laminar (from CS_2), sl sol cold water, v sol alcohol and ether, volatile with steam

Imide $C_6H_5Br.O.NH$ [c 181°] From pyrotartarimide or citraconimide and Br at 150° (Mendini, *G* 15, 182) Laminar, may be sublimed— $C_6H_5Br.O.Na$

Di-bromo-citraconic acid *Imide* $C_6H_3Br_2.O.NH$ [144°] From pyrotartarimide or citraconimide and Br (M) Laminar, may be sublimed— $C_6H_3Br_2.O.Na$

BROMO-CODEINE v CODEINE

DI BROMO-COLLIDINE v DI BROMO-TRIMETHYL PYRIDINE

BROMO-COMPOUNDS Bromine unites directly with most unsaturated compounds, but there are some cases in which it does not combine with them in the cold, *eg* fumaric, mesaconic, teraconic, tereblenic, aconic, *o* and *p* coumaric, and (8) hydropiperic acids (*cf* Fittig, *A* 227, 29) Aromatic compounds combine with great difficulty with bromine, but when reduced to their di or tetrahydrides they take up bromine as readily as the ordinary unsaturated compounds. Bromine displaces hydrogen in saturated compounds, the displaced hydrogen being given off as HBr, this reaction usually requires the aid of heat the substance is generally heated with bromine and a little water in a sealed tube.

Hydroxyl may be displaced by bromine by treatment with HBr or PBr₃, instead of PBr₅

red phosphorus and bromine may be used, one of the two being added gradually.

Chlorine may be displaced by bromine by treatment with the bromide of K, Mg, Ca, Sr, Ba, Al, Mn, or Co (Köhnelein, *A* 225, 194) CdBr_2 , SbBr_3 and AsBr_3 sometimes act similarly, thus AsBr_3 at 145° completely converts chloroacetic acid and benzyl chloride into bromoacetic acid and benzyl bromide respectively.

Iodine may be displaced by bromine by means of the bromides of Cu, Ag, Hg, Sn, Pb, As, and Sb. BiBr_3 at 160° only partially converts EtI into EtBr . Bromine itself can displace iodine (R Meyer, *J pr* [2] 84, 104).

Amidogen may be displaced by bromine by using the diazo reactions (p 399). In aromatic compounds it is sufficient to add HNO_3 to a hot solution of the amine in HBr (Losanitsch, *B* 18, 39, *v also* AMINFS).

Carriers—The displacement of hydrogen by Br is assisted by the presence of carriers which first combine with the bromine, and then pass it on to the organic body. The most suitable carriers for bromine are iodine , AlBr_3 (Gustavson, *B* 10, 971) for benzene and homologues, amorphous P for fatty acids (Hell & Gautier, *B* 14, 891), SbBr_3 , FeBr_3 , FeBr_2 , and, better still, FeCl_2 (Scheufelen, *A* 231, 154, *cf* Willgerodt, *J pr* [2] 34, 264).

Bromination of organic acids The following is a very convenient method, which depends upon the fact that the acid bromides and anhydrides are much more easily brominated than the acids themselves. The acid is mixed with amorphous phosphorus in quantity sufficient to convert it into the bromide or anhydride, and the corresponding quantity of bromine added together with the extra amount required for bromination. The mixture is heated to 100° till decolourised, when the reaction is complete (Hell, *B* 14, 891). The bromination of fatty acids may also be readily effected by boiling their chlorides with Br and CS_2 (Michael, *J pr* [2] 85, 92). Alkalis or water acting upon α -bromo acids usually produce α -oxy acids, with β -bromo acids they form unsaturated acids, while γ -chloro acids become lactones (Fitting, *A* 195, 169, Erlenmeyer, *B* 14, 1318, 15, 49).

Bromination of aromatic hydrocarbons

Bromine in presence of a carrier enters the benzene nucleus, bromine alone, or in presence of too little iodine, enters the side chains of boiling hydrocarbons. Sunlight promotes substitution in the side chains (Schramm, *B* 17, 2922, 18, 350, 1272, 19, 212).

Bromination of aromatic amines Bromine goes first into a position *p* to the NH_2 , and then into the *o* positions, but not into a *m* position (Neville & Winther, *B* 13, 962, *v also* AROMATIC COMPOUNDS, p 299).

Stability of bromo-compounds Bromo compounds are less stable than the corresponding chloro compounds, thus bromoacetic acid and bromo propionic acids may be converted by reduced silver into succinic and adipic acids respectively, in this they differ from the corresponding chloro but resemble the iodo acids. The relative stability of the alkyl bromides depends upon the reagents attacking them, thus Zn and H_2SO_4 reduces iso propyl bromide more quickly than propyl bromide, the order being

isopropyl, isoamyl, butyl, propyl, ethyl, on the other hand, alcoholic NaOH attacks propyl bromide more vigorously than isopropyl bromide, the order being ethyl, propyl, isoamyl, butyl, isopropyl (Remsen & Hillyer, *Am* 8, 251).

Other characteristics of bromo-compounds may be inferred from the article on CHLORO-COMPOUNDS, the bromo compounds resemble the chloro compounds in almost every respect.

BROMO CONINE *v* CONINE

BROMO-COUMARIC ACID $\text{C}_9\text{H}_7\text{BrO}_2$

Bromo o-oxy cinnamic acid Methyl derivative $\text{MeO C}_9\text{H}_7\text{C}_6\text{H}_3\text{Br CO}_2\text{H}$ [171°] S (CS₂) 32 at 14° . From the methyl derivative of α or β di bromo melilotic acid $\text{MeO C}_9\text{H}_7\text{C}_6\text{H}_3\text{Br}_2\text{CO}_2\text{H}$ and aqueous KOH (Perkin, *C J* 39, 422). Small prisms (from CS₂), sl sol boiling water, v sol alcohol. Boiling dilute KOH forms the methyl derivative of cumarinic acid $\text{MeO C}_9\text{H}_7\text{C}_6\text{H}_3\text{CO}_2\text{H}$.

Ethyl derivative $\text{EtO C}_9\text{H}_7\text{C}_6\text{H}_3\text{Br CO}_2\text{H}$ [164°]. From $\text{EtO C}_9\text{H}_7\text{C}_6\text{H}_3\text{Br}_2\text{CO}_2\text{Et}$ and cold alcoholic KOH (P). Flat prisms, sl sol boiling water, m sol CS₂, v sol alcohol.

(α)-BROMO-COUMARIN $\text{C}_9\text{H}_6\text{BrO}_2$ [110°]. From coumarin dibromide and alcoholic KOH (Perkin, *C J* 23, 368). Prisms, converted by alcoholic KOH into cumarinic acid.

(β)-Bromo coumarin $\text{C}_9\text{H}_6\text{BrO}_2$ [160°]. From sodium bromo α -oxy benzoic aldehyde and Ac_2O . Rhombic prisms (from alcohol) (Perkin, *C J* 24, 37).

(α) Di bromo coumarin $\text{C}_9\text{H}_4\text{Br}_2\text{O}_2$ [183°]. From coumarin, Br, and I (P). Needles, alcoholic KOH forms bromo cumarinic acid.

(β) Di bromo coumarin $\text{C}_9\text{H}_4\text{Br}_2\text{O}_2$ [176°]. From sodium di bromo α -oxy benzoic aldehyde and Ac_2O . Needles (P).

BROMO-o-CRESOL $\text{C}_7\text{H}_7\text{MeBr(OH)}$ [137° 6] [89°]. From bromo α -toluidine (Wroblewsky, *A* 168, 165). Golden needles, v sl sol water, the aqueous solution is turned green by FeCl_3 — $\text{KC}_2\text{H}_3\text{BrO}$ aq. red scales.

Bromo-m-cresol $\text{C}_7\text{H}_7\text{MeBr(OH)}$ [135] [57°]. From *s*-bromo toluidine by diazo reaction (Neville & Winther, *C J* 41, 421).

Bromo-p-cresol $\text{C}_7\text{H}_7\text{MeBr(OH)}$ [134] [214°] SG $\frac{25}{25} = 1.5468$. Liquid. Formed by the action of dry bromine upon sodium *p*-cresol. *Methyl ether* $\text{C}_7\text{H}_7\text{MeBr(OMe)}$ (226°), SG $\frac{25}{25} = 1.418$, liquid (Schall & Dralle, *B* 17, 2530).

Di-bromo-o-cresol $\text{C}_7\text{H}_5\text{MeBr}_2\text{(OH)}$ [57°] [89°]. From *o*-cresol and Br. Volatile with steam (Werner, *Bl* [2] 46, 278).

Di-bromo p-cresol $\text{C}_7\text{H}_5\text{(CH}_3)_2\text{Br}_2\text{OH}$ [135 4] [49°]. Large crystals. V sol alcohol, v sl sol. water. Excess of Br forms $\text{C}_7\text{H}_3\text{Br}_4\text{(OBr)}$ (W).

Benzoyl derivative $\text{C}_7\text{H}_5\text{MeBr}_2\text{(OBz)}$ [91°], white needles (Schall & Dralle, *B* 17, 2532, Werner, *Bl* [2] 46, 278).

Tri bromo m-cresol $\text{C}_7\text{H}_3\text{MeBr}_3\text{(OH)}$ [82°]. From *m*-cresol (W). Needles (from alcohol).

Tetra bromo p-cresol $\text{C}_7\text{H}_3\text{Me(OH)}$ [109°]. From *p*-cresol (Baumann & Brieger, *B* 12, 804). Plates, slowly decomposed by cold bromine-water into CO, and tri-bromo phenol.

BROMO-CRESOL SULPHONIC ACID

$\text{C}_7\text{H}_7\text{MeBr(OH)(SO}_3\text{H)}$ [12 or 6 57 8]. From α -bromo toluene by sulphonation, nitration, re-

duction, and diazotisation (Schafer, A. 174, 861) — $\text{BaA}', 4\frac{1}{2}\text{aq}$ — $\text{BaA}', 8\text{aq}$ — $\text{PbA}', 2\text{aq}$

Bromo cresol sulphonic acid

$\text{C}_6\text{H}_4\text{MeBr}(\text{OH})(\text{SO}_3\text{H})$ [1 4 5? 3] From (3,1,2)-bromo toluene sulphonic acid by nitration, reduction, and diazotisation (S) — $\text{BaA}', 8\text{aq}$

Bromo-*o*-sol sulphonic acid

$\text{C}_6\text{H}_4\text{MeBr}(\text{OH})(\text{SO}_3\text{H})$ [1 4? 2] From (4,1,2)-bromo toluene sulphonic acid in a similar way — BaA', aq

Di-bromo-cresol sulphonic acid

$\text{C}_6\text{H}_3\text{MeBr}_2(\text{OH})(\text{SO}_3\text{H})$ From (2,1,4)-amido toluene sulphonic acid and Br (Hayduck, A 174, 353) — $\text{KA}' \text{aq}$ $\text{BaA}', 8\frac{1}{2}\text{aq}$

α BROMO-CROTONIC ACID $\text{C}_4\text{H}_5\text{BrO}_2$, ϵ

$\text{CH}_3\text{CH CBr CO}_2\text{H}$ [106 5?] **Formation** — 1 From $\alpha\beta$ di bromo *n* butyric acid and alcoholic KOH, NH_3 , baryta water, or Ag_2CO_3 (Michael & Norton, Am 2, 15, Erlenmeyer & Müller, B 15, 49) — 2 From $\alpha\beta$ di bromo butyric ether and alcoholic KOH (Michael & Browne, Am 9, 280) — 3 Together with bromo pyrotartaric acid by the action of bromine on propanoic tri carboxylic acid (Bischoff & Guthzeit, B 14, 616)

Properties — Long needles (from water), needles (from ligroin), m sol cold, v sol hot, water — AgA' white needles, quickly affected by light — $\text{BaA}', 2\text{aq}$

Allo α Bromo crotonic acid

$\text{CH}_3\text{CH CBr CO}_2\text{H}$ [90°] (K), [92°] (M & N) From $\alpha\beta$ di bromo butyric acid (dibromide of crotonic acid) by treatment with alcoholic KOH (Michael & Norton, Am 2, 15) or NaOHAq (C Kolbe, J pr [2] 25, 394)

Properties — Long needles (from water), needles (from ligroin), m sol hot water — AgA' needles, little affected by light — $\text{BaA}', 3\frac{1}{2}\text{aq}$ — $\text{CaA}', 3\text{aq}$

β Bromo crotonic acid $\text{CH}_3\text{CBr CH CO}_2\text{H}$

[95°] From tetrolic acid and conc HBrAq at 0° (Michael & Browne, Am 9, 277, J pr [2] 35, 258) Flat needles (from water), feathery groups of tough needles (from ligroin), sl sol cold water, m sol hot water — AgA' amorphous, readily affected by light — BaA', aq — KA'

$\alpha\beta$ Di bromo crotonic acid

$\text{CH}_3\text{CBr CBr CO}_2\text{H}$ [96°] From tetrolic acid and Br (Pinner, B 14, 1081) — Boiling with Ag_2O gives $(\text{C}_4\text{H}_5\text{Br})_2$ [116°]

BROMO CUMALIC ACID $\text{C}_9\text{H}_7\text{BrO}_2(\text{CO}_2\text{H})$

[176°] Formed by the action of bromine on cumalic acid in acetic acid solution (Pechmann & Welsh, B 17, 2396) Colourless glistening needles Can be distilled in small quantities V sol alcohol, ether, acetic acid, and chloroform, more sparingly in benzene, insol ligroin

Methyl ether A Me [134°], prismatic

needles, sol alcohol and benzene, sl sol ether, insol water Aqueous NH_3 converts it into the methyl ether of brom oxy nicotinic acid

***o*-BROMO *n* CUMENE** $\text{C}_9\text{H}_7\text{Br}$ & $\text{C}_9\text{H}_7\text{BrPr}$

[12] **Bromo-*n* propyl benzene** (222 i V) A mixture of this body with the *p* isomeride is formed by the action of Br on propyl benzene in the dark or on ethyl benzene mixed with I in diffused daylight (Schramm, B 18, 1274) KMnO_4 gives *o*-bromo-benzoic acid

***p*-BROMO-*n*-CUMENE** $\text{C}_9\text{H}_7\text{BrPr}$ [14] (220°

cor) From $\text{C}_9\text{H}_7\text{Pr}$ and Br at 0° in presence of 1 (Meyer & Müller, B. 15, 698, R Meyer, J pr

[2] 34, 101) HNO_3 (S G. 1 2) forms *p* bromo-benzoic acid

β Bromo *n* cumene $\text{C}_9\text{H}_7\text{CHBr CH}_2\text{CH}_3$

Formed in the cold by the action of bromine (1 mol) upon *n*-cumene in direct sunshine. By further bromination in sunlight it gives β di-bromo *n* cumene $\text{C}_9\text{H}_7\text{CBr}_2\text{CH}_2\text{CH}_3$, but in the dark at 100° it yields $\alpha\beta$ -di bromo *n* cumene $\text{C}_9\text{H}_7\text{CHBr CHBr CH}_2\text{CH}_3$ (Schramm, B 18, 1275)

$\alpha\beta$ Di bromo *n* cumene $\text{C}_9\text{H}_7\text{CHBr CHBr CH}_2\text{CH}_3$

From allyl benzene (*q v*) and bromine (Ragheimer, A 172, 131, Radziszewski, C R 78, 1153, Perkin, C J 32, 668) From *n*-cumene and bromine at 160° (Wispeck & Zuber, A 218, 381, cf S *supra*) Silky needles (from alcohol)

$\beta\beta$ Di-bromo *n* cumene $\text{C}_9\text{H}_7\text{CBr}_2\text{CH}_2\text{CH}_3$

Phenyl ethyl ketone-di bromide Formed in the cold by the action of bromine (2 mols) upon *n* cumene exposed to direct sunshine (Schramm B 18, 1275)

$\alpha\alpha\beta$ Tri bromo *n* cumene

$\text{C}_9\text{H}_7\text{CHBr CHBr CH}_2\text{CH}_2\text{Br}$ **Styrcerin tri brom hydryn** [124°] From cinnamyl bromide and Br, or by the action of HBr on the dibromide of cinnamyl alcohol (Grimaux, Bl 20, 120)

Tetra bromo *n* cumene $\text{C}_9\text{H}_5\text{Br}_4$ Liquid

(Fitting, A 149, 327)

***o* Bromo-cumene** $\text{C}_9\text{H}_7\text{BrPr}$ [12] **Bromo**

isopropyl benzene (206° cor) at 740 mm From isopropyl phenol and PBr_3 (Fileti, G 16, 131)

***p* Bromo cumene** $\text{C}_9\text{H}_7\text{BrPr}$ [14] (217)

SG $\frac{1}{2}$ 13014 Prepared by brominating cumene at 0° in presence of I (Jacobsen, B 12, 430) With benzene, Na, and CO_2 it gives cumic acid (R Meyer, J pr [2] 34, 93)

Penta bromo cumene $\text{C}_9\text{H}_5\text{Br}_5$ [97°] From

cumene and Br (Meusel, Z 1867, 322, Fitting, A 149, 326) Needles, sl sol cold alcohol

Bromo ψ cumene $\text{C}_9\text{H}_7(\text{CH}_2)_2\text{Br}$ [1 2 4 5]

[73°] (227°) White plates

Formation — 1 By the action of cuprous

bromide upon diazo pseudo cumene (Haller, B 18, 93) — 2 By the action of bromine (1 mol) in the dark upon pseudo cumene, the yield is 60 p c (Beilstein, A 137, 323, Fitting, A 139, 188, 145, 138, Schramm, B 19, 216, Süssenguth, A 215, 243) — 3 By the action of bromine upon an aqueous solution of pseudo cumene-sulphonic acid (1 2 4 5) 76 p c is converted into bromo ψ cumene, the remainder forming bromo- ψ cumene sulphonic acid $\text{C}_9\text{H}_7\text{Me}_2\text{Br}(\text{SO}_3\text{H})$ [1 2 4 3 5] (Kelbe & Pathe, B 19, 1547)

Bromo ψ cumene $\text{C}_9\text{H}_7\text{Me}_2\text{Br}$ [1 2 4 3]

(226°-229°) Colourless oil Formed by the hydrolysis of the sulphonic acid $\text{C}_9\text{H}_7\text{Me}_2\text{Br}(\text{SO}_3\text{H})$ [1 2 4 3 5] by means of superheated steam at 200°-210° By MeI and Na it yields ϵ tetramethyl benzene (Kelbe & Pathe, B 19, 1551)

Bromo ψ cumene $\text{C}_9\text{H}_7\text{Me}_2\text{Br}$ [1 2 4 6] (237°)

Liquid, still fluid at -15° Obtained by hydrolysis of the sulphonic acid (1 3 4 5 2) By sulphonation it is reconverted into the same sulphonic acid (Jacobsen, B 19, 1223)

ω Bromo- ψ -cumene $\text{C}_9\text{H}_7(\text{CH}_2)_2\text{CH}_2\text{Cl}$ **Pseudo-**

cumyl bromide Liquid Decomposes on distillation Formed by the action in direct sunshine of 1 mol of bromine upon 1 mol pseudo-cumene (Schramm, B 19, 217)

Di-bromo- ψ -cumene $\text{C}_9\text{H}_7\text{Me}_2\text{Br}_2$ [1 2 4 5 6]

[64°] (294°) Formed by the action of 1 mol. of bromine upon 1 mol mono bromo-pseudo-

cumene by gaslight, or in the dark (Schramm, *B* 19, 216, Jacobsen, *B* 19, 1220) Long flat needles, v sol alcohol

α, ω -Di-bromo ψ cumene $C_6H_4(CH_2Br)(CH_2Br)$, [1 2 4] *Pseudo-cumylene bromide* [97°] Flat glistening needles (from petroleum ether) V sol alcohol and benzene Formed by the action of 2 mols of bromine upon 1 mol pseudo cumene *in direct sunshine* (Schramm, *B* 19, 218, Hjelt a. Gadd, *B* 19, 867)

Tri-bromo- ψ -cumene C_6Me_3Br , [1 2 4 3 5 6] [226°] or [233° cor] V sol hot toluene, sl sol alcohol Formed by the action of Br (3 mols) in the dark upon ψ cumene (1 mol) (Fittig a. Laubinger, *A* 101, 264, Schramm, *B* 19, 217, Jacobsen, *B* 19, 1222)

BROMO ψ CUMENE SULPHONIC ACID
 $C_6HMe_2Br(SO_3H)$ [1 2 4 5 6] [c 121°] Formed by dissolving bromo ψ cumene [73°] in warm slightly fuming H_2SO_4 . Needles (containing 2aq) By treating the Na salt with zinc dust and aqueous NH_3 it is debrominated with production of (1,2,4,6) pseudo cumene sulphonic acid

Salts — Na^+Na^+aq — $Ca^{2+}aq$ — $Cu^{2+}aq$ — $Ba^{2+}aq$ — K^+aq

Amide $C_6HMe_2Br(SO_3NH_2)$ [185°], small needles, v sol alcohol, nearly insol water (Jacobsen, *B* 19, 1218, Kelbe a. Pathe, *B* 19, 1553)

Bromo ψ cumene sulphonic acid
 $C_6HMe_2Br(SO_3H)$ [1 2 4 5 6 3] Formed, together with the di bromo acid, by the action of $ClSO_3H$ upon di bromo ψ cumene — Na^+aq

Amide $C_6HMe_2Br(SO_3NH_2)$ [158°], thin needles (Jacobsen, *B* 19, 1223)

Bromo- ψ -cumene-sulphonic acid
 $C_6HMe_2Br(SO_3H)$ [1 2 4 3 5] [116°] Colourless needles Formed by the action of bromine upon an aqueous solution of pseudo cumene sulphonic acid [1 2 4 5], 76 p.c. of the pseudo cumene sulphonic acid is converted into bromo pseudo-cumene [73°] the remainder yielding the bromo sulphonic acid It is also formed by sulphonation of bromo pseudo cumene [1 2 4 3] The latter body is formed by the action of super heated steam upon it at 200°–210°

Salts — Na^+aq — K^+aq — Ag^+aq — $Ba^{2+}aq$ — $Pb^{2+}aq$

Amide $C_6HMe_2Br(SO_3NH_2)$ [188°], thin needles (Helbe a. Pathe, *B* 19, 1547)

Di-bromo- ψ -cumene-sulphonic acid
 $C_6Me_2Br(SO_3H)$ [1 2 4 5 6 3] Obtained by sulphonation of di bromo pseudo cumene with sulphuric chlorhydrin

Salts — Na^+aq — Na^+aq — $Ba^{2+}aq$

Amide $C_6Me_2Br(SO_3NH_2)$ [above 250°], plates (Jacobsen, *B* 19, 1222)

BROMO ψ CUMENOL C_6HMe_2BrOH [1 2 4 3 5] [35°] Formed by bromination of pseudo cumenol in cold acetic acid Slender yellow needles Insol water, v sol other solvents (Heuter, *B* 11, 29, Auwers, *B* 18, 2657)

Bromo-iso-cumenol $C_6H_2PrBr(OH)$ [2 4 1] [49°] *Bromo isopropyl-phenol* From *o* isopropyl-phenol (*o* isocumenol) and Br (Fileti, *G* 16, 117) Decomposes at 250°

Methyl ether $C_6H_2PrBr(OMe)$ (250°).

Di bromo- ψ -cumenol
 $C_6Me_2Br_2OH$ [1 2 4 3 5 6]. [149°] Formed by bromination of pseudo-cumenol dissolved in a small quantity of acetic acid Long colourless

prisms or needles. Insol. water, m. sol. alcohol, acetic acid, and benzene, v sol ether

Methyl ether $C_6Me_2Br_2OMe$ [96°] Formed by methylation of the above or by bromination of pseudo cumenol methyl ether. White needles Insol water, v sol other solvents (Auwers, *B* 18, 2657)

Di bromo- ψ cumenol
 $C_6Me_2Br_2OH$ [1 2 4 3 5 6] [152°] From $C_6HMe_2Br_2$ [1 3 4 2 6] (Edler, *B* 18, 630, Jacobsen, *B* 19, 1220)

D-bromo-iso-cumenol
 $C_6H_2PrBr_2(OH)$ [2 4 6 1] From *o* iso cumenol and Br (Fileti) Liquid

Methyl ether $C_6H_2PrBr_2(OMe)$ (279°). HNO_3 forms a nitro derivative

$C_6H_2PrBr_2(NO_2)(OH)$ [2 4 6 1] [33°]

BROMO- ψ -CUMINIC ACID $C_6H_4BrO_2$ *is.* $C_6H_4Br(C_2H)CO_2H$ [151°] *Bromo propyl benzoic acid* From Br and cuminic acid or silver cuminate (Naquet a. Lugmin, *Z* 1866, 333, Gerichten, *B* 11, 1719) From bromo cumene and HNO_3 (Fileti a. Crosa, *G* 16, 296)

Ezo-bromo-cuminic acid $C_6H_4BrC_2H_3CO_2H$ From Br and cuminic acid at 120° (Czumpelik, *B* 3, 478)

BROMO-CUMYL-BUTYRIC ACID
 $C_6H_4BrO_2$ *is.* $C_6H_4PrC_2H_3CHBrCO_2H$ [150°]. From cumenyl crotonic acid and HBr Prisms Decomposed by $NaCO_3$ giving allyl isopropyl benzene (Perkin, *C* 7 32, 662)

BROMO-CUMYL-PROPIONIC ACID
 $C_6H_4BrO_2$ *is.* $C_6H_4PrC_2H_3CHBrCO_2H$ [87°] From cumyl acrylic acid and HBr (Perkin, *C* 7 32, 661) Resolved by boiling water into HBr and cumyl acrylic acid. Na_2CO_3 forms vinyl isopropyl benzene

Di-bromo-cumyl-propionic acid
 $C_6H_4PrCHBrCHBrCO_2H$ [190°] From cumyl acrylic acid and Br (Widman, *B* 19, 258)

BROMO CUMYL-VALERIC ACID
 $C_6H_4BrO_2$ *is.* $C_6H_4PrC_2H_3CHBrCO_2H$ From cumenyl angelic acid and HBr Prisms. Na_2CO_3 gives isopropyl butenyl benzene (Perkin, *C* 7 32, 663)

BROMO-CYANO-BENZENE *is* *Nitrile of* Bromo benzoic acid

BROMO- p -CYMENE $C_{10}H_{14}Br$ *is.* $C_6H_4(CH_2)(C_2H_5)Br$ [1 4 2] *Bromo p methyl-n propyl-benzene* (234° i V) SG 125 127

Formation—1 From cymene and Br (Laudolph, *B* 5, 267)—2 Together with bromo p -cymene-sulphonic acid $C_6H_4MePrBr(SO_3H)$ [1 4 5 2] by the action of bromine upon an aqueous solution of p -cymene sulphonic acid (Kelbe a. Koschitzsky, *B* 19, 1730)—3 The same or the following bromo-cymene is formed by hydrolysis of bromo p -cymene-sulphonic acid $C_6H_4MePrBr(SO_3H)$ [1 4 5 6 2] (K. a. K)

Bromo p -cymene $C_6H_4(CH_2)(C_2H_5)Br$ [1 4 3]. (232°) From thymol and PBr₃ (Fileti a. Crosa, *G* 16, 287) Formed also by the action of bromine upon an aqueous solution of p -cymene-sulphonic acid (Me Pr SO_3H = 1 4 3) (Claus a. Christ, *B* 19, 2165, *vs supra*)

Di-bromo p -cymene $C_6H_4Me_2Pr_2$ (272°). SG 12 1 596 (Claus a. Wimmel, *B* 13, 903)

(a) **Bromo- m isocymene** $C_6H_4MePrBr$ [1 3 6]. (225° cor) Formed, together with bromo-iso cymene sulphonic acid, by the action of bromine on m isocymene sulphonic acid (Kelbe, *A* 210,

48, 235, 281) Oxidised by dilute HNO_3 to bromo toluic acid [210°]

(8) **Bromo-isocymene** $\text{C}_9\text{H}_7\text{Me}(\text{Pr})\text{Br}$ [134] (224°) Got by distilling $\text{C}_9\text{H}_7\text{Me}(\text{Pr})\text{Br}(\text{SO}_3\text{K})$ [1346] with superheated steam (Kelbe a Czarnomski, A 235, 293) Dilute HNO_3 oxidises it to bromo toluic acid $\text{C}_9\text{H}_7\text{MeBrCO}_2\text{H}$ [143] [153°]

Di-bromo-*m*-isocymene $\text{C}_{10}\text{H}_{12}\text{Br}_2$ (273° uncor) Obtained by brominating (a) bromo-*m*-isocymene sulphonic acid (Kelbe a Czarnomski, A 235, 281) Converted by fuming HNO_3 into nitro bromo iso cymene $\text{C}_{10}\text{H}_{12}(\text{NO}_2)\text{Br}$ [83°]

Bromo *p*-cymene-sulphonic acid
 $\text{C}_9\text{H}_7\text{MePrBr}(\text{SO}_3\text{H})$ [145062] **Bromo-*p*-methyl *n*-propyl benzene sulphonic acid** Formed, together with bromo *p*-cymene $\text{C}_9\text{H}_7\text{MePrBr}$ [142], by the action of bromine upon *p*-cymene sulphonic acid $\text{C}_9\text{H}_7\text{MePr}(\text{SO}_3\text{H})$ [142] in aqueous solution at 40°-50° (Kelbe a Koschitzky, B 19, 1730) Formed also from cymidine by sulphonation and diazotisation (Widman, B 19, 248) Sodium amalgam reduces it to *n*-cymene sulphonic acid

Salts — KA' aq — BAa' , 2½ aq S 1 at 17° — BAa' , 1½ aq — CuA' , 12 aq

Amide $\text{C}_9\text{H}_7\text{MePrBr}(\text{SO}_2\text{NH}_2)$ [152°]

Bromo-*p*-cymene-sulphonic acid
 $\text{C}_9\text{H}_7\text{MePrBr}(\text{SO}_3\text{H})$ [1425] Formed by sulphonation of bromo *p*-cymene [142] with H_2SO_4 (Kelbe a Koschitzky, B 19, 1732, Claus a Christ, B 19, 2163, Remsen a Day, Am 5, 151), or ClSO_3H (Paterno a Canonieri, G 11, 126) Long needles containing Ba [c 60°] By zinc-dust and NH_3 it is easily debrominated to *p*-cymene sulphonic acid [145°]

Salts — KA' 3 aq — PbA' , S 21 at 30° — AgA' — CaA' , 8 aq — NaA' , 4½ aq (R a D) — ZnA' , 8 aq (R a D) — MgA' , 9½ aq (R a D) — CaA' , 9½ aq (R a D) — CaA' , 6 aq — BAa' , 9½ aq (R a D) — BAa' , 5 aq S 137 at 27° — CuA' , 8 aq

Amide $\text{C}_9\text{H}_7\text{MePrBr}(\text{SO}_2\text{NH}_2)$ [188°]

(K a K) [195°] (C a C)

Chloride $\text{C}_9\text{H}_7\text{MePrBrSO}_2\text{Cl}$ [82°].

Bromo-*p*-cymene-sulphonic acid
 $\text{C}_9\text{H}_7(\text{CH}_3)(\text{C}_2\text{H}_5)\text{Br}(\text{SO}_3\text{H})$ [1453] [180° uncor] Formed, by bromination of an aqueous solution of *p*-cymene-sulphonic acid $\text{C}_9\text{H}_7\text{MePr}(\text{SO}_3\text{H})$ [143] Glistening colourless plates (Claus a Christ, B 19, 2166)

(a) **Bromo iso cymene sulphonic acid**
 $\text{C}_9\text{H}_7\text{Me}(\text{Pr})\text{Br}(\text{SO}_3\text{H})$ [1364] [65°] and [126°] From (a) bromo iso-cymene by sulphonation, or from (8) isocymene sulphonic acid by bromination (Kelbe a Czarnomski, A 235, 277) Needles containing 3 aq (from water) After a week's exposure over H_2SO_4 it melts at 126° Salts — BAa' , 7 aq — CuA' , 7 aq — KA' aq — NaA' , 2 aq

Amide $\text{C}_{10}\text{H}_{12}\text{BrSO}_2\text{NH}_2$ [171°]

(8) **Bromo-*m*-iso-cymene sulphonic acid**
 $\text{C}_9\text{H}_7\text{BrSO}_3\text{H}$ s.e. $\text{C}_9\text{H}_7\text{Me}(\text{C}_2\text{H}_5)\text{Br}(\text{SO}_3\text{H})$ [1346] [109°] Formed by bromination of *m*-isocymene sulphonic acid (Kelbe a Czarnomski, A 235, 272) Salts — PbA' , aq — BAa' , — CuA' , 4 aq — KA' aq

Amide — $\text{C}_9\text{H}_7\text{BrSO}_2\text{NH}_2$ [162°]

BROMO-CYMENOL $\text{C}_9\text{H}_7\text{MePr}(\text{OH})$ [143208] From amido cymenol by the diazo-reaction. Oil (Mazzara, G 16, 191)

Tri-bromo-cymenol $\text{C}_9\text{H}_5\text{Me}(\text{C}_2\text{H}_5)_3\text{Br}_3(\text{OH})$ [241] [222°] Glistening golden plates Formed by shaking an aqueous solution of

cymenol with a solution of bromine in HBr (Jesurun, B 19, 1414)

BROMO CYMIDINE $\text{C}_9\text{H}_7\text{MeBr}(\text{C}_2\text{H}_5)_2\text{NH}_2$ From bromo-nitro cymene Liquid (Mazzara, G 16, 193)

BROMO-DECANE v **DECYL BROMIDE**
Di-bromo decane $\text{C}_{10}\text{H}_{18}\text{Br}_2$ **Decylene bromide** Oil From petroleum decylene (Reboul a Truchot, A 144, 248)

Di-bromo-decane $\text{C}_{10}\text{H}_{18}\text{Br}_2$ **Diamylene bromide** From diamylene and Br (Bauer, A 135, 344) Liquid Alcoholic KOH gives rutylene $\text{C}_{10}\text{H}_{18}$ (150°)

Tri-bromo-decane $\text{C}_{10}\text{H}_{16}\text{Br}_3$ Oil From diamylene and Br (Walz, Z 1868, 816) Decomposes at 100°

Tetra-bromo decane $\text{C}_{10}\text{H}_{14}\text{Br}_4$ **Menthene tetrabromide** From menthene and Br (Beckett a Wright, Report of British Ass 1875, ii 38) Oil, split up by distillation into HBr and cymene

Tetra bromo decane $\text{C}_{10}\text{H}_{14}\text{Br}_4$ **Decenylene tetra bromide** From decene (165°) and Br Oil (Reboul a Truchot, A 144, 249)

Tetra bromo decane $\text{C}_{10}\text{H}_{14}\text{Br}_4$ From allyl-propylidene propyl methane (158°) and Br (Reformatsky, J pr [2] 27, 389)

DI BROMO-DECINENES $\text{C}_{10}\text{H}_{16}\text{Br}_2$ Described as hydrobromides of terpenes V also **BROMYL BROMIDE**

Di bromo-decine $\text{C}_{10}\text{H}_{16}\text{Br}_2$ From di-amylenes and Br, p 211

Tetra bromo decene $\text{C}_{10}\text{H}_{14}\text{Br}_4$ **Di bromo camphulidene dibromide** [160°-164°] From camphor and PCl_5Br (De la Royère, Bl [2] 38, 579) Unctuous tables

γ BROMO-DECOIC ACID $\text{C}_{10}\text{H}_{17}\text{BrO}_2$ s.e. $\text{C}_9\text{H}_{17}\text{CHBrCH}_2\text{CH}_2\text{CO}_2\text{H}$ From decenoic acid (*g* v) and HBr (Schneegans, A 227, 92) Heavy oil Na_2CO_3 removes HBr forming the lactone of oxydecoic acid

Di-bromo-decoic acid $\text{C}_{10}\text{H}_{15}\text{Br}_2\text{O}_2$ **Di bromo capric acid** [135°] From decenoic ('amydecyl enic') acid and Br (Hall a Schoop, B 12, 194) Monoclinic prisms (from benzene)

DI-BROMO-DECYL ALCOHOL $\text{C}_{10}\text{H}_{21}\text{Br}_2\text{O}$ Oil From allyl-di-isopropyl-carbinol and Br (Lebedinsky, J pr [2] 23, 22)

BROMO DECYLENE $\text{C}_{10}\text{H}_{16}\text{Br}$ (215°) S G 121 109 Oil From decylene bromide (*v sup*) and alcoholic KOH (Reboul a Truchot, A 144, 248) Alcoholic KOH forms $\text{C}_{10}\text{H}_{16}$ (165°) and $\text{C}_{10}\text{H}_{16}\text{OEt}$

Bromo decylene v **MENTHYL BROMIDE**
Di-bromo-decylene $\text{C}_{10}\text{H}_{14}\text{Br}_2$ **Decene bromide** Oil From $\text{C}_{10}\text{H}_{16}$ and Br (R a T.)

Di bromo decylene $\text{C}_{10}\text{H}_{14}\text{Br}_2$ From terpene hydride and Br (Montgolfier, A Ch. [5] 19, 158)

Di-bromo-decylene $\text{C}_{10}\text{H}_{14}\text{Br}_2$ From rutylene and Br (Bauer, A 135, 344)

DI BROMO DODECANE $\text{C}_{12}\text{H}_{26}\text{Br}_2$ [—15°]. **Dodecylene bromide** Formed by the addition of Br to dodecylene (Krafft, B 17, 1371)

BROMO-ISO-DURENE $\text{C}_9\text{H}_7\text{BrMe}$ [13458]. (258°) Liquid, solidified by cold (Bielefeldt, A 198, 888)

Bromo s durene $\text{C}_9\text{H}_5\text{Me}_2\text{Br}$ [12458] [61°]. By bromination of durene (Gissmann, A 216, 210) Pearly plates (from alcohol)

Di bromo c durene $C_{10}H_6Br_2$ *see* $C_6Me_6Br_2$ [1 2 3 4 5 6] **Di bromo prehnitene** [210°] From o durene, Br, and I. Prisms (Jacobsen, *B* 19, 1218)

Di bromo-iso durene $C_{10}H_6Br_2$ [1 3 4 5 2 6] [209°] Long fine needles. Sl sol hot, v sl sol cold alcohol. Prepared by bromination of iso-durene (Jacobsen, *B* 15, 1853, *cf* Jannasch, *B* 8, 356)

Di bromo s durene $C_{10}Me_6Br_2$ [1 2 4 5 3 6] [203°] Needles (from alcohol) (Fittig & Jannasch, *Z* 1870, 161, Friedel & Crafts, *A Ch* [6] 1, 515)

BROMO DURENOL $C_{10}H_7BrOH$ [118°] Formed by bromination of durenol in acetic acid. Long prisms. V sol alcohol and ether, insol water (Jacobsen & Schnapauß, *B* 18, 2844)

DI BROMO ENNANE $C_8H_7Br_2$, *Nonylene bromide*. From Br and ennylene (from paraffin). Alcoholic KOH forms bromo ennylene C_8H_7Br (c 210°) (Thorpe & Young, *A* 165, 18)

BROMO-ENNOIC ACID $C_8H_7BrCO_2H$. From ennoic acid $C_8H_9O_2$ and HBr. Decomposed by warm aqueous Na_2CO_3 forming an oil, probably C_8H_7Br (Schneegans, *A* 227, 83)

BROMO-ENNYLENE *see* **DI BROMO ENNANE**

BROMO ERUCIC ACID $C_{22}H_{39}BrO_2$ [34°] From di bromo behenic acid and alcoholic KOH. Converted into behenic acid by alcoholic KOH (Haussknecht, *A* 143, 50)

Di-bromo-erucic acid $C_{22}H_{39}Br_2O_2$ [47°] From behenic acid and bromine (H)

BROMO-ETHANE *v* **ETHYL BROMIDE**

Di-bromo-ethane *v* **ETHYLENE BROMIDE** and **ETHYLIDENE BROMIDE**

***u*-Tri-bromo-ethane** $CHBr_3$, CH_2Br_2 *Bromo ethylene bromide* (188°) at 752 mm SG $\frac{17.5}{4}$ 2 6189, $\frac{11.5}{7}$ 2 6107 (Anschutz, *A* 221, 138) M M 12 897 at 11 7° From $CHBr_3$, water, and Br (Wurtz, *A Ch* [3] 51, 84) Also formed by the action of Br on ethyl bromide, ethylene bromide, or iodo ethylene (M Simpson, *P M* [4] 14, 544, Caventou, *A* 120, 323, Tawildaroff, *A* 176, 22, Staedel, *B* 11, 1741)

Reactions—1 Alcoholic KOH gives *u* di-bromo-ethylene, bromo acetylene, and acetylene. 2 *u* Di bromo ethylene is also formed by the action of alcoholic KOAc, water and PbO , and $NaOEt$ (Michael, *Am* 5, 192)—3 $SbCl_5$ gives $CHCl_2-CH_2Br$ (Henry, *Bl* [2] 42, 262)—4 Benzene in presence of Al_2Cl_3 produces bromo benzene, *s* di phenyl ethane, and *u* di phenyl-ethane (Anschutz, *A* 235, 333)

***u*-Tetra-bromo-ethane** CBr_4 , CH_2Br_2 *Acetylene tetra-bromide* (103 5°) at 13 5 mm SG $\frac{21.5}{4}$ 2 9216 From CBr_4 , CH_2 , and Br (Anschutz, *A* 221, 140, Lennox, *C J* 13, 206, Reboul, *A* 124, 270) Also from tri bromo ethane and Br (Denzel, *B* 12, 2207) Decomposed by heat, giving off Br, and HBr. Converted by benzene and Al_2Cl_3 into *u* di phenyl ethane, and *s* tetra phenyl ethane $CHPh_2-CHPh_2$ [210°] bromo-benzene and acetylene dibromide being also formed (Anschutz, *A* 235, 196)

***s*-Tetra-bromo-ethane** $CHBr_3$, $CHBr_2$ *Acetylene tetra-bromide* (114°) at 12 mm SG $\frac{21.5}{4}$ 2 9629 Acetylene, from $C_2H_2Br_2$ and alcoholic KOH is passed directly into bromine. The product, containing $CHBr_3$, CH_2Br_2 , is treated with

alcohol and zinc dust and $CHBr_3$ $CHBr$ is separated from CH_2 , $CHBr$ by fractional distillation, and is then mixed with bromine (Anschutz, *A* 221, 138, *cf* Reboul, *C R* 54, 1229, Sabanejeff, *B* 9, 1441, *A* 178, 112)

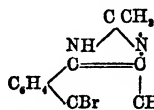

Properties—Smells of camphor and chloroform. Takes up moisture from air, becoming cloudy. At 185° it begins to decompose, giving off Br_2 and HBr, and leaving C_2HBr_3 . With water and bromine at 185° it gives C_2Br_4 and C_2Br_6 . Boiling alcoholic KOH forms acetylene and bromo acetylene. Zinc added to its alcoholic solution forms acetylene dibromide in the cold, but on warming it forms acetylene. With benzene and Al_2Cl_3 it forms bromo benzene, *u* di phenyl-ethane, anthracene, and anthraquinone (Anschutz, *A* 235, 161) Al_2Cl_3 alone forms $CHBr_3$, CH_2Br_2 and C_2Br_4 . Toluene and Al_2Cl_3 give di methyl anthracene [225°] *o m* and *p* xylene appear to give tetra methyl anthracenes

Penta bromo ethane CBr_3 , CBr_2H [49°] (*S*), [54°] (*D*), [57°] (*B*) (210°) at 300 mm

Formation—1 From $CHBr_3$, CBr_2 , and Br (Lennox, Sabanejeff, *A* 216, 281)—2 From bromo ethylene and Br (Denzel, *B* 12, 2208)—3 From bromo acetylene and Br (Reboul, *A* 124, 268)—4 By spontaneous decomposition of tri bromo ethylene exposed to air (Demole, *Bl* [2] 34, 204)—5 From acetylene tetrabromide and Br (Bourgoin, *Bl* [2] 23, 173)—6 From succinic acid, water, and Br (Orlovsky, *J R* 9, 280)

Hexa bromo ethane C_2Br_6 *Carbon hexa bromide*. Formed by brominating C_2Br_4 (Reboul). Formed also by the action of Br and Al on CCl_4 , C_2Cl_4 , or C_2Cl_6 (Gustavson, *J R* 13, 287) Also from mucobromic acid, water, and Br at 130° (Delbruck, *A* 165, 253) Prisms (from CS_2), insol alcohol. At 200°–210° it decomposes, without previous fusion, into Br and C_2Br_4 . Unlike the latter, it is not volatile with steam

BROMO-ETHENYL-NAPHTHYLENE-DIAMINE

[229°] Formed by reduction of the acetyl derivative of (1 3 4) bromo nitro (α) naphthyl amine with $SnCl_4$. Small white needles. V sol alcohol and ether, insol water. The ethenyl group is very stable. Salts— $BHCl$ — $B'H_2SO_4$ sparingly soluble needles— $B'HNO_3$ fine white sparingly soluble needles (Prager, *B* 18, 2160, *cf* Meldola, *C J* 47, 505)

BROMO ETHOXY- *v* BROMO OXY-

BROMO ETHYL-ACETO-ACETIC ETHER *v* BROMO ACETO ACETIC ETHER

see $CH_3COCH(CO_2Et)CH_2CH_2Br$ Heavy yellowish oil of camphor like odour. Not distillable. Formed by dissolving trimethylene methyl

ketone-carboxylic ether $\begin{array}{c} CH_3 \\ | \\ CH_2-C-COCH_3 \\ | \\ CH_2 \end{array}$ in three times its weight of strongly cooled conc HBr (1 85 SG), allowing to stand 10 mins at 15° and pouring into iced water. By boiling

with HCl it is converted into acetyl propyl alcohol $\text{CH}_3\text{COCH}_2\text{CH}_2\text{CH}_2\text{OH}$ (*v* p 46) with formation of alcohol, CO_2 , and HBr (Perkin, jun, & Frazer, *C J* 51, 883, *B* 19, 2565)

BROMO ETHYL ALCOHOL *v* GLYCOL BROM-HYDRIN

Dibromo ethylalcohol $\text{CHBr}_2\text{CH}_2\text{OH}$ (180°) *SG* 2 235. From bromo ethylene and dilute HBrO (Demole, *B* 9, 49) Reduces ammoniacal AgNO_3 . Alcoholic KOH gives bromo ethylene oxide *Acetyl derivative* $\text{CHBr}_2\text{CH}_2\text{OAc}$ (194°) *SG* 2 198

BROMO TRI-ETHYL AMINE *Ethylbromide* $\text{C}_2\text{H}_5\text{Br}$ NET_3Br From NET_3 and ethylene bromide Alcoholic KOH forms $\text{C}_2\text{H}_5\text{NET}_2\text{Br}$ (Hofmann, *C R* 49, 880)

BROMO ETHYL-ANILINE $\text{C}_6\text{H}_5\text{BrNHET}$ From *p*-bromo-aniline and EtBr (Hofmann, *A* 74, 145)

Bromo di ethyl aniline $\text{C}_6\text{H}_5\text{BrNET}_2$ [33°] (270°) Needles or prisms Formed by bromination of diethylaniline (Claus & Howitz, *B* 17, 137)

BROMO ETHYL BENZENE $\text{C}_6\text{H}_5\text{BrEt}$ [14] (204°) *SG* 13 134 From *p*-ethyl benzene, Br, and I (Kekulé & Thorpe, *C J* 22, 366) From $\text{C}_6\text{H}_5\text{Br}$, EtI , and Na (Aschenbrandt, *A* 216, 222) Does not solidify at -20° A mixture of *o* and *p* ethyl benzenes is formed by the action of bromine in the dark upon ethyl benzene, or by the action of bromine in presence of 3 p c of iodine upon ethyl benzene in diffused daylight (Schramm, *B* 18, 1272)

Bromo ethyl benzene $\text{C}_6\text{H}_5\text{CH}_2\text{CH}_2\text{Br}$ (c 148°) at 30 mm *SG* 2 1311 Formed by direct combination of styrene with HBr (Bernthsen & Bender, *B* 15, 1983) Formed also by treating a mixture of benzene and bromo ethylene with Al_2Cl_3 (Hanriot & Guilbert, *C R* 98, 520)

Bromo ethyl benzene $\text{C}_6\text{H}_5\text{CHBrCH}_3$ (37°) at 17 mm (c 150°) at 500 mm From Br and ethyl benzene at 140° (Radziszewski, *B* 6, 492, Berthelot, *C R* 67, 328, Anschutz, *A* 235, 328) Formed also by passing HBr into cooled phenyl methyl carbinol (Engler & Bethge, *B* 7, 1125) Partially decomposed by distillation into styrene and HBr

Di bromo ethyl benzene
PhCHBrCH₂Br [74°] (140°) at 15 mm
Styrene di bromide

Preparation—1 From styrene (10 g), ether (25 g) and bromine (17 g) (Blyth & Hofmann, *A* 53, 306, Zincke, *A* 216, 288)—2 From hot ethyl benzene and Br (Radziszewski, *B* 6, 493, Friedel & Balsohn, *Bl* [2] 35, 55)

Properties—White plates or needles (from 80 p c alcohol) *V* e sol ether, benzene and glacial HOAc, *v* sol alcohol or benzoline

Reactions—1 KOAc and alcohol at 160° gives chiefly β bromo styrene (150°-160° at 75 mm.)—2 KOAc and glacial HOAc gives chiefly the diacetate of phenyl glycol, $\text{PhCH(OAc)CH}_2\text{(OAc)}$ —3 Alcoholic KOH or water at 190° give α -bromo styrene (Glaser, *A* 154, 154)—4 Gives $\text{PhCH(OH)CH}_2\text{(OH)}$ by treatment with AgOAc , alcohol and AgOBz , or aqueous K_2CO_3 , AgOBz in presence of toluene forms $\text{PhCH(OBz)CH}_2\text{(OBz)}$ —5 Benzene and Al_2Cl_3 give *s*-di phenyl ethane (Anschutz, *A* 235, 328)

Tri-bromo ethyl benzene $\text{C}_6\text{H}_5\text{CHBrCHBr}_2$ [88°] From α -bromo-styrene and Br (Fitting & Binder, *A* 195, 142) Acted upon by benzene and Al_2Cl_3 in presence of CS_2 it is converted into *s*-tetra phenyl ethane [209°] (*A*)

Tetra-bromo ethyl benzene $\text{C}_6\text{H}_5\text{Br}_2$ From di bromo ethyl benzene and Br (Kinnicutt & Palmer, *Am* 5, 387)

Penta bromo-ethyl benzene $\text{C}_6\text{H}_5\text{Br}_3$ From ethyl benzene, Br, and Al_2Br_3 (Gustavsen, *Bl* [2] 30, 22)

Di bromo di ethyl benzene $\text{C}_6\text{H}_4(\text{C}_2\text{H}_5\text{Br})_2$ (200°-230°) at 80 mm From bromo ethylene, benzene, and Al_2Cl_3 (Hanriot & Guilbert, *C R* 98, 525)

Bromo tetra ethyl benzene $\text{C}_6\text{H}_2(\text{C}_2\text{H}_5)_4$ Br (284° uncor) Heavy liquid (Galle, *B* 16, 1745)

Di bromo tetra ethyl benzene $\text{C}_6\text{H}_2(\text{C}_2\text{H}_5)_4\text{Br}_2$ [75°] (above 330°) Prisms *V* sol alcohol (Galle, *B* 16, 1745)

BROMO ETHYL BROMIDE *v* **DI BROMO-ETHANE**

BROMO - ETHYL BROMO - ACETATE *v* **BROMO ACETIC ACID**

BROMO ETHYLENE $\text{C}_2\text{H}_3\text{Br}$ *te* CHBrCH_2 , *Vinyl bromide* (16°) *SG* 1 15167 (Anschutz) Formed by the action of alcoholic KOH upon either di bromo ethane (Regnault, *A Ch* [2] 59, 358, Beilstein, *J* 1861, 609, Glockner, *A Suppl* 7, 109, Semenov, *J* 1864, 480) Formed also from acetylene and HBr (Reboul, *C R* 74, 947) Gas or liquid, when kept in a sealed tube and exposed to sunlight it changes to an amorphous polymeride, insol water, alcohol, and ether, *SG* 2 075 This substance carbonises when heated (Hofmann, *C J* 13, 68, Baumann, *A* 163, 308), it is not affected by boiling alcoholic KOH Polymerisation is arrested by the presence of MeI or EtI, but not by chlorinated or brominated hydrocarbons, a little I stops polymerisation of the liquid, but not of the gas Aniline arrests, but SO_2 promotes, the change (Lwow, *Bl* [2] 35, 169)

Reactions—1 Split up into HBr and acetylene by alcoholic KOH, NaOEt, NaOC₂H₅, or ammoniacal AgNO_3 (Sawitsch, *Bl* 1861, 7, *A* 119, 185, Miasnikoff, *Bl* 1861, 12, *A* 118, 330)—2 Conc HBr at 6° forms *s*-di bromo-ethane, a more dilute acid gives *u*-di bromo ethane (Reboul, *A* 155, 29, 212)—3 Fuming HCl at 100° forms CH_2CHBrCl —4 Conc HI at 4° gives CH_2CHBrI , at 100° it forms also CHICH_2Br (*R*)—5 Aqueous solutions of metallic salts either have no action or split it up into acetylene and HBr (Kutscheroff, *B* 14, 1532, Linnemann, *A* 143, 347, Saytzeff & Ghinsky, *Z* [2] 3, 675)—6 Successive treatment with conc H_2SO_4 and water forms crotonic aldehyde (Zincke, *A* 191, 370)—7 Aqueous BrOH at 0° gives $\text{CHBr}_2\text{CH}_2\text{OH}$, $\text{CHBr}_2\text{CH}_2\text{Br}$, and $\text{C}_2\text{H}_3\text{BrO}$, [40°-45°] (90°) (Demole, *B* 9, 49)—7 Dry oxygen at 23° has no action—8 ICl forms $\text{CHBrICH}_2\text{Cl}$ and a less quantity of CHIICHBrCl (Henry, *C R* 98, 680)—9 With benzene and Al_2Cl_3 it produces styrene, ethylbenzene, *u*-di phenyl ethane, and di methyl-anthracene dihydride (Anschutz, *A* 235, 331) If elevation of temperature be avoided and the Al_2Cl_3 be slowly added the products are $\text{C}_6\text{H}_5\text{C}_2\text{H}_3\text{Br}$ and $\text{C}_6\text{H}_4(\text{C}_2\text{H}_3\text{Br})_2$ (Hanriot & Guilbert, *C R* 98, 525)

***s*-Di. bromo ethylene** CHBrCHBr *Acetylene dibromide* (110°–111°) S G ¹⁷⁵ 2 2714 (Anschütz, A 221, 141), 2 2 268 (Sabanéeff, B 9, 1441, Plimpton, C J 39, 536), 12 2 223 (S) V D 6 47 (calc 6 44) — Formed by mixing acetylene tetrabromide (100 g) with alcohol (20 g) and adding zinc dust slowly, with cooling (A, cf Sabanéeff, A 216, 252)

Properties — Oil, does not polymerise

Reactions — 1 Heated for several days with 50 pts of water at 135°, it is not affected — 2 Heated with dilute K_2CO_3 , bromo acetylene is formed, which is spontaneously inflammable Alcoholic KOH and aqueous KCy also form bromo acetylene — 3 Heated with dry KOAc at 160° for two days it forms $\text{CHBrCH}(\text{OAc})$, the acetate of bromo vinyl alcohol (Sabanéeff, Bl [2] 41, 253) — 4 Heated with AgOAc and a little HOAc at 100° it forms a compound $\text{C}_2\text{H}_2\text{Br}_2\text{AgOAc}$ This is decomposed by HCl with evolution of acetylene — 5 Combines with AgNO_3 — 6 With alcoholic KCN it forms a compound which, on saponification, gives an acid $\text{C}_2\text{H}_3\text{O}_2$ (163°–168°) Its silver salt is $\text{C}_2\text{H}_2\text{Ag}_2\text{O}_4$ (S) — 7 Alcoholic KOPh gives CHBrCHOPh (c 223°), SG ¹⁵ 1 485–8 With alcoholic NMe_3 , at 120° it forms NMe_2Br , NMe_2HBr , $\text{NMe}_2\text{H}_2\text{Br}$, and carbonaceous bodies

$2\text{NMe}_3 + \text{C}_2\text{H}_2\text{Br}_2 = 2\text{NMe}_2\text{HBr} + \text{C}_2$ (Plimpton, C J 39, 536) — 9 With NEt_3 it acts similarly — 10 Acts upon benzene in presence of AlCl_3 , forming CHBrCH_2Br , anthracene, and $\text{CH}_2\text{PhCH}_2\text{Ph}$ (Anschütz, A 235, 153)

***u*-Di bromo-ethylene** $\text{CBrCH}_2\text{CH}_2\text{CBr}$ *Acetylenide dibromide* (92°) at 754 mm in CO_2 , SG ²⁷⁶ 2 1780 (Anschütz) From CHBrCH_2Br by treatment with alcoholic KOH, NaOEt, sodium, or solid KOH (Cahours, C R 31, 293, Fontaine, C R 70, 1361, Sawitsch, A 119, 183, Reboul, A 124, 270, Tawildaroff, A 176, 22, Michael, Am 5, 192) From $\text{CBrCH}_2\text{CH}_2\text{Br}$ by boiling with alcohol and KOAc (Demole, Bl [2] 29, 205), or by treatment with zinc and alcohol (Sabanéeff, A 216, 255) Also from $\text{CH}_2\text{ClCHBr}_2$ and alcoholic KOH (Henry, Bl [2] 42, 262)

Properties — Pungent liquid, attacking the eyes Readily absorbs oxygen, changing to bromo acetyl bromide. Polymerises with great ease, becoming solid

Reactions — 1 HBrO forms CBr_2 , $\text{COCH}_2\text{CBr}_2$, [90°] SG 2 288 (Demole, B 11, 1710) — 2 Benzene and AlCl_3 give *u*-di phenyl ethylene (Anschütz, A 235, 158)

Tri-bromo-ethylene $\text{CHBr}_2\text{CBr}_2$ (163°–164°) SG ²⁷⁵ 2 708 (S a. D.), 2 2 69 (Demole, B 11, 818) From di bromo ethylene bromide and alcoholic KOH (Lennox, A 122, 125)

Preparation — Acetylene tetrabromide (1 mol.) is dissolved in twice its weight of alcohol and (somewhat more than 2 mols of) KOAc and Na_2CO_3 (1 mol) are added, the mixture is heated on a water bath 24 hours with inverted condenser (Sabanéeff a Dworkowsch, A 216, 260, cf Sabanéeff, A 178, 122, Bl [2] 29, 207)

Reactions — 1 Alcoholic KOH or Zn and HOEt give a mixture of CH_2 and C_2HBr — 2 Alcoholic KOPh at 100° forms phenyl di bromo vinyl oxide. — 3 Alcoholic KOPh at 170° forms the phenyl derivative of glyoxylic acid,

$\text{PhOCH}_2\text{CO}_2\text{H}$ — 4 Reacts upon benzene in presence of AlCl_3 , producing *u*-di phenyl-ethylene and tri-phenyl methane (Anschütz, A 235, 336) — 5 Absorbs oxygen, becoming $\text{CHBr}_2\text{CO}_2\text{Br}$ (Demole a. Din, B 11, 1302)

Tri-bromo-ethylene $(\text{C}_2\text{HBr}_3)_x$ [174°] A by product in formation of $\text{C}_2\text{H}_2\text{Br}_2$ from acetylene (Sabanéeff, A 178, 114)

Tetra-bromo ethylene C_2Br_4 , [54°] (215°)

Formation — 1 By the action of Br on alcohol or ether (Löwig, A 3, 292) — 2 From C_2HBr_3 and alcoholic KOH (Lennox, A 122, 126) — 3 From CH_2Cl_2 and IBr_3 (Höland, A 240, 234) — 4 From CBr_4 by heating at 220° (H) — 5 From di bromo succinic acid, Br, and water at 190° (Bourgoin, B 7, 1644)

Properties — Plates, volatile with steam, no. affected by oxygen even at 216° (D)

BROMO-ETHYL-ETHER *v* **BROMO ETHYL OXIDE**

BROMO-ETHYL-KAINEINE *v* **Ethyl ether of Bromo (B 4) OXY (B 4)-ETHYL QUINOLINE TRIHYDRIDE**

γ BROMO-ETHYL-MALONIC ACID
 $\text{C}_2\text{H}_5\text{BrO}_2$, *ie* $\text{BrCHCH}_2\text{CH}(\text{CO}_2\text{H})_2$, [116°]. From vinacetic (trimethylene di carboxylic) acid and HBr (Roder, A 227, 19, Peikin, jun, C J 47, 814) Sol benzene, CS, or light petroleum, sol chloroform Boiled with water it gives the lactone of γ -oxy ethyl-malonic acid (*q v*)

Bromo ethyl malonic acid
 $\text{CH}_2\text{CHBrCH}(\text{CO}_2\text{H})_2$ (?) [141°] From crotonic acid $\text{C}_4\text{H}_5\text{O}_2$ and HBr (Claus, A 191, 79)

TRIBROMO (a) ETHYL-NAPHTHALENE
 $\text{C}_6\text{H}_5\text{Br}_3\text{C}_2\text{H}_5$, [127°] Slender needles Prepared by the action of bromine on (a) ethyl-naphthalene (Carnelutti, B 13, 1672)

BROMO ETHYL (b) NAPHTHYL ETHER *a*. (b) **NAPHTHOOL**

***iso* BROMO DI ETHYL OXIDE**
 $\text{CH}_3\text{BrCH}_2\text{OEt}$ (128°) SG 2 1371 V D 5 29 (calc 5 28) From the iodo compound and Br (Henry, C R 100, 1007)

Di *iso* bromo di ethyl oxide $\text{CH}_3\text{BrCHBrOEt}$ From Br and vinyl ethyl oxide Very unstable liquid NaOEt gives $\text{CH}_3\text{BrCH}(\text{OEt})_2$ (Wishcenus, A 192, 111)

Tetra bromo di ethyl oxide $\text{C}_2\text{H}_4\text{Br}_4\text{O}$ A fuming liquid obtained by saturating ethylidene oxychloride with Br at 120° (Kessel, B 10, 1667)

Octo-bromo di ethyl oxide $\text{C}_2\text{H}_4\text{Br}_8\text{O}$ (c 134°) at 460 mm By heating ethylidene oxychloride with Br for 10 hours from 100°–210° (Kessel, B 10, 1667) Fuming oil

***Eso* *exo*-DI-BROMO-*o* ETHYL-PHENOL**
 $\text{C}_6\text{H}_4\text{Br}_2(\text{C}_2\text{H}_4\text{Br})\text{OH}$. From *o* ethyl phenol and Br in the cold Decomposed by distillation into HBr and $\text{C}_6\text{H}_4\text{Br}(\text{C}_2\text{H}_4)\text{OH}$ (Suida a. Plohn, M 1, 175)

Tri bromo (a)-ethyl phenol $\text{C}_6\text{H}_3\text{Br}_3\text{EtOH}$ [55°] Formed, together with the following body, by treating (a) ethyl phenol with excess of Br in the cold (Fittig a Kiesow, A 158, 251)

***Eso* *exo*-Tri-bromo-ethyl phenol**
 $\text{C}_6\text{H}_3\text{Br}_3(\text{OH})\text{CHBrCH}_2\text{Br}$ [108°] Long white needles Obtained by the action of alcoholic KOH upon $\text{C}_6\text{H}_4\text{Br}(\text{OH})\text{CHBrCHBrCO}_2\text{H}$, the product of the action of bromine upon *p* coumaric acid

Acetyl derivatives $C_6H_4Br(OAc)C_6H_4Br$; [94°], needles (Eigel, *B* 20, 2535)

Tetra-bromo-ethyl phenol C_6Br_4EtOH [106°] (v sup)

BROMO-TETRA-ETHYL-PHOSPHONIUM BROMIDE $CH_3BrCH_2PEt_2Br$ [235°] From PEt_3 and ethylene bromide in the cold (Hofmann, *P* 9, 287, 4 *Suppl* 1, 154) Rhombic dodecahedra

Reactions—1 Moist silver oxide gives $CH_3(OH)CH_2PEt_2OH$ (difference from corresponding derivatives of $AsEt_3$ and NEt_3 which give vinyl base)—2 With silver acetate and water at 100° it gives acetate of the vinyl base $C_6H_5PEt_2OAc$ —3 Zinc and H_2SO_4 give tetra ethyl phosphonium bromide—4 Alcoholic potash has no effect—5 Combines with PEt_3 , $AsEt_3$ and NH_3 forming di acid bases

Salts— $(C_6H_4BrPEt_2Cl)_2PtCl_4$ Pale orange monoclinic prisms, sl sol, cold, v sol hot, water— $(C_6H_4BrPEt_2Cl)AuCl_4$ — $C_6H_4BrPEt_2I$

Hydroxide— $C_6H_4BrPEt_2OH$ From the sulphate by the action of baryta Unstable, rapidly changing to $C_6H_4OHPEt_2OH$

BROMO-ETHYL-QUINOLINE

$C_6H_4(C_6H_4Br)N$ The hydrobromide is formed by heating quinoline with ethylene bromide— B^+HBr thick needles— $(B_2H_4Cl_2)PtCl_4$ orange-yellow needles (Berend, *B* 14, 1349)

DI-BROMO DI-ETHYL SULPHATE

$(CH_3CH_2CH)_2SO_4$ An oil formed by warming Ag_2SO_4 with benzene and ethylene bromide (Beilstein a Wiegand, *B* 15, 1369)

Bromo ethyl-sulphuric acid

$CH_3CH_2CH_2OSO_3H$ From ethylene bromide and SO_2 (Wroblewski, *Z* 1868, 563)— BaA_2 — PbA_2 , 3aq, scales An isomeric acid appears to be formed by heating ethylene bromide with Ag_2SO_4 and water (B a W)

BROMO ETHYL THIOPHENE

$C_6SH_4(C_6H_4)Br$ (195° uncor) Oil Formed by shaking ethyl thiophene with bromine-water (Demuth, *B* 19, 684)

Di bromo-(β) ethyl thiophene $C_6SHBr_2(C_6H_4)$ Oil Formed by adding 2 mols of bromine to 1 mol of (β) ethyl thiophene dissolved in acetic acid (Bonz, *B* 18, 550)

Tri bromo (β) ethyl thiophene $C_6SBr_3(C_6H_4)$ [108°] White plates Sl sol cold alcohol and ether Formed by complete bromination of (β) ethyl thiophene (Bonz, *B* 18, 549)

BROMO o-ETHYL TOLUENE $C_6H_4MeEtBr$ [124] (221°) Formed by bromination of o-ethyl toluene in presence of $FeBr_3$ Liquid By HNO_3 (1:1) at 200° it is oxidised to p-bromo o-toluic acid [118°] (Claus a. Pieszeck, *B* 19, 3088)

Bromo-p-ethyl-toluene $C_6H_4MeBrEt$ [124] From p-ethyl toluene and Br Oxidised to bromo p-toluic acid (Morse a Remsen, *B* 11, 224)

o-Di-bromo m-ethyl-toluene

$C_6H_4CHBrCH_2Br$ [45°] Formed by the combination of m-tolyl ethylene (m-methylstyrene) with bromine Colourless crystals (Müller, *B* 20, 1216)

Tri-bromo di-ethyl toluene $C_6Br_3MeEt_2$ [206°] From (1, 3, 5) di-ethyl toluene (Jacobsen, *B* 7, 1435)

TRI-BROMO-ETHYL-XYLENE $C_6Br_3EtMe_2$ [8.5.6.1:24] **Tri bromo di methyl ethyl benz**

ene [91°] From ethyl-m-xylene (187°) (Anschütz, *A* 235, 324)

BROMO-EUGENOL $C_6H_4Br(OMe)(OH)C_6H_4$ Methyl ether $C_6H_4Br(OMe)_2$ (190°) at 20 mm $\bar{S}G$ 2.1396 From the dibromide, hot alcohol, and Zn (Wassermann, *C R* 88, 1206) **Di bromide** $C_6H_4Br_2(OMe)_2$ Dimethyl ether of di bromo di oxy propyl-benzene (78°) From Br and a well-cooled solution of methyl-eugenol in ether Silky needles

Ethyl ether $C_6H_4Br(OMe)(OEt)$ [48°]. Prepared by the action of alcohol and Zn on its dibromide (Wassermann, *A* 179, 385) **Di-bromide** $C_6H_4Br_2(OMe)(OEt)$ [80°] From ethyl eugenol and Br

Di bromo eugenol $C_6HBr_2(OMe)(OH)(C_6H_4)$ [59°] Glistening hexagonal prisms V sol, alcohol Formed by boiling an alcoholic solution of the di bromide with zinc dust (Chasarnowitz a Hell, *B* 18, 824)

Di bromide $C_6HBr_2(OMe)(OH)(C_6H_4Br_2)$ [119°] Glistening quadratic or trimetric tables. Sparingly soluble in ether and cold alcohol. Formed by bromination of eugenol.

BROMO-FLUORENE

$C_{10}H_6Br_{10} < C_6H_4 > CH_2$ [102°] From fluorene, $CHCl_3$ and Br in the cold (Hodgkinson a Matthews, *C J* 43, 165) Needles (from alcohol) V sol $CHCl_3$ Oxidises to bromo-di phenylene ketone.

(a) Di-bromo-fluorene

$C_{10}H_6Br_2 < C_6H_4Br > CH_2$ Di bromo di-phenylene methane [165°] (Barbier, *A Ch* [5] 7, 479, Hodgkinson a. Matthews, *C J* 43 164) Got by adding bromine to a solution of fluorene in $CHCl_3$ Monoclinic crystals, $a b c = 1.167 \ 1.1065 \ \beta = 77^\circ 52'$ (Arzruni, *Z Kryst* 1, 624) Sol boiling alcohol Turned yellowish by light CrO_3 gives di-bromo di-phenylene ketone

Sulphonic acid $C_{10}H_6Br_2SO_3H$ [142°]. Formed by sulphonation with $ClSO_3H$ in $OHCl_3$ — BaA'

(β) Di-bromo-fluorene $C_{10}H_6Br_2$ [163°]. Formed together with the preceding (Fitig a. Schmitz, *A* 193, 134) Monoclinic crystals, $a b c = 563 \ 1.697 \ \beta = 78^\circ 21'$ (A) Readily changes into two isomeric modifications (γ) and (δ) (Lehmann, *Z Kryst* 1, 626)

Tri-bromo-fluorene

$C_{10}H_6Br_3 < C_6H_4Br > CHBr$ [162°] From fluorene (1 mol) in CS_2 and Br (3 mols) Oxidised by CrO_3 to (β)-di-bromo diphenylene ketone (B)

DI-BROMO-FLUORESCIN $C_{20}H_{12}Br_2O_4$ [260°–270°] From fluorescein (1 mol) and Br (2 mols) in $HOAc$ (Baeyer, *A* 183, 1) Reddish-brown needles with green reflex. Dyes wool and silk salmon pink

Di-acetyl derivatives $C_{20}H_{12}Ac_2Br_2O_4$ [210°]

Tetra bromo-fluorescein

$C_{20}H_4Br_4O_4 < O < C_6HBr_2(OH) > O < C_6H_4 > CO$ **Eosin** Formed by adding Br to a solution of fluorescein in $HOAc$. It is purified by conversion into the K salt (Baeyer, *A* 183, 88) Prepared by dissolving fluorescein (1 mol.) in

NaOHaq, adding a solution of Br (4 mols) in NaOHaq, and acidifying Orange needles (containing HOEt) (from alcohol), or flesh-coloured crystals $C_{20}H_7Br_2O_5$ (from dilute alcohol containing HCl) Tetra bromo fluorescein is v sl sol water and benzene, its alkaline solutions are pink and show strong yellow fluorescence, they dye wool and silk pink Zinc dust and NaOH reduce it to a leuco compound, which is reoxidised by air Potash fusion forms di bromo resorcin and di bromo resorcin phthalein Conc H_2SO_4 forms $C_{20}H_7Br_2O_{10}$ PCl_5 forms $C_{20}H_7Cl_2Br_2O_5$ Sodium amalgam forms fluorescein Warming with conc KOH gives a deep blue solution whence HCl pps unstable

Salts — $K_2(C_{20}H_7Br_2O_5)$ 5aq S 50 — $K_2A''HOEt - (NH_4)A'' - BaA''2aq - CaA''\frac{1}{2}aq - AgA'' - (HOPb)A''$

Methyl ether $C_{20}H_7MeBr_2O_5$ Methyl erythrin

Ethyl ether $C_{20}H_7EtBr_2O_5$ Erythrin Spirit soluble eosin From K_2A'' , $KEtSO_4$, and alcohol at 150° From fluorescein, boiling alcohol and Br Red crystals (from alcohol). Formed, together with a colourless ethyl eosin, by heating silver eosin with EtI and alcohol at $100^\circ - KC_{20}H_7EtBr_2O_5$ aq dyes a more violet shade than eosin

Di-ethyl ether $C_{20}H_7Et_2Br_2O_5$ From Ag_2A'' and EtI

Acetyl derivative $C_{20}H_7Ac_2Br_2O_5$ (?) [278°]

BROMOFORM $CHBr_3$ Tri bromo methane Mol w 253 [8°] (151°) SG $\frac{1}{2}$ 28341 (T), $\frac{1}{2}$ 29045 (Perkin, C J 45, 633), $\frac{2}{3}$ 28842 (P) CE ($0^\circ - 10^\circ$) 000944, ($0^\circ - 100^\circ$) 0010116 SV 103 53 (Thorpe, C J 87 203) MM 11 626 at 17.9° (P) V D 8 63 (calc 875) (Cahours, A Ch [3] 19, 484)

Occurrence — In crude bromine (Hermann, A 95, 211, Dyson, C J 43, 36)

Formation — 1 By the simultaneous action of Br and KOH, or of 'bromide of lime,' on alcohol or acetone, or by decomposing bromal with alkalis (Löwig, A 8, 295, Dumas, A Ch [2] 56, 120, Gunther, Ar Ph [3] 25, 373) — 2 From CH_2Cl_2 and IBr_3 (Holand, A 240, 236)

Reactions — 1 Alcoholic KOH forms CO (3 vols) and ethylene (1 vol) but no formate (Long, A 194, 23) — 2 Br in presence of dilute KOH in sunlight forms CBr_4 (Habermann, B 6 549) — 3 Reduced to CH_4 by KI, water, and Zn or Cu (Berthelot, A Ch [3] 51, 48) or by the copper zinc couple (Gladstone a Tribe, C J 28 510)

BROMO-FUMARIC ACID $C_4HBr(CO_2H)_2$ [178°]

Formation — 1 From iso di bromo succinic acid by heating at 180° or by boiling with water (Kekulé, A Suppl 2, 91, A 130, 1) — 2 From di bromo succinic acid and water at 140° (Bandrowski, B 12, 345) — 3 By dissolving acetylene di carboxylic acid in strong aqueous HBr (Bandrowski, B 15, 2097) — 4 From (β)-dibromopyromucic acid and from (β) bromopyromucic acid by dilute HNO_3 (Hill a Sanger, A 232, 82, 64) — 5 From bromo maleic acid and cold fuming HBr (Fittig a Petri, A 195, 67)

Properties — Laminas, v e sol water, v sol alcohol and ether At 200° it changes to bromo maleic acid or its anhydride Sodium-amalgam forms fumaric acid Br gives the same tri bromo succinic acid as with bromo-maleic acid Fuming HBr combines slowly in the cold, at 100° it quickly forms iso di bromo-succinic acid With its equivalent of aniline it unites immediately to form the acid aniline salt This does not give an anilide on standing for weeks in contact with cold water On boiling its aqueous solution the same substance is obtained as on heating aniline bromo maleate, viz $C_{16}H_{11}N_2O_5$ [230°] (Michael, Am 9, 180)

Salts — $AgA'' - PbA''2aq - A''H(NH_4Ph)$ [154°] (Michael, B 19, 1373)

Dimethyl ether $A''Me_2$ [80°] (Anschutz, B 12, 2284)

Di bromo fumaric acid $CO_2H CBr CBr CO_2H$ [920°] Colourless crystals Prepared by the addition of bromine to acetylenedicarboxylic acid On distillation it is converted into dibromomaleic acid [108°]

Salts — $AgA''\frac{1}{2}aq - PbA''$ (Bandrowski, B 12, 2213)

(β) **BROMO-FURFURANEC** C_5H_2BrO (103°) From the corresponding bromo pyromucic acid by distilling with lime (Canzoneri a Oliveri, G 17, 42) Heavy oil

(a) Di-bromo-furfurane $C_5H_2Br_2O$ i.e., $HC = CBr$ $\begin{matrix} | \\ HC = CBr \end{matrix} O$ [10°] (63°) at 15 mm, (165°) at 764 mm Formed by adding bromine to an alkaline solution of (β) bromo pyromucic acid [184°] On oxidation it gives fumaric and maleic acids

Tetra bromide $C_5H_2Br_4O$ [111°], by long boiling with water it yields bromo fumaric and bromo maleic acids (Hill a Hartshorn, B 16, 1132, B 18, 448, A 232, 53)

(β) Di-bromo-furfurane $\begin{matrix} CBr CH \\ | \\ CBr CH \end{matrix} O$ (166°)

Formed by distilling di bromo pyromucic acid (1 pt) with $Ca(OH)_2$ (2 pts) (Canzoneri a Oliveri, G 15, 116)

Tetra-bromo-furfurane C_5Br_4O [65°] From (β) di bromo pyromucic acid, or from tri-bromo pyromucic acid, water and bromine vapour Formed also by the action of alcoholic KOH on di bromo furfurane tetrabromide (Hill a Sanger, A 232, 86, 96, B 16, 1132, 17, 1760)

Di-bromide C_5Br_2O [123°] Six sided plates V sol ether, m sol alcohol and benzene By boiling with water it yields di bromo maleic acid (Hill a Hartshorn, B 18, 450)

BROMO-FURIL v FURIL

BROMO-GALLIC ACID v Bromo tri-oxo-benzoic acid

TRI BROMO-GUAIACOL $C_9H_7Br_3O_5$ i.e. $C_9H_7Br_3(OMe)(OH)$ [102°] From guaiacol and Br (Tiemann a Koppe, B 14, 2017)

BROMO GUANIDINE CH_3BrN_3 From guanidine carbonate and Br (Kamenski, B 11, 1600) Needles, detonates just above 100°

BROMO-GUANINE $C_5H_7N_4OBr$ From guanine and bromine, crystallised from water White powder Sl sol boiling water, insol cold water, alcohol or ether — $BHCl$ Triam.

Converted by NaNO_2 into bromo-xanthine (Fischer & Reese, *A* 221, 841)

TRI-BROMO-HEMIMELLITHOL *v* **TRI-BROMO TRI-METHYL-BENZENE** (1 2 3 4 5 6)

BROMO-HEPTANE *v* **HEPTYL BROMIDE**

Di-bromo-heptane $\text{C}_7\text{H}_{14}\text{Br}_2$ *Heptylene bromide* SG 123 1515 From heptane of paraffin oil Decomposes at 150° (Thorpe & Young, *A* 165, 12)

Di bromo heptane $\text{C}_7\text{H}_{14}\text{Br}_2$ (211°) From heptane in the oil of *Pinus sabina* (Venable, *A* C J 4, 22)

Di bromo heptane $\text{CMe}_3\text{CMeBrCH}_2\text{Br}$ From penta methyl ethyl alcohol and PBr_3 Easily fusible solid (Kaschirski, *C* C 1881, 278)

Di bromo heptane

$\text{CH}_3\text{CH}_2\text{CHCH}_2\text{CH}_2\text{CHCH}_2\text{Br}$ *Heptylidenes bromide* From α -naphthalene and PCl_5Br_2 (Braylants, *B* 8, 409)

Hexa bromo-heptane $\text{C}_7\text{H}_4\text{Br}_6$ From heptonene and Br Oil (Saytzeff, *A* 185, 144)

α -BROMO-HEPTOIC ACID $\text{C}_7\text{H}_{13}\text{BrO}_2$ *ie* $\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CHBrCO}_2\text{H}$ (250°) From Br and heptonic acid (Cahours, *A* Suppl 2, 83, Helms, *B* 8, 1168, Hell & Schule, *B* 18, 625)

Ethyl ether EtA' (c 225°) SG 124 1211

TETRA-BROMO-HEPTYL ALCOHOL $\text{C}_7\text{H}_7\text{Br}_4\text{O}$ *ie* $(\text{CHBrCH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{OH})$ From di allyl-carbinol and Br (M Saytzeff, *A* 185, 135) Oil

Acetyl derivative $\text{C}_7\text{H}_{11}\text{Br}_4\text{OAc}$ Converted by AgOAc into $\text{C}_7\text{H}_{11}\text{O}(\text{OAc})_2$, SG 3 1180, whence baryta forms a syrup $\text{C}_7\text{H}_{11}\text{O}(\text{OH})_2$ (Dieff, *J* pr [2] 85, 17)

BROMO-HEPTYLENE $\text{C}_7\text{H}_{10}\text{Br}$ (158°) From the heptylene bromide of Venable

Bromo heptylene $\text{C}_7\text{H}_{10}\text{Br}$ (165°) From the heptylene bromide of Bruylants

BROMO-HEXADECANE *v* **CETYL BROMIDE**

Di-bromo-hexadecane $\text{C}_{16}\text{H}_{32}\text{Br}_2$ *Cetene bromide* (131°) Colourless crystalline solid Formed by addition of Br_2 to cetene (Krafft, *B* 17, 1373)

BROMO-HEXANE *v* **HEXYL BROMIDE**

Di-bromo-hexane $\text{C}_6\text{H}_{12}\text{Br}_2$ *ie* $\text{CH}_3\text{CH}_2\text{CH}_2\text{CHBrCH}_2\text{CH}_3$ (196°) at 740 mm SG 13 15809 From the corresponding hexylene (Erlenmeyer & Wanklyn, *A* 135, 141, cf Hecht & Strauss, *A* 172, 69, Hecht, *B* 11, 1423)

Di-bromo hexane $\text{Me}_2\text{CBrCH}_2\text{CBrMe}$ (170°) (K), (140°) (E) From Me C CMe, and Br Needles (from ether) Converted by heating with water and PbO at 150° into pinacoln (Pawlow, *A* 196, 124, Eltekoff, *J* R 10, 220, Kaschirsky, *J* R 13, 84)

Di bromo hexane $\text{Me}_3\text{CCHBrCH}_2\text{Br}$ From $\text{Me}_3\text{CCHCH}_3$ Crystalline (Friedel & Silva, *Bl* [2] 19, 289)

Di bromo hexane $\text{C}_6\text{H}_{12}\text{Br}_2$ (211°) From hexane of petroleum (Pelouze & Cahours, *A* 124, 293)

Tetra bromo hexane $\text{C}_6\text{H}_8\text{Br}_4$ *Diallyl tetrabromide* (63°) From diallyl and Br (Wagner & Tollens, *B* 6, 588)

Tetra bromo-hexane $\text{C}_6\text{H}_8\text{Br}_4$ (142°) From iodo hexylene and Br (Bouchardat, *Z* 1871, 699)

Tetra-bromo hexane $\text{C}_6\text{H}_8\text{Br}_4$ From hexinene derived from mannite (Hecht, *B* 11, 1054)

Tetra-bromo-hexane $\text{C}_6\text{H}_8\text{Br}_4$ From hexinene from di-methyl-allyl-carbinyl chloride (Saytzeff, *B* 11, 2152)

Tetra bromo hexane $\text{C}_6\text{H}_8\text{Br}_4$ (112°) (318° cor) From hexinene derived from coal tar (Schorlemmer, *A* 139, 250)

Hexa bromo hexane $\text{C}_6\text{H}_4\text{Br}_6$ From diallylene (Henry, *Bn* 1, 199)

Hexa-bromo hexane $\text{C}_6\text{H}_4\text{Br}_6$ (77°). From di bromo diallyl (Henry, *B* 7, 23)

Hexa bromo hexane $\text{C}_6\text{H}_4\text{Br}_6$ (152°) From sec hexyl iodide and Br at 130° (Merz & Weith, *B* 11, 2250)

Hexa bromo hexane $\text{C}_6\text{H}_4\text{Br}_6$ From hexane and Br at 125° (Wahl, *B* 10, 1234)

Octo bromo hexane $\text{C}_8\text{H}_{16}\text{Br}_2$ From hexane and Br (W)

Octo bromo-hexane $\text{C}_8\text{H}_{16}\text{Br}_2$ (135°) From sec hexyl iodide and Br at 130° (M & W)

Octo bromo hexane $\text{C}_8\text{H}_{16}\text{Br}_2$ *Dipropargyl octobromide* (141°) (Henry, *B* 7, 21)

BROMO-HEXENOIC ACID $\text{C}_6\text{H}_7\text{BrO}_2$ *Di-bromo-hydrosorbic acid* (95°) From sorbic acid and Br Lamine (Fittig & Kachel, *A* 168, 287)

DI-BROMO-HEXINENE $\text{C}_6\text{H}_6\text{Br}_2$ *Di bromo diallyl* (210°) SG 121 656 From diallyl tetra bromide and solid KOH (Henry, *J* pr [2] 8, 57)

Tetra bromo hexinene $\text{C}_6\text{H}_4\text{Br}_4$ *Propargyl tetrabromide* SG 2 2464 Liquid (Henry, *B* 6, 959)

α -BROMO-*n*-HEXOIC ACID

$\text{CH}_3\text{CH}_2\text{CH}_2\text{CH}_2\text{CHBrCO}_2\text{H}$ *Bromo-caproic acid* (240°) From caproic acid and Br (Cahours, *A* Suppl 2, 78)

Ethyl ether EtA' (205° - 210°) (Hell, *B* 17, 2218)

γ -Bromo-*n*-hexoic acid

$\text{CH}_3\text{CH}_2\text{CHBrCH}_2\text{CH}_2\text{CO}_2\text{H}$ From hydrosorbic, or iso hydrosorbic, acid and HBr Oil Sodium amalgam reduces it to *n*-hexoic acid Boiling water converts it into hydrosorbic and oxy hexoic acids (Fittig, *A* 200, 42, Hjelt, *B* 15, 618)

γ -Bromo-iso hexoic acid

$\text{Me}_2\text{CBrCH}_2\text{CH}_2\text{CO}_2\text{H}$ *Ethyl ether* A⁶Et Formed by saturating an absolute alcoholic solution of isocapro lactone with HBr By distillation it is decomposed into the original lactone and EtBr (Bredt, *B* 19, 514)

Bromo hexoic acid $\text{C}_6\text{H}_{11}\text{BrO}_2$ (86°) From iso pyroterebic acid and HBr Prisms AgA' (Lagermark & Eltekoff, *J* R 11, 128)

Bromo hexoic acid $\text{C}_6\text{H}_{11}\text{BrO}_2$ (25°) From ethyl crotonic acid and conc HBrAq Sodium-amalgam forms hydro ethyl crotonic acid. Aqueous Na_2CO_3 even at 0° forms amylene, NaBr, and CO_2

α S-Di-bromo-iso-hexoic acid

$\text{PrCHBrCHBrCO}_2\text{H}$ (99°) From pyroterebic acid and Br (W C Williams, *B* 6, 1095, Geisler, *A* 208, 46) Large crystals (from CS_2)

Di-bromo-hexoic acid $\text{C}_6\text{H}_8\text{Br}_2\text{O}_2$ (68°) From sorbic acid and fuming HBr Boiling water or alkalis produce sorbic acid, and other bodies (cf Hjelt, *B* 15, 620)

Di-bromo-hexoic acid $\text{C}_6\text{H}_8\text{Br}_2\text{O}_2$ From hydrosorbic acid and Br in CS_2 . Liquid, decomposed by boiling water, giving oxy hydrosorbic acid (Fittig, *A* 161, 314, 300, 46, Hjelt, *B* 15, 619).

Di-bromo-hexoic acid $C_6H_4Br_2O_2$. From isosorbic acid and HBr. Oil (L. a. E.)

Di-bromo-hexoic acid $CHBrCHBrCMeBrCO_2H$ [98°]. From methyl ethyl acrylic acid and Br. Monoclinic crystals, $a, b, c = 96.1, 153.8 = 94^\circ 36'$. Water at 100° forms bromo amylene $CHBrCMeBr$, methyl ethyl acrylic acid, di oxy hexoic acid, and methyl ethyl ketone (Lieben, a. Zeisel, *M* 4, 78).

Di-bromo-hexoic acid $C_6H_4Br_2O_2$ [81°]. From ethyl crotonic acid and Br. Decomposed by cold Na_2CO_3 aq into bromo amylene, NaBr, and CO_2 (Fittig, *A* 200, 85).

Tetra-bromo-hexoic acid $C_6H_2Br_4O_2$ [183°]. From sorbic acid and Br (Fittig, *A* 161, 323, 168, 277, 200, 58). Monoclinic crystals (from alcohol). More stable than the preceding acids, not being attacked by water at 100°— NaA' 2aq— CaA' 7aq— BaA' 13aq.

DI BROMO HEXOIC ALDEHYDE $C_6H_4Br_2O$. $CH_2, CH, CHBrCMeBrCHO$. *Di bromo methyl propyl-acetic aldehyde*. From Br and cold methyl-ethyl acrolein. Pungent oil— $(C_6H_4Br_2O)NaHSO_3$ aq (Lieben a Zeisel, *M* 4, 19).

BROMO HEXONENE C_6H_4Br . *Bromo-di-allylene*. (150°). From di bromo di allyl and KOH. Pps ammoniacal $AgNO_3$ and cuprous chloride (Henry, *B* 14, 400).

Octo bromo hexonene C_6H_4Br . From sec hexyl iodide and Br at 140°. Prisms. At 200° it splits up into Br and hexa bromo benzene (Merz a Weith, *B* 11, 2247).

BROMO HEXYL ALCOHOL C_6H_4BrO . $CH, CHBrCH(OH)CH_2Et$ (189°). SG 1.3. Liquid. From hexylene oxide and Br (Henry, *C R* 97, 260, *Bl* [2] 41, 363).

Di-bromo hexyl alcohols v Dibromides of HEXANYL ALCOHOLS

DI-BROMO HEXYL-BENZENE $C_6H_4Br_2$. $PhCHBrCHBrCH_2CH_2CH_3$ [80°]. From hexyl benzene (*q v*). Needles or plates.

BROMO HEXYLENE C_6H_4Br (138°-141°) at 739 mm SG $\frac{1}{4}$ 1.2025. From (*s*) hexylene bromide and alcoholic KOH (Caventou *A* 135, 126, Reboul a Truchot, *M* 144, 247, Hecht, *B* 11, 1424, *A* 172, 70). See also **HEXANYL BROMIDE**.

Di bromo hexylene $C_6H_4Br_2$. SG $\frac{1}{4}$ 1.698. From hexylene (derived from mannite) and Br (Henry, *B* 11, 1054).

Tetra bromo hexylene $C_6H_2Br_4$. From di-allylene and Br (Henry, *C R* 87, 171).

Octo-bromo hexylene $C_6H_4Br_2$ [184°]. From sec-hexyl iodide and Br at 130° (Merz a Weith, *B* 11, 2249, Hecht, *B* 11, 1420).

Octo bromo hexylene $C_6H_4Br_2$. From hexane and Br at 125° (Wahl, *B* 10, 402).

BROMO-HIPPURIC ACID $C_6H_4BrNO_2$. $C_6H_4BrCO.NHCH_2CO_2H$. From hippuric acid, alcohol, and Br. Slender needles. Possibly identical with the following acid.— CaA' (Mayer, *E* 1865, 415).

p-Bromo-hippuric acid

[14] $C_6H_4BrCO.NHCH_2CO_2H$. Excreted when p-bromo toluene is taken with food. Flat needles (from water). Boiling $HClAq$ forms glycooll and p-oxy-benzoic acid (Preussner, *H* 5, 63).

BROMO-HYDRATEPIC ACID v BROMO-PHENYL-PROPIONIC ACID

BROMHYDRIN v GLYCERIN.

Tri-bromhydrin v Tri bromo PROPANE.

p-BROMO-HYDROCARBOSTYRIL C_6H_4BrNO
 $\begin{matrix} C_6H_4CO \\ \backslash NH/ \end{matrix}$ [4 $\frac{1}{2}$] [178°] Long

flat needles. V sol alcohol, ether, benzene and acetic acid. Prepared by reduction of p-bromo-o nitro hydro cinnamic acid with tin and HCl (Gabriel a Zimmermann, *B* 13, 1683).

BROMO HYDROCINNAMIC ACID v BROMO-PHENYL-PROPIONIC ACID

DI-BROMO HYDRO CEBULIGNON v CEBULIGNON

BROMO HYDROQUINONE $C_6H_4BrO_2$. $C_6H_4Br(OH)_2$ [111°]

Formation—1 Together with di bromo hydroquinone, by the action of conc $HBrAq$ on quinone (Wichelhaus, *B* 12, 1504)—2 From hydroquinone (1 mol) and Br (1 mol) in ether-chloroform (Sarauw, *A* 409, 99).

Properties—Leaflets, may be sublimed. V sol water, alcohol, and benzene. $FeCl_3$ forms bromoquinone.

Di-acetyl derivative $C_6H_4Br(OAc)_2$ [73°]. Formed, together with di acetyl di bromo hydroquinone by heating quinone with $AcBr$ (Schulz, *B* 15, 655). Needles, sol alcohol and benzene.

Di bromo-hydroquinone $C_6H_4Br(OH)_2$ [187°]. **Formation**—1 As above (W)—2 From hydroquinone and Br in $HOAc$ (Benedikt, *M* 1, 345)—3 From quinone and Br (Sarauw).

Properties—Long needles (from water). Converted by $FeCl_3$ or bromine water into di-bromoquinone.

Di-acetyl derivative $C_6H_4Br(OAc)_2$ [161°]. Formed as above (Schulz). Needles, sol chloroform and ether.

Methyl ether $C_6H_4Br_2(OH)(OMe)$. From methyl hydroquinone and Br (B).

Di methyl ether $C_6H_4Br_2(OMe)_2$ [142°]. From di methyl hydroquinone and Br in $HOAc$ (Habermann, *B* 11, 1036). Methyl-ethyl ether $C_6H_4Br_2(OMe)(OEt)$ [88°]. Prepared like the preceding (Fiala, *M* 6, 913).

Di isobutyl ether $C_6H_4Br_2(OC_2H_5)_2$. From $C_6H_4(OC_2H_5)_2$ and Br (Schubert, *M* 8, 684). Plates (from $HOAc$).

Di bromo hydroquinone $C_6H_4Br(OH)(OBr)$ (?) **Bromoxy bromo phenol** [87°]. From quinone (1 mol) and Br (1 mol) in chloroform (Sarauw). Golden tables, al sol ether and $CHCl_3$, decomposed by water into HBr and bromoquinone, changes slowly to $C_6H_4Br_2(OH)_2$.

Tri-bromo-hydroquinone $C_6H_3Br_3(OH)_2$ [136°]. Formed together with tetra-bromo-hydroquinone, by treating di-bromo-quinone with conc HBr, or by the action of Br (6 mols) on hydroquinone (2 mols) or quinone (3 mols) (Sarauw, *A* 209, 116). Silky needles, sol alcohol and benzene, v sol boiling water. $FeCl_3$ gives tri bromo quinone.

Tetra-bromo-hydroquinone $C_6Br_4(OH)_2$ [244°]. Prepared as above (Sarauw). Prepared also by reducing tetra bromo-quinone (brom-anil) with SO_2 or HI and P (Stenhouse, *A* 91, 810, *Suppl* 8, 20) or by warming it with conc $HBrAq$. Slender needles (from $HOAc$), insol. boiling water, v sol alcohol. $FeCl_3$ forms tetra bromo quinone.

BROMO-HYDROQUINONE-PHTHALEIN v.**HYDROQUINONE-PHTHALEIN****DI-BROMO-HYDROSOEBIC ACID** v. **BROMO-HEXENOIC ACID****BROMO HYDRO THYMOQUINONE**

$C_{10}H_8Br_2$, $\pm C_6H_4(C_2H_5)(CH_3)Br(OH)_2$. [58°] From thymoquinone and HBr (Schniter, *B* 20, 1318) Oxidises to bromothymoquinone [45°]

The di acetyl derivative is formed by the action of acetyl bromide on thymoquinone

Di acetyl derivative [91°] Rhombohedral crystals (Schulz, *B* 15, 657)

Di-bromo-hydro-thymoquinone

$C_6(C_2H_5)(CH_3)Br_2(OH)_2$
Di-acetyl derivative [122°] Colourless tables (Schulz, *B* 15, 658)

BROMO-HYDRO-TOLUQUINONE

$C_9H_7MeBr(OH)_2$. [o 160°] Formed by the action of cold conc HBr upon toluquinone. Glistening plates (Schniter, *B* 20, 2286)

Tri bromo hydro toluquinone

$C_9H_5Br_3O_2$, $\pm C_6Br_3Me(OH)_2$. [202°] From tri bromo toluquinone and SO_2 . Needles, sol water (Canzoneri a Spica, *G* 12, 471)

BROMO - HYPOGÆIC ACID v. **HYPOGÆIC ACID**

DI-BROMO - ICOSYLENE $C_{20}H_{38}Br_2$. Oil From icosinene and Br (Lippmann a Hawliczek, *B* 12, 69)

DI-BROMO-INDIGO $C_{16}H_8Br_2N_2O_2$, \pm .

$C_8H_5Br \begin{array}{c} O \\ \diagup \quad \diagdown \\ N \end{array} C = C \begin{array}{c} O \\ \diagup \quad \diagdown \\ N \end{array} C_8H_5Br$ Formed by

boiling ω di bromo m bromo o -amido aceto phenone [5 2 1] $C_8H_5Br(NH_2)COCHBr_2$, or ω di chloro m bromo - o amido - acetophenone [5 2 1] $C_8H_5Br(NH_2)COCHCl_2$, or their acetyl derivatives with dilute NaOH and exposure to the air (Baeyer a Bloem, *B* 17, 908) Prepared by heating bromo isatin with PCl_5 and treating the product with a 10 p c solution of HI in acetic acid and then with aqueous SO_2 . Some isomeric di bromo indipurpurin is formed at the same time (Baeyer, *B* 12, 1316) Small black needles, may be sublimed, v sl sol most menstrua May be reduced to a 'vat' like indigo

BROMO-INDIRUBIN $C_{16}H_8BrN_2O_2$. Long needles Formed by the action of Na_2CO_3 on an alcoholic solution containing indoxyl and bromo isatin (Baeyer, *B* 14, 1745)

 $\beta\beta$ -BROMO-IODO-ACRYLIC ACID

$C_3H_3IBrO_2$, $\pm CBrI CH CO_2H$ [110°] *S* 17 at 20° From bromo propiolic acid and HI (Hill, *Am* 3, 175) Scales — BaA' , 3aq *S* (of BaA'_2) 16 at 20° — CaA' , 3aq — AgA'

$\alpha\beta$ Bromo-iodo acrylic acid $CHI CBr CO_2H$ [96°] Formed by the addition of HBr to β iodo propiolic acid (Homolka a Stolz, *B* 18, 2284) Needles, sl sol cold water By heating in alcoholic solution with $AgBr$ it yields $\alpha\beta$ di-bromo-acrylic acid [85°] (Stolz, *B* 19, 537)

$\beta\alpha$ -Bromo iodo acrylic acid $CHBr Cl CO_2H$. [71°] Colourless crystals v sol water Formed by boiling propiolic acid with an ethereal solution of BrI (Stolz, *B* 19, 536)

 $\beta\beta\alpha$ Bromo di iodo acrylic acid

$CBrI Cl CO_2H$. [160°] *S* 2 at 20° From bromo-propionic acid and iodine in ether Flat six-sided plates — BaA' , 4aq *S* 15 26 at 20° —

CaA'_2 — KaA' — AgA' (Mabery a Lloyd, *Am* 3, 124)

 $\alpha\beta\beta$ -Bromo-di-iodo-acrylic acid

$Cl, CBr CO_2H$ [182°] Glistening colourless plates Formed by the action of iodine bromide upon iodo propiolic acid in ethereal solution (Homolka a Stolz, *B* 18, 2286)

 $\beta\beta\alpha$ Di-bromo-iodo-acrylic acid

$CBr, Cl CO_2H$ [140°] *S* 3 5 at 20°. From bromo propiolic acid and IBr (Mabery a Lloyd, *Am* 4, 94, *N Am* 4 17, 94) Monoclinic prisms (from water), $a b c = 617.1 \ 581 - BaA'$, 3 3aq *S* 16 7 at 20° — CaA'_2 — AgA'

 $\beta\alpha\beta$ Di-bromo-iodo acrylic acid

$CIBr CBr CO_2H$ [147°] Long silky needles Sl sol cold water Formed by the action of a solution of bromine in chloroform upon iodo-propionic acid $IC CO_2H$ (Homolka a Stolz, *B* 18, 2285)

DI-BROMO-IODO-ALLYL ALCOHOL**Ethyl ether** C_4H_7BrIO , \pm

$CIBr CBr CH_2 OEt$ Oil From iodo propargyl ethyl ether and Br (Liebemann, *A* 135, 286)

 o BROMO-IODO-BENZENE C_6H_4BrI [1 2]

(257°) From o bromo aniline or o iodo aniline by the diazo-reaction (Korner, *G* 4 339)

m Bromo iodo benzene C_6H_4BrI [1 3] (252°). Similarly prepared (K)

p Bromo iodo benzene C_6H_4BrI [1 4] [92°] (252°) Similarly prepared (Griess, *J* 1866, 452, K)

Dichloride $C_6H_4BrICl_2$ [115°-120°, with decomposition] Ppd as yellow needles when chlorine is passed into a solution of bromo-iodo benzene in chloroform (C Willgerodt, *J pr* [2] 33, 158) With alcohol it forms aldehyde and C_6H_4BrI It converts metallic and alcoholic iodides into chlorides, iodine being separated

Tri bromo-iodo-benzene $C_6H_3Br_3I$ [1 3 6]

[104°] Obtained by adding conc HI to a solution of $C_6H_4Br, N N NO$. Colourless needles, sol hot alcohol (Silberstein, *J pr* [2] 27, 120)

Tri bromo iodo benzene $C_6H_3IBr_3$ [1 2 4 5]

[165°] *Dichloride* $C_6H_3IBr_2Cl_2$ Formed by dissolving $C_6H_3IBr_3$ in $CHCl_3$ and passing in Cl_2 (Willgerodt, *J pr* [2] 33, 159)

 β BROMO IODO ETHANE C_2H_4BrI , \pm

$CH_2Br CH_2I$ *Ethylene bromiodide* [28°] (163°) *S* β 2 516 From bromo ethylene and conc $HIAq$ at 100° (Reboul, *A* 155, 213), also from ethylene and BrI (Maxwell Simpson, *Pr* 22, 61) Needles, sl sol cold alcohol Alcoholic KOH gives iodo ethylene and acetylene (Lagermark, *J R* 5, 534)

u Bromo iodo ethane CH_3CHBrI *Ethyl-iodene bromiodide* (142°) *S* β 2 452 From bromo ethylene and conc $HIAq$ at 4° (*R*), or from *u* di iodo ethane and IBr (Maxwell Simpson, *Pr* 27, 424) Alcoholic KOH forms bromo-ethylene

Di bromo-iodo-ethane $C_2H_4IBr_2$, (170°-180°).

S β 2 2 86 From bromo-ethylene and IBr (M Simpson, *Pr* 22, 61) Ag_2O forms C_2H_3Br

 β - BROMO - IODO - ETHYLENE C_2H_3IBr .

Acetylene bromiodide [α 8°] (150° cor) *S* β (solid) 2 2 750, 17 2 627 Got by passing acetylene into aqueous solution of BrI , the product being treated with $Na_2S_2O_3$ and distilled with steam (Plimpton, *C. J* 41, 395, Sabanejeff, *A*.

216, 266) With alcoholic NaOH it appears to give off C_2HBr

u Bromo iodo ethylene CH_2CBrI (129°) SG 2 2565 From chloro bromo iodo ethane and alcoholic KOH (Henry, C R 98, 741) Slowly absorbs oxygen from air

Di bromo iodo ethylene $ClBrCHBr$ [66°] Small prisms Formed by the action of an aqueous solution of bromine upon iodo propionic acid $ICCCO_2H$, CO_2 being evolved (Homolka & Stolz, B 18, 2285)

BROMO IODO METHANE CH_2BrI *Methylene bromiodide* (189°) SG $\frac{16.6}{16.8}$ 2926 VD 965 From methylene iodide and Br or IBr (Henry, C R 101, 599)

Di-bromo iodo-methane $CHBr_2I$ *Bromiodo form* [64°] From iodoform and Br (Serullas, A Ch [2] 84, 225, 39, 97, Bouchardat, J Ph 23, 10)

BROMO IODO NAPHTHALENES $C_{10}H_7BrI$ The three following are obtained from the corresponding bromo naphthylamines by the diazo reaction (Meldola, C J 47, 523)

(*aa*)-Bromo iodo naphthalene $C_{10}H_7BrI$ [14] [84°] Large flat needles, insol water, sol alcohol and glacial HOAc, v e sol benzene and ether

(*ab*) Bromo iodo naphthalene $C_{10}H_7BrI$ [13] [68°] Needles

(*ac*) Bromo iodo naphthalene $C_{10}H_7BrI$ [12] [94°] Thick needles

BROMO IODO NITRO BENZENE $C_6H_4BrI(NO_2)$ [125] [106°] From C_6H_5BrI [12] and HNO_3 or from $C_6H_4Br(NH_2)(NO_2)$ [125] (Körner, G 4, 383) Needles or prisms Alcoholic NH_3 displaces I by NH_2

Bromo iodo nitro-benzene $C_6H_4BrI(NO_2)$ [143] [90°] From $C_6H_4Br(NH_2)(NO_2)$ [143] (K)

Bromo-iodo nitro benzene $C_6H_4BrI(NO_2)$ [134] [84°] From $C_6H_4Br(NH_2)(NO_2)$ [134] (K) Alcoholic NH_3 displaces I by NH_2

Bromo iodo nitro-benzene $C_6H_4BrI(NO_2)$ [136°] [127°] Formed, together with the following body, by dissolving *m* bromo iodo benzene in fuming HNO_3 (K) Alcoholic NH_3 displaces Br by NH_2

Bromo-iodo nitro-benzene $C_6H_4BrI(NO_2)$ [132°] Needles

BROMO-IODO-NITRO-PHENOL $C_6H_3(OH)(NO_2)BrI$ [1342] [104°] From (1,3,4)-bromo nitro phenol, KOH, HIO_3 , and I (Körner, J 1867, 617) Monoclinic tables a b c = 520 1 587, β = 65° 32' (Groth, Z Kryst 1, 487), volatile with steam— KA' — NaA'

Bromo iodo-nitro-phenol $C_6H_3(OH)(NO_2)BrI$ [1426] From (1,3,6) bromo nitro phenol as above (K) Prisms (from ether)— KA' yellow needles

BROMO IODO NITRO TOLUENE $C_7H_4MeBrI(NO_2)$ [1342] [118°] Formed by nitrating (1,3,6) bromo-iodo toluene Needles (Wroblewsky, A 168, 160)

Bromo-iodo nitro toluene $C_7H_4MeBrI(NO_2)$ [132 or 62] From the corresponding bromo-iodo toluene (W)

Di-bromo iodo nitro-toluene $C_7H_3MeBr_2I(NO_2)$ [13542] [69°] From C_7H_4MeBrI by nitration (Wroblewsky, A 192, 210) Large needles Volatile with steam

Di-bromo di-iodo nitro-toluene $C_7H_2MeBr_2I_2(NO_2)$ [13542.6]. [129°] From

$C_7H_3MeBr_2I_2$ and fuming HNO_3 Yields on reduction by Sn and HCl an amido- compound which is converted by further treatment by Sn and HCl to *o* toluidine (W)

BROMO DI IODO PHLOEOGLUCIN $C_6(OH)_2BrI_2$ From tri bromo phloroglucin and aqueous KI Decomposed by heat (Benedikt & Schmidt, M 4, 605)

BROMO IODO PROPANE C_3H_7BrI *u* $CH_3CBrICH_3$ (148°) SG 1220 Formed by union of HI with allylene hydrobromide (Reboul, C R 74, 669, 944)

Bromo iodo propane CH_3CHICH_2Br or $CH_3CHBrCH_2I$ (160°–168°) From propylene, water, and IBr (M Simpson, Pr 22, 51)

DI BROMO IODO PROPYLENE $C_3H_4Br_2$ (?) From iodo allylene and Br Does not combine with Br (Liebermann, A 135, 275)

DI BROMO IODO STEARIC ACID $C_{18}H_{33}Br_2IO_2$ From ricinoleic acid $C_{18}H_{33}O_2$ and $C_{18}H_{33}IO_2$ (Claus, B 9, 1917)

BROMO IODO TOLUENE C_7H_4MeBrI [123or5] (260°) SG 12139 From $C_7H_5MeBr(NH_2)$ (Wroblewsky, A 168, 164)

Bromo iodo toluene C_7H_4MeBrI [134] (265°) SG 22044 From the corresponding bromo toluidine (W)

Di bromo iodo toluene $C_7H_3MeBr_2I$ [1354] [86°] (270°) From $C_7H_4MeBr(NO)(NH_2)$ and $C_7H_4MeBr(NO_2)I$, and $C_7H_4MeBr(NH_2)I$ (Wroblewsky, A 192, 209) Also from di bromo *p* toluidine, $C_7H_4MeBr_2(NH_2)$ by diazo reaction

Di bromo iodo toluene $C_7H_3MeBr_2I$ [13542] [68°] From $C_7H_4MeBrI(NH_2)$ by diazo reaction (Wroblewsky, A 192, 212)

DI BROMO IODO TOLUIDINE $C_7H_3MeBr_2I(NH_2)$ [13542] [64°] By reduction of the corresponding nitro compound (Wroblewsky, A 192, 210) Converted by sodium amalgam into *o* toluidine

Acetyl derivative $C_7H_3MeBr_2I(NHAc)$ [121°] Small white needles

BROMO ISATIC ACID *v* ISATIC ACID

BROMO ISATIN *v* ISATIN

BROMO-ISATOIC ACID *v* ISATOIC ACID

BROMO-ISO- v BROMO

BROMO ITACONIC ACID $C_7H_5BrO_2$ [164°]

Formed by the dry distillation of *ita* di bromo pyrotartaric acid (Swarts, J 1873, 584) Its anhydride is formed similarly from *ita* di bromo pyrotartaric anhydride (Petru, B 14, 1637) Alkalies form acenic acid, Sn reduces it to itaconic acid

BROMO LACTIC ACID *v* BROMO OXY PROPIONIC ACID

DI-BROMO LAURENE $C_{18}H_{33}Br_2$ (?) [210°] From laurene and Br (Montgolfier, A Ch [5] 14, 93)

Tri bromo-laurene $C_{18}H_{33}Br_3$ [125°] From laurene and Br in the cold (Fittig, Köbrich & Jilke A 145, 149) Cf LAURENE

BROMO LEVLIC ACID *v* BROMO-ACETYL-PROPIONIC ACID

BROMO LUTIDINE *v* BROMO DI-METHYL-PYRIDINE

BROMO MALEIC ACID $C_4H_2Br_2(CO_2H)_2$ *u* $CO_2H.CH.CBr.CO_2H$, or $CO_2H.C.CHBr.CO_2H$, $CBr.C(OH)_2$, or $CH.CO \begin{matrix} \diagup O, \\ \diagdown CBr \end{matrix} \begin{matrix} \diagdown O \\ \diagup CO \end{matrix}$ [128°]

Formed by boiling di bromo succinic acid or its Ba salt with water (Kekulé, *A Suppl* 1, 367, Petri, *A* 195, 62) Formed also, together with bromo fumaric acid (*q v*) by the action of Br and water on succinic acid at 180° (Kekulé, *A* 180, 1), or fumaric acid at 100° (Carius, *A* 149, 264) Deliquescent prisms or needles, v e sol water, alcohol, and ether, splits up into water and its anhydride on distillation

For discussion of formula see MALEIC ACID

Reactions —1 Sodium amalgam gives succinic acid —2 Fuming HBr unites in the cold, forming di bromo succinic acid —3 *Electrolysis* of its Na salt gives CO and HBr —4 Boiling conc baryta-water forms oxalic and acetic acids —5 When it is dissolved in water and an equivalent of aniline is added separates a crystalline pp $C_6H_5Br(CO_2H)(CO_2H \cdot NH_2 \cdot C_6H_5)$ [128°] This acid aniline salt dissolved in water and allowed to stand deposits the acid anilide $CO_2H \cdot C_6H_5Br \cdot CO_2 \cdot NHC_6H_5$, which crystallises in prisms, insol in dilute HCl If instead of allowing the substance to react in the cold the solution is heated, the compounds $C_{16}H_{12}N_2O_2$ and $C_{16}H_{14}N_2O_2$ are obtained

[230°], forms ochre coloured microscopic needles, Insol hot, sl sol cold aq, sol hot alcohol, less in cold, $C_{16}H_{14}N_2O_2$, probably $\parallel \begin{array}{c} \text{CH CO NHPh} \\ \text{C(NHPh)---CO}_2H \end{array}$, [176°], forms yellowish

indistinct crystals Sol hot, m sol cold aq Sol alkalis acids pp the substance unchanged (Michael, *Am* 9, 180, *B* 19, 1373)

Salts— Ag_2A'' crystalline pp — CaA'' 2aq — $CaNa_2A''$, 4aq — PbA'' aq

Dimethyl ether $A''Me_2$, (238° i V) Converted by iodine into dimethyl bromo fumarate

Diethyl ether $A''Et_2$, (256° i V) (140°–150°) at 25 mm (Anschütz, *B* 12, 2284, Schacherl, *A* 229, 91)

Anhydride $C_6H_5BrO_2$, (215° i V). Formed as above, and also by heating di bromo succinic acid with Ac_2O at 130° (Anschütz, *B* 10, 1884) Water forms bromo maleic acid

Amide $C_6H_5BrN_2O_2$, [168°–175°] From the imide and NH_3

Imide $(C_6H_5BrO_2)NH$ [151°] Formed, together with the amide of di bromo maleic acid, by heating succinimide with Br at 160° (Ciamician a Silber, *B* 17, 557, Kieselinski, *Sitz*, *B* 74, 561)

Iso. bromo. maleic acid is BROMO FUMARIC ACID (*q v*).

Bromo maleic acid (?) $C_6H_5BrO_2$, [112°] From mucobromic acid and baryta (Hill, *B* 17, 289) — K_2A'' aq — BaA'' 2aq — Ag_2A''

Di-bromo-maleic acid $C_6H_5Br_2O_2$, [123°] Formed, together with bromo maleic acid, by brominating succinic acid (Kekulé, *A* 180, 2) From (87) di-bromo-pyromucic acid and from tri bromo-pyromucic acid by hot dilute HNO_3 (Hill a Sanger, *A* 232, 89) Formed also by heating mucobromic acid with Br at 140° (Hill, *Am* 8, 48, *B* 13, 784) Slender felted needles, v sol water, alcohol, and ether, v sl sol benzene and ligroin An equivalent quantity of aniline added to a solution of the acid in water dissolves

VOL. I

and then deposits the acid aniline salt When this is allowed to stand under water it gradually forms an anilide The neutral salt in the same way gives the di anilide $C_6H_5Br_2(CO \cdot NHPh)_2$, [140°] By heating the acid (3 pts), with water (60 pts) and aniline (2 2 pts) for 30 minutes $C(NHPh) \cdot CO$ } NPh [183°] is obtained in the form of flat, yellowish red prisms, insol aq, m sol hot alcohol (Michael, *Am*, 9, 180)

Salts— BaA'' 2aq S 6 05 at 20° — PbA'' aq — Ag_2A'' explodes when heated

Anhydride $C_6H_5Br_2O_2$, [115°] Prepared by heating the acid Needles (by sublimation), sl sol cold water

heating succinimide with bromine Monoclinic crystals, $a b c = 4342 \cdot 1 \cdot 9649$, $\beta = 119^\circ 59'$ By boiling with aqueous KOH it is converted into di bromo maleic acid (Ciamician a Silber, *B* 17, 556, *G* 14, 35, cf Kieselinski, *Sitz* *B* 74, 561)

Bromo maleic acid-di-bromide v Tri-bromo-succinic ACID

DI BROMO MALEIC ALDEHYDE $C_6H_5Br_2O_2$ [200°] Got in small quantity from (87)-dibromopyromucic acid and aqueous bromine (Tönnies, *B* 12, 1203, Hill a Sanger, *A* 232, 87) Long thin prisms (from water). V sol alcohol, ether, chloroform, and benzene, m sol light petroleum In a current of CO_2 it may be sublimed On oxidation it gives mucobromic acid

BROMO MALEYLBROMIDE $C_6H_5Br_2O_2$ [56°] Formed by treating (88) di bromo pyromucic acid with cold bromine (Hill a Sanger, *A* 232, 80) Long prisms (from light petroleum)

BROMO MALEIC ACID $C_6H_5BrO_2$ The sodium salt $NaHA''$ is formed by the action of NaOEt sodium di bromo succinate Boiling lime water converts it into calcium racemate Sodium-amalgam forms sodium succinate $Pb(OAc)_2$ pps PbA''

Ethyl derivative Sodium salt $CO_2Na \cdot CH_2 \cdot CH(OEt) \cdot CO_2Na$ Hygroskop mass, formed by adding alcoholic NaOEt to sodium di bromo succinate (Mulder a. Hamburger, *R T C* 1, 154)

BROMO-MALONIC ACID $C_6H_5BrO_2$, 1,6 $CHBr(CO_2H)_2$ Obtained by reducing the di-brominated acid with sodium amalgam (Petrieff, *J R* 10, 65, *B* 11, 415) Deliquescent, moist Ag_2O forms tetracetic acid — $AgHA''$ — Ag_2A''

Di bromo malonic acid $CBr_2(CO_2H)_2$, [126°]. From malonic acid $CHCl_2$ and Br (Petrieff, *B*, 7, 400, *J R* 10, 65, Van 't Hoff, *B* 8, 355) Needles, v e sol water Boiling baryta water forms mesoxalic acid

Amide $CBr_2(CONH_2)_2$, [206°] Formed by adding Br to malonamide in aqueous solution (Freund, *B* 17, 782) Formed also by the action of alcoholic NH_3 on the amide of penta-bromo-aceto acetic acid $CBr_3 \cdot CO \cdot CBr_2 \cdot CO \cdot NH_2$ (Stokes a Pechmann, *Am* 8, 880) Needles, prisms, or large octahedra Sl sol hot water, alcohol, and acetic acid. — $CBr_2 \cdot \begin{array}{c} \text{CO NH} \\ \text{CO NH} \end{array} \cdot Hg$ white amorphous powder, insoluble in water and alcohol

Methylamide $CBr_2(CO \cdot NHMe)_2$, [162°]; P P

large white needles or trimetric crystals (Freund, *B* 17, 782)

BROMO MALOPHTHALIC ACID $C_8H_7BrO_4$
From tetra hydro phthalic acid and bromine-water (Baeyer, *A* 166, 868) Prisms or tables (containing $\frac{1}{2}$ aq) Baryta water converts it into $C_8H_5BrO_6$.

BROMO-MELILOTIC ACID *v* Bromo-oxy-phenyl propionic acid

BROMO MESITENE LACTONE

C_8H_7Br $\left< \begin{smallmatrix} O \\ CO \end{smallmatrix} \right>$ [105°] From mesitene lactone, CS_2 and Br (*v* Aceto acetic ether) Sl sol cold alcohol and water (Hantzsch, *A* 222, 18)

BROMO-MESITOL C_8H_7BrO *z* $C_8H_6Me_2Br(OH)$ [80°] Needles (from alcohol) (Biedermann & Ledoux, *B* 8, 59)

Di-bromo-mesitol $C_8H_4Br_2(OH)$ [150°] From mesitol, Br, HOAc, and I (Jacobsen, *A* 195, 265)

BROMO MESITYL ALCOHOL *v* Bromo- ω -oxy-mesitylene

p **BROMO MESITYL BROMIDE** *v* *p* ω -Di-bromo mesitylene

BROMO MESITYLENE $C_8H_6Me_2Br$ [13 5 4] *Bromo s tri-methyl benzene* [-1°] (227° 1 V) SG 12 1 82 Formed by the action of 1 mol Br upon cold mesitylene in the dark (Fittig & Storer, *A* 147, 6, Schramm, *B* 19, 212)

(5 3 1) ω Bromo mesitylene $C_8H_5(CH_3)_2(CH_2Br)$ [13 5] *Mesityl bromide* [88°] (231°) Prisms Formed by bromination of mesitylene at 130° (Wispek, *B* 16, 1577, Colson, *A* Ch [6] 6, 89, *C* R 96, 713)

eso Di-bromo mesitylene $C_8H_4Me_2Br_2$ [64°] (278°) Long needles Formed by the action of 2 mols of bromine upon mesitylene in the dark (F & S, Sussenguth, *A* 215, 248, Schramm, *B* 19, 212) Fuming HNO_3 gives bromo di nitro mesitylene [194°]

p- ω -Di-bromo mesitylene $C_8H_4(CH_3)_2Br(CH_2Br)$ [5 3 4 1] *p* *Bromo-mesityl bromide* Oil, fluid at -19° Decomposes on distillation Formed by the action of bromine (1 mol) in *sunshine* upon *eso* bromo mesitylene (Schramm, *B* 19, 213)

ω -Di-bromo mesitylene $C_8H_4Me(CH_2Br)_2$ [66°] Formed by passing CO_2 charged with bromine vapour into boiling mesitylene (Colson, *A* Ch [6] 6, 92, *C* R 96, 713, Robinet, *C* R 96, 500) Formed also by treating ω -di-oxy-mesitylene with HBr (Robinet & Colson, *Bl* [2] 40, 111) Long prisms, decomposed by alcohol

Tri-*eso* bromo mesitylene $C_6Me_2Br_3$ [224°] Formed by the action of 3 mols of bromine upon mesitylene in the dark (Schramm, *B* 19, 213) Trichino crystals, *v* sl sol alcohol

ω , ω , Tri-bromo-mesitylene $C_8H_3(CH_3)_2Br(CH_2Br)_2$ [5 4 3 1] [122°] Obtained by the action of bromine (1 mol) in *sunshine* upon hot *p*- ω -di bromo mesitylene (*p*-bromo-mesityl-bromide) $C_8H_3(CH_3)_2Br(CH_2Br)$ Very slender needles (from alcohol) Schramm, *B* 19, 215)

ω , ω , Tri-bromo mesitylene $C_8H_4Me_2Br(CH_2Br)_2$ [5 2 1 3] [81°] From bromo ω , ω , di-oxy mesitylene and conc HBr Can be formed by brominating mesitylene (Colson, *A* Ch. [6] 6, 101, *Bl* [2] 41, 862)

ω , ω , Tri-bromo-mesitylene $C_8H_3(CH_2Br)_3$ [94°] (215°) at 10 mm. From boiling mesityl

ene and Br (8 mols) Needles, *v* sol boiling alcohol (Colson, *C* R 96, 713, *A* Ch. [6] 6, 96)

BROMO MESITYLENE GLYCOL *v* Bromo-di-oxy-mesitylene

BROMO-MESITYLENE SULPHONIC ACID $C_8H_7BrSO_3$ *z* $C_8H_6Me_2BrSO_3H$ Formed by the action of bromine water on a very dilute solution of mesitylene-sulphonic acid or its Ba salt, formed also from bromo mesitylene and fuming H_2SO_4 (Rose, *A* 164, 56) Deliquescent trimetric needles (from ether) $-BaA'_2aq - PbA'_2, 1\frac{1}{2}aq - KA'_2aq - CuA'_2, 2aq - NaA'$

(a) **BROMO MESITYLENE ACID** $C_8H_7BrO_4$ *z* $C_8H_6Me_2Br(CO_2H)$ [13 4 5] [147°] Formed, together with some of its isomerides, by the slow action of Br on mesitylenic acid in the cold Formed also from the corresponding amido mesitylenic acid (Schmitz, *A* 193, 172) Trimetric prisms (from alcohol), $a b c = 927.1 : 470 : 863.2$ monoclinic, $a b c = 806.8 : 804.4 : 63.24^\circ$ $-CaA'_2, 2aq$

(8) Bromo mesitylenic acid $C_8H_6Me_2Br(CO_2H)$ [13 2 5] [215°] (Sch), [212°] (S) Formed by oxidising bromo mesitylene (Fittig & Storer, *A* 147, 1), or from the corresponding amido acid (Sch) Monoclinic crystals, $a b c = 1193.1 : 760.8 : 70.85^\circ$ $-BaA'_2, -CaA'_2, -CaA'_2, 5aq - KA'$

Di bromo-mesitylenic acid $C_8H_4Br_2Me_2(CO_2H)$ [195°] Formed by oxidising di bromo mesitylene (Sussenguth, *A* 215, 250) Needles (by sublimation) $-CaA'_2, 7aq - BaA'_2, 8aq$

BROMO METHACRYLIC ACID $C_8H_7BrO_4$ *z* $CHBr CMe CO_2H$ *Bromo crotonic acid* [63°] (229°) From *citra-* or *mesa* di bromo pyrotartaric acid by treatment with water, Na_2CO_3aq , or KOHAq (Kekulé, *A* Suppl 2, 97, Cahours, *A* Suppl 2, 347, Fittig & Krusemark, *A* 206, 7, Friedrich, *A* 203, 854) Also from *as* di bromo-isobutyric acid and NaOHAq (C Kolbe, *J* pr [2] 25, 382) Flat needles, sl sol cold water Reduced by sodium amalgam to isobutyric acid Decomposed by heating with alkalis into methane, allylene, and acetic acid (F) $-CaA'_2, 8aq$ S (of CaA'_2) 576 at 11° $-AgA' - HO CuA' - NH_4A'_2$ (Morawski, *Sitz* B 74, 89)

Ethyl ether EtA' (193°) (O)

Bromo methacrylic acid $CH_2 C(CH_2Br) CO_2H$ [68°] Formed, together with the preceding, by boiling *mesa* di bromo-pyrotartaric acid with water or Na_2CO_3aq (Krusemark, *A* 206, 12) Laminæ (from water), *v* sol water, volatile with steam Reduced with difficulty by sodium amalgam to isobutyric acid. $-CaA'_2, 2aq$ S (of CaA'_2) 80 at 5°

Di-bromo-methacrylic acid $C_8H_7Br_2O_4$ Needles From tri-bromo-butyric acid (dibromide of bromo methacrylic acid) At 120° it takes up Br forming tetra bromo butyric acid, whence boiling alkalis form

Tri-bromo methacrylic acid $C_8H_6Br_3O_4$ Needles (C)

BROMO-METHANE *v* METHYL BROMIDE

Di-bromo-methane *v* METHYLENE BROMIDE

Tri-bromo methane *v* Bromoform

Tetra bromo methane $CBBr_4$ Carbon tetrabromide [92°] (189°) Occurs in commercial bromine (Hamilton, *C* J 89, 48)

Formation -1 By heating Br with CS_2 in presence of I or SbBr₃ (Bolas & Groves, *C* J 28, 161; 24, 778, *A* 156, 60, 160, 160) -2.

From CH_2Cl_2 and IBr , (Höland, *A* 240, 236) — 8 From alcohol and Br (Schaffer, *B* 4, 366) — 4 By exposing a mixture of dilute KOH , bromoform, and Br to sunlight (Habermann, *A* 167, 174) — 5 By heating bromoform or bromopurine with SbBr , or Br at 150° — 6 From Cl_2 and Br (Gustavson, *A* 172, 176) — 7 From CCl_4 and AlBr_3 at 100° (Gustavson, *J R* 13, 286) 8 From CH_2Br_2 and Br in presence of animal charcoal (Damoiseau, *C R* 92, 42)

Preparation — CS_2 (2 pts) is heated with iodine (3 pts) and Br (14 pts) for 96 hours at 150° (Holand, *A* 240, 238)

Properties — Tables with faint camphor like smell, extremely prone to sublimation At 220° it splits up into C_2Br_2 and bromine Boiling alcohol gives bromal, HBr , and aldehyde Alcoholic KOH gives K_2CO_3 and KBr Sodium amalgam forms CHBr , and CH_2Br

BROMO METHANE- α -DI SULPHONIC ACID $\text{CHBr}(\text{SO}_3\text{H})_2$ Potassium salt K_2A From bromo di sulpho aldehyde $\text{CBr}(\text{SO}_3\text{H})_2$, CHO by boiling with aqueous K_2CO_3 (Rathke, *A* 161, 161)

Di bromo methane sulphonic acid $\text{CHBr}_2\text{SO}_3\text{H}$ Barium salt BaA , Thin unctuous plates, formed by the action of Br upon barium sulpho acetate at 180° (Andreasch, *M* 7, 157)

BROMO PENTA METHYL TRI AMIDO TRI PHENYL CARBINOL $\text{C}_6\text{H}_5\text{Br}_3\text{N}_3\text{O}$ Hydrobromide $\text{C}_6\text{H}_5\text{N}_3\text{Br}_3$ Formed by heating di methyl aniline with Br at 120° (Brandenburg a Brunner, *B* 10, 1845, 11, 697)

DI BROMO METHYLAMINE MeNBr_2 v **METHYLAMINE**

p BROMO METHYL ANILINE $\text{C}_6\text{H}_4(\text{Br})\text{NHMe}$ [11°] (260°) Prepared from the nitrosamine

Acetyl derivative [99°]

Nitrosamine $\text{C}_6\text{H}_4(\text{Br})\text{NMe}(\text{NO})$ [74°]. Long needles Formed by the action of HNO_2 on *p* bromo di methyl aniline (Wurster a Scheibe, *B* 12, 1818)

m Bromo di methyl aniline $\text{C}_6\text{H}_4(\text{Br})\text{NMe}_2$ [18°] [11°] (264° corr) Prepared by the methylation of *m* bromaniline By the action of HNO_2 it gives a nitroso compound which forms light green needles and melts at [about 148°]

Methylo iodide $\text{C}_6\text{H}_4\text{BrNMe}_2\text{I}$ [201°] Leaflets (Wurster a Scheibe, *B* 12, 1818)

p Bromo di methyl aniline $\text{C}_6\text{H}_4(\text{Br})\text{NMe}_2$ [14°] [55°] (264° corr)

Preparation — 1 By bromination of di methyl aniline dissolved in acetic acid (Weber, *B* 8, 714, 10, 763) — 2 By methylation of *p* bromaniline By the action of HNO_2 it gives a mixture of *p* nitro di methyl aniline and *p* bromo phenyl methyl nitrosamine

Methylo iodide $\text{C}_6\text{H}_4\text{BrNMe}_2\text{I}$ [185°] (Wurster a Scheibe, *B* 12, 1816)

Ferrocyanide $\text{B}'_2\text{H}_2\text{Fe}(\text{CN})_6\text{2aq}$ leaflets **Ferricyanide** $\text{B}'_2\text{H}_2\text{Fe}(\text{CN})_6\text{3aq}$ very soluble yellow crystals (Wurster a Roser, *B* 12, 1825)

BROMO-DI METHYL ANILINE - PHTHALEIN $\text{C}_6\text{H}_4\text{Br}_2\text{N}_2\text{O}_2$ etc

$\text{C}_6\text{H}_4 < \text{C}(\text{C}_6\text{H}_4\text{BrNMe}_2)_2 >$ The hydrochloride, formed by heating *p*-bromo di methyl aniline with phthalyl chloride, crystallises in steel blue needles Conc HCl aq pps dingy green $\text{B}'_2\text{HCl}$ (*O* Fischer, *B* 10, 1628) — $\text{B}'_2\text{H}_2\text{PtCl}_4$.

DI BROMO METHYL-ANTHRACENE

$\text{C}_{14}\text{H}_8\text{Br}_2$, [188° — 140°] From methyl anthracene by Br in CS_2 (Liebermann, *A* 212, 35) Yellow needles (from glacial HOAc)

Tetra bromo methyl-anthracene $\text{C}_{14}\text{H}_4\text{Br}_4$ Needles (from toluene) Oxidises to di bromo methyl anthraquinone (*L*)

DI BROMO DI METHYL - ANTHRACENE-DIHYDRIIDE $\text{C}_{14}\text{H}_{10}\text{Br}_2$ From di methyl anthracene dihydride and Br in HOAc (Anschütz, *A* 235, 309) Oxidises to anthraquinone

DI BROMO METHYL-ATROLACTIC ACID v **DI BROMO OXY TOLYL PROPIONIC ACID**

TETRA BROMO METHYL AURINE

$\text{C}_{20}\text{H}_8\text{Br}_4\text{O}_2$ Formed by brominating methylaurine — $\text{B}'\text{HBr}$ 2aq (Zulkowsky, *M* 3, 471)

BROMO METHYL - BENZENE v **Bromo TOLUENE**

Bromo-di methyl benzene v **Bromo XYLENE** Tri bromo tri-methyl benzene $\text{C}_6(\text{CH}_3)_3\text{Br}_3$, [1 2 3 4 5 6] Tri bromo-hexamellitene [245°] Needles Sl sol alcohol Formed by bromination of (1 2 3) tri methyl-benzene (Jacobsen, *B* 15, 1858) Other bromo-tri methyl benzenes are described as **BROMO ψ -CUMENES** and **BROMO MESITYLENES**

Bromo - tetra - methyl benzene v **Bromo DURENE**

Bromo penta methyl benzene C_6BrMe_5 , [161°] (289°) From $\text{C}_6\text{Me}_5\text{H}$, Br , and I (Friedel a Crafts, *A Ch* [6] 1, 473)

Hexa α -bromo hexa methyl benzene

$\text{C}_6(\text{CH}_2\text{Br})_6$, [255°] (F a C), [227°] (H) From hexa methyl benzene, water, and Br at 100° (Hofmann, *B* 13, 1732, Friedel a Crafts, *A Ch* [6] 1, 468)

BROMO-METHYL-BENZOIC ACID v **Bromo TOLUIC ACID**

Bromo-di methyl-benzoic acid $\text{C}_6\text{H}_3\text{BrMeCO}_2\text{H}$ [173°] **Bromo-pseudo cumenae acid** **Bromo xylilic acid** From $\text{C}_6\text{H}_4\text{BrMe}_2$, [1 2 4 5] by CrO_3 in HOAc (Sussenguth, *A* 216, 244) Also from $\text{C}_6\text{H}_4\text{Me}_2(\text{CO}_2\text{H})$ [1 3 4] and Br (Gunter, *B* 17, 1608) Needles (from water) V e sol alcohol — CaA , 2aq — BaA , 6aq

Bromo di methyl benzoic acid $\text{C}_6\text{H}_3\text{BrMe}_2\text{CO}_2\text{H}$ [189°] **Bromo-p xylilic acid**. From $\text{C}_6\text{H}_4\text{Me}_2(\text{CO}_2\text{H})$ [1 2 4] and Br (Gunter, *B* 17, 1609) Needles (from dilute alcohol)

Other isomerides are described as **BROMO MESITYLENIC ACIDS** (*q* v)

exo BROMO DI METHYL COUMARIN

$\text{C}_6\text{H}_4(\text{CH}_3)_2 \begin{matrix} \text{C}(\text{CH}_3) \text{CBr} \\ \diagdown \quad \diagup \\ \text{O} \quad \text{CO} \end{matrix}$ Formed by bromination of di methyl coumarin dissolved in CS_2 . Crystalline solid Sl sol alcohol Converted by hot alcoholic KOH into di methyl coumarilic acid (di-methyl-coumarone-carboxylic acid) (Hantzsch a Lang, *B* 19, 1299)

DI-BROMO-METHYLENE-DI-PHENYLENE

$\text{C}_{18}\text{H}_8\text{Br}_2$ [162°] From methylene di phenylene (*q* v) Needles or octahedra (from ether) (Carnelley, *C J* 87, 710)

HEXA-BROMO-METHYLENE-DI-PHENYLENE OXIDE $\text{C}_{18}\text{H}_4\text{Br}_6\text{O}$ Formed, together with the hepta brominated compound $\text{C}_{18}\text{H}_2\text{Br}_7\text{O}$ [186°], by adding Br to *o* methylene di-phenylene oxide suspended in water Blackens at *c.* 325° (Salzmann a Wischelhaus, *B* 10, 1401)

BROMO METHYLENE-PHTHALIDE

C_6H_4BrO , i.e. C_6H_4 $\begin{matrix} \diagup C=CHBr \\ \diagdown C=O \end{matrix}$ [183°] Long

colourless needles Formed by heating phthalyl-bromo acetic acid *in vacuo*, or by bromination of acetophenone-carboxylic acid It combines with Br_2 forming C_6H_4 $\begin{matrix} \diagup CBr(CBr,H) \\ \diagdown CO \end{matrix}$ $>O$ [118°] (Gabriel, *B* 17, 2525)

p BROMO-METHYL-ETHYL-ANILINE

C_6H_4BrN i.e. $C_6H_4BrNMeEt$ (265°) From methyl ethyl aniline and Br Solidifies below 0° (Claus & Howitz, *B* 17, 1327)

TRI BROMO DI METHYL ETHYL BENZENE $C_6H_4Br_3$ i.e. $C_6Br_3Me_2Et$ [218°] (Jacob sen, *B* 7, 1434)

DI-BROMO-METHYL-ETHYL-GLYOXALINE $C_6Br_2(CH_3)(C_2H_5)N_2$ *Di bromo oxal ethylane* [38°] Colourless crystals Sol acids Formed by bromination of methyl ethyl glyoxaline (oxal ethylane) (Wallach, *B* 16, 537)

HEXA-BROMO-METHYL-ETHYL KETONE $C_6H_4Br_6O$ i.e. $CBr_3COCH_2CBr_3$ [90°] From *u*-di bromo ethylene and $HBrO$ (Demole, *B* 11, 1710) Reduced by sodium amalgam to methyl ethyl ketone Fuming HNO_3 gives malonic acid

DI-BROMO-(*B* 2 *Py* 2)-DI-METHYL-(*Py* 3) ETHYL-QUINOLINE $C_8H_4Br_2N$ [144°] White needles (Harz, *B* 18, 3389)

TRI-BROMO-METHYL-GLYOXALINE $C_6Br_3(CH_3)_2N_2$ *Tri-bromo-oxalmethylin* [89°] White crystals Insoluble in cold water

Formation—1 By the action of MeI on tri bromo glyoxaline silver—2 By bromination of methyl glyoxaline (oxal methylane) dissolved in dilute H_2SO_4 (Wallach, *B* 16, 537)

BROMO-METHYL-INDONAPHTHENE-CARBOXYLIC ACID $C_{10}H_7Br$ $\begin{matrix} \diagup CBrMe \\ \diagdown CH \end{matrix}$ $>CO_2H$ [245°] Formed by bromination of methyl indonaphthene in chloroform Needles Sol alcohol (Roser, *B* 20, 1575)

HEXA-BROMO DI METHYL METHYLENE DIKETONE $C_6H_2Br_6O_2$ i.e. $CBr_3COCH_2CO CBr_3$ *Hexa bromo-acetyl-acetone* [108°] From the diketone and Br (Combes, *A Ch* [6] 12, 240, Needles, decomposed by alkalis into tri bromo-acetone and tri bromo-acetic acid

eso BROMO- α METHYL-NAPHTHALENE $C_{10}H_7Br(CH_3)$ (298° corr) Colourless fluid Formed by the action of bromine on a cold solution of (*a*) methyl naphthalene in CS_2 .

Psicric acid compound $C_{10}H_7Br.C_6H_4(NO_2)_2.OH$ [105°] Yellow needles (Schulze, *B* 17, 1528)

eso-Bromo- β -methyl-naphthalene $C_{10}H_7Br(CH_3)$ (296°) Colourless fluid Formed by the action of bromine on a cold solution of (β) methyl naphthalene in CS_2

Psicric acid compound $C_{10}H_7Br.C_6H_4(NO_2)_2.OH$ [113°], yellow needles (Schulze, *B* 17, 1528)

o-Bromo-(β)-methyl-naphthalene $C_{10}H_7Br$ [56°] (213° at 100 mm) White glistening plates Formed by passing gaseous bromine into (β)-methyl-naphthalene heated to 240° (Schulze, *B* 17, 1529)

Tri-bromo-di-methyl naphthalene $C_{10}H_6Br_3$ [228°] (Cannizzaro & Carnelutti, *G* 12, 410, cf. Giovanozzi, *G* 12, 147)

TRI-BROMO-METHYL DI PHENYL AMINE $C_{10}H_8Br_3N$ i.e. $NMe(C_6H_4Br)_2(C_6H_5Br)$ [98°] From methyl di phenyl amine and Br (Gnehm, *B* 8, 926) HNO_3 forms $\{C_6H_4Br(NO_2)_2\}_2NH$

Tetra-bromo methyl di phenyl-amine $(C_6H_4Br)_2NMe$ [129°] Formed at the same time as the preceding (*G*)

DI BROMO DI METHYL QUINOL *o* *Di-methyl Bromo hydroquinone*

BROMO METHYL PIPERIDINE

CH_2 $\begin{matrix} \diagup CHBrCH_2 \\ \diagdown CH_2CH_2 \end{matrix}$ $>NMe$ The methyl-bromide (*B*MeBr) is formed very readily by isomeric change of di methyl *o* di bromo *n*-amyl amine (so called 'di methyl piperidine di bromine'), CH_3Br $CHBrCH_2CH_2CH_2NMe_2$, by warming its alcoholic solution for a short time (Merling, *B* 19, 2630)

DI BROMO-METHYL-PYRIDINE $C_5H_4Br_2N$ i.e. $C_5NH_4MeBr_2$ [109°] Formed, together with ethylene bromide, from tropidine (*q v*) hydrobromide and bromine at 165° (Ladenburg, *A* 217, 145)

s Di bromo di methyl pyridine $C_5NH_4Me_2Br_2$ [1524] *Di bromo lisdine* [65°] Formed by the action of bromine upon an aqueous solution of the potassium salt of *s* di methyl pyridine di carboxylic acid— $B'H_2Cl.PtCl_2.2aq$ needles (Pfeiffer, *B* 20, 1350)

Di bromo *s* tri methyl pyridine $C_5NMe_3Br_2$ [13524] *Di bromo collidine* [81°] (262° at 726 mm) Obtained by the action of bromine upon an aqueous solution of the potassium salt of *s* tri methyl pyridine di carboxylic acid, the yield is 50 p.c. of the theoretical White pearly plates Very volatile with steam Weak base

Salts— $B'HCl$ easily soluble small glistening crystals— $B'H_2Cl.PtCl_2.2aq$ orange-yellow needles— $B'H_2Cr_2O_7$ [146°], needles— $*B'C_4H_4(NO_2)_2.OH$ [160°] dark yellow flat prisms, *v* sol hot alcohol, insol water (Pfeiffer, *B* 20, 1345)

DI BROMO TRI METHYL PYRIDINE DI-CARBOXYLIC ETHER *Dibromide* $NC_5H_2Br_2(CO_2Et)_2$ [102°] From the following body and fuming HNO_3 (Hantzsch, *A* 215, 17)

Di bromo tri methyl pyridine di-carboxylic ether *Di-bromhydride* $NC_5H_2Br_2(CO_2Et)_2$ [88°] From the dihydride of (1,3,5,2,4) tri methyl pyridine di-carboxylic ether by Br in CS_2 (Hantzsch, *A* 215, 14) Yellow twin crystals

DI-BROMO-DI-METHYL PYROCATECHIN *v* *Di methyl ether of Di bromo PYROCATECHIN*

HEXA-BROMO-DI-METHYL TRISULPHIDE $C_2Br_6S_2$ i.e. $(CBr_3)_2S_2$ *Carbotrisulthiohexabromide* [125°] *S* (alcohol) 5.5 at 78°, *S* (ether) 2.85 at 0° From CS_2 and Br (Hell & Urech, *B* 15, 275, 987, 16, 1147) Prisms or tables, insol water Hot conc $NaOH$ gives $NaBr$, Na_2CO_3 , and Na_2S Decomposed by heat into CBr_3 , CS_2 , Br_2 , and a blue substance $C_2Br_6S_2.2aq$

DI-BROMO-METHYL-THIOPHENE $C_4H_3Br_2(CH_3)S$ (228°) Oil (Meyer & Kreis, *B* 17, 787)

Tri bromo-(*a*) methyl-thiophene $C_4Br_3(CH_3)S$ *Tri-bromo (β) thiatolene* [86°] Formed by bromination of (β) methyl thiophene (Egl, *B* 18,

545). Long colourless silky needles V sol ether and hot alcohol

Tri-bromo-methyl-thiophene $C_4Br_3(CH_3)_2S$ [89°] Formed by bromination of the methyl-thiophene from pyrotartaric acid Large colourless needles (Volhard a Erdmann, *B* 18, 455) Forms a molecular compound [74°] with the preceding (Gattermann, *B* 18, 3005)

Bromo di methyl thiophene $C_4H(CH_3)_2BrS$ *Bromo thioxene* (194° uncor) Formed by bromination of thioxene dissolved in CS_2 Volatile with steam Colourless fluid Heavier than water (Messinger, *B* 18, 1637)

Di-bromo di methyl thiophene $C_4(CH_3)_2Br_2S$ *Di bromo thioxene* [46°] (247° uncor) Long colourless needles Formed by adding 2 mols of bromine to cooled thioxene (from coal tar) (Messinger, *B* 18, 563)

Di bromo di methyl thiophene $C_4(CH_3)_2Br_2S$ *Di bromo thioxene* [47° 50°] Needles Volatile with steam Formed by bromination (with 2Br₂) of thioxene (from acetyl acetone) (Paal, *B* 18, 2253)

Tri bromo di methyl thiophene $C_4H_3Br_3S$ *Tri bromo thioxene* [144°] Crystallises and sublimes in needles Formed by the action of an excess of bromine upon the di bromo- derivative of the thioxene obtained from acetyl acetone (Paal, *B* 18, 2253)

Octo bromo di methyl thiophene $C_4Br_8(CH_3)_2S$ *Octo bromo thioxene* [114°] Small needles Formed by the action of an excess of bromine upon thioxene (from coal tar) (Messinger, *B* 18, 565)

BROMO DI METHYL-*o* TOLUIDINE

C_8H_7BrN *o* $C_8H_7(CH_3)(Br)NMe_2$ (245°) Prepared by bromination of di methyl-*o* toluidine, or by methylation of bromo *o* toluidine (Michler a Sampaio, *B* 14, 2172) Liquid, sol alcohol and ether, volatile with steam

Bromo di methyl *m* toluidine

$C_8H_7(Br)(CH_3)NMe_2$ [1 2 4] [98°] (276°) Prepared by bromination of di methyl *m* toluidine White leaflets Insol water, sol alcohol, ligroin and C_6H_6 (Wurster a Riedel, *B* 12, 1800)

Ferrocyanide $B'H_4Fe(CN)_4aq$ crystals

Ferrocyanide $B'H_4Fe_2(CN)_{12}9aq$ Very soluble yellow crystals (Wurster a Roser, *B* 12, 1826)

TETRA BROMO MYRISTIC ACID

$C_{18}H_{32}Br_4O_2$ From myristic acid and Br (Masino, *A* 202, 176)

DI-BROMO-MYRISTIC ACID $C_{18}H_{32}Br_2O_2$

Obtained by gently warming the preceding (M) ***α*-BROMO-NAPHTHALENE** $C_{10}H_7Br$ [1] [5°] (277°), (280° cor) (Ramsay a Young, *C J* 47, 650) $SG \frac{2}{1} 14750$, $\frac{12}{1} 1503$ $R_{\infty} 84.9$ (Nasini, *G* 15, 93)

Formation—1 From naphthalene in CS_2 and Br (Laurent, *A Ch* [2] 59, 196, Glaser, *A* 185, 40, Wahlforss, *Z* 1865, 3, Gnehm, *B* 15, 2721)—2 From diazo bromo naphthalene salts by boiling with alcohol (Rother, *B* 4, 851, Stallard, *C J* 49, 188)—3 From $Hg(C_{10}H_7)_2$ and Br (Otto, *A* 147, 175)

Properties—Liquid, insol water, miscible with alcohol, ether, and benzene

Reactions—1 CrO_3 gives phthalic acid (Beilstein a Kurbatow, *C C* 1881, 359)—2 *A* solution in CS_2 gently heated with $AlCl_3$ gives (8) bromo naphthalene as the chief product, to

gether with di bromo-naphthalenes, and naphthalene (Roux, *Bl* [2] 45, 510)—3 Toluene in presence of $AlCl_3$ forms bromo toluene and naphthalene (Roux)—4 Reduced by *sodium-amalgam* to naphthalene—5 $ClCO_2Et$ and Na give naphthoic acid

Picric acid compound

$C_{10}H_7BrC_6H_3(NO_2)_3OH$ [135°] Yellow needles (Wichelhaus, *B* 2, 305, R)

Dichloride $C_{10}H_7BrCl_2$ [165°], tables

(8) **Bromo-naphthalene** $C_{10}H_7Br$ [2] [59°] (282 cor) S (92 p c alcohol) 6 at 20°

Formation—1 By heating (8) diazo naphthalene with a large excess of HBr (Gasirowski a Ways, *B* 18, 1941, cf Liebermann, *A* 183, 268)—2 By running a solution of (8) diazo-naphthalene bromide into a hot solution of cuprous bromide, the yield is 30 p c of the retical (Leilmann a Kem, *B* 19, 811)—3 From (8) naphthol and PBr_3 (Brunel, *B* 17, 1179)—4 From (a) bromo naphthalene and $AlCl_3$ (Roux, *Bl* [2] 45, 513)

Properties—Trimetric scales, v sol CS_2 , $CHCl_3$, benzene, and ether

Picric acid compound

$C_{10}H_7BrC_6H_3(NO_2)_3OH$ [79°] (R), [86°] (B), S (alcohol of 92 p c) 6 at 20° (R)

Di-bromo-naphthalene $C_{10}H_6Br_2$ [61°]

Formed in small quantity by brominating naphthalene (John, *Bl* [2] 28, 514, not observed by others)

o Di bromo naphthalene $C_{10}H_6Br_2$ [1 2] [68°]

From (1, 2) bromo (8) naphthylamine by the diazo perbromide reaction (Meldola, *C J* 43, 5) Oblique rhombic prisms (from alcohol, acetone or petroleum)

m Di bromo-naphthalene $C_{10}H_6Br_2$ [1 3]

[64°] From di bromo (a)-naphthylamine, [119°] by removal of NH_2 (Meldola, *C J* 43, 2) Needles

Di bromo-naphthalene $C_{10}H_6Br_2$ [2 3] ?

[c 68°] Formed, together with two isomerides, [81°] and [130°] by the action of Br (2 mols) on naphthalene (1 mol) (Guareschi, *G* 7, 24) Also from bromo (8) naphthol and PBr_3 (Canzoneri, *G* 12, 425) Prisms (from alcohol)

(a8) Di bromo naphthalene $C_{10}H_6Br_2$ [4 2' or 3']

[74°] From (4, 2 or 3', 2) di bromo-naphthylamine by diazo reaction (Meldola, *C J* 47, 513) Silvery scales (from dilute alcohol)

η-Di-bromo-naphthalene $C_{10}H_6Br_2$ [1 x] [77°]

Formed, together with the isomeride [130°], by brominating naphthalene (a) sulphonic acid (Darmstadter a Wichelhaus, *A* 152, 304)

(8)-Di-bromo-naphthalene $C_{10}H_6Br_2$ [1 4]

[82°] (310°) S (93.5 per cent alcohol) 1.33 at 11.4°, 6 at 56° (Guareschi, *A* 222, 269)

Formation—1 The chief product of the action of bromine (2 mols) on naphthalene (Glaser, *A* 135, 40)—2 By distilling (a) bromo-naphthalene sulphonic acid or nitro (a) bromo-naphthalene [85°] with PBr_3 (John, *Bl* [2] 28, 514)—3 From acetyl (a) naphthylamine by brominating, saponifying, and treating the resulting $C_{10}H_7Br(NH_2)$ by the diazo reaction (Meldola, *C J* 43, 4)

Properties—Long needles Oxidised by HNO_3 to di bromo phthalic and bromo-nitro-phthalic acids and bromo-nitro-naphthalene CrO_3 in acetic acid gives di bromo naphtho quinone and di bromo phthalide Reacts with

Br forming $C_{10}H_7Br$, [178°] (Guareschi, *G* 16, 141)

Constitution.—This follows from the oxidation to di bromo phthalic acid, coupled with the observation that the bromo (a) naphthylamine from which it may be formed (*supra*) gives (a)-bromo naphthalene by the diazo reaction

(γ) Di bromo naphthalene

$C_{10}H_7Br_2$ [11' or 4'] [131° cor] (326°) S (93.5 p.c. alcohol) 2 at 56°

Formation.—1 By brominating naphthalene (*G*, Magatti, *G* 11, 357) — 2 From diazo bromo naphthalene (from bromo-naphthylamine [64°]) by adding bromine water and warming the pp with HOAc — 3 The chief product of the action of Br on naphthalene (a) sulphonic acid (Darmstadter a Wichelhaus, *A* 152, 303) — 4 By the action of PBr₃ on (a) di nitro naphthalene or bromo naphthalene (a) sulphonic acid (J)

Properties.—Tables HNO₃ gives bromo nitro phthalic acid CrO₃ in HOAc gives bromo phthalic acid [176°] Does not form a tetra bromide with Br

δ Di bromo naphthalene $C_{10}H_7Br_2$ [141°] From naphthalene (a) sulphonic acid and PBr₃ (J) Thin plates

ε-Di bromo naphthalene $C_{10}H_7Br_2$ [160°] From (a) bromo naphthalene sulphonic acid and PBr₃ (J)

Di-bromo-naphthalene tetra-chloride $C_{10}H_4Br_2Cl_4$ [156°] From di- brominated naphthalene (?) [82°] and Cl (Laurent)

Di bromo naphthalene tetra-bromide $C_{10}H_2Br_4$ A mixture of three bodies of this composition, [c 100°] [120°] and [173°] is formed from naphthalene and Br (G)

Tri-bromo-naphthalene $C_{10}H_5Br_3$ [75°] Formed by brominating naphthalene, or by heating di bromo naphthalene tetra bromide with alcoholic KOH (Laurent, *A Ch* [2] 59, 196, Glaser, *A* 185, 43) Needles (from alcohol)

Tri-bromo naphthalene $C_{10}H_5Br_3$ [141°] [85°] From di bromo nitro-naphthalene [117°] and PBr₃ (John) Needles

Tri bromo naphthalene $C_{10}H_5Br_3$ [87°] From di bromo naphthalene (β) sulphonic acid and PBr₃ (J) Needles

Tri bromo naphthalene $C_{10}H_5Br_3$ [131' or 4'] [105°] From (3, 1' or 4', 1)-di bromo naphthyl amine [102°] by diazo-reaction (Meldola, *C J* 47, 516)

Tri bromo naphthalene $C_{10}H_5Br_3$ [132' or 8'] [110°] From (1, 2' or 3', 3)-di bromo-naphthyl amine by the diazo reaction Needles (from alcohol) (Meldola, *C J* 47, 513)

Tri-bromo-naphthalene $C_{10}H_5Br_3$ [124°] [114°] From $C_{10}H_7(NH_2)Br_2$ [124°] by diazo reaction (Meldola, *C J* 43, 4) Formed also by heating $C_{10}H_7(NH_2)(NO_2)Br$ [124°] with conc HBrAq and glacial HOAc at 180° (Prager, *B* 18, 2168) White needles (from dilute $C_2H_5O_2$) Dilute HNO₃ at 180° gives phthalic acid

Tetra-bromo-naphthalene $C_{10}H_3Br_4$ [142' 8'] [175°] S (95 p.c. alcohol) 5 at 78° From di bromo naphthalene tetrabromide [178°] and NaOEt (Guareschi, *G* 16, 141) Needles (from alcohol) or plates (by sublimation) CrO₃ in HOAc gives di-bromo phthalide [188°] and tetra bromo (a) naphthoquinone [224°]

Tetra-bromo naphthalene $C_{10}H_3Br_4$ [120°] From di bromo naphthalene tetrabromide [100°] and NaOEt (Gu) Needles (from alcohol)

Tetra-bromo-naphthalene tetra-bromide $C_{10}H_3Br_4$ [178°] From (1, 4)-di bromo naphthalene and Br (Gu)

Penta bromo naphthalene $C_{10}H_2Br_5$ From $C_{10}H_7Br_2$ and Br at 150° (Glaser) ¶ Granules, insol alcohol

Hexa bromo-naphthalene $C_{10}H_0Br_6$ [252°] From naphthalene, Br, and I at 400° (Gessner, *B* 9, 1505) Also from naphthalene (20 g), Al₂Cl₆ (15 g) and Br (300 g) (Roux, *Bl* [2] 45, 515) Needles, easily sublimed Does not combine with picric acid

BROMO NAPHTHALENE DI CARBOXYLIC ACID $C_{12}H_8BrO_4$ *vs* $C_{10}H_6Br(CO_2H)_2$ [210°] From bromo acenaphthene and CrO₃ (Blumenthal, *B* 7, 1095) Needles (from benzene) Converted by NH₃ into the amide $C_{10}H_6Br(CO)_2NH$ [above 265°]

BROMO-NAPHTHALENE-(β)-SULPHINIC ACID $C_{10}H_7BrSO_3H$ From naphthalene (β) sulphonic acid and Br (Gessner, *B* 9, 1503)

(a) **BROMO-NAPHTHALENE SULPHONIC ACID** $C_{10}H_7Br(SO_3H)$ [14] [139°] Formed by sulphonating (a) bromo naphthalene (Laurent, *Compt chim* 1849, 392, Darmstadter a Wichelhaus, *A* 152, 303, Otto, *A* 147, 184) Flat needles Oxidised by KMnO₄ to phthalic acid (Meldola, *B* 12, 1964) Potash fusion gives no bromo naphthol (M) Br gives chiefly $C_{10}H_6Br_2$ [82°] — CaA₂ 8aq — BaA₂ 2aq — PbA₂ 1½aq

Chloride $C_{10}H_7Br(SO_2Cl)$ [87°] (John, *Bl* 28, 516) In its preparation there is also formed $C_{10}H_6Cl(SO_2Br)$ [116°] (Gessner, *B* 9, 1504)

Bromide $C_{10}H_7Br(SO_3Br)$ [115°] (J)

Amide $C_{10}H_7Br(SO_2NH_2)$ [190°] (J), [195°] (O)

Bromo naphthalene (a) sulphonic acid $C_{10}H_7Br(SO_3H)$ [104°] Formed by brominating naphthalene (a) sulphonic acid (D a W) PBr₃ gives di bromo naphthalene [131°] — KA'

Chloride $C_{10}H_7Br(SO_2Cl)$ [90°] (J)

Amide $C_{10}H_7Br(SO_2NH_2)$ [205°] (J)

Bromo-naphthalene (β)-sulphonic acid

$C_{10}H_7Br(SO_3H)$ [62°] Formed by brominating naphthalene (β) sulphonic acid (D a W) Crystalline mass, sol ether (difference from the two preceding acids) — KA'

Bromo naphthalene sulphonic acid

$C_{10}H_7Br(SO_3H)$ Formed in small quantity in preparing its isomeride [139°] by sulphonating (a) bromo naphthalene with H₂SO₄ or ClSO₃H (Armstrong a Williamson, *C J Proc* 1, 284)

Chloride $C_{10}H_7BrSO_2Cl$ [151°]

Di-bromo naphthalene (β)-sulphonic acid

$C_{10}H_6Br_2(SO_3H)$ Formed by brominating naphthalene (β) sulphonic acid (J) Crystalline. PBr₃ gives tri-bromo naphthalene [87°]

Chloride $C_{10}H_6Br_2(SO_2Cl)$ [109°]

Amide $C_{10}H_6Br_2(SO_2NH_2)$ [238°]

Di-bromo-naphthalene sulphonic acid

$C_{10}H_6Br_2(SO_3H)$ Got by sulphonating di-bromo naphthalene (Laurent, *A* 72, 299) — KA' — BaA'

BROMO NAPHTHALIC ACID *vs* Bromo oxy-(a) NAPHTHOQUINONE

BROMO (a) NAPHTHOIC ACID $C_{11}H_7BrO_2$ *vs* $C_{10}H_5BrCO_2H$ [14] [246°] (Ek-

strand, *B* 19, 1185) Produced from its nitrile or by brominating (a) naphthoic acid (Hausmann, *B* 9, 1516) White needles (by sublimation) — $\text{KA}'\frac{1}{2}\text{aq}$ — $\text{CaA}'_2\frac{1}{2}\text{aq}$ *S* 15 at 20° — $\text{BaA}'_2\frac{3}{4}\text{aq}$ *S* 17 at 21° — AgA'

Amide $\text{C}_{10}\text{H}_7\text{BrCONH}_2$ [241°], flat needles
Nitrile $\text{C}_{10}\text{H}_5\text{BrCN}$ [147°] From (a)-naphthotriole in CS_2 and Br

Bromo (β)-naphthoic acid $\text{C}_{10}\text{H}_7\text{BrCO}_2\text{H}$ [258°] From (β) naphthoic acid and Br (H) Needles (by sublimation) — $\text{KA}'\frac{1}{2}\text{aq}$ — $\text{CaA}'_2\frac{3}{4}\text{aq}$ *S* 02 at 20° — $\text{BaA}'_2\frac{3}{4}\text{aq}$ *S* 023 at 21° — AgA'

Nitrile $\text{C}_{10}\text{H}_5\text{BrCN}$ [149°], flat needles

Tri bromo (β)-naphthoic acid $\text{C}_{10}\text{H}_4\text{Br}_3\text{CO}_2\text{H}$ [270°] From (β) naphthoic acid (1 mol), Br (3 mols), and I at 350° Needles (by sublimation) — BaA'_2 (H)

Tetra bromo (α) naphthoic acid $\text{C}_{10}\text{H}_2\text{Br}_4\text{CO}_2\text{H}$ [239°] From (α) naphthoic acid (1 mol) and Br (4 mols) at 350° (H) Granules (from alcohol) or needles (by sublimation) — BaA'_2

Tetra-bromo (β) naphthoic acid $\text{C}_{10}\text{H}_4\text{Br}_4\text{CO}_2\text{H}$ [260°] Preparation and properties similar to those of the preceding acid (H)

BROMO (α) NAPHTHOL *Ethyl ether* $\text{C}_{10}\text{H}_7\text{Br(OEt)}$ [48°] From ethyl bromo (α) naphthol and Br (Marchetti, *C* N 40, 87) Prisms, v sol ether

Bromo (β) naphthol $\text{C}_{10}\text{H}_7\text{Br(OH)}$ [32°] [84°] Prepared by adding Br in glacial acetic acid slowly to naphthol in glacial acetic acid (A J Smith, *C* J 35, 789) Needles Sol alcohol, ether, light petroleum and benzene At 130° it begins to decompose, giving off HBr Oxidised by alkaline KMnO_4 to phthalic acid FBr₃ gives di bromo naphthalene [68°] and (β) bromo naphthalene (Canzoneri, *G* 12, 424)

Acetyl derivative $\text{C}_{10}\text{H}_7\text{Br(OAc)}$ (215°) at 20 mm (C)

Nitroso derivative $\text{C}_{10}\text{H}_6(\text{NO})\text{Br(OH)}$ [65°] green needles

Di bromo (α) naphthol $\text{C}_{10}\text{H}_5\text{Br}_2(\text{OH})$ [134°] [106°] (Fitting, *A* 227, 244) Formed by brominating (α)-naphthol in HOAc (Biedermann, *B* 6, 1119) and in small quantity from di bromo (α) naphthylamine by the diazo-reaction (Meldola, *C* J 45, 161) Long needles (from alcohol) Powerful oxidising agent

Reactions —1 KMnO_4 gives phthalic acid — 2 Alcoholic KOH gives tri oxy naphthalene — 3 Combines with aniline forming a white crystalline salt If this is heated for 10 minutes at 200°, and then allowed to cool, crystals of $\text{C}_{10}\text{H}_6(\text{NPhH})\text{C}_2\text{O}_2$ or (β) naphthoquinone di-anilide (*q v*) are got (Meldola, *C* J 45, 156) — 4 *p* Toluidine forms the corresponding (β) naphthoquinone di toluidide (*q v*) — 5 (β) naphthylamine forms the corresponding (α) naphthoquinone di naphthalide (*q v*)

Tetra-bromo (β)-naphthol $\text{C}_{10}\text{H}_2\text{Br}_4\text{OH}$ [156°] Prepared by adding excess of bromine to (β)-naphthol dissolved in glacial acetic acid (A J Smith, *C* J 35, 791) White needles (from glacial acetic acid) Sol CS_2 , benzene and alkalis Oxidised by KMnO_4 and KOH to bromo phthalic acid (anhydride [125°]) Hence it is $\text{C}_6\text{HBr}_2(\text{C}_4\text{H}_2\text{Br}_2\text{O})$

Penta-bromo (α) naphthol $\text{C}_{10}\text{H}_2\text{Br}_5\text{OH}$ [241° 3' 4' 1]. [289°] Formed by bromination

of (α)-naphthol in presence of Al_2Br_6 . Slender felted needles Sol sol benzene, xylene, and cumene, nearly insol alcohol and ether Dissolves in alkalis By dilute HNO_3 at 100° it is oxidised to tetra bromo-(α)-naphthoquinone [265°], at 150° it is oxidised to di-bromo-phthalic acid [206°] — $\text{C}_{10}\text{H}_4\text{Br}_2\text{ONa}$ long easily soluble needles — $\text{C}_6\text{H}_5\text{Br}$, OK small colourless needles (Blumlein, *B* 17, 2485)

Penta-bromo-(β) naphthol $\text{C}_{10}\text{H}_2\text{Br}_5(\text{OH})$ [237°] Formed by bromination of (β) naphthol in presence of Al_2Br_6 . White needles Insol alcohol, sl sol benzene It is oxidised by HNO_3 to tetra bromo (β) naphthoquinone, on further oxidation it yields tri-bromo phthalic acid $\text{C}_{10}\text{H}_2\text{Br}_3(\text{ONa})$ long white silky needles (Flessa, *B* 17, 1479)

Bromo (α) naphthol (α) sulphonic acid $\text{C}_{10}\text{H}_7\text{Br(OH)SO}_3\text{H}$ [32 1?]

Salts —Formed by adding the calculated quantity of bromine to saturated solutions of the salts of (β) naphthol (α) sulphonic acid (Armstrong & Graham, *C* J 39, 137) — KA' *S* 4 at 15° Boiling HNO_3 forms phthalic acid. — $\text{CaA}'_2\frac{1}{2}\text{aq}$

BROMO (α) NAPHTHOQUINONE

Anilide $\text{C}_{10}\text{H}_6\text{Br(NHC}_6\text{H}_5)_2\text{O}_2$ [166°] Formed by the action of aniline on bromo oxy-(α) naphthoquinone [197°] in acetic acid solution Red prisms Sol hot alcohol and hot acetic acid By cold aqueous NaOH it is split up into its constituents (Baltzer, *B* 14, 1902)

An isomeric *anilide* $\text{C}_{10}\text{H}_6\text{Br(NPhH)O}_2$ [234 1] [194°] is formed by boiling di bromo-(α)-naphthoquinone [218°] with an alcoholic solution of aniline It is converted by KOH into bromo oxy-(α)-naphthoquinone [202°] (Miller, *Bl* [2] 43, 125)

p Bromo *anilide* $\text{C}_{10}\text{H}_6\text{Br(NHC}_6\text{H}_4\text{Br)O}_2$ [240°] Prepared by bromination of (α) naphthoquinone anilide, or by boiling a mixture of *p*-bromo aniline and bromo oxy (α) naphthoquinone with acetic acid Red needles Sol benzene, sl sol alcohol By alcoholic H_2SO_4 it is decomposed into bromo oxy (α) naphthoquinone and *p* bromo-aniline (Baltzer, *B* 14, 1901)

Bromo (β)-naphthoquinone $\text{C}_{10}\text{H}_6\text{C}_2\text{O}_2$

[178°] Obtained by bromination of (β) naphthoquinone in acetic acid Red needles or prismatic crystals M sol warm alcohol, benzene, and acetic acid Sublimable Dissolves in dilute caustic alkalis with a brownish red colour, forming bromo oxy-(α) naphthoquinone [196°] (Zincke, *B* 19, 2495)

Di-bromo (α)-naphthoquinone $\text{C}_{10}\text{H}_4\text{Br}_2\text{O}_2$ [151°] *S* (alcohol) 98 at 13° Formed by the action of Br (7 pts) and I (2 pts) on (α) naphthol (1 pt) in presence of water (Diehl & Merz, *B* 11, 1065) Yellow needles, may be sublimed Alkalis from HBr and bromo-oxy-naphthoquinone

Di bromo - naphthoquinone $\text{C}_{10}\text{H}_4\text{Br}_2\text{O}_2$ [171°-173°] [141° 4']? *S* (95 p alcohol) 34 at 16° From di bromo-naphthalene [82°], CrO_3 and glacial acetic acid (Guaracchi, *A* 222, 279) Yellow needles (from alcohol) Insol water Cannot be sublimed. Volatile with steam CrO_3 does not oxidise it to di-bromo-phthalide.

Di-bromo-(β)-naphthoquinone $C_{10}H_6Br_2O_2$ [1 2 3 4] [174°] Obtained by the action of bromine upon bromo-(β)-naphthoquinone in hot acetic acid, or better upon (a) amido (β) naphthol or its sulphate. Thick red plates or tables. Sl sol alcohol and ether (Zincke, B 19, 2496)

Di-bromo-naphthoquinone $C_{10}H_6Br_2O_2$ [218°] From (a)-naphthoquinone, Br, and I (Miller, B [2] 38, 138) Prisms. Converted by KOH into bromo oxy naphthoquinone [200°]

Anilide [194°]

Tetra-bromo-(a)-naphthoquinone $C_{10}H_2Br_4O_2$ [265°] Yellow plates. Sl sol alcohol. Formed by oxidation of penta-bromo (a) naphthol with dilute HNO_3 at 100°. By further oxidation at 150° it yields di bromo phthalic acid [206°] (Blümlin B 17, 2488)

Tetra-bromo-(a)-naphthoquinone $C_{10}H_2Br_4O_2$ [1' 4' 2 3 1 4] [224°] Formed by oxidising tetra-bromo naphthalene [178°] Orange yellow prisms, v sol hot water (Guareschi, G 16, 149)

Tetra-bromo-(β) naphthoquinone $C_{10}H_2Br_4O_2$ [164°] Red granular crystals. Sl sol alcohol. Formed by oxidation of penta bromo (β) naphthol with dilute HNO_3 . By further oxidation it is converted into tri bromo phthalic acid (Flessa, B 17, 1481)

BROMO-NAPHTHOSTYRIL *v* *Inner anhyride of Bromo amido naphthoic acid*

DI-BROMO-(aa)-DINAPHTHYL $C_{20}H_{12}Br_2$ [215°] From di naphthyl and bromine vapour (Lossen, A 144, 77) Monoclinic prisms, v sl sol alcohol

Hexa-bromo-(aa) dinaphthyl $C_{20}H_2Br_6$. Resin
Hepta-bromo-($\beta\beta$) dinaphthyl $C_{20}H_2Br_7$. Amorphous (Smith a Poynting, C J 27, 854)

BROMO-NAPHTHYLAMINE $C_{10}H_7Br(NH_2)$ [225°] By reduction of bromo nitro naphthalene [85°] of John, itself got from (a) bromo naphthalene by nitration. An oil. May be distilled with steam. Fe_2Cl_6 gives a violet colour in its aqueous solution. Reduces $AgNO_3$ (Guareschi, A 222, 299) Possibly identical with Rother's (1, 4)-bromo naphthylamine [94°]

m-Bromo-(a)-naphthylamine $C_{10}H_7Br(NH_2)$ [3 1] [62°] From the nitro compound, zinc dust, and $HOAc$ (Meldola, C J 47, 509) Needles (from dilute alcohol)

Acetyl derivative $C_{10}H_7Br(NHAc)$ [187°] needles.

o-Bromo (β) naphthylamine $C_{10}H_7(Br)NH_2$ [1 2] [68°] Got by saponification of the acetyl derivative obtained by bromination of acetyl (β) naphthylamine [181°] Small white needles. Volatile with steam. It is a neutral body. Dilute HNO_3 gives phthalic acid (Meldola, C J 43, 6) When NH_3 is displaced by H (a) bromo naphthalene results (M)

Acetyl derivative $C_{10}H_7BrNH(Ac)$ [135°] Needles (Cosiner, B 14, 59)

Bromo (a) naphthylamine $C_{10}H_7Br(NH_2)$ [1 1' or 4'] [64°] From bromo-nitro naphthalene [122 5°] (Guareschi, A 222, 297) Volatile with steam. Plates (from boiling water). May be sublimed. $KMnO_4$ forms c bromo phthalic acid [165°-172°] — $BHCl$

m Bromo (β)-naphthylamine $C_{10}H_7Br(NH_2)$ [1 3] [72°] From Liebermann's bromo nitro naphthalene by reduction (Meldola, C J 47, 509) Converted into (1, 8) di bromo naphthalene by the diazo reaction.

Acetyl derivative $C_{10}H_7Br(NHAc)$ [187°] needles

p-Bromo-(a)-naphthylamine $C_{10}H_7Br(NH_2)$ [1 4] [94°] From its acetyl derivative and KOH (Rother, B 4, 850, Meldola, B 12, 1961) Needles. On oxidation it gives phthalic acid. By diazo-reaction it gives (a) bromo naphthalene. Br gives di bromo naphthylamine [119°]

Acetyl derivative $C_{10}H_7BrNHAc$ [192°] Prepared by slowly adding HCl to a solution of bromine in $NaOH$ in which is suspended acetyl-(a) naphthylamine. White needles (Prager, B 18, 2159)

Di bromo (a) naphthylamine $C_{10}H_6Br_2(NH_2)$ [3 2' or 3' 1] [102°] From its acetyl derivative. Needles, sol boiling dilute acids. Removal of NH_2 gives di bromo naphthalene [74°] (? [1 1'])

Acetyl derivative $C_{10}H_6Br_2(NHAc)$ [221°] From acetyl (3, 1) bromo naphthylamine and Br (Meldola, C J 47, 514)

Di bromo (a) naphthylamine $C_{10}H_6Br_2(NH_2)$ [1' 3 1] [105°] From its acetyl derivative. Needles. Oxidised by dilute HNO_3 to c bromo phthalic acid [174°] Converted into di bromo naphthalene [74°] by diazo reaction

Acetyl derivative $C_{10}H_6Br_2(NHAc)$ [222°] From bromo naphthylamine [62°] by acetylation and bromination (Meldola, C J 47, 512, C J Proc 1, 173)

Di bromo (a) naphthylamine $C_{10}H_6Br_2(NH_2)$ [1 3 4] [119°] From the acetyl derivative by hot aqueous KOH. Needles, does not combine with acids. Oxidation gives phthalic acid, the diazo reaction gives (1, 3)-di bromo naphthalene

Acetyl derivative $C_{10}H_6Br_2(NHAc)$ [225°] Formed by bromination of acetyl (a)-naphthylamine (Meldola, B 12, 1961)

Di bromo (β) naphthylamine $C_{10}H_6Br_2(NH_2)$ [121°] Long colourless needles. Formed by the action of bromine in acetic acid solution upon (β) naphthalene-azo (β) naphthylamine

Acetyl derivative [208°] (Lawson, B 18, 2424)

Tetra bromo naphthylamine
Acetyl derivative $C_{10}H_4Br_4NHAc$ [138°]. Formed by brominating acetyl (1,2) bromo (β)-naphthylamine in acetic acid solution (Meldola, C J 43, 8) Minute needles (from alcohol). Could not be saponified

BROMO-NAPHTHALENE-DIAMINE.
Acetyl derivative $C_{10}H_6Br(NH_2)(NHAc)$ [2 4 1] [c 222°]. From bromo nitro acetnaphthalide. Is not basic (Meldola, C J 47, 499)

Di bromo-(1' or 4')-naphthylene diamine $C_{10}H_6Br_2(NH_2)_2$. From naphthylene-diamine hydrochloride (from (a)-di nitro naphthalene) and bromine water (Hollemann, Z 1866, 556)

DI-BROMO (a) DINAPHTHYLENE-OXIDE $C_{20}H_{10}Br_2O$ [287°] Light yellow crystals. Sl sol benzene and acetic acid. Prepared by the action of Br on a CS_2 solution of (a)-dinaphthylene-oxide (Knecht a. Unzeitig, B 13, 1725)

Di-bromo (β) dinaphthylene oxide $C_{20}H_{10}Br_2O$ [247°] Yellow needles. Prepared by the action of bromine on a CS_2 solution of (β) dinaphthylene-oxide (K a U)

DI-BROMO-DI-NAPHTHYL-METHANE $C_{20}H_{14}Br_2$ [193°] From di-naphthyl methane and Br (Grabowski, B 7, 1006) Needles (from

alcohol benzene), not affected by boiling alcoholic KOH

BROMO-NICOTINE v NICOTINE

BROMO-*o*-NITRO-ACETOPHENONE

$C_6H_4BrNO_2$ (2:1) $C_6H_4(NO_2)COCH_2Br$ [56°] By bromination of $C_6H_4(NO_2)CO Me$ (Gevekoht, *A* 221, 327) Needles (from benzoline)

Bromo-*m*-nitro acetophenone

[3:1] $C_6H_4(NO_2)COCH_2Br$ Nitro phenyl bromo methyl ketone [96°] Formed by nitrating bromo acetophenone Needles (from dilute alcohol), v sl sol ether Oxidation gives *m* nitro benzoic acid (Hunnius, *B* 10, 2008)

Di-bromo-*o*-nitro acetophenone

$C_6H_3(NO_2)_2COCH_2Br$ [86°] Prepared like the above (G) Attacks the eyes Prisms (from benzoline)

ω -Di-bromo-*m*-nitro acetophenone

$C_6H_3(NO_2)_2COCH_2Br$, *m* Nitro phenyl di bromo methyl ketone [59°] Formed by careful nitration of ω di bromo acetophenone, or by further bromination of ω bromo *m* nitro acetophenone Yellowish tables V sol most solvents (Engler a Hassenkamp, *B* 18, 2240)

BROMO-NITRO- α -AMIDO-BENZOIC ACID

$C_6H_3Br(NO_2)(NH_2)CO_2H$ [1:2:4:5] [272°] Formed by treating nitro isatoic acid at 100° with bromine dissolved in glacial acetic acid (Dorsch, *J pr* [2] 43, 40) Long yellow needles Sol hot water, acetone, alcohol, glacial acetic acid and ether Insol chloroform and benzene

Di-bromo-nitro- α -amido-benzoic acid

$C_6H_2Br_2(NO)(NH_2)CO_2H$ [c 203°] From nitro isatoic acid and bromine in glacial acetic acid at 100° (D) Plates Sol acetone, alcohol and glacial acetic acid, less sol benzene, chloroform, and ether, insol water

Tri bromo nitro- α -amido-benzoic acid

$C_6Br_3(NO_2)(NH_2)(CO_2H)$ [196°] From nitro isatoic acid and bromine (D) Needles (ppd by adding water to its solution in acetone) V sol acetone, alcohol, ether, glacial acetic acid, chloroform and benzene

(3:5:4:1) BROMO NITRO AMIDO PHENYL

ACETIC ACID $C_6H_3(Br)(NO)(NH_2)CH_3CO_2H$ [3:5:4:1] [192°] Prepared by saponification of the acetyl derivative of (3:5:4:1) bromo nitro amido benzyl cyanide (Gabriel, *B* 15, 1994) Long yellow needles Sol hot alcohol, ether and acetic acid, sl sol cold water, benzene, and chloroform

Nitrile

$C_6H_3(Br)(NO_2)(NH_2)CH_2CN$ [3:5:4:1] Bromo nitro amido benzyl cyanide Acetyl derivative [191°] Formed by nitration of the acetyl derivative of (3:4:1) bromo-amido phenyl aceto nitrile (Gabriel, *B* 15, 1992) Slender yellow needles, sol alcohol and acetic acid, sl sol cold water, v sl sol ether and CS₂

BROMO NITRO ANILINE

$C_6H_4Br(NO_2)(NH_2)$ [1:3:6] [104°] Formed by heating $C_6H_4Br_2(NO_2)$ [59°] with alcoholic NH₃ at 190° (Körner, *G* 4, 371) Yellow needles, gives *m* bromo nitro benzene by diazo reaction Br forms di-bromo *p* nitro aniline [208°]

Benzoyl derivative $C_6H_3Br(NO_2)(NHBz)$ [160°] From benzoyl *p* nitro aniline and Br (Johnson, *B* 10, 1709)

Bromo-nitro aniline $C_6H_4Br(NO)(NH_2)$ [1:3:4] [111°] S 014 at 23°, S (alcohol) 10:4

Formation.—1 From nitro *p*-di bromo benzene and alcoholic NH₃ at 165° (K, Meyer a Wurster, *A* 171, 59)—2 By nitrating *p*-bromo aniline in glacial HOAc (Hübner, *A* 209, 357) 3 By the action of alcoholic NH₃ on the methyl derivative of (1,3,4) bromo nitro phenol

Properties.—Orange needles, may be sublimed, scarcely basic Converted by diazo reaction into *m* bromo nitro benzene [56°]

Acetyl derivative $C_6H_3Br(NO_2)(NHAc)$ [103°] Formed by nitrating acetyl-*p* bromo-aniline (H) Ammonia and zinc dust reduce it to $C_6H_4Br(NHAc)N_2$, $C_6H_4Br(NHAc)$ [282°] (Matthiessen a Mixer, *Am* 8, 347)

Benzoyl derivative $C_6H_3Br(NO_2)(NHBz)$ [138°] Formed by nitrating benzoyl *p* bromo-aniline or brominating benzoyl-*o*-nitro aniline (Meinecke, *B* 8, 564, Johnson, *B* 10, 1710)

Bromo nitro aniline

$C_6H_4Br(NO_2)(NH_2)$ [1:2:4] [132°] Formed by nitration of *p* bromaniline dissolved in 10 pts of H₂SO₄ Flat plates V sol alcohol, ether, acetic acid, and chloroform, v sol water By further bromination it yields tri bromo nitraniline [103°] (Nolting a Collin, *B* 17, 266)

Bromo nitro aniline

$C_6H_3Br(NO_2)(NH_2)$ [1:4:5] [151°] Formed by the action of alcoholic NH₃ upon (1,5,4) di-bromo nitro benzene [62°] or on (1,4,5) bromo di nitro benzene [56°] (K, Wurster, *B* 6, 1542) Orange needles Gives by diazo reaction *p* bromo nitro benzene Is not basic Dilute HNO₃ (S G 1:38) slowly forms bromo di nitro phenol [81°]

Bromo di nitro aniline

$C_6H_3Br(NO_2)_2(NH_2)$ [1:3:5:6] [154°] (L), [144°] (K) Formed by brominating di nitro aniline (K), or by heating di nitro methyl aniline with HOAc and Br (Leymann, *B* 15, 1234) Yellow needles Converted by boiling KOH into bromo di nitro phenol [118°]

Bromo di nitro aniline $C_6H_3Br(NO_2)_2(NH_2)$

[160°] From di bromo di nitro benzene [100°] and alcoholic NH₃ at 100° (Austen, *B* 9, 919) Orange scales

Bromo di nitro aniline $C_6H_3Br(NO_2)_2(NH_2)$

[178°] From di bromo di nitro benzene [117°] and alcoholic NH₃ (K)

Bromo di nitro-aniline *Benzoyl derivative* $C_6H_3Br(NO_2)_2(NHBz)$ [1:3:5:4] [221°] Small needles, formed by nitrating benzoyl bromo nitro aniline $C_6H_4Br(NO_2)(NHBz)$ [1:3:4], or benzoyl di bromo aniline (Johnson, *B* 10, 1710)

Bromo di nitro aniline *Benzoyl derivative* $C_6H_3Br(NO_2)_2(NHBz)$ [196°] Formed by nitrating benzoyl *p* bromo aniline (Meinecke, *B* 8, 564), is probably identical with the preceding

Di bromo nitro-aniline $C_6H_3Br_2(NO_2)(NH_2)$ [75°] From di bromo di nitro-benzene [159°] and alcoholic NH₃ at 100° (Austen, *B* 9, 622) Red needles

Di bromo-*o*-nitro aniline $C_6H_3Br_2(NO_2)(NH_2)$ [1:3:5:6] [127°] (Hentschel, *J pr* [2] 34, 426)

Formation.—1 By brominating *o*-nitro aniline or (1,3,4) bromo nitro aniline—2 By the action of alcoholic NH₃ on (1,3,4,5) tri-bromo-nitro benzene or the methyl ether of (1,3,5,6)-di-bromo nitro-phenol (K)

Properties.—Orange needles

Acetyl derivative $C_6H_3Br_2(NO_2)(NHAc)$

[209°] From acetyl di bromo aniline by nitration. Needles, v sol alkalis (Remmers, *B* 7, 848)

Benzoyl derivative $C_6H_4Br_2(NO_2)(NHBz)$ [1356]? [195°] Formed by brominating benzoyl *o* nitro aniline (Johnson, *B* 10, 1710) Yellow needles

Di bromo *p* nitro aniline $C_6H_4Br_2(NO_2)(NH_2)$ [1352] [207°] (L), [203°] (K)

Formation—1 By brominating *p* nitro aniline or (1,3,6) bromo nitro aniline—2 By the action of alcoholic NH_3 on tri bromo nitro benzene [112°] or the methyl ether of (1,3,5,2) di bromo nitro phenol (K)—3 From tri bromo aniline in $HOAc$ by warming with conc HNO_3 for a short time (Losanitsch, *B* 15, 474)

Properties—Thin yellow needles Displacement of NH_3 by Hg gives tri bromo benzene [112°]

Tri bromo nitro aniline $C_6HBr_3(NO_2)(NH_2)$ [13546] [103°] From *m* nitro aniline and bromine vapour (K), or from (1,2,4) bromo nitro aniline and Br in $HOAc$ (Nolling a Collin, *B* 17, 266) Pale greenish yellow needles in stellate groups, v sol alcohol Converted by diazo reaction into (1,3,5,4) tri bromo nitro benzene

Tri bromo nitro aniline $C_6HBr_3(NO_2)(NH_2)$ [13546]? [215°] From its acetyl derivative (Remmers, *B* 7, 351) Flat yellow needles, sl sol alcohol This body might be expected to be identical with the preceding

Acetyl derivative $C_6HBr_3(NO_2)(NHAc)$ [239°] From acetyl (1,3,5,6) tri bromo aniline (H) Needles

Di-acetyl derivative $C_6HBr_3(NO_2)(NAc_2)$ Formed by nitrating di acetyl tri bromo aniline

Tri-bromo nitro-aniline $C_6HBr_3(NO_2)(NH_2)$ [12356] [161°] From (1,2,4) bromo nitro aniline [151°] and bromine vapour (K), Lemon-yellow needles (from alcohol) Converted by diazo reaction into (1,2,3,5) tri-bromo nitro-benzene [112°]

BROMO NITRO ANTHRAQUINONE

$C_{14}H_7(NO_2)(Br)O_2$ [261° uncor] Prepared by nitration of tetra bromo anthracene Whiteneedles Sublimable Sol acetic acid, sl sol alcohol, ether, and chloroform On reduction it gives amido anthraquinone (Claus a Hertel, *B* 14, 980)

Bromo di-nitro-anthraquinone

$C_{14}H_5Br(NO_2)_2O_2$ [218° uncor] Prepared by nitration of tri bromo anthracene with a mixture of fuming HNO_3 and fuming H_2SO_4 Yellow needles Sol benzene, chloroform, and acetic acid, m sol alcohol and ether (Claus a. Diernfellner, *B* 14, 1333)

Di bromo nitro-anthraquinone

$C_{14}H_3Br_2(NO_2)_2O_2$ [245° uncor] Prepared by nitration of tetra bromo anthracene Sublimable. Fine yellow needles V sol hot acetic acid, less in alcohol and ether On reduction with sodium amalgam it gives amido anthraquinone

Di-bromo di-nitro anthraquinone

$C_{14}HBr_2(NO_2)_2O_2$ [239° uncor] Prepared by nitration of tetra bromo anthracene with a mixture of fuming H_2SO_4 and fuming HNO_3 Needles Sol acetic acid, benzene and chloroform, sl sol alcohol and ether (C a D)

Tetra-bromo di-nitro-anthraquinone

$C_{14}H_2(NO_2)_2Br_4O_2$ [105°] Prepared by nitration of dibromo anthracene-tetrabromide Sol alcohol, ether, benzene, and acetic acid. Not

sublimable On reduction it gives (a) diamido-anthraquinone (Claus a Hertel, *B* 14, 981)

p BROMO-*o* NITRO-BENZALDOXIM

$C_6H_4N_2O_2Br$ is [241] $C_6H_4(NO_2)(Br)(CHNOH)$ [163°] Prepared by heating *o* nitro *p* diazo benzaldoxim with HBr (Gabriel a Meyer, *B* 14, 827) Fine needles Sol alcohol, ether, acetic acid, and hot benzene

o BROMO NITRO BENZENE $C_6H_4Br(NO_2)$

[12] Mol. w 202 [41°] (F a M), [43°] (K) (261° i V) Formed, together with a much larger quantity of the *p* isomeride, by nitrating bromo benzene (Habner a Alsberg, *A* 156, 316, *Z* [2] 6, 369, Walker a Zincke, *B* 5, 114, Fittig a Mager, *B* 7, 1179) Yellow needles, more sol alcohol than the *p* isomeride

Reactions—1 $SnCl_4$ reduces it to *o* bromo aniline—2 Alcoholic NH_3 at 190° gives *o* nitro aniline (W a Z)—3 HNO_3 gives bromo di nitro-benzene [72°]—4 KCN and alcohol at 190° gives C_6H_4BrCN —5 Heating with KOH aq gives *o* bromo phenol

m Bromo-nitro benzene $C_6H_4Br(NO_2)$ [13] [56°] (257° i V)

Formation—1 From *m* nitro aniline by the diazo reaction (Griess, *T* 1864 [3] 712)—2 From (1, 3, 4) bromo nitro aniline (Wurster, *B* 6, 1543, 7 416)—3 From nitro benzene (10 g), $FeCl_3$ (1 g), bromine (13 g) in sealed tubes for 12 hours at 70° (Scheufelen, *A* 231, 165) The yield is 80 p c of the theoretical—4 By the action of a hot solution of cuprous bromide upon *m* nitro diazo benzene sulphate (from *m* nitraniline) (Sandmeyer, *B* 18, 1495)

Properties—Yellow trimetric plates Not attacked by KOH aq or alcoholic NH_3

p Bromo nitro benzene $C_6H_4Br(NO_2)$ [14] [126°] (256° i V)

Formation—1 The chief product obtained by dissolving bromo benzene in fuming HNO_3 (Couper, *A* 104, 226)—2 From *p* nitro aniline by the diazo reaction—3 From bromo nitro aniline [151°]—4 From bromo benzene *p* sul phonic acid and HNO_3 (Spiegelberg, *A* 197, 257) 5 Formed by the action of preprecipitated Cu_2O (1 mol) upon *p* bromo diazo benzene nitrite (1 mol) obtained by adding slowly a solution of 15 g of $NaNO_2$ in 50 cc of water to a mixture of 17 g of *p*-bromo aniline, 20 g HNO_3 (14), and 50 cc of water The yield is small (Sandmeyer, *B* 20, 1496)

Properties—Long white needles, sl sol $HOEt$

Reactions.—1 Resembles *o* nitro aniline in reactions 1 and 2—2 Alcoholic KCN at 190° gives *m* bromo benzonitrile (Bichter, *B* 4, 462) 3 Br at 250° gives *p* di-, *u*-tri-, and *s* tetra-bromo benzenes (Ador a Rilhet, *J* 1876, 370)

Bromo di nitro benzene $C_6H_3Br(NO_2)_2$ [134]

[59°] From *m* bromo nitro benzene, HNO_3 and H_2SO_4 (Körner, *J* 1875, 832) Monoclinic plates (from ether alcohol) Alcoholic NH_3 at 180° forms $C_6H_3Br(NO_2)_2(NH_2)$ [143] [151°] Boiling $NaOH$ aq (S G 1185) gives $C_6H_3Br(NO_2)(OH)$ [143] and a little $C_6H_3Br(NO_2)_2(OH)$ [134] (Lauenbenheimer, *B* 11, 1159)

Bromo-di-nitro-benzene $C_6H_3Br(NO_2)_2$ [124]

[72°] From bromo benzene, fuming HNO_3 , and H_2SO_4 in the cold (Kekulé, *A* 187, 167, Spiegelberg, *A* 197, 257) Large yellow prisms Alcoholic NH_3 forms di nitro aniline. KOH aq forms di nitro phenol [114°] Sn and HCl gives *is*

benylene diamine (Zincke & Sintenis, *B* 5, 791) crystallises with benzene as $(C_6H_4Br(NO_2))_2 \cdot C_6H_6$ [35°]

Bromo-di nitro benzene $C_6H_3Br(NO_2)_2$ [87°] *n*-bromo di nitro benzene [158°] is treated with alcoholic NH_3 at 100° and in the resulting $C_6H_3Br(NO_2)_2(NH_2)$ hydrogen is substituted for H_2 by the diazo reaction (Austen, *B* 8, 1183) [not affected by alcoholic NH_3]

Di bromo nitro benzene $C_6H_4Br_2(NO_2)$ [1 2 4] fol w 281 [59°] From *o* di bromo benzene and HNO_3 (Riese, *A* 164, 179) Monoclinic (Groth & Bodewig, *B* 7, 1563) May be reduced to di bromo aniline [80°]

Di-bromo-nitro benzene $C_6H_3Br_2(NO_2)$ [1 3 4] 32° Formed by nitrating *m* di bromo benzene (Meyer & Stuber, *A* 165, 176) Trichlinic prisms (by sublimation, *G* & *B*), volatile with steam Converted by alcoholic NH_3 at 190° into (1,4,3) bromo nitro aniline Reduction gives (1,3,4) di bromo aniline Alcoholic KCN at 250° gives the nitrile of di bromo benzoic acid [209°] (*R*)

Di bromo nitro benzene $C_6H_4Br_2(NO_2)$ [1 3 2] 33° Separates from the alcoholic mother liquors from which the preceding has crystallised Prisms or laminae Alcoholic NH_3 at 90° gives nitro *m* phenylene diamine (Körner, *A* 4, 360)

Di bromo nitro benzene $C_6H_3Br_2(NO_2)$ [1 4 5] 35° *From *p* di nitro benzene by nitration (Riche & Bérard, *A* 133, 51) From *m* bromo nitro benzene (14 g), Br_2 (11.2 g), and $FeCl_3$ (g) at 80° for 12 hours (Scheufelen, *A* 231, 69) Yellowish green tablets (from ether-alcohol) Alcoholic NH_3 at 210° gives (1,3,4) bromo nitro aniline Sn and HCl gives *p* di bromo aniline [51°] Alcoholic KCN gives the nitrile of di bromo benzoic acid [152°]

Di bromo nitro benzene $C_6H_3Br_2(NO_2)$ [1 3 5] 105° From (1,5,3,6) or (1,5,3,2) di bromo nitro aniline by diazo reaction (Körner) Prisms or tablets (from ether) May be reduced to di bromo aniline [57°]

Di bromo di nitro benzene $C_6H_2Br_2(NO_2)_2$ [17°] Formed by nitrating *m*-di bromo benzene (Körner) Greenish yellow needles, volatile with steam Heating with KOH gives bromo di nitro phenol [92°]

Di bromo di nitro benzene $C_6H_2Br_2(NO_2)_2$ 58° Formed by nitrating *o* di bromo benzene (Austen, *B* 8, 1182) Prisms (from $HOAc$) By displacement of Br by NH_2 and H successively it may be converted into bromo di nitro benzene [87°]

Di bromo di nitro benzene $C_6H_2Br_2(NO_2)_2$ [20°] Formed in small quantities in the preparation of the preceding body (*A*)

Di bromo di nitro benzene $C_6H_2Br_2(NO_2)_2$ 159° Formed by nitrating *p* di bromo benzene (Austen, *B* 9, 621) Small needles Alcoholic H_2 forms di bromo nitro aniline [75°]

Di bromo di nitro benzene $C_6H_2Br_2(NO_2)_2$ [1 4 2 6] [100°] Formed in reparing the preceding (*A*) Alcoholic NH_3 converts it into bromo-di nitro aniline [160°]

Tri-bromo-nitro benzene $C_6H_3Br_3(NO_2)$ [1 8 4 6] Mol w 360 [94°] Formed by nitrating *u*-tri bromo-benzene (Mayer, *A* 137, 36) Pale yellowish green needles (from alcohol) Alcoholic NH_3 gives bromo nitro *p*-benylene diamine.

Tri-bromo nitro benzene

$C_6H_3Br_3(NO_2)$ [1 2 3 5] [112°] From (1,5,3,6) di bromo nitro-aniline [208°] by displacing NH_2 by Br , or from (1,2,3,5,4) tri-bromo nitro-aniline by displacing NH_2 by H (Körner) Trichlinic crystals, $a b c = 1.005 \times 1.4823$ (La Valle, *G* 10, 1) Reduction gives tri bromo-aniline Alcoholic NH_3 gives di bromo nitro aniline [203°]

Tri bromo nitro benzene

$C_6H_3Br_3(NO_2)$ [1 2 4 6] [120°] From (2,4,6,1) di bromo nitro aniline by diazo reaction (Körner) Needles (from $HOAc$) Alcoholic NH_3 gives the parent di bromo nitro aniline

Tri bromo nitro benzene

$C_6H_3Br_3(NO_2)$ [1 3 5 2] [125°] (177°) at 11 mm Prepared by nitration of *s* tri bromo benzene with HNO_3 (1.5) (Wurster & Beran, *B* 12, 1821, cf *C* L Jackson, *B* 8, 1172) Formed also by diazo reaction from (1,3,5,2,4) tri bromo nitro aniline (Körner, *G* 4, 422) Monoclinic prisms $a b c = 6518 \times 1.8695$, $\eta = 99.46^\circ$ (Panbianco, *G* 9, 354) Tin and HCl reduce it to ordinary tri-bromo aniline Alcoholic NH_3 at 170° gives (1,4,3,5) bromo nitro phenylene diamine

Tri bromo nitro benzene

$C_6H_3Br_3(NO_2)$ [1 3 4 2] [above 187°] Formed in small quantity in preparing the isomeride [94°] Sublimes at 187°

Tri bromo di nitro benzene

$C_6H_2Br_3(NO_2)_2$ [1 2 4 3 5°] [135°] Formed by nitrating the preceding body (Mayer) Trichlinic crystals, $a b c = 455 \times 1.457$ (Panbianco, *G* 9, 355) Alcoholic NH_3 gives bromo-di nitro-phenylene diamine

Tri bromo di nitro benzene

$C_6H_2Br_3(NO_2)_2$ [1 3 5 2 6] [192°] Glistening needles Prepared by nitration of *s* tri bromo benzene with HNO_3 and H_2SO_4 (Wurster & Beran, *B* 12, 1821)

Tetra bromo nitro benzene

$C_6H_2Br_4(NO_2)$ [1 3 4 5 6] [96° after several fusions] Slender needles, [60°] (from alcohol) From *u* tetra bromo benzene by nitration Formed also by heating $C_6(NO_2)Br_3SO_3H$ with HCl (V v Richter, *B* 8, 1427, Langfurth, *A* 191, 202)

Penta bromo nitro-benzene

$C_6Br_5(NO_2)$ [228°] From *u* tetra bromo benzene and fuming HNO_3 (*R*) Monoclinic prisms (from benzene)

BROMO-NITRO-BENZENE SULPHONIC

ACID $C_6H_3Br(NO_2)(SO_3H)$ [1 4 2] [130°-135°] From bromo benzene *o* sulphonic acid and conc HNO_3 (Bahlmann, *A* 186, 315) From *p* bromo-nitro benzene and fuming H_2SO_4 (Augustin & Post, *B* 8, 1559) Flat yellow columns, *v* e sol water Reduction gives amido benzene *o*-sulphonic acid, exchange of NO_2 for Br gives *p* di bromo benzene sulphonic acid— AgA' — $BaA', 5aq$ *S* (of BaA') 5.3 at 16°— $CaA', 4aq$ — $CaA', 6\frac{1}{2}aq$ (*A* & *P*)— KA' — NaA' — NH_4A' $PbA', 5aq$ — $ZnA', 7aq$

Chloride $C_6H_3Br(NO_2)(SO_2Cl)$ [92°], tables. **Amide** $C_6H_3Br(NO_2)(SO_2NH_2)$ [205°]

Bromo nitro benzene sulphonic acid

$C_6H_3Br(NO_2)(SO_3H)$ [1 6 2] Formed in small quantity in preparing the above by nitrating bromo benzene *o* sulphonic acid (*B*)— BaA' —*S* 156 at 8°— KA'

Chloride $C_6H_3Br(NO_2)(SO_2Cl)$ [97°], tables. **Amide** $C_6H_3Br(NO_2)(SO_2NH_2)$ [215°]

Bromo-nitro-benzene-sulphonic acid

$C_6H_4Br(NO_2)(SO_3H)$ [1 3 6] Formed by heating nitro-diazo benzene sulphonic acid (1 3 6) with HBr (Lumprecht, *B* 18, 2186)

Chloride [75°], large yellow tables

Amide [166°], small white tables

Bromo-nitro-benzene sulphonic acid

$C_6H_4Br(NO_2)(SO_3H)$ [1 4 3] Formed by nitration bromo benzene *m* sulphonic acid (Berndsen, *A* 177, 95, Thomas, *A* 186, 124) Reduced to amido benzene *o* sulphonic acid Exchange of NO_2 for Br gives *p* di bromo benzene sulphonic acid— $AgA', 1\frac{1}{2}aq$ — $BaA', 3aq$ *S* 2 4 at 7°— $CaA', 6aq$ — KA — NH_4A' — $PbA', 3aq$

Chloride $C_6H_4Br(NO_2)(SO_2Cl)$ [83°]

Amide $C_6H_4Br(NO_2)(SO_2NH_2)$ [170°]

Bromo nitro benzene sulphonic acid

$C_6H_4Br(NO_2)(SO_3H)$ [1 2 4] Formed by nitration bromo benzene *p* sulphonic acid (Goshich, *A* 180, 93, Lumprecht, *B* 8, 456) Formed also by sulphonating *o* bromo nitro benzene (*A* & *P*, Andrews, *B* 13, 2127) Reduction by HI at 120° gives amido benzene *m* sulphonic acid— BaA', aq *S* (of BaA'_2) 1 71 at 15° (*A*)— $BaA', 1\frac{1}{2}aq$ *S* (of BaA'_2) 1 46 at 9° (*G*)— $CaA'_2, 2aq$ (*A* & *P*)— $CaA'_2, 2\frac{1}{2}aq$ *S* (of CaA'_2) 4 71 at 9° (*G*)— $CuA', 9\frac{1}{2}aq$ — KA' *S* 1 02 at 9° (*G*)— NH_4A' *S* 5 96 at 9°— $PbA'_2, 2aq$ — $ZnA'_2, 2aq$

Chloride $C_6H_4Br(NO_2)(SO_2Cl)$ [40°–50°] (*A*), [57°] (*G*)

Amide $C_6H_4Br(NO_2)(SO_2NH_2)$ [177°], plates

Bromo nitro benzene di sulphonic acid

$C_6H_3Br(NO_2)(SO_3H)_2$ From nitro benzene *m* sulphonic acid *via* di nitro benzene di sulphonic acid and amido nitro benzene disulphonic acid (Lumprecht, *B* 8, 289) Trimetric tables (containing *aq*)

Di bromo-nitro benzene sulphonic acid

$C_6H_3Br_2(NO_2)(SO_3H)$ [1 2 4 6] From *o* di-bromo benzene sulphonic acid and fuming HNO_3 (Goshich, *A* 186, 152) Reduction gives di bromo-aniline sulphonic acid— $BaA', 3aq$ *S* 9 at 7°— $CaA', 4aq$ — $CaA', 6aq$ — KA' — NH_4A' — $PbA'_2, 3aq$ *S* 8 at 11°

Chloride $C_6H_3Br_2(NO_2)(SO_2Cl)$ [99°]

Amide $C_6H_3Br_2(NO_2)(SO_2NH_2)$ [211°]

Di bromo nitro benzene sulphonic acid

$C_6H_3Br_2(NO_2)(SO_3H)$ [1 4 3? 5] From (1,4,5)-di-bromo benzene sulphonic acid and HNO_3 (Borns, *A* 187, 358, Hubner & Williams, *A* 167, 121) Hygroscopic prisms which blacken at 100°— BaA', aq — $BaA', 1\frac{1}{2}aq$ — $BaA', 2\frac{1}{2}aq$ — $BaA', 6aq$ — $BaA', 9aq$ — $CaA', 3aq$ — CuA', aq — KA', aq — $KA', 2\frac{1}{2}aq$ — $NH_4A', \frac{1}{2}aq$ — $PbA'_2, 2aq$ — $PbA'_2, 3aq$ *S* 10 3 at 10°

Chloride $C_6H_3Br_2(NO_2)(SO_2Cl)$ Oil (?)

Amide $C_6H_3Br_2(NO_2)(SO_2NH_2)$ [178°]

Di-bromo nitro benzene sulphonic acid

$C_6H_3Br_2(NO_2)(SO_3H)$ [1 3 4 5] From *s* di-bromo benzene sulphonic acid and HNO_3 (Lenz, *A* 181, 82) Tablets (containing *aq*), not hygroscopic By exchanging NO_2 for Br it is converted into (1,3,4,5) tri bromo benzene sulphonic acid— $BaA', 1\frac{1}{2}aq$ *S* 73 at 20°— $BaA'_2, 4aq$ — $CaA'_2, 3aq$ — KA', aq *S* 1 09 at 20°— NH_4A' — $PbA'_2, 5aq$ *S* 120 at 20°

Chloride $C_6H_3Br_2(NO_2)(SO_2Cl)$ [121°]

Amide $C_6H_3Br_2(NO_2)(SO_2NH_2)$ Blackens at 300°.

Di-bromo-nitro benzene sulphonic acid

$C_6H_3Br_2(NO_2)SO_3H$ [1 3 4 6] [above 200°] Formed by nitrating $C_6H_3Br_2SO_3H$ [1 8 4] (Bassmann, *A* 191, 235) Deliquescent needles or prisms (containing *aq*)— KA' *S* 1 4 at 21 5°— BaA'_2, aq *S* (of BaA'_2) 1 06 at 24°— $CaA'_2, 6aq$ — $PbA'_2, 4aq$ *S* (of BaA'_2) 1 16 at 24°— $CaA'_2, 6aq$ — $PbA'_2, 4aq$ *S* (of BaA'_2) 1 16 at 24°

Chloride $C_6H_3Br_2(NO_2)SO_2Cl$ [115 5°]

Amide $C_6H_3Br_2(NO_2)SO_2NH_2$ Minute tablets Not melted at 240°

Tri-bromo nitro benzene sulphonic acid

$C_6H_2Br_3(NO_2)SO_3H$ [1 3 5 2 6] [*c* 100°] Formed by nitrating $C_6H_2Br_3SO_3H$ (Langfurth, *A* 191, 196, Reinke, *A* 186, 282, Bassmann, *A* 191, 216) Hygroscopic, monoclinic prisms Conc HCl at 180° gives H_2SO_4 and $C_6H_2Br_3(NO_2)$ [125°]— KA' *S* 76 at 5° (*B*), 133 at 11° (*L*)— BaA'_2, aq *S* (of BaA'_2) 207 at 15° (*B*), 331 at 15° (*L*) $BaA'_2, 1\frac{1}{2}aq$ — $CaA'_2, 2aq$ — $PbA'_2, 9aq$ *S* (of PbA'_2) 63 at 7° (*B*), 93 at 10° (*L*)— $PbA'_2, 1\frac{1}{2}aq$ — $PbA'_2, PbO 7aq$ — $PbA'_2, PbO 6aq$ — NH_4A'

Chloride $C_6H_2Br_3(NO_2)SO_2Cl$ [145°]

Amide $C_6H_2Br_3(NO_2)SO_2NH_2$

Tri bromo nitro benzene sulphonic acid

$C_6H_2Br_3(NO_2)(SO_3H)$ [1 2 3 4 5] From (1,2,3,5) tri bromo benzene sulphonic acid by nitration (Lumprecht & Lenz, *B* 8, 1072, 1432, *A* 181, 41) Lammns— $BaA'_2, 4aq$, *S* 0 74 at 18°— $CaA', 3aq$ *S* 1 05 at 20°— KA', aq *S* 16 at 18°— NH_4A', aq — PbA'_2, aq *S* 1 4 at 20°

Chloride $C_6H_2Br_3(NO_2)(SO_2Cl)$ [116°]

Amide $C_6H_2Br_3(NO_2)(SO_2NH_2)$ [202°]

Tri bromo nitro benzene sulphonic acid

$C_6H_2Br_3(NO_2)(SO_3H)$ [1 3 4 2 6] [125°] or, anhydrous, [141°] From (1,2,4,5) tri bromo benzene sulphonic acid and HNO_3 (Spiegelberg, *A* 197, 284) columns (containing *aq*)— AgA', aq *S* (of AgA'_2) 45 at 7°— $BaA'_2, 8aq$ *S* (of BaA'_2) 669 at 9°— $CaA', 4\frac{1}{2}aq$ *S* (of CaA'_2) 1 95 at 8°— KA' *S* 1 19 at 8°— NH_4A' *S* 1 68 at 6 5°— $PbA'_2, 6aq$ *S* (of PbA'_2) 853 at 7°

Chloride $C_6H_2Br_3(NO_2)(SO_2Cl)$ [143°]

Amide $C_6H_2Br_3(NO_2)(SO_2NH_2)$ Blackens at 250°

Tri bromo di nitro benzene sulphonic acid

$C_6H_2Br_3(NO_2)_2SO_3H$ [1 3 5 2 4 6] [216°] From $C_6H_2Br_3SO_3H$ and conc HNO_3 at 100° (Bassmann, *A* 191, 239) Colourless columns (containing *aq*) Not hygroscopic, but *v* sol water, sol alcohol.—With water at 230° it gives $C_6H_2Br_3(NO_2)_2$ and H_2SO_4 Reduced by Sn and HCl to $C_6H_2Br_3(NH_2)_2SO_3H$ — NH_4A', aq — KA', aq *S* (of KA'_2) 48 at 24°— $BaA'_2, 9aq$ *S* (of BaA'_2) 83 at 21°— $CaA'_2, 7\frac{1}{2}aq$ — $PbA'_2, 9aq$ *S* (of PbA'_2) 1 02 at 19 5°

Chloride $C_6H_2Br_3(NO_2)_2SO_2Cl$ [203°]

Amide $C_6H_2Br_3(NO_2)_2SO_2NH_2$ [260°]

Tetra bromo nitro-benzene sulphonic acid

$C_6HBr_4(NO_2)SO_3H$ [1 2 3 5 4 6] Got by nitrating $C_6HBr_4SO_3H$ Crusts of needles (containing *aq*) *V* sol alcohol and water (Beckurts, *A* 181, 220, Langfurth, *A* 191, 202) With conc HCl at 200° it gives $C_6HBr_4(NO_2)$ and H_2SO_4 — $KA', 1\frac{1}{2}aq$ *S* (of KA'_2) 57 at 10 5°— $BaA'_2, 9aq$ *S* (of BaA'_2) 36 at 11° (*B*), 100 at 14 5° (*L*)— NH_4A', aq *S* (of $NH_4A'_2$) 1 01 at 11°— $CaA'_2, 8aq$ *S* (of CaA'_2) 16 at 6°— $PbA'_2, 9aq$ *S* (of PbA'_2) 06 at 6°

Chloride $C_6HBr_4(NO_2)SO_2Cl$ [147 5°], tablets.

Amide crystalline powder

Tetra-bromo nitro benzene sulphonic acid
 $C_6Br_4(NO_2)SO_3H$ [1 2 3 4 5 6] [173°] From *c*-tetra bromo benzene sulphonic acid and HNO_3 (Spiegelberg, *A* 197, 297) Slender needles (containing aq) — $BaA'_2, 4aq$ S (of BaA'_2) 22 at 12° — $BaA'_2, 9aq$ — CaA'_2, aq S (of CaA'_2) 2 8 at 13° — KA' aq S (of KA') 17 at 11° — NH_4A' S 46 at 11° — $PbA'_2, 2aq$ S 0 42 at 11°

Chloride $C_6Br_4(NO_2)(SO_2Cl)$ [173°], prisms

Amide $C_6Br_4(NO_2)(SO_2NH_2)$ Blackens at 260°

BROMO NITRO BENZOIC ACID

$C_6H_4Br(NO_2)CO_2H$ [1 4 3] [141°] Formed, together with the isomeride [250°] by nitrating *m* bromo benzoic acid (Hubner & Ohly, *Z* [2] 1, 547, 2, 241, *A* 143, 230, 222, 102) Monoclinic prisms — NaA' 3aq — $NaA'_2, 4aq$ — KA' 2aq — $BaA'_2, 4aq$ — $MgA'_2, 4aq$ — PbA'_2 — CuA'_2 — AgA'

Ethyl ether EtA' [55°], monoclinic prisms

Bromo nitro benzoic acid $C_6H_4Br(NO_2)CO_2H$ [1 3 5] [161°] S 057 at 11° Formed from $C_6H_4(NH_2)(NO_2)CO_2H$, glacial acetic acid, HBr (*S* G 1 49), and nitrous acid gas (Hesemann & Kohler, *A* 222, 166) Long needles (from water, benzene, ether, or CS_2), whetstone shaped crystals (from glacial acetic acid) or thin six-sided plates (from alcohol) — KA' 4aq — $BaA'_2, 5\frac{1}{2}aq$ — CaA'_2, aq — MgA'_2, aq — $ZnA'_2, 4\frac{1}{2}aq$ — $CdA'_2, 4\frac{1}{2}aq$ — SrA'_2 — AgA' — PbA'_2

Bromo nitro benzoic acid $C_6H_4Br(NO_2)CO_2H$ [1 3 6] [164°] Formed by oxidation of $C_6H_4Br(NO_2)Me$ by dilute HNO_3 (Scheufelen, *A* 231, 173) V sol ether and dilute alcohol Sl sol water Reduced by Sn and HCl to *m* bromo aniline, CO_2 going off — AgA'

Bromo nitro benzoic acid $C_6H_4Br(NO_2)(CO_2H)$ [1 4 6] [180°] From $C_6H_4MeBr(NO_2)$ [1 2 5] and dilute HNO_3 (Scheufelen, *A* 231, 181) or by nitrating *o* bromo benzoic acid (Burghard, *B* 8, 560) Almost insol cold water, sl sol hot water, v sol ether and dilute alcohol Alcoholic NH_3 at 130° gives *p* nitro aniline and (1, 4, 6) amido nitro benzoic acid — $BaA'_2, 5\frac{1}{2}aq$

Ethyl ether EtA' [66°], needles

Bromo nitro benzoic acid

$C_6H_4Br(NO_2)CO_2H$ [1 2 4] [199°] Formed by nitration of *p* bromo benzoic acid [248°] (Hubner, *A* 143, 248, Ravelli, *A* 222, 177) and by oxidation of the corresponding bromo nitro toluene (Scheufelen, *A* 231, 183) Long needles (from water) or plates (from dilute alcohol), v sol ether, sl sol water Reduction gives *m* amido benzoic acid

Salts — AgA' — $BaA'_2, 4aq$ — $MgA'_2, 6aq$

Ethyl ether EtA' [74°], prisms

Bromo nitro benzoic acid

$C_6H_4Br(NO_2)CO_2H$ [1 2 3] [250°] From *m* bromo benzoic acid by nitration Separated from its isomeride [141°] by being less soluble in water (Hubner, *A* 143, 234, *A* 222, 101) Monoclinic octahedra (from ether) — NaA' aq — $BaA'_2, 4aq$ — $MgA'_2, 6aq$

Ethyl ether EtA' [80°], prisms

Di bromo-nitro benzoic acid

$C_6H_3Br_2(NO_2)CO_2H$ [3 4 2or6 1] [162°] From di bromo benzoic acid [230°] by nitration (E F Smith, *A* 222, 188) Colourless needles, reduction gives anthranilic acid

Salts — PbA'_2 — $NaA'_2, 3aq$ — KA' — BaA'_2, aq — $CaA'_2, 3\frac{1}{2}aq$ — MgA'_2

Di-bromo-nitro benzoic acid

$C_6H_3Br_2(NO_2)(CO_2H)$ [162°] Formed by nitrating the di bromo benzoic acid [223°–227°] obtained by brominating benzoic acid (Angerstein, *A* 158, 13) Needles (from water) Reduction gives di bromo-amido-benzoic acid [196°] and then anthranilic acid — NaA' 3aq — $BaA'_2, 2aq$ This acid is perhaps identical with the preceding

Di-bromo nitro benzoic acid

$C_6H_3Br_2(NO_2)CO_2H$ [3 5 2 1] [233°] Formed by nitration of $C_6H_3Br_2CO_2H$ (Hesemann & Kohler, *A* 222, 178) Long colourless needles, may be sublimed — $BaA'_2, 4aq$ — CaA'_2 — AgA' — KA'

BROMO NITRO o BENZYL-PHENOL

$C_6H_4BrNO_2$ [105°–110°] From potassium nitro *o* benzyl phenol sulphonic acid and Br (Rennie, *C J* 49, 410) Yellow scales (from alcohol) — KA'

Bromo nitro *p* benzyl phenol

$PhCH_2C_6H_4Br(NO_2)OH$ [1 3 5 4] [65°]

Formation — 1 From potassium bromo benzyl phenol sulphinate and dilute HNO_3 , (11) (Rennie, *C J* 41, 223) — 2 From potassium nitro-benzyl phenol sulphinate, $C_6H_5O_2$, and Br — 3 From nitro benzyl phenol, $C_6H_5O_2$, and Br — 4 From benzyl phenol by first brominating and then nitrating

Properties — Crystalline scales (from alcohol) — KA' Red scales HNO_3 oxidises it to bromo-di nitro phenol, $C_6H_3Br_2(NO_2)_2OH$ [1 2 3 5] [118°]

BROMO NITRO BUTANE $C_4H_9BrNO_2$

$C_4H_9Br(NO_2)$ (181° cor) From nitro butane, potash, and Br (Zublin, *B* 10, 2085) The three following compounds are prepared in a similar way (*Z*)

Di bromo nitro butane $C_4H_8Br_2(NO_2)$ (204° cor)

Bromo-di nitro butane $C_4H_7Br(NO_2)_2$ Not volatile

Bromo di nitro iso butane

$(CH_3)_2CHCHBr(NO_2)_2$ [38°] Solid resembling camphor Volatile with steam Readily decomposed by alkalis forming dimethyl isobutane

BROMO m NITRO CINNAMIC ACID

[3 1] $C_6H_4(NO_2)C_6H_4BrCO_2H$ [212°] Formed by heating the dibromide of *m* nitro benzylidene-maleonic acid (Stuart, *C J* 49, 361)

Bromo *p* nitro cinnamic acid

[4 1] $C_6H_4(NO_2)C_6H_4BrCO_2H$ [146°] V sol alcohol, ether, chloroform Sl sol hot CS_2 More sol in cold water than its isomeride [205°]

Salt — BaA'_2 Boiled with water gives nitro-phenyl acetylene, CO_2 and $BaBr_2$

Ethyl ether EtA' [63°] Prisms From $C_6H_4(NO_2)CHBrCHBrCO_2Et$ and alcoholic KOH (C L Muller, *A* 212, 131)

Bromo *p* nitro cinnamic acid

[4 1] $C_6H_4(NO_2)C_6H_4BrCO_2H$ [205°] Slender silky needles (from water) Sl sol cold water, insol cold CS_2 V sol alcohol, ether, chloroform, or benzoline

Salt — BaA'_2 Decomposed by boiling into nitro phenyl acetylene, CO_2 and $BaBr_2$

Ethyl ether EtA' [93°] Needles From di *exo* bromo *p* nitro phenyl propionic ether by alcoholic KOH (C L Muller, *A* 212, 131)

Di-bromo *p* nitro cinnamic acid

[4 1] $C_6H_4(NO_2)C_6H_4Br_2CO_2H$ [c 180°] From *p*-nitro phenyl propionic acid and Br (Drewson, *A* 212, 157).

Ethyl ether EtA' [86°] V sol benzene, chloroform or glacial HOAc, sl sol benzoline

BROMO-NITRO-CINNAMIC ALDEHYDE

$C_6H_4(NO_2)CHCBrCHO$ [97°] Long yellowish needles Formed together with the isomeride [186°] by nitration of a bromo-cinnamic aldehyde

Phenyl hydrazide [184°] Large yellow plates (Zincke & Hagen, *B* 17, 1816)

Bromo-nitro-cinnamic aldehyde

$C_6H_4(NO_2)CHCBrCHO$ [136°] Yellowish needles Formed as above

Phenyl hydrazide [154°], red crystal line solid, sl sol alcohol (Z & H)

DI-BROMO-NITRO-*o*-CRESOL

$C_6H_3(CH_3)(NO_2)(Br)_2(OH)$ [1 4 x 2] [92°] Formed by bromination of nitro *o*-cresol

$C_6H_3(CH_3)(NO_2)(OH)$ [1 4 2] Yellowish needles V sol alcohol and ether, nearly insol water (Nöbling & Collin, *B* 17, 270)

Di-bromo-nitro-*p*-cresol

$C_6H_3Me(NO_2)(OH)Br_2$ [1 2 4 ? ?] [83°] From aqueous nitro cresol, [78°], and bromine water Long yellow needles (from alcohol) Insol cold water, v sl sol hot water, v sol alcohol or ether (E Knecht, *A* 215, 89, *B* 15, 1071)

Salts — $C_6H_3Me(NO_2)(ONa)Br_2$ 2½ aq Red needles (from alcohol) — $C_6H_3Me(NO_2)(OK)Br_2$ aq

DI-BROMO-NITRO-CUMENE

$C_6H_5CHBrCBr(NO_2)CH_3$, *Di bromo-nitro-phenyl propylene* [77°–78 5°] From Ph CH C(NO₂)CH₃ and Br (Priebe, *A* 225, 362) Colourless prisms (from light petroleum) Not decomposed even by hot aqueous NaOH, thus differing markedly from the corresponding di bromo nitro ethyl benzene

Bromo-nitro-*ψ*-cumene

$C_6H_5MeBr(NO_2)$ [1 2 4 5 x] [192°] Formed by nitration of bromo pseudo cumene [73°] by fuming HNO₃. Needles Sol benzene, sl sol alcohol (Kelbe & Pathe, *B* 19, 1548)

Bromo-di-nitro-*ψ*-cumene

$C_6H_5Me_2Br(NO_2)_2$ [1 2 4 3 5 6] [181°] Formed by nitration of bromo pseudo cumene [1 2 4 3] Long yellowish needles Sl sol hot alcohol, nearly insol cold (Kelbe & Pathe, *B* 19, 1551)

Bromo-di-nitro-*ψ*-cumenol

$C_6H_5Me_2Br(NO_2)_2$ [1 2 4 5 3 6] [214°] Formed by nitration of bromo pseudo cumene [73°] with fuming HNO₃ and conc H₂SO₄. Microscopic fumes Sol benzene, sl sol hot alcohol, nearly insol cold alcohol (Fittig, *A* 147, 14, Kelbe & Pathe, *B* 19, 1548)

BROMO NITRO-*iso* CUMENOL $C_6H_5BrNO_2$, *ie* $C_6H_4(C_6H_5)Br(NO_2)(OH)$ [1 5 3 2] *Bromo nitro isopropyl phenol* [38°] From bromo *iso* propyl phenol and HNO₃ (Fietli, *G* 16, 123) Pale yellow needles (from dilute HOAc)

Bromo nitro *iso* cumenol

$C_6H_5PrBr(NO_2)(OH)$ [1 3 5 2] [88°] From nitro-isopropyl phenol and Br (F) Nacreous tables (from dilute alcohol), volatile with steam

BROMO-NITRO-CUMYL-PROPIONIC ACID

$C_6H_5BrNO_2$, *ie* $C_6H_4(C_6H_5)(NO_2)CHBrCH_2CO_2H$ [127°] From *o*-nitro-*iso* propyl cinnamic acid and HBr (Einhorn & Hess, *B* 17, 2020)

Di-bromo-nitro-cumyl propionic acid

$C_6H_5(C_6H_5)(NO_2)CHBrCHBrCO_2H$ [171°] From *o*-nitro-*iso*-propyl-cinnamic acid and Br (Widman, *B* 19, 260)

Di bromo-nitro cumyl propionic acid [184°]. From *m*-nitro-*iso* propyl cinnamic acid and Br (Widman, *B* 19, 418)

BROMO-NITRO-CYMENE $C_6H_5BrNO_2$, *ie* $C_6H_4Me(C_6H_5)Br(NO_2)$ [1 4 3 x] Formed by nitrating the bromo cymene derived from thymol (Mazzara, *G* 16, 193) Oil, volatile with steam

Bromo-di-nitro-cymene

$C_6H_5MePrBr(NO_2)_2$ [1 4 2 ? ? ?] [98°] Formed by nitrating bromo cymene (229°) Monoclinic prisms (Gerichten, *B* 11, 1092) May be identical with the following

Bromo-di-nitro-cymene

$C_6H_5MePrBr(NO_2)_2$ [1 4 3 ? ?] [94°] Formed by nitrating the bromo cymene derived from thymol (M) Slender yellow needles

Bromo-nitro-isocymene

$C_6H_4(C_6H_5)(CH_3)Br(NO_2)$ [4 2 1 ?] [121°] Long red needles Prepared by nitration of (1 2 4) bromo isocymene (Kelbe, *B* 15, 40)

Bromo-nitro-*m* isocymene (?) $C_{10}H_{17}(NO_2)Br$ [83°] From di bromo *m* isocymene by nitration (Kelbe & Czarnowski, *A* 235, 284)

Bromo-di-nitro-isocymene

$C_6H_4(C_6H_5)(CH_3)(NO_2)_2Br$ [55°] Short thick needles. Prepared by nitration of (B) bromo isocymene (Kelbe, *B* 15, 42)

BROMO NITRO ETHANE $C_2H_5BrNO_2$, *ie*

$CH_3CHBr(NO_2)$ (147°) Formed by dissolving nitro ethane (*q v*) in aqueous caustic potash and adding bromine $CH_3CH(NO_2) + Br_2 = CH_3CHBr(NO_2) + KBr$ (Meyer & Wurster, *B* 6, 94, Tscherniak, *B* 7, 916, *A* 180, 126) — Pun gent oil Forms unstable salts

Bromo di nitro ethane $CH_3CBr(NO_2)_2$ From Br and potassium dinitroethane (Ter Meer, *A* 131, 15) — Oil, volatile with steam, decomposed by K₂CO₃, which forms $CH_3CK(NO_2)_2$

Di bromo tetra nitro ethane

$CBr(NO_2)_2CBr(NO_2)_2$ From ethylene bromide and fuming HNO₃, or from C(NO₂)₄K₂ and Br Unstable liquid, forms with potash a compound $C_2Br_2(NO_2)_4 \cdot 2KOH$, m sol hot water, which explodes at about 180° Ammonium sulphide converts it into $C_2K_4(NO_2)_4 \cdot SO_2$ forms NH₃, HBr, and HCN Aqueous K₂SO₄ forms yellow crystals $C_2(NO_2)_4 \cdot K_2 \cdot 3H_2SO_4$ (Villiers, *C R* 94, 1122, 98, 431)

Di bromo nitro ethane $CH_3CBr_2(NO_2)$ (165°) Formed by adding potash to a mixture of nitro ethane (*q v*) and the calculated quantity of bromine (V Meyer, *B* 7, 1813) Indifferent oil, insol KHO

BROMO-NITRO-ETHENYL-NAPHTHYLENE-DIAMINE

$C_6H_5Br(NO_2) \langle \text{N} \rangle \text{CH} = \text{C} CH_3$ [4 x 2] [242°]

Formed by nitration of ethenyl (4 2 1) bromo-naphthylene diamine (Prager, *B* 18, 2162) Yellow needles sl sol alcohol, v sol HNO₃ aq

DI BROMO *o* NITRO ETHYL BENZENE $C_6H_5BrNO_2$, *ie* [2 1] $C_6H_4(NO_2)CHBrCH_2Br$ *o* nitro styrene dibromide [52°] From *o*-nitro-styrene and Br (Einhorn, *B* 16, 2218)

Di-bromo-*m*-nitro ethyl benzene

[3 1] $C_6H_4(NO_2)CHBrCH_2Br$ [79°] From *m*-nitro styrene and Br (Praisnitz, *B* 17, 598)

Di-bromo-*p*-nitro ethyl-benzene

[4 1] $C_6H_4(NO_2)CHBrCH_2Br$ [78°] From *p*-nitro-styrene and Br (Basler, *B* 16, 8008)

***ω*-Di-bromo *ω*-nitro ethyl-benzene**

$C_6H_4CHBrCHBrNO_2$ [86°] From *ω*-nitro phenyl ethylene and Br (Erdmann, *B* 17, 414). Also from *ω* nitro ethyl benzene and Br (Priebs, *A* 225, 341). Monoclinic crystals, a b c = 1.257 1.1396, L = 83° 54'. Cold aqueous NaOH gives bromo nitro styrene.

***ω*-Di bromo *ω* di nitro ethyl benzene**

[2.1] $C_6H_4(NO_2)_2CHBrCHBrNO_2$ [91°] From *ω*-di nitro phenyl ethylene and Br (Priebs, *A* 225, 352). White needles, v sol ligroin.

***ω*-Di bromo *ω* di nitro ethyl benzene**

[4.1] $C_6H_4(NO_2)_2CHBrCHBrNO_2$ [103°] From *ω*-*p*-di nitro phenyl-ethylene and Br (P) Plates.

DI-BROMO NITRO ETHYLENE

$C_2HBr_2(NO_2)_2$ [112°] From sodium tri nitro resorcin $C_6H(NO_2)_3(OH)(ONa)$ in aqueous solution, and bromine vapour (Merz & Zetter, *B* 12, 2048). Prisms (from $CHCl_3$), does not combine with Br. Zn and HCl give ethylamine.

DI BROMO-DI NITRO FLUORESCIN

$C_{10}H_6Br_2(NO_2)_4O_2$ From di bromo fluorescein and HNO_3 , or from di nitro fluorescein and Br. Yellow needles, is not fluorescent.

Acetyl derivative [256°] (Baeyer, *A* 183, 61).

BROMO NITROFORM *v* BROMO TRI NITRO METHANE**BROMO NITRO HYDROCINNAMIC ACID *v* BROMO-NITRO PHENYL PROPIONIC ACID**

BROMO NITRO-MESITYLENE $C_6H_3BrNO_2$, v $C_6HBrMe_2(NO_2)_2$ [54°] Formed by nitrating bromo mesitylene (Fittig & Storer, *A* 147, 7).

Bromo di nitro mesitylene $C_6BrMe_2(NO_2)_2$ [194°] From di bromo mesitylene by fuming HNO_3 . Needles (Süssenguth, *A* 215, 248).

BROMO-NITRO METHANE $CH_3Br(NO_2)$

[144°] Formed by the action of bromine on sodium nitro methane (Tscherniak, *B* 7, 916, *A* 180, 128 *v* Nitro methane). Pungent oil. The bromine and nitroxyl render its hydrogen displaceable by sodium; it is a strong acid.

Bromo di nitro methane $CHBr_2(NO_2)_2$ From di bromo di nitro methane and alcoholic KOH (Villiers, *Bl* [2] 47, 452, Losanitsch, *B* 16, 51), or from (α) di-bromo camphor and conc HNO_3 (Kachler & Spitzer, *M* 4, 558). Oil.

Salt — $CKBr(NO_2)_2$ SG 125, trichinic crystals which explode at about 147°. Reduction by sodium amalgam gives HCN, HBr, and NH_3 (Villiers, *Bl* [2] 41, 282). Ammonium sulphide gives di nitro methane.

Bromo-tri-nitro-methane $CBBr_3(NO_2)_3$, *Bromo nitroform* [about 12°] SG 28. From nitroform and Br in sunlight, or from mercuric nitroform and Br (Schischkoff, *A* 119, 247). Decomposes at 140°, but volatile with steam.

Di-bromo-nitro-methane $CHBr_2(NO_2)$

[155°–160°] Formed by adding bromine to potassium bromo nitro methane.

 $CHKBr(NO_2) + Br_2 = CHBr_2(NO_2) + KBr$

Bromopicroin, insoluble in potash, is formed at the same time (Tscherniak, *A* 180, 130). Very pungent oil, volatile with steam, soluble in caustic soda.

Di-bromo-di-nitro-methane $CBBr_2(NO_2)_2$

[0°] Formed by the action of conc HNO_3 on tri-bromo-aniline, ethylene bromide, bromo phenol, or di-bromo *p* toluidine (Losanitsch, *B* 15, 473, Villiers, *Bl* [3] 87, 452). Greenish

yellow, pungent oil, volatile with steam. Alkalis form salts of bromo di-nitro-methane.

Tri-bromo-nitro-methane $CBBr_3(NO_2)_3$ *Bromo picrin* [10°] SG 2811.

Formation — From nitro methane, bromine, and KOH (V Meyer & Tscherniak, *A* 180, 122).

Preparation — CaO (4 pts), H_2O (50 pts), Br_2 (6 pts) and picric acid (1 pt) are mixed in the order named and the product is distilled (Stenhouse, *P. M.* [4] 8, 36, Groves & Bolas, *A* 155, 253, *C. J.* 23, 153).

Properties — Pungent prisms, may be distilled *in vacuo*. Converted by Br into $CBBr_4$.

BROMO-DI-NITRO-METHYL-ANILINE

$C_6H_4Br(NO_2)_2NHMe$ [135.6] [147°] From di nitro methyl aniline and Br. Yellow crystals, boiling aqueous KOH gives bromo di-nitro phenol (Norton & Allen, *B* 18, 1996).

Bromo-nitro-di-methyl-aniline

$C_6H_3Br(NO_2)_2NMe_2$ [43.1] [72°] Long crystals. Formed together with other products by the action of nitrous acid upon *p* bromo di methyl aniline (Koch, *B* 20, 2460).

BROMO-DI-NITRO-METHYL-DI PHENYL-AMINE $C_6H_5NBr(NO_2)_2$ [194°] Light yellow tables. Formed by bromination of di nitro methyl di phenyl amine (Leymann, *B* 15, 1236).

BROMO-NITRO-NAPHTHALENE

$C_{10}H_7Br(NO_2)_2$ [1.4] [85°] From (α) bromo-naphthalene and HNO_3 . Yellow needles. PBr_3 gives $C_{10}H_6Br_2$ [81°] (Jolin, *Bl* [2] 28, 515).

Bromo-nitro-naphthalene

$C_{10}H_7Br(NO_2)_2$ [1.1' or 4'] [122.5°] S (93 p alcohol) 337 at 15.7°. From (α) nitro naphthalene and bromine (Guareschi, *A* 222, 291). Yellow needles (from alcohol). $KMnO_4$ gives bromo phthalic acid [174°–176°].

Bromo-nitro-naphthalene $C_{10}H_7Br(NO_2)_2$ [3.1] [131°] From (2,4,1) bromo nitro (α)-naphthyl amine by the diazo reaction (Liebermann & Scheiding, *A* 183, 262, Meldola, *C. J.* 47, 508). Straw coloured needles. Exchange of NO_2 for Br gives (1,3) di bromo naphthalene [64°].

Bromo-nitro-naphthalene $C_{10}H_7Br(NO_2)_2$ [1.3] [132°] From (α) naphthylamine by bromination, nitration, diazotisation &c (Liebermann, *B* 8, 1108, *A* 183, 262). Yellow needles, Sn and HCl give (β) naphthylamine.

Bromo-di-nitro-naphthalene

$C_{10}H_6Br_2(NO_2)_2$ [170°] Long glistening needles. Formed together with the following isomeride by nitration of (α) bromo naphthalene with fuming HNO_3 (1.5). Not attacked by boiling with aqueous NaOH. On oxidation with dilute HNO_3 , it gave a small quantity of (α) nitro phthalic acid (Merz & Weith, *B* 15, 2710).

Bromo-di-nitro naphthalene

$C_{10}H_6Br_2(NO_2)_2$ [143°] Tables or prisms. Formed as above. Not attacked by boiling aqueous NaOH. On oxidation with dilute HNO_3 , it gave a little (α)-nitro phthalic acid (Merz & Weith, *B* 15, 2710).

Bromo-tetra nitro naphthalene

$C_{10}H_4Br_2(NO_2)_4$ [190°] Needles S (benzene at 18°) 3.7. Formed by further nitration of bromo di nitro naphthalene [170°] by heating with a mixture of HNO_3 and H_2SO_4 . It dissolves in caustic alkalis forming tetra-nitro-naphthol. NH_3 converts it into tetra nitro naphthylamine, and aniline gives the phenyl derivative of the latter. On oxidation with dilute HNO_3 , it gives

di-nitro phthalic acid [227°] (Merz & Weith, *B* 15, 2712)

Bromo-tetra nitro-naphthalene

$C_{10}H_2Br(NO_2)_4$ [245°] White glistening needles. Nearly insol. ordinary solvents. Formed by nitration of bromo di nitro naphthalene [143°] with a mixture of HNO_3 and H_2SO_4 . It is attacked by alkalis with difficulty. NH_3 converts it into tetra nitro naphthylamine and aniline gives the phenyl derivative of the latter. On oxidation with dilute HNO_3 it gives di nitro phthalic acid [200°] (Merz & Weith, *B* 15, 2718)

Di bromo nitro-naphthalene $C_{10}H_6Br_2(NO_2)$ [96.5°-98°] One of the products of action of Br on nitro naphthalene. Small yellow needles (from alcohol) (Guareschi, *A* 222, 286)

Di bromo-nitro naphthalene

$C_{10}H_6Br_2(NO_2)$ [14.1°] [116.5°] From (1,4) di bromo naphthalene and HNO_3 (S G 14) in the cold (John, *Bl* [2] 28, 515). PCl_5 gives tri bromo-naphthalene [85°]

Di bromo nitro naphthalene $C_{10}H_6Br_2(NO_2)$ [100°-105°] From di bromo naphthalene [68°] and HNO_3 (S G 14) (Canzoneri, *G* 12, 427)

Tri bromo-di-nitro naphthalene

$C_{10}H_4Br_3(NO_2)_2$ From (1, 2, 4)-tri bromo naphthalene and fuming HNO_3 (Prager, *B* 18, 2164)

BROMO-NITRO-(a)-NAPHTHOIC ACID

$C_{10}H_6Br(NO_2)CO_2H$ [14.4°] [260°] Formed by nitration of bromo (a) naphthoic acid [246°]. Small yellowish prisms (from alcohol). Its ammonium salt forms glistening plates, sl sol cold water (Ekstrand, *B* 19, 1135)

BROMO NITRO-(a)-NAPHTHOL

$C_{10}H_6Br(NO_2)(OH)$ [2.4.1] [136°] From (2, 4, 1) bromo nitro acetyl (a) naphthylamine and conc NaOH. Silky needles (from alcohol), oxidation gives phthalic acid

Salts— $C_{10}H_6Br(NO_2)(ONa)aq$ red needles— $(C_{10}H_6Br(NO_2)O)_2Ba$ 3aq

Methyl ether $C_{10}H_6Br(NO_2)(OMe)$ [115°] Pale yellow silky needles (Meldola, *C J* 47, 497)

Bromo nitro-(a)-naphthol $C_{10}H_6Br(NO_2)OH$ [142°] From acetyl bromo (a) naphthylamine by nitration and saponification (Biedermann & Remmers, *B* 7, 538)

BROMO NITRO-(a) NAPHTHYLAMINE

$C_{10}H_6Br(NO_2)(NH_2)$ [2.4.1] [197°] From the acetyl derivative by dissolving in conc H_2SO_4 and ppg with water. Orange needles, gives phthalic acid on oxidation (Meldola, *C J* 47, 497, 43, 9)

Acetyl derivative $C_{10}H_6Br(NO_2)(NHAc)$ [225°] From acetyl (a) naphthylamine by nitration and bromination. Pale ochreous needles

Bromo nitro (a) naphthylamine

$C_{10}H_6Br(NO_2)(NH_2)$ [4.2.1] [200°] From acetyl (a)-bromo (a) naphthylamine by nitration and saponification (Liebermann & Scheiding, *A* 183, 258). Oxidised by dilute HNO_3 to phthalic acid. Elimination of NH_3 gives bromo nitro-naphthalene [182°]. Conc $HBrAq$ at 180° gives (1, 2, 4) tri bromo naphthalene

Acetyl derivative $C_{10}H_6Br(NO_2)(NHAc)$ [232°]

DI-BROMO NITRO-ORCIN $C_{10}H_6Br_2NO_2$ 1:2 $C_6MeBr_2(NO_2)(OH)$ [112°] From (β) nitro-orcin and Br. Yellow laminae (from alcohol) —

$Ba(C_6H_4Br_2NO_2)_2$ 2aq red needles (Weselsky, *B* 7, 444)

BROMO NITRO-o-OXY-BENZOIC ACID

$C_6H_4Br(NO_2)(OH)CO_2H$ [5.3.2.1] *Bromo nitro-salicylic acid*. [175°] Yellow needles. Formed by nitration of bromo-salicylic acid in acetic acid solution— A_2Ca 2aq. V sol water— A_2Ba yellow needles— $C_6H_4Br(NO_2) \begin{smallmatrix} CO \\ \diagup \end{smallmatrix} O \begin{smallmatrix} \diagdown \\ O \end{smallmatrix} Ba$ 2aq

red crystals— $C_6H_4Br(NO_2) \begin{smallmatrix} CO \\ \diagup \end{smallmatrix} O \begin{smallmatrix} \diagdown \\ O \end{smallmatrix} Pb$ nearly insoluble pp (Lellmann & Grothmann, *B* 17, 2729)

Bromo nitro-o oxy benzoic acid

$C_6H_4Br(NO_2)(OH)CO_2H$ [5.3.2.1] [222°] Colourless needles. V sol alcohol, ether, and hot water. Formed by bromination of nitro salicylic acid in acetic acid solution

Salts— A_2Ba 4aq long yellow needles— A_2Ca 6aq yellow prisms (Lellmann & Grothmann, *B* 17, 2724)

Bromo nitro-o oxy benzoic acid *Methyl derivative* $C_6H_4Br(NO_2)(OMe)(CO_2H)$ From methyl bromo isopropyl phenyl oxide and HNO_3 (S G 13) (Peratoner, *G* 16, 420). A di bromo nitro o oxy benzoic acid is also formed

Bromo nitro p-oxy benzoic acid *Methyl derivative* $C_6H_4Br(NO_2)(OMe)(CO_2H)$ [1.8.2.5] [182°] *Bromo-nitro-anisic acid*. Formed by nitrating bromo anisic acid

Ethyl ether EtA' [85°] needles (Balbano, *G* 14, 241)

DI BROMO DI NITRO DI OXY DI PHENYL SULPHONE

$C_6H_4Br_2N_2SO_2$ 1:2 $(C_6H_4(NO_2)(OH)Br)SO$ [235°] From di nitro di oxy di phenyl sulphone in CS_2 and Br (Annheim, *B* 9, 600). Yellowish needles— $C_6H_4Br_2N_2SO_2$ 2aq orange needles

BROMO NITRO OXY PIPERIDINE v CARBOXYLIC ETHER $C_6H_4(Br)(NO_2)(OH)NCO_2Et$ [157°] Colourless prisms, sol alcohol. Formed by the action of Br in HOAc on nitro dehydro piperidine v carboxylic ether (Schotten, *B* 16, 646)

BROMO NITRO PHENANTHRENE v PHENANTHRYNE

BROMO-o NITRO PHENOL

$C_6H_4Br(NO_2)(OH)$ [1.4.3] [44°] Formed, together with the following body [88°] by boiling (1, 3, 4)-bromo di nitro benzene with aqueous KOH (Laubenheimer, *B* 11, 1160). Prisms, volatile with steam— NaA' scarlet needles— BaA' 2aq red needles, sl sol water— CaA' 2aq AgA'

Bromo-o-nitro phenol $C_6H_4Br(NO_2)(OH)$ [1.3.4] [88°]

Formation—1 From *p*-bromo phenol and HNO_3 (Hubner & Brenken, *B* 6, 170, Körner, *G* 4, 388)—2 From o nitro phenol (45g) and Br (52g) (Brunck, *Z* 1867, 203)—3 From bromo di nitro phenol (*v sup*)

Properties—Yellow monoclinic laminae (from alcohol) $abc = 2.941 \times 1.1625$ $\beta = 64^\circ 2'$ (Arzruni, *Z Kryst* 1, 438), may be sublimed, v sol alcohol and ether, slightly volatile with steam. Reduced by Sn and HCl to bromo amido phenol (Schütt, *J pr* [2] 82, 61)

Salts— $Na(C_6H_4BrNO_2)$ red needles with golden-green lustre, v sol water— KA' 2aq— BaA' — AgA'

Methyl ether $C_6H_4Br(NO_2)OMe$ [88°] From the silver salt and MeI by boiling, or from the potassium salt, MeOH and MeI at 110° Needles V sol hot alcohol or hot ether, v sl sol water (Staedel, *A* 217, 55, *B* 11, 1750)

Ethyl ether $C_6H_4Br(NO_2)OEt$ [43°] (S), [47°] (H) From the potassium salt, EtI and alcohol at 100° Formed also by nitrating *o* bromo phenetol

Benzyl derivative $C_6H_4Br(NO_2)(OC_2H_5)$ [84°] Yellow needles Insol water, v sol alcohol and glacial acetic acid, sl sol benzene, ether or chloroform (Roll a Hölz, *J pr* [2] 32, 57) Reduced to bromo amido phenol, when treated with Sn and HCl, benzyl chloride splitting off

Bromo-*m*-nitro phenol $C_6H_3(Br)(NO_2)(OH)$ [? 3 1] [147°] (L), [110°] (P) Prepared by bromination of *m*-nitro phenol (Pfaff, *B* 16, 612, Lindner, *B* 18, 612) Yellow needles Sublimable Sl sol hot water, CS₂ and petroleum ether, insol cold water On reduction with tin and HCl it gives *m*-amido phenol, the Br atom being eliminated—KA' 2aq red crystals, sol water and alcohol—NaA' aq yellowish red crystals, sol water and alcohol—BaA' 4aq

Methyl ether MeA' [104°], white needles, v sol alcohol and ether, on reduction with tin and HCl it gives *m*-anisidine

Ethyl ether EtA' [57°] prisms

Bromo-*p*-nitro phenol $C_6H_4Br(NO_2)(OH)$ [1 3 6] [102°] Formed by brominating *p*-nitro phenol (Brunck, *Z* 1867, 204) Satiny needles (from ether or alcohol), m sol water—Ba(C₂H₅BrNO₂)₆aq orange needles, m sol water

Methyl ether MeA' [106°] From the potassium salt, MeI and MeOH at 110° White needles (from alcohol) V sol hot alcohol or ether, m sol hot water (Staedel, *A* 217, 66)

Ethyl ether EtA' [98°] (S), [55°] (H) Formed like the preceding (S) From *p*-nitro phenetol and Br (Halloch, *B* 14, 37) Yellow needles (from alcohol) V sol alcohol or ether

Benzylether $C_6H_4Br(NO_2)(OC_2H_5)$ [126°] Nearly colourless plates (from alcohol) Insol water, sol alcohol and ether (R a H) Reduced by Sn and HCl to bromo-*p*-amido phenol and C₆H₄Cl

Bromo-*di*-nitro phenol $C_6H_3Br(NO_2)_2(OH)$ [1 3 5 4] [86°] (K), [71°] (Austen), [76°] (Armstrong) Formed by nitrating *p*-bromo phenol in HOAc, or by brominating and nitrating *o*-nitro phenol (Körner, *A* 137, 205, Armstrong a Prevost, *B* 7, 922) Formed also by brominating *di*-nitro phenol [64°] (Körner, *G* 4, 305), and by boiling *di*-nitrated *p*-*di*-bromo benzene with aqueous KNO₃ (Austen, *Am S* [3] 16, 46) Yellow monoclinic prisms, $a b c = 2.795 \times 1.1778$, $\beta = 67^\circ 58'$ (Arzruni, *loc cit*) Water and Br at 100° change it into the isomeride [118°] (Armstrong, *C J* 28, 520) HNO₃ forms picric acid

Salts—NH₄A' silky red needles, sol boiling water and alcohol—NH₄A' aq—BaA' yellow needles, sol hot water—CuA' short brown needles, insol water—KA' long red needles, sl sol water—AgA'—CaA' 8aq

Ethylether EtA' [86°] small needles, sol alcohol and hot water, saponified by cold Vol. I

NaOHAq (Schoonmaker a Van Mater, *Am S*, 187)

Bromo-*di*-nitro-phenol $C_6H_3Br(NO_2)_2(OH)$ [91 5°] Formed by nitrating *m*-bromo phenol, and also from *di*-bromo *di*-nitro phenol [117°] and boiling aqueous KOH (Körner, *G* 4, 305) Prisms (from alcohol or ether) The K salt forms yellow needles

Methyl ether MeA' [103°]

Bromo-*di*-nitro phenol $C_6H_3Br(NO_2)_2OH$ [1 3 6] [118°]

Formation—1 From (1,3,4) *di*-nitro phenol and Br (Laurent, *Rev Scient* 6, 65)—2 By nitrating *o*-bromo phenol (Körner, *G* 4, 394)—3 From *o*-nitro phenol by bromination and nitration—4 By boiling bromo *di*-nitro aniline [144°] with aqueous KOH (Körner)—5 By nitrating brominated phenol disulphonic acid or *di*-brominated phenol *p*-sulphonic acid (Armstrong a Brown, *C J* 25, 861, 865)—6 By warming the isomeride [c 76°] with Br and water (Armstrong, *C J* 28, 520)—7 From picric acid, water, and Br (Armstrong, *B* 6, 650) 8 By nitrating tri-bromo-phenol (Armstrong a Harrow, *C J* 29, 477)—9 From bromo nitro benzyl phenol in HOAc by HNO₃ benzyl being displaced by NO₂ (Rennie, *C J* 41, 225)

Properties—Yellow prisms Needles (from alcohol)

Salts—KA' aq flat yellow needles, sl sol cold water—KA' 1½aq—BaA' 3½aq—BaA' 4aq—BaA' 5aq yellow needles, sl sol water—CaA' 7aq—CaA' 8aq—CaA' 12aq—NH₄A' 2aq—NaA' 1½aq—PbA' 2aq

Methylether MeA' [48°] From bromo-anisic acid and HNO₃ Yellow prisms, sol alcohol and ether, insol water (Balbiano, *G* 14, 235)

Di-bromo-*o*-nitro-phenol $C_6H_3Br_2(NO_2)(OH)$ [1 3 5 6] [117 5°]

Formation—1 From *o*-nitro phenol and Br (Brunck, *Z* 1867, 203, Körner)—2 From (1,3,4) *di*-bromo phenol by nitration (K)—3 By nitrating *di*-bromo phenol sulphonic acid (Armstrong a Brown, *C J* 25, 863)

Properties—Golden monoclinic prisms (from alcohol), $a b c = 515 \times 1.591$, $\beta = 65^\circ 23'$ (Arzruni, *Z Kryst* 1, 436) Volatile with steam, may be sublimed, v sl sol water Heated with bromine at 100° it gives some of the isomeride [141°] together with tetra-bromo quinone and (1,3,6) bromo nitro phenol (Lung, *C J* 51, 147)

Salt—KA' scarlet needles, v sl sol cold water

Methyl ether MeA' [77°] From the silver salt and MeI, alcoholic NH₃ converts it into *di*-bromo nitro aniline [127°] whence HNO₃ gives *di*-bromo-nitro benzene [105°] (K)

Ethylether EtA' [46°] From the silver salt, EtI and alcohol at 100° (Staedel, *A* 217, 58) V sol benzene, alcohol or ether, insol water

Benzylether $C_6H_3Br_2(NO_2)(OC_2H_5)$ [65°] Yellow crystals (from ether) Sol benzene, chloroform, and glacial acetic acid, insol water (R a H, *J pr* [2] 32, 57) Reduced by Sn and HCl to *di*-bromo amido phenol and benzyl chloride

Di-bromo-*m*-nitro phenol $C_6H_3Br_2(NO_2)OH$ [91°] Formed by heating *m*-nitro-phenol (1

mol) with bromine (2 mols) Yellowish plates.
V sol alcohol, sl sol water

Salts—KA' easily soluble orange-red needles—AgA' sparingly soluble red powder—BaA', 6aq very soluble red needles

Ethyl ether $C_2H_5Br(NO_2)OEt$ [110°] yellowish needles, sol hot alcohol (Lindner, *B* 18, 613)

Di-bromo-*p* nitro-phenol $C_6H_3Br_2(NO_2)(OH)$ [1536] [142°] (Lellmann & Grothmann, *B* 17, 2731)

Formation—1 By brominating *p* nitro phenol or its sulphonic acid (Brunck, *Z* 1867, 204, Post & Brackebusch, *A* 205, 94)—2 By nitrating tri bromo phenol dissolved in HOAc (Armstrong & Harrow, *loc cit*)—3 In small quantity by heating the isomeride [117°] with Br (Lang, *C J* 51, 147)

Properties—Prisms, sl sol water, v sol alcohol and ether

Salt—BaA', 10aq yellow needles, effervesces to a red powder—BaA', 3½aq—AgA'

Methyl ether MeA' [123°] (Körner, *G* 4, 890) From di bromo anisic acid and HNO₃, the CO₂H being displaced by NO₂ (Balbiano, *G* 14, 9) Pyramidal needles, converted by NH₃ into di bromo *p* nitro-aniline [203°]

Ethyl ether [108°] Long quadratic columns (Staedel, *A* 217, 67)

Benzyl ether $C_6H_5Br_2(NO_2)(OC_6H_5)$ [94°] Nearly colourless needles (from alcohol) Insol water, sl sol alcohol, ether, benzene, chloro form, and glacial acetic acid (R & H) Reduced by Sn and HCl to di bromo-*p* amido phenol (*q v*) and benzyl chloride

Tri bromo nitro phenol $C_6HBr_3(NO_2)OH$ [64231] [85°] (L), [89°] (D) Formed by heating *m* nitro phenol with Br (3 mols) at 100° (Lindner, *B* 18, 614) Colourless crystalline powder, v sol alcohol, ether, and benzene, v sl sol hot water

Salts—A'NH₄, sparingly soluble microscopical needles—A'Ka₂q v sol water—A', Ba 8aq sparingly soluble orange yellow crystals—A', Ba aq—A', Mg* easily soluble red plates

o Nitro benzoyl derivative
 $C_6HBr_2(NO_2)OCO_2C_6H_4(NO_2)$ [129° cor], very small colourless needles

m Nitro benzoyl derivative
 $C_6HBr_2(NO_2)OCO_2C_6H_4(NO_2)$ [154° cor], glistening colourless needles, 8 (90 p c alcohol) 258 at 14° (Dacomo, *B* 18, 1167)

Ethyl ether EtA' [79°], prisms

BROMO NITRO PHENOL SULPHONIC ACID
 $C_6H_4BrNSO_3$ $C_6H_4Br(NO_2)(OH)SO_3H$ [1365] Formed, together with di bromo nitro phenol, by brominating (1, 4, 3) nitro phenol sulphonic acid (Post & Brackebusch, *A* 205, 92)—CaA', 3aq—BaA', 8aq— $C_6H_4BrNSO_3(PbOH)_2$ 2½aq

Bromo-phenol sulphonic acids have been obtained by Armstrong (*C J* 25, 857, *B* 7, 404, 924) and Post (*B* 7, 169) by the action of nitric acid on various brominated phenol sulphonic acids, and by the action of bromine on (1, 2, 5) nitro phenol sulphonic acid

BROMO-NITRO-DIPHENYL $C_{12}H_8BrNO_2$, *is* [41] $C_6H_4BrC_6H_4(NO_2)$ [14] [173°] (above 360°) Formed by heating diphenyl (1 pt) with conc HNO₃ (1 pt), or from amido-nitro diphenyl by the diazo reaction (Schultz, *A* 174, 218) Long white needles (from toluene) CrO₃ gives

p bromo benzoic acid and a little *p* nitro benzoic acid

Bromo-nitro-diphenyl $C_{12}H_8BrNO_2$, *is* [41] $C_6H_4BrC_6H_4(NO_2)$ [12] [65°] (*c* 860°). Formed together with the preceding Monoclinic columns CrO₃ gives *p* bromo benzoic acid (Schultz, *A* 207, 848)

Di bromo nitro diphenyl
 $C_6H_4BrC_6H_4Br(NO_2)$ [127°] Formed by nitration of di bromo diphenyl in acetic acid solution (Lellmann, *B* 15, 2837) Yellowish crystals; v sol alcohol, benzene, and acetic acid

Di bromo di nitro diphenyl $C_{12}H_6Br_2(NO_2)_2$ From *pp* di bromo diphenyl and fuming HNO₃ (Fittig, *A* 182, 206, S) Hair like crystals (from benzene) Sn and HCl give di bromo di-amido diphenyl [89°]

Di bromo tri nitro diphenyl
 $C_6H_4Br(NO_2)C_6H_3Br_2(NO_2)_2$ [177°] Formed by nitration of di bromo diphenyl with cold fuming HNO₃ (155) (Lellmann, *B* 15, 2838) Small colourless needles Sol benzene, sl sol alcohol.

BROMO NITRO PHENYL ACETIC ACID
 $C_6H_4Br(NO_2)CH_2CO_2H$ [124] [114°] Formed by nitration of a mixture of *o* and *p* bromo phenyl acetic acids (Bedson, *C J* 37, 97) Flat greenish yellow needles Sol hot, insol cold water V sol alcohol and ether K₂CrO₇ and H₂SO₄ give $C_6H_4Br(NO_2)CO_2H$ [199°]

Salts—BaA', aq Its aqueous solution gives white pps with AgNO₃, Pb(OAc)₂, and a blue pp with Cu(OAc)₂

Methyl ether MeA' [41°] Needles.

Ethyl ether Oil

(a) **Bromo nitro phenyl acetic acid**
 $C_6H_4Br(NO_2)CH_2CO_2H$ [169°] Formed by nitration of mixture of *o* and *p* bromo phenyl acetic acids (Bedson) Yellowish white, branching needles V sol alcohol and ether, insol cold, sol hot water

Salt—BaA', 4aq Its aqueous solution gives white pps with AgNO₃ and Pb(OAc)₂, but a green pp with Cu(OAc)₂

Methyl ether [68°] Flat needles

Ethyl ether Yellowish needles.

(β) **Bromo nitro phenyl acetic acid**
 $C_6H_4Br(NO_2)CH_2CO_2H$ [162°] Formed together with the two preceding (Bedson) Small yellow prisms

BROMO DI NITRO-DI PHENYL AMINE
 $C_{12}H_8BrN_2O_2$, *is* $C_6H_4Br(NO_2)NH_2C_6H_4$ Phenyl bromo-nitro phenyl amine [120°] Formed by warming bromo di nitro benzene [100°] with aniline (Austin, *B* 9, 920) Orange hair like needles (from alcohol)

Bromo di-nitro-di phenyl amine
 $C_{12}H_8BrNH_2C_6H_4(NO_2)_2$ Bromo phenyl di-nitro-phenyl-amine [158°] From (1, 2, 4) bromo-di nitro benzene and di *p*-bromo di phenyl urea at 170° Yellow needles (from ether) (Willgerodt, *B* 11, 602)

Bromo tri-nitro-di phenyl-amine
 $C_{12}H_8Br(NO_2)_2NH_2C_6H_4NO_2$ [158°] From bromo-di nitro di phenyl amine [120°] and HNO₃ (A)

Di-bromo di nitro-di phenyl amine
 $C_{12}H_8Br_2(NO_2)_2N$ [196°] Formed by bromination of di-nitro-di phenyl amine (Leymann, *B* 15, 1236)

Di bromo-tetra-nitro di-phenyl amine
 $C_{12}H_8Br_2(NO_2)_4NH_2C_6H_4Br(NO_2)_2$ [236°-242°]

From $\text{NMe}(\text{C}_2\text{H}_5\text{Br})_2(\text{C}_6\text{H}_5\text{Br})$ and HNO_3 (Gnehm, *B* 8, 929) Laminæ (from HOAc)

Tri-bromo-di-nitro-di-phenyl-amine

$\text{C}_6\text{H}_3\text{Br}_2(\text{NO}_2)_2\text{N}$ [210°] Formed by nitrating tetra bromo-di-phenyl-amine ($\text{C}_6\text{H}_2\text{Br}_3\text{NH}$) (Gnehm & Wyss, *B* 10, 1323)

BROMO-NITRO-PHENYL BENZYL OXIDE

v Bromo Nitro Phenol, Benzyl ether

DI-BROMO-NITRO-PHENYL-CARBAMIC

ACID Methyl ether
[184] $\text{C}_6\text{H}_2\text{Br}_2(\text{NO}_2)_2\text{NHCO}_2\text{Me}$ [152°] From methyl (1,3,4) di bromo phenyl carbamate and HNO_3 (Hentschel, *J pr* [2] 34, 425) Prisms (from alcohol) NH_3 forms (1,3,4) di bromo-amine

BROMO NITRO *m* PHENYLENE-DIAMINE

$\text{C}_6\text{H}_2\text{Br}_2\text{NO}_2$ *vs* $\text{C}_6\text{H}_2\text{Br}(\text{NO}_2)(\text{NH}_2)_2$ [1235] From tri bromo nitro benzene and alcoholic NH_3 for some days at 175° (Körner, *G* 4) Orange needles, decomposes at 163° Converted into *p* bromo benzene by the diazo reaction

Bromo nitro *p* phenylene diamine

$\text{C}_6\text{H}_2\text{Br}(\text{NO}_2)(\text{NH}_2)_2$ [1425] [156°] From tri bromo nitro benzene [94°] and alcoholic NH_3 at 110° (Körner, *G* 4) Pyramidal needles Converted by diazo reaction into *p* bromo benzene

BROMO-NITRO-PHENYL-ETHANE *v*

BROMO NITRO ETHYL BENZENE

Di-bromo-di-nitro-*s*-di-phenyl-ethane

$\text{C}_6\text{H}_4(\text{NO}_2)_2\text{CHBrCHBrC}_6\text{H}_4\text{NO}_2$ [above 300°] Di bromide of di *p* nitro stilbene Split up by heat into 2HBr and di nitro toluene (Elbs & Bauer, *J pr* [2] 34, 345)

Di-bromo-di-nitro-*s*-di-phenyl-ethane

$\text{C}_6\text{H}_4\text{Br}_2(\text{NO}_2)_2$ Di bromo di-nitro di benzyl [205°] Formed by nitrating di *p* bromo di benzyl (Fittig & Stelling, *A* 137, 260) Sword shaped crystals (from benzene)

BROMO-NITRO-PHENYL ETHYL OXIDE *v*

Ethyl Bromo Nitro Phenol

aa-DI-BROMO- ω -DI-NITRO- ω -PHENYL-METHYL-CARBINOL

Ethyl ether $\text{CBr}_2(\text{NO}_2)_2\text{CH}(\text{C}_6\text{H}_4\text{NO}_2)_2\text{OEt}$ [99°] —1 From the compound of alcohol with *am*-di nitro cinnamic ether (*q v*) by simultaneous treatment with aqueous NaOH and Br (Friedlander & Lazarus, *A* 229, 237) —2 From ω -di nitro styrene, alcohol, aqueous NaOH and Br (White plates (from dilute alcohol) Insoluble in aqueous NaOH

Methyl ether $\text{CBr}_2(\text{NO}_2)_2\text{CH}(\text{C}_6\text{H}_4\text{NO}_2)_2\text{OMe}$ [146°] Formed in a similar way from the compound of methyl alcohol with the same body, or from ω -di nitro styrene, methyl alcohol, Br, and aqueous NaOH White plates

BROMO-NITRO-PHENYL-METHYL-

KETONE *v* Bromo Nitro Acetophenone

***p*-BROMO α NITRO β PHENYL PROPIONIC**

ACID $\text{C}_6\text{H}_2(\text{Br})(\text{NO}_2)_2\text{C}_2\text{H}_4\text{CO}_2\text{H}$ [421] Bromo-nitro hydrocinnamic acid [142°] Prepared by the action of HBr on the diazo compound from *p* amido- α -nitro hydrocinnamic acid Formed together with the (4,3,1) isomeride by nitration of *p* bromo-hydrocinnamic acid Flat feathery crystals. By reduction with tin and HCl it gives *p*-bromo-hydrocarboxystyryl (Gabriel & Zimmermann, *B* 18, 1682)

***p* Bromo α -nitro β phenyl propionic acid**

$\text{C}_6\text{H}_2(\text{Br})(\text{NO}_2)_2\text{C}_2\text{H}_4\text{CO}_2\text{H}$ [481] [90°-95°] Long glistening needles Prepared as above On reduction with tin and HCl it gives *p* bromo

m-amido-hydrocinnamic acid (Gabriel & Zimmermann, *B* 13, 1683)

β Bromo- α nitro β -phenyl-propionic acid

$\text{C}_6\text{H}_4(\text{NO}_2)\text{CHBrCH}_2\text{CO}_2\text{H}$ [140°] From α -nitro cinnamic acid, HOAc , and HBr at 100° (Einhorn, *B* 16, 2208) Monoclinic crystals, *v* sol ordinary solvents, sl sol benzene

Reactions —1 Boiling water forms indoxyl 2 NaOHAq forms nitro-cinnamic acid —3 Cold $\text{Na}_2\text{CO}_3\text{Aq}$ forms the lactone of α -nitro β -oxy-phenyl propionic acid —4 Hot $\text{Na}_2\text{CO}_3\text{Aq}$ gives nitro cinnamic acid, nitro oxy phenyl-propionic acid, and α nitro styrene

β Bromo α nitro β phenyl-propionic acid

$\text{C}_6\text{H}_4(\text{NO}_2)\text{CHBrCH}_2\text{CO}_2\text{H}$ [96°] Prepared by heating an acetic acid solution of *m*-nitro-cinnamic acid with HBr at 100° *V* sol alcohol, sl sol toluene, insol petroleum ether

Reactions —1 By boiling with water it chiefly gives *m* nitro styrene —2 An excess of alkali converts it back into *m*-nitro cinnamic acid —3 By adding the powdered acid to an aqueous solution of $\frac{1}{2}$ mol of Na_2CO_3 , it yields 30 p c of *m* nitro styrene, 20 p c of *m* nitro-cinnamic acid, and 10 p c of *m* nitro β -oxy-phenyl propionic acid If the powdered acid is added to a cold solution of Na_2CO_3 , the β -lactone is formed (Prausnitz, *B* 17, 595)

β Bromo α nitro β phenyl propionic acid

$\text{C}_6\text{H}_4(\text{NO}_2)\text{CHBrCH}_2\text{CO}_2\text{H}$ [172°] Prepared by heating *p* nitro cinnamic ether with HBr at 100° Prisms, sol hot alcohol, sl sol water and benzene

Reactions —1 Long boiling with dilute H_2SO_4 (25 p c) reconverts it into *p* nitro-cinnamic acid —2 Heated with water it yields *p* nitro β -oxy phenyl propionic acid (72 p c) and *p* nitro styrene (28 p c) —3 Cold aqueous KOH gives *p*-nitro oxy phenyl propionic acid and its lactone Alcoholic KOH yields almost entirely *p* nitro cinnamic acid —4 Aqueous NH_3 yields the lactone which by excess of NH_3 is converted into the corresponding amido-acid

Ethyl ether A^{Et} [81°], colourless plates (Basler, *B* 16, 3001)

Di bromo α -nitro-phenyl propionic acid

$\text{C}_6\text{H}_4(\text{NO}_2)\text{CHBrCHBrCO}_2\text{H}$ Dibromide of α -nitro cinnamic acid [e 180°] From Br and α nitro cinnamic acid (Baeyer, *B* 13, 2257) Needles or plates, sol hot water NaOHAq gives α nitro-phenyl propionic acid Zinc dust and NaOH give indole

Methyl ether MeA^{t} [99°]

Ethyl ether EtA^{t} [71° uncor] (*M*) From α nitro-cinnamic ether and Br (Muller, *A* 212, 130) Alcoholic KOH converts it into α nitro phenyl propionic acid Heated with water at 120° it gives α -nitro cinnamic acid

Di bromo α nitro-phenyl-propionic acid

$\text{C}_6\text{H}_4(\text{NO}_2)\text{CHBrCHBrCO}_2\text{H}$ [218°] From *p*-nitro-cinnamic acid and Br (Drewson, *A* 212, 151) Rhombic prisms (from glacial HOAc) *M* sol water or glacial HOAc , *v* sol alcohol or ether, sl sol benzene, *v* sl sol benzoline. Aqueous NaOH forms *p* nitro cinnamic and *p*-nitro phenyl propionic acids — CaA^{t} .

Ethyl ether EtA^{t} [111°] From *p* nitro-cinnamic ether and Br in CS_2 (C L Müller, *A* 212, 129) Columns (from CS_2), *v* sol hot alcohol, ether, or benzoline Alcoholic KOH converts it into a mixture of two isomeric bromo-*p*-

nitro cinnamic ethers, and *p* nitro phenyl propionic acid. Heated with water at 120° it gives *p* nitro cinnamic acid

BROMO NITRO PHTHALIC ACID

$C_6H_4Br(NO_2)(CO_2H)_2$ [1 4 2 3] From di bromo naphthalene [82°] and HNO_3 — Na_2A' (Guarezchi, *A* 222, 277)

α -BROMO- α NITRO PROPANE

$CH_3CH_2CHBr(NO_2)$ (c 160°) Formed together with di bromo nitro propane by the action of potash and Br on nitro propane (V Meyer a Tscherniak, *A* 180, 116) Oil, sol potash

α Bromo α nitro propane $CH_3CBr(NO_2)CH_3$ (150°) From $CH_3CH(NO_2)CH_3$ Insol potash

Di bromo nitro propane $CH_3CHCBr(NO_2)CH_3$ (181°-186°) From bromo nitro propane, Br, and potash. An oil, insol potash

TRI BROMO DI NITRO PROPIONIC ACID

$C_3H_4Br_3N_2O_6$ α α α $CBr_3C(NO_2)_2CO_2H$ From tri bromo phloroglucin and conc HNO_3 (Benedikt, *A* 184, 255) Silky scales, insol cold water, v e sol alcohol and ether, decomposed by boiling water

BROMO NITRO PROPYL BENZENE v

BROMO NITRO CUMENE

BROMO NITRO PROPYL PHENOL v BROMO CUMENOL

DI BROMO DI NITRO PYRROL

$C_4H_4Br_2N_2O_4$ α α α α $\begin{matrix} CBr C(NO_2) \\ | \\ CBr C(NO_2) \end{matrix} > NH$ [169°]

Formed by dissolving di bromo-nitro pyrrol methyl ketone [206°] in a mixture of fuming HNO_3 and conc H_2SO_4 at -18°, and precipitating in water. Silky leaflets (containing aq) At the ordinary temperature it is converted into di bromo maleimide (Ciamician a Silber, *B* 20, 699, *G* 17, 262)

DI BROMO NITRO PYRRYL METHYL KE-

$\begin{matrix} CBr C(NO_2) \\ | \\ >NH \\ | \\ CBr C-CO CH_3 \end{matrix}$ [206°] Long needles

Formed by the action of cold nitric acid upon di bromo pyrrole di methyl di ketone $CBr C-CO CH_3$, $\begin{matrix} | \\ >NH \\ | \\ CBr C-CO CH_3 \end{matrix}$, [171°], which is formed by passing bromine vapour into pyrrole di methyl di ketone (Ciamician a Silber, *B* 20, 699)

Di-bromo-nitro pyrrol methyl ketone

$\begin{matrix} CBr \\ | \\ >NH \\ | \\ C(NO_2) C-CO CH_3 \end{matrix}$ [175°] From nitro pyrrol methyl ketone [197°] and Br. Needles

BROMO NITRO-QUINOLINE $C_8H_6N(Br)(NO_2)$

[133°] Formed by nitration of bromo quinoline. Long glistening needles. Volatile undecomposed. Sol alcohol and ether, sl sol water. Weak base— $B \cdot H_2Cl_2PtCl_4$, short orange yellow prisms (La Coste, *B* 15, 1918)

DI BROMO NITRO QUINONE

$C_6H_4Br_2(NO_2)_2$ [6 2 3 4 1] [246°] Yellow plates, v sl sol hot water and cold alcohol. Formed by the action of a mixture of HNO_3 and H_2SO_4 upon the propionyl derivative of tri bromo phenol (Guareschi a Daccomo, *B* 18, 1174)

BROMO NITRO RESORCIN Ethyl ether

$C_6H_4Br(NO_2)(OH)(OEt)$ [114°] From ethyl (1, 2, 4) nitro resorcin and Br (Weselsky, *M* 1, 898)

Di-bromo nitro resorcin $C_6H_2Br_2NO_4$ α α $C_6H_4Br_2(NO_2)(OH)$, [147°] From (1, 2, 4) nitro resorcin [115°] in ether and Br (Weselsky, *A* 164, 7) Golden laminae— $Ba(C_2H_5BrNO_2)_2$ 4aq. Ethyl ether $C_6H_4Br_2(NO_2)(OEt)(OH)$ [1 5 3 2 6] [69°] From ethyl nitro resorcin and Br (W)

Di bromo nitro resorcin $C_6H_4Br_2(NO_2)(OH)$, [1 8 5 4 6] [117°] From (1, 2, 6) nitro resorcin and Br (W)

Bromo di nitro resorcin $C_6H_4Br(NO_2)(OH)_2$, [193°] Formed by nitrating di bromo nitroso resorcin or by brominating di nitro resorcin (Fèvre, *Bl* [2] 39, 590, *C R* 96, 790, Typke, *B* 16, 555) Orange needles, sl sol boiling alcohol— KA'' 3aq red needles— Na_2A'' 2aq— BaA'' 3aq— $(NH_4)A''$ 3aq

Acetyl derivative [135°], prisms

BROMO-NITRO-SALICYLIC ACID v BROMO-NITRO OXY BENZOIC ACID

DI-BROMO-NITROSO-RESORCIN

$C_6H_4Br_2(NO)(OH)_2$ From nitroso resorcin and Br (Fèvre, *Bl* [2] 39, 591) Yellowish needles (containing 2aq) which turn brown at 188° and decompose at 150°, insol benzene, sl sol cold water, v e sol alcohol

BROMO-NITROSO THYMOL

$C_8H_8MePrBr(NO)(OH)$ (c 135°) From nitroso thymene and Br (Mazzara a Descalzo, *G* 16, 196)

BROMO-NITRO-STYRENE Ph CBr CBrNO₂

[68] From di bromo nitro phenyl ethane $PhCBrH CBrHNO_2$ and aqueous NaOH (Priebe, *A* 225, 343) Golden needles or plates (from light petroleum). Smells something like hay, when freshly prepd from alcoholic solution by water it is soluble in alkalis, hence its constitution is as above, rather than $Ph CH CBr(NO_2)_2$

DI-BROMO-DI-NITRO-THIOPHENE

$C_4SBr_2(NO_2)_2$ [134°] Light yellow crystals. V sol hot alcohol. Formed by nitration of di- or tri bromo thiophene (Kreis, *B* 17, 2074, Rosenberg, *B* 18, 3029)

TRI-BROMO-NITRO-THIOPHENE

$C_4SBr_3(NO_2)$ [106°] Formed by nitration of tri bromo thiophene. Felted yellow needles. V sol ether, sl sol alcohol (Rosenberg, *B* 18, 3028)

BROMO NITRO-THYMOL

$C_8H_8MePrBr(NO_2)(OH)$ [101°] From bromo-nitroso thymol and K_2FeC_4 (Mazzara, *G* 16, 196)

BROMO-NITRO-TOLUENE

$C_6H_4Me(NO_2)Br$ [1 2 3] Oil. From bromo nitro *m* toluidine by nitrous gas and alcohol (Neville a Winther, *C J* 37, 630)

Bromo nitro toluene $C_6H_4Me(NO_2)Br$ [1 3 4] [32°] (256°) *SG* 12 1 631. From the corresponding nitro toluene by the diazo perbromide reaction (Neville a Winther, *C J* 37, 442) Formed also by nitrating *p* bromo toluene (Wroblewsky, *A* 168, 176) and by treating *m*-nitro toluene with Br and $FeBr_3$ at 70° (Scheufelen, *A* 231, 180)

Bromo nitro-toluene $C_6H_4Me(NO_2)Br$ [1 2 4],

[45°] (257°) From the corresponding nitro-toluidine [78°] by the diazo perbromide reaction (Beilstein a Kuhlberg, *A* 158, 340, Neville a Winther, *C J* 37, 441) Formed also, together with the preceding, by nitrating *p* bromo-toluene (W) Large monoclinic tables

Bromo nitro toluene $C_6H_4Me(NO_2)_2Br$ [1 2 or 6 3] [55°] (267°) Formed by nitrating *m* bromo toluene (W, Grete, *A* 177, 216).

Trimetric crystals, on reduction it gives bromo-*o*-toluidine

Bromo nitro toluene $C_6H_4Me(NO_2)Br$ [1 4 2] [77°] From $C_6H_4(CH_3)Br(NO_2)(NH_2)$ [1 2 4 5] (Neville a Winther, *C J* 39, 85) From *p* nitro-toluene, $FeBr_3$, and bromine (Scheufelen, *A* 231, 171) Also from diazo nitro toluene piperidine $C_6H_4Me(NO_2)N_2NC_6H_5$ and boiling $HBrAq$ (Wallach, *A* 235, 248) Needles

Bromo nitro toluene $C_6H_4Me(NO_2)Br$ [1 3 6] [78°] From *m* nitro toluene, $FeBr_3$, and bromine (Scheufelen, *A* 231, 179) From (3, 1, 6) nitro *o*-toluidine (N a W)

Bromo nitro toluene $C_6H_4Me(NO_2)Br$ [1 3 5] [81°] (N a W), [86°] (W), [270°] Formed (a) from bromo nitro *p*-toluidine [65°], (b) from nitro (5;1, 2) bromo *o*-toluidine [143°], or (c) from bromo nitro *o*-toluidine [181°] by the usual methods (Neville a Winther, *C J* 37, 431, Wroblewski, *A* 192, 203) Hence it can be prepared from a mixture of acetyl *o* and *p*-toluidines by successive bromination, nitration, saponification, and diazotisation

Bromo di nitro toluene $C_6H_3Me(NO_2)_2Br$ [104°] From *m* bromo toluene and fuming HNO_3 (Grote, *A* 177, 258)

Di bromo nitro toluene $C_6H_3Me(NO_2)Br_2$ [1 4 or 2 3] [c 57°] From $C_6H_4(CH_3)Br_2$ [28°] by nitration (Neville a Winther, *C J* 37, 434)

Di bromo nitro-toluene $C_6H_3Me(NO_2)Br_2$ [1 4 2 6] [58°] From $C_6H_4(CH_3)(NH_2)(NO_2)Br_2$ [124°-130°] by ethyl nitrite (Neville a Winther, *C J* 37, 445) Also from (2,4,1) bromo nitro toluene, $FeBr_3$, and Br (Scheufelen, *A* 231, 178)

Di bromo nitro toluene $C_6H_3Me(NO_2)Br_2$ [1 5 3 4] [63°] From bromo nitro toluuidine, $C_6H_4(CH_3)(NO_2)(NH_2)Br$ [1 5 4 3] by diazo per bromide reaction (Neville a Winther, *C J* 37, 447) Colourless plates (from alcohol)

Di bromo - nitro - toluene $C_6H_3Me(NO_2)Br_2$ [1 3 2 5] [70°] From bromo-nitro-*o*-toluidine, [143°], by diazo perbromide reaction (Neville a Winther, *C J* 37, 448)

Di - bromo nitro - toluene $C_6H_3MeBr_2(NO_2)$ [1 4 6 2 ?] [80°] By nitrating di bromo toluene from di bromo *m*-toluidine, [75°] (Neville a Winther, *C J* 37, 441)

Di bromo nitro - toluene $C_6H_3Me(NO_2)Br_2$ [1 6 3 4] [87°] Formed by nitrating the corresponding di bromo toluene Converted by reduction and diazo reaction into (2, 4, 5, 1) tri-bromo toluene [113°] (Neville a Winther, *C J* 39, 83)

Di - bromo nitro toluene $C_6H_3Me(NO_2)Br_2$ [1 4 2 5] [88°] From $C_6H_4(CH_3)(NO_2)(NH_2)Br$, [181°] by the diazo perbromide reaction Formed also by nitrating $C_6H_4(CH_3)Br_2$ [1 2 5] Converted by reduction and diazotisation into (2, 4, 5, 1) tri-bromo toluene [113°] (Neville a Winther, *C J* 37, 445, 39, 83)

Di - bromo - nitro toluene $C_6H_3Me(NO_2)Br_2$ [1 3 5 6] [106°] From bromo nitro *o*-toluidine, [181°], by exchange of NH_2 for Br (Neville a Winther, *C J* 37, 433),

Di bromo nitro toluene $C_6H_3Br(NO_2)Phenyl$ di bromo nitro methane Colourless oil Formed by the action of bromine upon an aqueous solution of the di sodium salt of nitro benzylidene phthalide

$C_6H_3 \begin{matrix} \swarrow C(ONa) \\ \searrow CO \end{matrix} \begin{matrix} \swarrow CN_2(NO_2) \\ \searrow O \end{matrix} C_6H_5$ Volatile with steam (Gabriel a Koppe, *B* 19, 1145)

Di bromo di nitro toluene $C_6H_2Me(NO_2)_2Br_2$ [158°] Formed by nitrating $C_6H_4(CH_3)Br_2$, [39°] (Neville a Winther, *C J* 37, 437)

Di bromo di nitro-toluene $C_6H_2Me(NO_2)_2Br_2$ [105°] Formed at the same time as the preceding (N a W)

Di-bromo di nitro-toluene $C_6H_2Me(NO_2)_2Br_2$ [1 ? ? 2 6] [161°] By nitration of (2, 6, 1)-di bromo toluene (N a W)

Tri - bromo nitro toluene $C_6H_2Me(NO_2)Br_3$ [1 4 2 5 6] [106°] From di bromo nitro *m*-toluidine, [125°-130°], by the diazo perbromide reaction White needles (Neville a Winther, *C J* 39, 85)

Tri - bromo nitro - toluene $C_6H_2Me(NO_2)Br_3$ [107°] [1 x 2 3 4] Formed by nitrating tri-bromo toluene, [44°] (N a W)

Tri - bromo nitro toluene $C_6H_2Me(NO_2)Br_3$ [1 3 2 4 6] [215°] Formed by nitrating tri-bromo toluene [70°] (Wroblewski, *A* 168, 195)

Tri bromo di nitro toluene $C_6H_2Me(NO_2)_2Br_3$ [1 ? ? 2 3 4] [217°-220°] Formed by nitrating tri-bromo toluene [44°] (Neville a Winther, *B* 13, 975)

Tetra bromo nitro toluene $C_6H_2Me(NO_2)Br_4$ [1 4 2 3 5 6] [218°] (N a W), [227°] (S). Formed by nitration of $C_6H_4(CH_3)Br_4$, [117°] (Neville a Winther, *C J* 37, 450) From (2,4,1)-bromo nitro toluene, bromine, and $FeBr_3$ (Scheufelen, *A* 231, 179)

Tetra bromo nitro-toluene $C_6H_2Me(NO_2)Br_4$ [1 2 3 4 5 6] [212°] From tetra bromo toluene, [111°]

Tetra bromo nitro toluene $C_6H_2Me(NO_2)Br_4$ [1 5 2 3 4 6] [216°] By nitration of tetra-bromo toluene, [108°]

BROMO - NITRO - TOLUENE SULPHONIC ACIDS $C_6H_3MeBr(NO_2)SO_3H$ The six following acids of this constitution have been described

I Formed by nitrating *o*-bromo toluene sulphonic acid (Muller, *A* 169, 42, Pagel, *A* 176, 299) Deliquescent — PbA' , 2aq — NaA' , aq — KA' — BaA' , 2aq

II By the action of fuming HNO_3 on (2,1,4)-bromo toluene sulphonic acid or on (2,1,4)-*o*-toluidine sulphonic acid in the latter case the resulting diazo nitro toluene sulphonic acid is boiled with $HBrAq$ (Hayduok, *A* 172, 219, 174, 347) Minute needles, may be reduced to (1,3,4) *m*-toluidine sulphonic acid — BaA' , 3aq

Chloride $C_6H_3MeBr(NO_2)SO_2Cl$ [220°]
Amide $C_6H_3MeBr(NO_2)(SO_2NH_2)$ Does not melt below 200°

III From *m* bromo toluenesulphonic acid and HNO_3 , (Wroblewski, *A* 168, 169) — CaA' , 4½aq — BaA' , 8½aq — PbA' , 8aq

IV Formed by nitrating (3,1,2 or 6) *m*-bromo toluene sulphonic acid (Weckwarth, *A* 172, 200) — NaA' — CaA' , 3aq — BaA' , 3½aq

V Formed by nitrating (4,1,2) *p*-bromo-toluene sulphonic acid (Hasselbarth, *A* 169, 29), Deliquescent laminae — AgA' — BaA' , 2aq — CaA' , 6aq — PbA' , 8aq — SrA' , 7aq

VI Formed by nitrating (4,1,8) *p* bromo toluene sulphonic acid (H) Deliquescent needles —BaA', aq —PbA', 2} aq —SrA', 5 aq

Di bromo nitro toluene di sulphonic acid
 $C_6H_4Br_2(NO_2)Me SO_3H$ From *p* bromo toluene di sulphonic acid and boiling fuming HNO_3 (Kornatzki, A 221, 197) —KA' aq —BaA', 3} aq

BROMO-NITRO-*p*-TOLUIC ACID $C_6H_4BrNO_2$, $se C_6H_4MeBr(NO_2)(CO_2H)$ [176°] From bromo *m* toluic acid and HNO_3 (Fittig, A 147, 34) —CaA', 3 aq —BaA', 3 aq

Bromo nitro *p* toluic acid
 $C_6H_4MeBr(NO_2)(CO_2H)$ [4 2 x 1] [200°] S
 1 at 15° Formed by boiling bromo cymene (from thymol) with HNO_3 (S G 13) Laminæ —BaA', 4 aq (Fileti a Crosa, G 16, 297)

Bromo nitro-*p*-toluic acid
 $C_6H_4MeBr(NO_2)(CO_2H)$ [4 3 x 1] [170°–180°] From bromo-*p*-toluic acid and fuming HNO_3 (Landolph, B 5, 268) Needles (from water) —BaA', aq

BROMO-NITRO-*o*-TOLUIDINE

$C_6H_4Me(NH_2)(NO_2)Br$ [1 2 3 5] [139°] (W), [148°] (N a W) Formed by nitrating bromo acetyl-*o*-toluidine, $C_6H_4Me(NHAc)Br$ [1 2 5], and removing acetyl (Wroblewski, A 192, 206, Neville a Winther, C J 37, 431) Gives, by nitrous gas and alcohol, $C_6H_4Me(NO_2)Br$, [81°] whence $C_6H_4Me(NH_2)Br$, [35°]

Bromo-nitro-*o*-toluidine

$C_6H_4Me(NH_2)(NO_2)Br$ [1 2 5 3] [181° cor] By brominating $C_6H_4Me(NH_2)(NO_2)$ [1 2 3], [128°] (N a. W) Converted by nitrous gas and alcohol into $C_6H_4Me(NO_2)Br$, [81°] whence $C_6H_4Me(NH_2)Br$ [86°]

Bromo nitro-*m*-toluidine

$C_6H_4Me(NH_2)(NO_2)Br$ [1 3 6 5] [89°] Formed by nitrating bromo acetyl *m* toluidine, and then removing acetyl by H_2SO_4 (2 vols) and water (1 vol) (Neville a Winther, C J 37, 630)

Bromo-nitro-*m*-toluidine

$C_6H_4Me(NH_2)(NO_2)Br$ [1 3 2 6] [103°] Is formed in small quantity in the preparation of its isomeride [181°]

Bromo-nitro-*m*-toluidine

$C_6H_4Me(NH_2)(NO_2)Br$ [1 5 4 2] [181°] From the acetyl derivative by saponification

Acetyl derivative [110°–121°] Formed by nitration of bromo acetyl *m* toluidine (Neville a. Winther, C J 37, 444)

Bromo-nitro-*p* toluidine

$C_6H_4Me(NH_2)(NO_2)Br$ [1 4 3 5] [64 5°] Got by saponifying its acetyl derivative Orange needles Converted by nitrous gas and alcohol into bromo nitro toluene [86°] (cf Hand, A 234, 157)

Acetyl derivative [211°] From bromo acetyl *p* toluidine and HNO_3 Or from acetyl *p* toluidine by successive nitration and bromination (N a W) White needles (from alcohol or dilute acetic acid) (Wroblewski, A 192, 202)

Di-bromo nitro-*m* toluidine

$C_6H_4Me(NH_2)(NO_2)Br_2$ [1 5 4 2 6] [124°–180°] From the acetyl derivative of bromo nitro *m* toluidine [181°] by heating with H_2SO_4 (2 vols) and water (1 vol.) and subsequent treatment with bromine (Neville a. Winther, C J 37, 444)

BROMO-NITRO-*m*-XYLENE $C_6H_4Me_2(NO_2)Br$ (260°–265°) From bromo *m* xylene and cold fuming HNO_3 Liquid (Fittig, A 147, 81)

Di bromo-nitro-*o* xylene $C_6H_4Me_2(NO_2)Br$, [1 2 3 4 5] [141°] Obtained by nitration of di bromo-*o* xylene $C_6H_4(CH_3)_2Br_2$ [1 2 4 5] with cold fuming HNO_3 Colourless needles (from alcohol) (Tohl, B 18, 2561)

Di bromo nitro *m* xylene $C_6H_4Me_2(NO_2)Br$, [108°] From di bromo-*m* xylene and HNO_3 Needles (F)

Di bromo nitro *p* xylene $C_6H_4Me_2(NO_2)Br$, [112°] From di bromo *p* xylene and fuming HNO_3 (F) Needles

Di bromo di nitro *o* xylene $C_6(CH_3)_4Br_2(NO_2)_2$, [1 2 4 5 3 6] [c 250°] Small needles Nearly insol cold alcohol Formed by nitration of di bromo *o* xylene $C_6H_4(CH_3)_2Br_2$ [1 2 4 5] (Töhl, B 18, 2561)

BROMO-NITRO XYLENE SULPHONIC ACID
 $C_6H_4Me_2Br(NO_2)(SO_3H)$ [1 3 6 4] From nitro-*m* xylidine sulphonic acid by diazo reaction (Sartig, A 230, 341, B 16, 2190) Rhombic plates, v sol water and alcohol —BaA', 3} aq —KA' aq

BROMO NONYLIC ACID v BROMO ENNOIC ACID

DI-BROMO-OCTADECANE $C_{18}H_{36}Br_2$ Octadecylene bromide [24°] Silvery plates S1 sol alcohol Formed by the addition of Br (1 mol) to octadecylene (Krafft, B 17, 1373)

BROMO-OCTANE v OCTYL BROMIDE

Di bromo octane $C_8H_{18}Br_2$ Octylene bromide From Br and octylene derived from castor oil (Rubien, A 142, 297) or that from paraffin (Thorpe a Young, Pr 21, 193) Non volatile oil
Tetra bromo octane $C_8H_8Br_4$ Caprylidene tetra bromide From bromo octylene and Br Oil

BROMO-OCTONENE C_8H_8Br (204°) From $C_8H_{16}Br$, (v *supra*) and alcoholic KOH (R)

BROMO-OCTYL-BENZENE $C_8H_7(C_6H_5)Br$ (285°–287°) Formed by bromination of octyl benzene Oil (Ahrens, B 19, 2719)

BROMO OXYLENE $C_8H_{16}Br$ (185°) From di bromo octane and alcoholic KOH (Rubien, A 142, 297) With Br it gives an oily tri bromo decane

Di-bromo octylene $C_8H_{16}Br_2$ S G 14 1 568
 Conylene bromide From conylene and Br (Wertheim, A 123, 182)

BROMO OCTYL THIOPHENE

$C_8SH_7(C_6H_5)Br$ (285°–290°) Colourless oil solidifying to plates at 5° V sol ether, insol water Formed by shaking octyl thiophene with bromine water (Schweinitz, B 19, 644)

BROMO OLEIC ACID $C_{18}H_{33}BrO_2$ From di bromo stearic acid and alcoholic KOH (Overbeck, A 140, 47)

Di bromo oleic acid $C_{18}H_{33}Br_2O_2$ From stearic acid and Br (O)

BROMO OREIN $C_8H_7Me(OH)Br$ [135°] From orein and bromine water (Lamparter, A 134, 258) Crystals, m sol hot water, v e sol alcohol and ether Solutions are ppd. by lead subacetate

Di bromo orein

Methyl derivative
 $C_8H(CH_3)(OMe)(OH)Br$, [146°] White needles. Prepared by bromination of the mono methyl ether of orein (Tiemann a Streng, B 14, 2002)

Di methyl derivative
 $C_8H(CH_3)_2(OMe)_2Br$, [160°] Colourless plates. Sol alcohol, ether, and benzene, insol. water and ligroin Prepared by bromination of the di methyl ether of orein (B 14, 2001).

Tri bromo-orein $C_6(H_2)Br_3(OH)_x$ [103°]
From orein and Br (Stenhouse, *Tr* 1848, 87, Laurent a. Gerhardt, *A Ch* [3] 24, 317, Lam-
parter, *A* 134, 257, Hesse, *A* 117, 311, Sten-
house a. Groves, *A* 203, 298) Is formed by
heating penta bromo orein with formic acid
Needles, insol water, sol alcohol and ether

Diacetyl derivative [143°] White
needles Formed by the action of Ac_2O on
penta bromo orein (Claassen, *B* 11, 1440)

Penta bromo orein $C_6H_2Br_5O_2$ *ie*
 $C_6MeBr_5(OBr)_2$? [126°] From orein and excess
of bromine water Triclinic crystals (from CS_2)
At 160° it gives off Br_2 , leaving $C_6H_2Br_3O_2$ (Sten-
house, *A* 163, 180, Liebermann a. Dittler, *A*
169, 252)

Bromo β -orein in Bromo betorcin

DI BROMO OXAL ETHYLENE *v* **DI BROMO-
METHYL ETHYL GLYOXALINE**

BROMO OXINDOLE *v* **OXINDOLE**

BROMO OXY ACRYLIC ACID *Phenyl
derivative* $C_6H_4BrO_2$ *ie* $CHBr C(Ph) CO_2H$
[138°] From phenyl oxy mucobromic acid
 $CHO CBr C(Ph) CO_2H$ and KOH (Hill a.
Stevens, *Am* 6, 190) Needles (from water),
v *e* sol alcohol and ether — KA' — BaA' , 5aq —
 CaA' , 5aq — AgA'

BROMO OXY AMIDO BENZOIC ACID

Methyl derivative $C_6H_4BrNO_2$ *ie*
 $C_6H_4Br(OMe)(NH_2)CO_2H$ [185°] *Bromo amido-
amic acid* From the corresponding nitro acid
Needles, sl sol water — CaA' , 5aq — BaA' , 2aq
— $HA'Cl$ [186°] (Balbiano, *G* 14, 245)

BROMO DI OXY ANTHRAQUINONE

$C_{10}H_6BrO_2$ *ie* $C_{10}H_4(OH)_2Br$ *Bromo alizarin*
From alizarin (3 pts) and Br ($2\frac{1}{2}$ pts) in CS_2 at
190° (Peikin, *C J* 27, 401) Tufts of orange
needles, may be sublimed KOH aq forms a
blue solution, exhibiting the same absorption
bands as alizarin HNO_3 forms phthalic acid
The same bromo alizarin, or an isomeride, is
formed by treating tri bromo anthraquinone with
KOH It melts at 280° (Diehl, *B* 11, 190)

Bromo tri oxy anthraquinone

$C_{10}H_2(OH)_3Br$ *Bromo purpurin* [276°]
From Br and purpurin, or its carboxylic acid,
or by warming di bromo purpurin (*v infra*)
with conc H_2SO_4 Red needles (Plath, *B* 10,
615, 1619, Schunck a. Roemer, *B* 10, 554)

(*B* 1,3,2) **Di bromo oxy anthraquinone**

$C_{10}H_4Br_2O_2$ *ie* $C_{10}H_2(C_2O_2)C_2HBr_2(OH)$ [208°]
Formed, together with di bromo phenol by heat-
ing tetra bromo phenol phthalein with excess of
 H_2SO_4 at 150° (Baeyer, *A* 202, 136) Slender
yellow needles, its alcoholic solution shows
reddish fluorescence Its solution in alkalis is
reddish brown NaOH at 200° gives alizarin

Acetyl derivative $C_{10}H_4AcBr_2O_2$ [190°]

Di bromo di oxy anthraquinone

$C_{10}H_2(OH)_2Br_2$ *Di bromo alizarin* [170°]
Prepared by the action of Br in presence of I on
alizarin Small brownish red needles Com-
bines with mordants (Diehl, *B* 11, 190)

Di-bromo-di-oxy-anthraquinone

$C_{10}H_2(OH)_2Br_2$ *Di bromo purpuroanthrin*
[227°–230°] (*P*), [231°] (*S* a. *R*) From pur-
puroanthrin and Br (Plath, *B* 9, 1205) From
munjistan and Br (Schunck a. Roemer, *C J* 33,
424) Orange needles (from HOAc) Warm
conc H_2SO_4 forms bromo purpurin

Salt — $(NH_4)_2A''$.

Tri bromo tri oxy-anthraquinone

$C_{10}H_2O_3(OH)_3Br_3$ *Tri-bromo flavopurpurin*.
[284°] From flavopurpurin in HOAc and Br
Orange needles Its alkaline solutions are orange
(Schunck a. Roemer, *B* 10, 1225).

Tetra bromo-di oxy anthraquinone

$C_{10}H_2O_3(OH)_2Br_4$ *Tetra bromo alizarin*. From
alizarin and excess of iodine bromide at 180°
Does not combine with mordants (Diehl, *B* 11,
191)

BROMO OXY BENZOIC ACID $C_6H_4BrO_2$ *ie*
 $C_6H_4Br(OH)CO_2H$ [3 2 1] *Bromo salicylic acid*
[184°] (*L* a. *G*), [220°] (*H* a. *E*) From the
corresponding bromo amido benzoic acid by ex-
change of NH_2 for OH (Hubner a. Emmerling,
Z 1871, 709) or from (3, 5, 2, 1) bromo amido
oxy benzoic acid by eliminating NH_2 (Lellmann
a. Grothmann, *B* 17, 2725) Needles, *v* sl sol
cold water, *v* e sol alcohol $FeCl_3$ gives a
violet colouration — CaA' , 12aq *v* sol water —
 BaA' , 3aq prisms — PbA' , 2 (*H*) — $PbC_2H_3BrO_2$

Bromo o oxy-benzoic acid $C_6H_4Br(OH)(CO_2H)$
[5 2 1] [165°] From salicylic acid and Br or
PBr, (Gerhardt, *A Ch* [3] 7, 217, Cahours, *A Ch*
[3] 10, 441, 13, 99, Henry, *B* 2, 275, *H* a. *E*)
Also from the corresponding amido *m* bromo-
benzoic acid (*H* a. *E*) Needles (from water)
 $FeCl_3$ gives a violet colouration — BaA' , 3aq —
 PbA' , 3 — $PbC_2H_3BrO_2$ — CuA' , — AgA'

Methyl ether MeA' [38°] (Henry), [61°]
(Peratoner, *G* 16, 405) [265°] From methyl
salicylate and Br or PBr, Trimetric prisms or
needles Coloured violet by $FeCl_3$

Methyl derivative $C_6H_4Br(OMe)CO_2H$
[119°] — BaA' , 3aq — CaA' , 4aq — AgA' aq
Methyl ether $C_6H_4Br(OMe)CO_2Me$ [40°]
(295°) (*P*)

Ethyl derivative $C_6H_4Br(OEt)CO_2H$
[130°] — BaA' , 4aq — CaA' , 2aq *Methyl ether*
 $C_6H_4Br(OEt)CO_2Me$ [49°] (301°)

Propyl derivative $C_6H_4Br(OPr)CO_2H$.
[62°] *Methyl ether* $C_6H_4Br(OPr)CO_2Me$
(323°)

Isopropyl derivative $C_6H_4Br(OPr)CO_2H$.
[101°] *Methyl ether* (304°)

Bromo-p oxy benzoic acid *Methyl der-
ivative* $C_6H_4Br(OMe)CO_2H$ [3 4 1] *Bromo-
anisic acid* [214°] [218° cor]

Formation —1 From anisic acid and Br
(Laurent, Cahours, *A* 56, 311, Salkowski, *B*
7, 1013) —2 By oxidising the methyl ether of
bromo *p* cresol (Schall a. Dralle, *B* 17, 2531)

Properties —Needles, may be distilled or
sublimed Insol water

Salts — AgA' — BaA' , 3aq — BaA' , 4aq —
 CaA' , 6aq — CuA' , 2aq — MgA' , 5aq — NaA' , 2aq.
— PbA' , 3aq — ZnA' , 3aq

Ethyl ether $C_6H_4Br(OMe)(CO_2Et)$ [74°]
(Crespi, *G* 11, 419)

Amide $C_6H_4Br(OMe)(CO_2NH_2)$ [186°];
insol water

Bromo-p-oxy-benzoic acid *Methyl der-
ivative* $C_6H_4Br(OMe)CO_2H$ [212°] *Ethyl bromo-
anisate* [74°] is converted into an isomeride
[60°] by heating with NaOEt at 180° for 20
hours, on saponification it yields the acid which
crystallises in needles, sl sol water Potash
fusion forms protocatechuic acid HNO_3 gives
the methyl ether of (2,4,6,1)-bromo-di-nitro-
phenol.

Salt — ZnA' , 4aq (Balbiano, *G* 11, 409).

Ethyl ether EtA' [60°] (*v supra*) This acid is possibly identical with the preceding

Bromo di oxy benzoic acid *Methyl derivative* $C_6H_4Br(OH)(OMe)CO_2H$ [x 4 3 1]

Bromo vanillic acid [193°] From its acetyl derivative Needles (containing aq) Acetyl derivative $C_6H_4Br(OAc)(OMe)CO_2H$ [167°] From acetyl vanillic acid and Br (Matsumoto, *B* 11, 138)

Di methyl derivative $C_6H_4Br(OMe)_2CO_2H$ [x 4 3 1] **Bromo veratric acid** [184°] From veratric acid and Br (M)

Methylene derivative $C_6H_4Br(O,CH_2)CO_2H$ or $C_6H_4(OCHBr)CO_2H$ **Bromo piperonylic acid** [205°] From bromo piperonal and $KMnO_4$ (Fitting & Mielck, *A* 172, 158)

Bromo di oxy benzoic acid $C_6H_4Br(OH)_2CO_2H$ [x 1 3 5] [253°] From *s* di oxy benzoic acid and bromine water (Barth & Senhofer, *A* 164, 115) Needles (containing aq) Potash fusion forms gallic acid $FeCl_3$ gives a yellowish brown colour $-CaA'_2, 8aq - AgA'$

Bromo di oxy benzoic acid $C_6H_4Br(OH)_2CO_2H$ [x 2 6 1] [184°, anhydrous] From *c* di oxy benzoic acid in ether and Br (Zehenter, *M* 2, 480) Prisms (containing aq) $FeCl_3$ gives a violet colour to its aqueous solution $-AgA'_2aq - BaA'_2, 7\frac{1}{2}aq - CuA'_2, 4\frac{1}{2}aq - PbA'_2, 3aq - KA'_2, 1\frac{1}{2}aq$

Bromo tri oxy benzoic acid $C_6H_4Br(OH)_3CO_2H$ **Bromo gallic acid** [above 200°] From gallic acid and Br (Hlasiewicz, *A* 142, 250, Grimaux, *Z* 1867, 431) Monoclinic, sl sol water

Di bromo-o-oxy-benzoic acid $C_6H_4Br_2(OH)CO_2H$ [5 3 2 1] *Di bromo salicylic acid* [219°] (R), [223°] (L & G) From salicylic acid and Br or from (3,5,2,1) bromo amido salicylic acid by the diazo reaction (Cahours, *A Ch* [3] 10, 339, 13, 102, Rollwage, *B* 10, 1707, Lellmann & Grothmann, *E* 17, 2727) Gives a violet colour with $FeCl_3$. Heated with dilute H_2SO_4 it gives (3,5,2)-di bromo phenol [36°] $-BaA'_2, 4aq$

Methyl ether $C_6H_4Br(OH)CO_2Me$ [149°], from methyl salicylate and Br (Peratoner, *G* 16, 405) Long needles, sl sol alcohol

Methyl derivative $C_6H_4Br_2(OMe)_2CO_2H$ [194°] $-Salt BaA'_2, 2\frac{1}{2}aq$ **Methyl ether** $C_6H_4Br_2(OMe)_2CO_2Me$ [53°], needles

Ethyl derivative $C_6H_4Br_2(OEt)_2CO_2H$ [156°], white needles **Methyl ether** $C_6H_4Br_2(OEt)_2CO_2Me$ [43°], needles

Di bromo-o oxy benzoic acid $C_6H_4Br_2(OH)CO_2H$ [4 3 2 or 6 1] [218°] From (4,3,1) di bromo benzoic acid [229°] by nitration, reduction, and diazotisation (Smith, *B* 10, 1706) Gives a violet colour with $FeCl_3$

Di bromo-o oxy benzoic acid $C_6H_4Br_2(OH)CO_2H$ [221°] Formed as a by-product in converting (5,2,1) bromo nitro benzoic acid [250°] into di bromo benzoic acid by the diazo reaction (Hubner & Lawrie, *B* 10, 1706) $FeCl_3$ gives a violet colour

Di-bromo-p-oxy benzoic acid $C_6H_4Br_2(OH)CO_2H$ [268°] From di bromo anisic acid and conc HCl (Alecci, *G* 15, 242) One of the products of the dry distillation of sodium di bromo anisate (Balbiano, *G* 13, 69) Long needles, insol. water, sol alcohol and ether

$FeCl_3$ turns its solutions yellowish red Sodium amalgam forms *p*-oxy benzoic acid $-CaA'_2, 8aq$

Methyl derivative $C_6H_4Br_2(OMe)_2CO_2H$ [3 5 4 1] *Di bromo-anisic acid* [207°] (R), [214°] (C) From anisic acid, Br, and water at 120° (Reinecke, *Z* 1866, 366, Crespi, *G* 11, 425) Converted by prolonged action of Br and water into tri-bromo-anisol [87°] $-NaA'_2, 3aq - AgA'_2 - BaA'_2, 4\frac{1}{2}aq$ **Ethyl ether** $C_6H_4(OMe)(CO_2Et)$ [88°], plates

Di bromo di oxy benzoic acid $C_6H_4Br_2(OH)_2CO_2H$ [214°] From (3, 2, 1) di oxy benzoic acid and Br (Zehenter, *M* 2, 475) Needles (containing aq), m sol hot water $FeCl_3$ turns its solution violet, conc H_2SO_4 gives a green colour Heating with water forms di bromo resorcin $-KA'_2, 3\frac{1}{2}aq - CaA'_2, 8\frac{1}{2}aq - PbC_6H_4Br_2O_4 - CuA'_2, aq - AgA'$

Di bromo tri oxy benzoic acid $C_6H_4Br_2(OH)_3CO_2H$ *Di bromo gallic acid* [140°] (G), [150°] (E) From gallic acid and Br (Grimaux, *Z* 1867, 431, Etth, *B* 11, 1882) $FeCl_3$ gives a blue black colour in its aqueous solution

Tri bromo o oxy benzoic acid $C_6H_4Br_3(OH)CO_2H$ *Tri bromo salicylic acid* From Br and salicylic acid Small prisms, insol water (Cahours, *A Ch* [3] 13, 104)

Tri bromo m oxy benzoic acid $C_6H_4Br_3(OH)CO_2H$ [147°] From *m* oxy benzoic acid (1 mol) and Br (3 mols) (Werner, *Bl* [2] 46, 276)

Tri bromo di oxy benzoic acid $C_6H_4Br_3(OH)_2CO_2H$ [183°] From (5, 3, 1) di oxy benzoic acid and Br (Barth & Senhofer, *A* 159, 225) Tables (from water) Potash fusion reproduces *s* di oxy benzoic acid

BROMO o - OXY BENZOIC ALDEHYDE C_6H_4BrO *ie* $C_6H_4Br(OH)CHO$ **Bromo salicylic aldehyde** [99°] From salicylic aldehyde and Br or PBr_3 (Löwig, *P* 46, 57, 383, Piria, *A Ch* [2] 69, 281, Henry, *B* 2, 275) Laminæ, insol water, sol alcohol and ether Combines with $KHSO_5$

Methyl derivative $C_6H_4Br(OMe)CHO$ [114°] From methyl salicyl aldehyde and Br (Perkin, *A* 145, 304) Flat prisms (from alcohol)

Ethyl derivative $C_6H_4Br(OEt)CHO$ [68°], prisms

Bromo p oxy benzoic aldehyde $C_6H_4Br(OH)CHO$ [180°] From *p* oxy benzoic aldehyde and Br $\sqrt{}$ sol alcohol and ether, $\sqrt{}$ sl sol water Combines with $KHSO_5$ (Hertzfeld, *B* 10, 2198)

Di bromo-o oxy benzoic aldehyde $C_6H_4Br_2(OH)CHO$ *Di bromo salicylic aldehyde* Prisms From salicylic aldehyde and Br (Heerlein, *J pr* 32, 65)

Phenyl hydrazide $C_6H_4Br_2(OH)CHN_2.HPh$ [148°], $\sqrt{}$ sol alcohol, benzene, ether, and $CHCl_3$, insol water The mono acetyl derivative $C_6H_4Br_2(OAc)CHN_2.HPh$ forms fine needles [188°], nearly insoluble in ether The di acetyl derivative $C_6H_4Br_2(OAc)_2CHN_2.HPh$ crystallises in white needles, [158°], easily soluble in ether, it is formed by brominating the di acetyl derivative of the phenyl hydrazide of salicylic aldehyde (Rossing, *B* 17, 8008)

Di-bromo p oxy benzoic aldehyde $C_6H_4Br_2(OH)CHO$ [181°] From *p* oxy benzoic

aldehyde (1 mol) and Br (2 mols) (Werner, *Bl* [2] 46, 277)

BROMO OXY BUTYRIC ACID $C_4H_7BrO_2$, [102°] From di bromo butyric acid and baryta Laminæ (Petrieff & Eghis, *J R* 7, 179) — BaA' , — AgA'

Bromo-oxy butyric acid

$CH_3CHBrCH(OH)CO_2H$ or $CH_3CH(OH)CHBrCO_2H$ An uncrystallisable syrup obtained as a residue when β di bromo butyric acid is distilled with water (C Kolbe, *J pr* 133, 389, cf Erlenmeyer & Müller, *B* 15, 49)

Bromo-oxy butyric acid

$CH_3CHBrCH(OH)CO_2H$ or $CH_3CH(OH)CHBrCO_2H$ [90°] From β -methyl-glycidic acid $O < \begin{smallmatrix} CH_2 \\ CH \end{smallmatrix} CO_2H$ and HBr (Mehkoft, *Bl* [2] 43, 116) Prisms Probably identical with the preceding

Bromo oxy iso butyric acid

$CH_3BrC(OH)MeCO_2H$ [101°] Formed by boiling di bromo iso butyric acid with water, and extracting with ether (K) Also from HBr and α methyl glycidic acid $O < \begin{smallmatrix} CH_2 \\ CMe \end{smallmatrix} CO_2H$ Needles, sol hot benzene, insol $CHCl_3$ and CS_2 ; Not affected by boiling water Reduced by the action of sodium amalgam on its aqueous solution, kept neutral by H_2SO_4 , to oxy iso butyric acid, [79°]

BROMO OXY CINNAMIC ACID ν Bromo-coumaric acid

BROMO (B 4) OXY (Py 4) ETHYL QUINOLINE TETRA HYDRIDE $C_{12}H_{11}Br(OH)EtN$

Ethyl ether [35°], long monoclinic prisms, $abc = 0.7902 \ 1.05828$ Formed by bromination of ethyl kairine (ethyl ether of oxy ethyl quinoline tetra hydride), or by ethylation of the ethyl ether of bromo oxy quinoline tetra hydride The picrate forms yellow needles [174°] (Fischer & Renout, *B* 17, 762)

DI BROMO OXY INDONAPHTHENE

$C_{12}H_7Br_2O$ ν $C_6H_4 < \begin{smallmatrix} CO \\ CBr \end{smallmatrix} > CBr$ Phenylene di bromo acetylene ketone [123°] Obtained by heating di bromo cinnamic acid $C_6H_4BrCBrCO_2H$ with conc H_2SO_4 ; Yellow needles

Oxim $C_{12}H_7Br_2(OH)$ [195°], yellow needles

Anilide [170°], red needles

Di bromide $C_{12}H_7OBr_2$, [124°], prisms (Roser, *B* 20, 1273)

BROMO OXY MALEIC ACID Phenyl derivative $CO_2H CBr C(Ph) CO_2H$ [104°] From the phenyl derivative of oxy mucobromic acid and Ag_2O (Hill & Stevens, *Am* 6, 187) Needles — AgA'

p BROMO ω OXY MESITYLENE $C_{11}H_7BrO$ ν $C_6H_3(CH_3)_2Br(CH_2OH)$ [53.41] p Bromo-mesityl alcohol [66°] Obtained from p di-bromo mesitylene (p mesityl bromide) by treatment with KOAc and saponification of the acetate Pointed needles ν sol alcohol, ether, and benzene, sl sol cold petroleum ether, insol cold water Decomposes on distillation with separation of H_2O and formation, amongst other products, of p bromo mesitylenic aldehyde $C_6H_3(CH_3)_2Br(CH=O)$ By oxidising agents it is readily converted into p bromo mesitylenic acid [214°] (Schramm, *B* 19, 213)

endo-Bromo α, ω , di oxy mesitylene

$C_{12}H_7Br(CH_3)(CH_2OH)_2$ [121°] S $3\frac{1}{2}$ at 100° From the corresponding tri bromo mesitylene

(200°–215°) by boiling with water and $PbCO_3$ (Colson, *A Ch* [6] 6, 98, *C R* 97, 177) Pearly scales, ν sl sol cold water, m sol alcohol Boiling $HClAq$ forms $C_6H_7Br(CH_3)(CH_2Cl)_2$, [75°]

BROMO OXY β METHYL CUMARILIC ACID

$C_6H_7Br(OH) < \begin{smallmatrix} (1) \\ CMe \\ (2) \\ O \end{smallmatrix} > CO_2H$ [221°] Formed

by boiling bromo β methyl umbelliferon dibromide $C_6H_7Br(OH) < \begin{smallmatrix} CMeBr \\ O \end{smallmatrix} > CHBr$ with alcoh

holie KOH Colourless needles ν sol alcohol and ether, sl sol benzene, insol water Cold H_2SO_4 gives a colourless solution which becomes violet on heating $FeCl_3$ gives a yellow colouration with the alcoholic solution (Pechmann & Cohen, *B* 17, 2134)

BROMO OXY METHYL ETHYL PYRIMIDINE

$C_6H_7C < \begin{smallmatrix} N(COH) \\ N(CCH_3) \end{smallmatrix} > CBr$ [195°] Formed by bromination of oxy methyl ethyl pyrimidine Long colourless glistening needles Sl sol water $C_6H_7N_2Br(OH)aq$ very soluble long white needles (Pinner, *B* 20, 2362)

BROMO OXY DI METHYL PYRIMIDINE

$CH_2C < \begin{smallmatrix} N(COH) \\ N(CCH_3) \end{smallmatrix} > CBr$ Formed by bromination of oxy di methyl pyrimidine The hydrobromide ($B'Br$) forms colourless needles, m sol water, ν alcohol (Pinner, *B* 20, 2361)

(*Py* 2,3,1) **BROMO OXY METHYL QUINOLINE**

$C_{10}H_8NOBr$ ν $C_6H_4 < \begin{smallmatrix} CMeBr \\ N \\ OH \end{smallmatrix} > ?$ Bromo

oxyquinaldine, or bromo quinoxyl [c 258°] Formed by the action of cold conc H_2SO_4 upon the anilide of bromo aceto acetic acid $CH_2C(OH)CBrCONHPh$ Also from (*Py* 3,1) oxy methyl quinoline and bromine water (Knorr, *B* 17, 2875, *A* 236, 91) Fine silky needles Sl sol alcohol, ether, and chloroform Dissolves in aqueous acids and alkalis

Tri bromo (*Py* 1) oxy (*Py* 3) methyl quinoline $C_6H_4MeBr_3(OH)N$ [275°] Formed by bromination of (*Py* 1, 3) oxy methyl quinoline Insol alcohol (Conrad & Limpach, *B* 20, 949)

Bromo (*Py* 3)-oxy (*Py* 1,4) di methyl quinoline $C_{11}H_{10}BrNO$ Bromo methyl lepidone [172°] From the corresponding oxy dimethyl quinoline and bromine water (Knorr, *A* 236, 110) Spherical aggregates of needles (from alcohol) Insol water and $NaOHAq$, ν sol dilute acids

BROMO OXY (a) NAPHTHOIC ANHYDRIDE

$C_{11}H_7BrO_2$ ν $C_{10}H_6Br < \begin{smallmatrix} CO \\ O \end{smallmatrix} >$ [192°] Formed by bromination of oxy naphthoic anhydride

$C_{10}H_6 < \begin{smallmatrix} CO \\ O \end{smallmatrix} >$ dissolved in CS_2 Small white needles (Ekstrand, *B* 19, 1189)

Bromo oxy (a) naphthoquinone

$C_{10}H_6 < \begin{smallmatrix} CO \\ CO(OH) \end{smallmatrix} > CBr$ [197°] Formation — 1 From di bromo-(a)-naphthoquinone [151°] by boiling with aqueous $NaOH$

or Na_2CO_3 , the yield being 60 p.c. of the theoretical (Diehl & Merz, *B* 11, 1064) — 2 From oxy-(a) naphthoquinone and Br — 3 Prepared by the action of alcoholic H_2SO_4 on di bromo (a)-naphthoquinone anilide, *p* bromo aniline being simultaneously produced (Baltzer, *B* 14, 1901) 4 By the action of alkali upon bromo β naphthoquinone (Zincke & Gerland, *B* 20, 1515) — 5 By boiling bromo amido (a) naphthoquinone $\text{C}_6\text{H}_4\text{C}(\text{CO} \cdot \text{C}(\text{NH}_2))\text{C}(\text{CO} \cdot \text{CBr})$ with dilute alkalis (Z) — 6 From bromo oxy (a) naphthoquinone imide $\text{C}_6\text{H}_4\text{C}(\text{CO} \cdot \text{C}(\text{OH}))\text{C}(\text{NH})\text{CBr}$ by boiling with conc HCl or by treatment with alcoholic NaOH (Z)

Properties — Yellow needles, v sl sol water, sl sol ether, v sol alcohol Oxidation gives phthalic acid

Salts $\text{KA}'\text{aq}$ red needles — BA'_2 S 07 at 13° — AgA'

Bromo-oxy (a) naphthoquinone [202°] From the anilide [197°] of di bromo naphthoquinone [218°] by boiling with aqueous Na_2CO_3 (Miller, *Bl* [2] 43, 125) Oxidises to phthalic acid, it should therefore be identical with the preceding

BROMO OXY - (a) NAPHTHOQUINONE -

IMIDE $\text{C}_6\text{H}_4\text{C}(\text{CO} \cdot \text{C}(\text{OH}))\text{C}(\text{NH})\text{CBr}$ [c 265°] Formed by boiling bromo amido (a) naphthoquinone imide $\text{C}_6\text{H}_4\text{C}(\text{CO} \cdot \text{C}(\text{NH}_2))\text{C}(\text{NH})\text{CBr}$ with dilute NaOH

Formed also by the action of NH_3 upon bromo (b) naphthoquinone Brownish red glistening needles By boiling with conc HCl or by treatment with alcoholic NaOH it is converted into bromo oxy (a) naphthoquinone The sodium salt forms red needles, the salts of the heavy metals are sparingly soluble pps

Acetyl derivative [270°], red hair like needles (Zincke & Gerland, *B* 20, 1514)

BROMO-OXY NAPHTHOQUINONE SULPHONIC ACID $\text{C}_{10}\text{H}_6\text{BrSO}_6$ *ie* $\text{C}_{10}\text{H}_6\text{O}_4\text{Br}(\text{OH})(\text{SO}_3\text{H})$ From (b) naphthol sulphonic acid and Br, di bromo oxy naphthoquinone being also formed, in small quantity (Armstrong & Graham, *C J* 39, 138, Armstrong & Streetfield, *C J Proc* 1, 232) — $\text{BaC}_{10}\text{H}_6\text{BrSO}_6$

BROMO-OXY-NICOTINIC ACID *v* **BROMO-OXY PYRIDINE CARBOXYLIC ACID**

BROMO-OXY-OCTOIC ACID $\text{C}_8\text{H}_7\text{BrO}_3$ *ie* $\text{CH}_3\text{CHBrCH}_2\text{CH}(\text{CO}_2\text{H})\text{CH}_2\text{CH}(\text{OH})\text{CH}_3$
Bromo-oxy-di propyl-acetic acid

Lactone $\text{CH}_3\text{CHBrCH}_2\text{CH}(\text{COO})\text{CH}_2\text{CH}_3$

SG 13 1394 From di allyl acetic acid and HBr , the compound $(\text{CH}_3\text{CHBrCH}_2)_2\text{CHCO}_2\text{H}$ being probably first formed (Hjelt, *A* 216, 73) Oil Insol cold water, v sl sol warm water Insol cold NaOH Boiled for a long time with water or aqueous Na_2CO_3 it appears to form the

lactone $\text{CH}_3\text{CHCH}_2\text{CH}(\text{COO})\text{CHMe}$ *v* **Oxy-**

OCTENOIC ACID

Tri-bromo oxy-octoic acid **Lactone**
 $\text{CH}_2\text{BrCHBrCH}_2\text{CH}(\text{COO})\text{CH}_2\text{Br}$ *From*

di allyl-acetic acid and bromine in chloroform (Hjelt, *A* 216, 76) Oil V sol ether Insol cold NaOH Aq Boiled with aqueous Na_2CO_3 it forms $(\text{CH}_2(\text{OH})\text{CH}(\text{OH})\text{CH}_2)_2\text{CHCO}_2\text{Na}$.

Tri-bromo-di-oxy octoic acid **Lactone**
 $\text{C}_8\text{H}_7\text{Br}_3\text{O}_3$ *ie* $\text{CH}_2\text{BrCHBrCH}_2\text{C}(\text{OH})\text{CH}_2\text{CH}(\text{CH}_2\text{Br})\text{OCO}$

From so called 'di allyl oxalic acid' and bromine (*v* **Oxy octoic acid**) (Schatzky, *J pr* [2] 34, 485)

Tetra bromo oxy octoic acid $\text{C}_8\text{H}_4\text{Br}_4\text{O}_3$ *ie* $(\text{CH}_2\text{BrCHBrCH}_2)_2\text{C}(\text{OH})\text{CO}_2\text{H}$ From so called 'di allyl oxalic acid' and Br (Saytzeff, *A* 185, 189) Oil readily splits up into HBr and the preceding lactone

Ethyl ether EtA' Oil (Schatzky, *J R* 17, 73)

DI-BROMO-HEXA-OXY-DIPHENYL
Methyl ether $\text{C}_{12}\text{H}_8\text{Br}_2(\text{OMe})_2$ [140°] From the methyl ether of hexa oxy diphenyl and Br (Ewald, *B* 11, 1623) Needles (from alcohol or HOAc), conc H_2SO_4 forms a blue solution

Tetra bromo di oxy diphenyl $\text{C}_{12}\text{H}_4\text{Br}_4\text{O}_2$ *ie* $\text{C}_6\text{H}_4\text{Br}(\text{OH})\text{C}_6\text{H}_4\text{Br}(\text{OH})$ [264°] From di oxy diphenyl and Br (Magath, *B* 11, 2267, 13, 225) Also by reduction of bromo resorquinone (Baeyer, *B* 11, 1301) Fuming HNO_3 forms brownish red scales of $(\text{C}_6\text{H}_4\text{Br}_2\text{O})_2$ 'Tetra-bromo-diphenyl quinone'

Acetyl derivative $\text{C}_{12}\text{H}_4\text{Ac}_2\text{Br}_4\text{O}_2$ [245°]; needles

Tetra bromo tetra oxy diphenyl
 $\text{C}_{12}\text{H}_4\text{Br}_4(\text{OH})_4$ **Tetra bromo diorescin** From tri bromo resorquinone $\text{C}_6\text{HBr}_3\text{O}_2$ (?) and H_2S or Sn and HCl Needles (from HOAc) Turns brown at 230° and decomposes at 280° Insol water, v sol alcohol and ether Sodium amalgam gives diorescin Red hot zinc dust gives di phenyl

Acetyl derivative $\text{C}_{12}\text{H}_4\text{Br}_4(\text{OAc})_4$ [195°], needles (from alcohol) (Benedikt, *M* 1, 352, *B* 11, 2170)

Deca bromo tetra oxy diphenyl $\text{C}_{12}\text{Br}_{10}(\text{OBr})_4$ Formed by adding Br and HCl to a solution of diorescin in aqueous potash (Benedikt & Julius, *M* 5, 179) Unstable crystals, gives off Br (2 mols) at 185° SO_2 reduces it to $\text{C}_{12}\text{Br}_4(\text{OH})_4$

BROMO-p-OXY-PHENYL-ACETYLENE

Methyl derivative $\text{C}_8\text{H}_7\text{Br}(\text{OMe})\text{CCH}$ [75°] Formed by heating the methyl derivative of tri bromo *p* oxy phenyl-propionic acid $\text{C}_8\text{H}_7\text{Br}(\text{OMe})\text{CHBrCHBrCO}_2\text{H}$ with aqueous KOH (30 p.c) Plates Gives an unstable greenish yellow compound with ammoniacal CuCl_2 (Engel, *B* 20, 2538)

DI-BROMO-DI-OXY-DI-PHENYL-AMINE

$\text{C}_6\text{H}_4(\text{OH})\text{NH}\text{C}_6\text{H}_4\text{Br}_2\text{OH}$ [4 6 2 1] **Leuco-di-bromo-quinone phenol imide** [170°] Colourless prisms. V sol all ordinary solvents, except water Formed by reduction of di bromo-quinone phenol-imide (Möhlau, *B* 16, 2848)

a ***B* iso-iso-TETRA-BROMO-OXY β -**

PHENYL BUTYRIC ACID **Methyl derivative**
 $\text{C}_6\text{H}_4\text{Br}_2(\text{OMe})\text{CHBrCMeBrCO}_2\text{H}$ [c 200°] From (a) or (b) methoxy phenyl crotonic acid and bromine vapour (Perkin, *C J* 39, 434). Crystalline powder (from chloroform)

Tetra-bromo-di oxy-di phenyl methane
 $\text{C}_{12}\text{H}_4\text{Br}_4\text{O}_2$ *ie* $\text{CH}_2(\text{C}_6\text{H}_4\text{Br}_2\text{OH})_2$ [225°] From di oxy di phenyl methane and bromine water

In ethereal solution it forms an unstable crystalline compound with hydric bromide $C_{11}H_7Br_2O_2$ (Beck, B 10, 1837)

BROMO-OXY-PHENYL-METHYL PYRAZOLE

$C_6H_5N \begin{smallmatrix} \text{CO}-CHBr \\ \text{N}=\text{CMe} \end{smallmatrix}$ *Bromo phenyl methyl-pyrazolone* [c 130°]. From oxy phenyl-methyl pyrazole and Br in glacial acetic acid (Knorr, A 238, 176) Sol alkalis, and dilute acids, insol water Sl sol ether, v sol glacial HOAc and chloroform. In alcoholic solution it slowly forms pyrazole blue Fe_2Cl_6 forms pyrazole blue

Di-bromo-oxy-phenyl methyl pyrazole

$C_{10}H_7N_2OBr_2 \cdot e$ $PhN \begin{smallmatrix} \text{CO}-CBr_2 \\ \text{N}=\text{CMe} \end{smallmatrix}$ *Di bromo phenyl-methyl pyrazolone* [80°] From oxy-phenyl methyl pyrazole (1 pt) and Br (2 pts) in acetic acid solution (Knorr, A 238, 177) Sol alcohol, HOAc, ether, and $CHCl_3$, insol water, alkalis, and acids Not attacked by Fe_2Cl_6 . Reduced by Sn and HCl or fuming HI to oxy-phenyl methyl pyrazole

BROMO OXY PHENYL METHYL PYRIMID

$1NE C_{11}H_7N_2BrO \cdot e$ $C_6H_5 \begin{smallmatrix} \text{N} \text{ C(OH)} \\ \text{N} \text{ C(CH}_3\text{)} \end{smallmatrix} \gg CBr$ [260°] Formed by bromination of oxy phenyl methyl pyrimidine Glistening needles (Pinner, B 20, 2361)

BROMO O OXY PHENYL PROPIONIC ACID

Methyl derivative

$C_6H_5(OMe)Br C C CO_2H$ [168°] (with decomposition) From the methyl derivative of tri bromo oxy phenyl propionic acid (q v) Short white needles (from benzene)

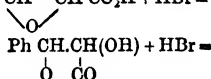

BROMO-o OXY β PHENYL PROPIONIC ACID $C_6H_5BrO_2 \cdot e$ $C_6H_5Br(OH)CH_2CH_2CO_2H$ *Bromo meliolic acid* [142°] From its anhydride by boiling with water Rectangular tables (from chloroform) Sol alcohol, sl sol water Changes on melting into its anhydride

Anhydride $C_6H_5Br \begin{smallmatrix} O \\ \text{CH}_2CH_2 \end{smallmatrix} \gg CO$ [106°]

From meliolic anhydride and Br in CS_2 in the cold (Fitting & Hochstetter, A 226, 361) Thick prisms (from chloroform) Bromine is not taken out by boiling alkalis Sol alcohol and chloroform, sl sol CS_2 . Slowly converted by boiling water into bromo meliolic acid

α Bromo β oxy β phenyl propionic acid

$C_6H_5CH(OH)CHBrCO_2H$ [122°], [125°, anhydrous] From $\alpha\beta$ di bromo β phenyl propionic acid by boiling with water (Glaser, A 147, 84) Thin laminae (containing aq) Boiled with very dilute Na_2CO_3 it gives phenyl acetic aldehyde.

The yield is 75 p c of the theoretical, but some phenyl-glyoxylic acid is also formed

$Ph \text{ CH(OH) CH(OH) CO}_2H$ (Erlenmeyer, B 13, 308) Salt— AgA' .

$\beta\beta$ -Bromo α -oxy- α -phenyl-propionic acid $CHBr, CPh(OH)CO_2H$ *Di bromo atrolactic acid* [167°] Prepared by dissolving di-bromopyruvic acid and benzene in cold H_2SO_4 . Long needles or four sided tables. Sol benzene and CS_2 , sl sol cold water By boiling with water it decomposes into CO_2 , HBr, and α bromo-acetophenone ($C_6H_5COCH_2Br$) On reduction it gives atrolactic acid (Böttger, B 14, 1235).

Bromo di oxy phenyl propionic acid

Methylene ether $C_{10}H_7BrO_2$ or

$CH_2 \begin{smallmatrix} O \\ \diagup \quad \diagdown \end{smallmatrix} C_6H_5Br \text{ CH}_2 \text{ CH}_2 \text{ CO}_2H$ *Bromo-pipero propionic acid* [140°] From sodium bromo-(β) hydro piperate and $KMnO_4$ (Weinstein, A 227, 44) Monoclinic crystals (from ether) sl alcohol, sl sol water— CaA_2

Di bromo α oxy phenyl propionic acid

$C_6H_5Br_2O_2$ *Di bromo meliolic acid* [115°]. From meliolic acid and Br (Zwenger, A Suppl 5, 116) Needles, may be distilled— BaA'_2 5aq

$\alpha \beta$ Di bromo α oxy phenyl propionic acid.

Di bromide of coumaric acid

Methyl derivative

$C_6H_5(OMe)CHBrCHBrCO_2H$ [163°] S ($CHCl_3$) 2.7 at 17° From the methyl derivative of coumaric acid $C_6H_5(OMe)CHCHCO_2H$ and Br V sol ether Decomposed by aqueous alkalis With bromine vapour it gives rise to $C_6H_5Br_2(OMe)CHBrCHBrCO_2H$ [c 202°] Crystals (from benzene) (Perkin, C J 39, 420, Fittig & Ebert, A 216, 157) Strong potash (1 l) forms $C_6H_5(OMe)C_2HBrCO_2H$ [171°].

Di methyl ether

$C_6H_5(OMe)CHBrCHBrCO_2Me$

(a) compound [125°] S (CS_2) 3.4

(β) compound [68°] S (CS_2) 4

These two compounds are formed together by acting on the isomeric methoxy phenyl acrylates of methyl with bromine in CS_2 . But the (α) isomeride gives chiefly that melting at 125° while the (β) isomeride forms chiefly the other (Perkin, C J 39, 424) Alcoholic potash converts both into methoxy phenyl bromo acrylic acid

Ethyl derivative

$C_6H_5(OEt)CHBrCHBrCO_2H$ [155°] S (CS_2) 1.03 at 18° From the ethyl derivatives of coumaric and of coumaric acids by Br (F & E). Small crystals (from CS_2)

Di-ethyl ether

$C_6H_5(OEt)CHBrCHBrCO_2Et$ [78°] From $C_6H_5(OEt)CHCHCO_2Et$ and Br in CS_2 (P)

iso Di-bromo p oxy β phenyl propionic acid $HO C_6H_4Br_2CH_2CH_2CO_2H$ *Di bromo hydro-p coumaric acid* [108°] From aqueous hydro-p coumaric acid and cold bromine water (Stöhr, A 225, 64) Needles (from acetic acid)

Salts— $(NH_4)_2C_6H_4Br_2O_2$ — $Ag_2C_6H_4Br_2O_2$ $\alpha\beta$ Di bromo p -oxy phenyl-propionic acid $C_6H_5(OH)CHBrCHBrCO_2H$ *p-Coumaric acid di bromide*

Methyl derivative

$C_6H_5(OMe)CHBrCHBrCO_2H$ [149°], colourless crystals. Formed by combination of the methyl derivative of *p* coumaric acid with Br

Di-methyl ether

$C_6H_5(OMe)CHBrCHBrCO_2Me$: [118°], m. sol ether and chloroform Formed by combination of the di methyl ether of *p* coumaric acid with bromine When boiled with aqueous

potash solution (30 p.c.) it is converted into the methyl derivative of ω bromo p -vinyl pheno $C_6H_4(OMe)CHCHBr$ (Valentini, *G* 16, 424 Eigel, *B* 20, 2536)

Di-bromo di-*iso* oxy α -di phenyl-propionic acid $C_{12}H_{17}Br_2O_4$ *Di bromo di phenopropionic acid* Formed by bromination of di pheno propionic acid $CH_3C(C_6H_5OH)_2CO_2H$ Amorphous powder Sol alcohol, insol water

Di-acetyl derivative $C_{12}H_{15}Br_2(OAc)_2O_2$, insoluble light yellow powder (Böttlinger, *B* 16, 2073)

Tri bromo p oxy phenyl propionic acid $C_9H_7Br_3(OH)CHBrCHBrCO_2H$ *Bromo p -coumaric acid-di-bromide* [188°] Obtained by the action of bromine upon p coumaric acid Needles By alcoholic KOH it is converted into tri-bromo-oxy ethyl benzene $C_6H_4Br_3(OH)CHBrCH_2Br$

Methyl derivative

$C_9H_7Br_3(OMe)CHBrCHBrCO_2H$ [162°], needles Formed by the action of bromine upon the methyl derivative of p coumaric acid $C_9H_7(OMe)CHCHCO_2H$ By heating with aqueous KOH (30 p.c.) it is converted into bromo methoxy phenyl acetylene $C_6H_4Br(OMe)CCH$ (Eigel, *B* 20, 2534)

α - β tri bromo-oxy phenyl propionic acid

Methyl derivative

$C_9H_7Br_3(OMe)CHBrCHBrCO_2H$ [185°–188°] S (chloroform) 42 From methyl α coumaric acid and bromine vapour (Perkin, *C J* 39, 417) White nodules (from benzene)

Boiled with sodium acetate it gives off CO_2 forming the methyl derivative of α *exo* dibromo α vinyl phenol, $C_6H_4Br(OMe)C_2H_4Br$, a viscid oil Strong KOH (1:1) gives the methyl derivative of bromo oxy phenyl propionic acid (q v)

Tetra-bromo α oxy phenyl propionic acid

Methyl derivative

$C_{12}H_{15}Br_4(OMe)CHBrCHBrCO_2H$ [202°] From the preceding and Br (P)

DI-BROMO-DI-OXY-DI-PHENYL SULPHIDE $S(C_6H_4BrOH)_2$ [173°] From p bromo-phenol and SO_2 in CS_2 (Tassinari, *G* 17, 91) Amorphous, reduced by zinc dust to $S(C_6H_4OH)_2$ [128°]

DI-BROMO-DI-OXY-DI-PHENYL-SULPHONE *Di methyl derivative*

$SO_2(C_6H_4(OMe)Br)_2$ [166°] From $SO_2(C_6H_4(OMe)_2)$ and Br Small plates, v sol. boiling alcohol (Annaheim, *A* 172, 48)

Di-ethyl-derivative $SO_2(C_6H_4(OEt)Br)_2$ [183°]

Di-isoamyl derivative

$SO_2(C_6H_4(OC_4H_9)Br)_2$ [100°]

Tetra-bromo-di oxy di phenyl sulphone

$SO_2(C_6H_4Br_2OH)_2$ [279°] From di oxy di phenyl sulphone and Br Thick monoclinic prisms (from alcohol)

TETRA-BROMO-OXY-PHENYL-VALERIC ACID *Methyl derivative*

$C_{12}H_{15}Br_4(OMe)CHBrCHBrCO_2H$ [159°] From (α) and (β) methoxy phenyl angelic acids and bromine vapour Crystallised from light petroleum (Perkin, *C J* 39, 437)

Di-bromo di-oxy phenyl valeric acid

Methylene derivative $C_{12}H_{11}Br_2O_4$ *v s*

$CH_2<\overset{O}{\underset{O}{\text{C}}}>C_6H_4C_2H_4Br_2CO_2H$ *Di bromo piperhydronic acid* [136°–140°] From (α) hydro

piperic acid and Br (Fittig & Mielck, *A* 172, 159; Weinstein, *A* 227, 58) Warm $NaOH_{aq}$ gives piperic acid Sodium amalgam gives hydro piperic acid

Tetra bromo di-oxy-phenyl valeric acid

Methylene derivative

$CH_2<\overset{O}{\underset{O}{\text{C}}}>C_6H_4CHBrCHBrCHBrCHBrCO_2H$

Tetra bromo piperhydronic acid [160°–165°] From piperic acid and Br (F & M) Alkalis give HBr and piperonal $CH_2O_2C_6H_4CHO$ Boiling water produces HBr and di bromo piperinide $C_{12}H_{15}Br_2O_4$ [136°], this body crystallises from alcohol in prisms, insol water and alkalis, converted into piperonal by boiling aqueous Na_2CO_3 Further treatment with water converts di bromo piperinide into bromo oxy piperinide $C_{12}H_{15}Br_2O_4$ [132°], which separates from alcohol in monoclinic crystals, insol aqueous Na_2CO_3

BROMO DI OXY PHTHALIDE *Di methyl derivative* $C_{10}H_7BrO_4$ *v s*

$C_6H_3Br(OMe)_2<\overset{CO}{\underset{CO}{\text{C}}}>O$ [$\times 651^\circ$]

Bromo pseudo meconine [142°] White flocculent solid (Salomon, *B* 20, 887)

BROMO OXY PIPELINIDE v TETRA-BROMO-DI OXY PHENYL VALERIC ACID

α BROMO β OXY PROPIONIC ACID

$C_6H_4BrO_2$ *v s* $CH_2(OH)CHBrCO_2H$ *Bromo-hydracrylic acid* Formed by warming silver $\alpha\beta$ di bromo propionate with water (Beckurts & Otto, *B* 13, 236) Syrup, converted by moist Ag_2O into glyceric acid Salt $-ZnA_2$

β Bromo α oxy propionic acid

$CH_2BrCH(OH)CO_2H$ *β Bromo lactic acid* [90°] From oxy acrylic acid and HBr (Melikoff, *B* 13, 958) Prisms (from ether), miscible with water

Di ethyl ether $CH_2BrCH(OEt)CO_2Et$ From $CH_2BrCHBrCO_2Et$ and $NaOEt$ (Michael, *J pr* [2] 55, 136)

$\alpha\beta$ Di-bromo α oxy propionic acid

$CH_2BrCHBr(OH)CO_2H$ *Di bromo lactic acid* [98°] From acrolein dibromide and cold dilute HNO_3 (Linnemann & Peni, *B* 8, 1101)

$\beta\beta$ Di bromo α oxy propionic acid

$CHBr_2CH(OH)CO_2H$ *Di bromo lactic acid* From the nitrile and HCl_{aq} Syrup

Nitrile $CHBr_2CH(OH)CN$ From di bromo aldehyde and HCN Oil (Pinner, *A* 179, 71, *B* 7, 1501)

$\beta\beta\beta$ Tri bromo oxy propionic acid

$CBBr_2CH(OH)CO_2H$ *Tri bromo lactic acid* [143°] From bromal, HCN , and HCl (Pinner, *B* 7, 1501, Wallach, *A* 193, 50)

Ethyl ether EtA' [46°], prisms

Nitrile $CBBr_2CH(OH)CN$ From bromal hydrate and conc HCN_{aq} Prisms, v sol water.

Tri bromo-ethylidene ether v Bromalide

Tri chloro ethylidene ether

$CCl_3CH(C_6H_4Br_2O_2)$ [134°] Formed by heating the acid with chloral

DI-BROMO-DI-OXY-PROPYL BENZENE v BROMO EUGENOL

Di-bromo-tri oxy-propyl-benzene *Di-bromo propyl-pyrogallol*

Di-methyl derivative $C_{11}H_{11}Br_2O_4$ *i.e.* $C_6(C_6H_4)Br_2(OH)(OMe)_2$ [109°] *Acetyl derivative* $C_6(C_6H_4)Br_2(OAc)(OMe)_2$ [102°]

Methyl di-acetyl derivative

$C_6(C_2H_5)Br_2(OAc)_2(OMe)$ [79°] These compounds are formed by brominating the corresponding derivatives of tri oxy propyl benzene (Hofmann, *B* 11, 831, Brezina, *M* 4, 492, Pastrovich, *M* 4, 185)

DI BROMO DI OXY DI-PROPYL MALONIC ACID $(CH_2Br CH(OH) CH_2)_2C(CO_2H)_2$

Di lactone

From di allyl malonic acid in glacial HOAc by Br (Helt, *B* 15, 625, *A* 216, 61) The tetra bromide $(CH_2Br CHBr CH_2)_2C(CO_2H)_2$ is first formed, but splits off 2HBr. Small plates (from alcohol). Insol cold water, sl sol boiling water, \sqrt sol warm alcohol, sl sol ether. When boiled with baryta it ought to form $Ba(CO_2)_2C(CH_2CH(OH)CH_2OH)_2$ but this splits off $BaCO_3$ forming the lactonic acid

DI BROMO OXY PYRIDINE $C_5H_4Br_2NO$ or $C_5H_4Br_2(OH)N$ Prepared by heating piperidine with Br and water to 200° (Hofmann, *B* 12, 984) Glistering scales. Sl sol water, ether, and alcohol. Sol aqueous acids and alkalis — $(B/HCl)_2PtCl_4$ long needles — $C_5H_4AgBr_2ON$ white pp

Methyl derivative [193°], long needles

Di bromo oxy-pyridine $C_5H_4Br_2(OH)N$ [207°] Long white needles. Formed by adding bromine water to a solution of oxy pyridine [107°] (Königs & Geigy, *B* 17, 591)

Di bromo oxy pyridine $C_5H_4Br_2(OH)N$ [o 200°] Formed by the action of bromine-water upon (8) oxy pyridine [125°] Colourless needles. \sqrt sol water and alcohol, nearly insol benzene. Fe_2O_3 gives a violet colouration

Salts — $B'HBr$ small white silky needles $B'H_2SO_4$ easily soluble plates — $B'H_2C_2O_4$ needles sl sol alcohol. The picrate forms yellow needles (Fischer & Renouf, *B* 17, 1898)

BROMO-OXY PYRIDINE CARBOXYLIC ACID $C_5H_4N(Br)(OH)CO_2H$ [1 x 2 5] *Bromo oxy nicotinic acid* [296°] Obtained by saponification of the methyl ether, which is formed by the action of aqueous NH_3 upon the methyl ether of bromo cumalic acid. Sl sol hot water, nearly insol ether, alcohol, and acetic acid

Methyl ether $C_5H_4N(Br)(OH)CO_2Me$ [222°] Slender glistering needles. Sol hot water and hot alcohol

Phenyl derivative of the methyl ether $C_5H_4N(Br)(OPh)CO_2Me$ [183°] Formed by the action of aniline on the methyl ether of cumalic acid in alcoholic solution. Distils without decomposition, white glistering needles, sol alcohol and ether, insol water (Pechmann & Welsh, *B* 17, 2398)

DI BROMO OXY QUINOLINE

$C_8H_6Br_2(OH)N$ [195°] Prepared by the action of bromine water on a solution of oxy quinoline (Bedall & Fischer, *B* 14, 1367) White silky needles. Sol alcohol, ether, benzene, CS_2 , $NaOH$ water, ligroin, and dilute acids

\sqrt also Bromo-carbostyryl

BROMO-(B 4)-OXY QUINOLINE TETRA-HYDRIDE *Ethyl ether* $C_8H_6Br_2(OEt)N$

[45°] Obtained by adding bromine to a cooled chloroform solution of (B 4) ethoxy tetra hydroquinoline. Long triclinic crystals. The hydrochloride crystallises in felted needles, the sulphate in colourless plates, and the oxalate in prisms. The picrate forms sparingly soluble yellow needles [108°] The nitrosamine forms glistering plates [86°] (Fischer & Renouf, *B* 17, 760)

DI p BROMO DI OXY QUINONE

$C_6Br_2(OH)_2O_2$ [1 4 2 5 3 6] *Bromanilic acid*.

Formation — 1 By dissolving di, tri, or tetra bromo quinone in potash (Stenhouse, *A* 91, 311, Sarauw, *A* 209, 115) — 2 By heating the sodium salt of di oxy quinone di p carboxylic acid with conc HBr — 3 Together with tetra bromo quinone by heating (1,3,5,2) tri bromo phenol with pyrosulphuric acid at 115°, the reaction is anomalous as the two Br should remain *m* to one another (Salzmänn, *B* 20, 1997), *v* also Di chloro di oxy quinone

Properties — Monosymmetrical dark red needles or bronzy plates. Converted by Br into hexa bromo acetone. A neutral solution of the Na salt gives the following reactions — $CaCl_2$ brown pp — $BaCl_2$ yellowish brown pp — $FeSO_4$ and $NiSO_4$ greenish grey pp — $FeCl_3$ brownish black — $Co(NO_3)_2$ brown — $Pb(OAc)_2$ red dish brown — $CuSO_4$ greenish brown — $AgNO_3$ and $Hg(NO_3)_2$ red — $HgCl_2$ no pp

Salts — $Na A''$ 4aq asymmetric crystals — $K_2 A''$ 2aq asymmetric crystals — $K_2 A''$ aq (Hantzsch, *B* 20, 1303, Hantzsch & Schnitzer, *B* 20, 2040, 2279)

Di bromo di oxy quinone *Di methyl derivative* $C_6Br_2(OMe)_2O_2$ [175°] (Hofmann, *B* 11, 332)

Tri bromo oxy quinone $C_6(OH)Br_3O_2$ [207°] From oxy hydroquinone and Br (Barth & Schreder, *M* 5, 593) Orange grains, sol alcohol and $CHCl_3$

DI BROMO OXY TOLUIC ACID *Methyl ether* $C_6H_4Br_2Me(OMe)CO_2H$ [? 4 2 1] [194°] From the methyl derivative of di bromo thymol by oxidation (Paternò & Canzoneri, *G* 10, 233)

DI BROMO OXY TOLUQUINONE

$C_6MeBr_2(OH)O_2$ • [197°] Formed in small quantity by the action of dilute KOH on tribromo toluquinone (Spica & Magnanini, *G* 13, 312)

BROMO OXY TOLYL PHENYL KETONE-CARBOXYLIC ACID

$C_6H_4(CO_2H)CO C_6H_4(CH_3)(Br)OH$ [228°] Prepared by the action of Br and acetic acid on an alcoholic solution of o cresol phthalein. Small prisms. By heating with H_2SO_4 to 130° it is readily converted into bromo oxy methyl anthraquinone *Chloride* [208°] (Fraude, *B* 12, 239)

DI β BROMO α OXY α TOLYL PROPIONIC ACID $C_6H_4Br_2O_2$ α $CHBr_2C(C_2H_5)(OH)CO_2H$ *Di bromo eso methyl atrolactic acid* [163°] Prisms or needles. Prepared by dissolving di bromo pyruvic acid and toluene in H_2SO_4 at 0°. By hot water it is decomposed into CO_2 and tolyl bromo methyl ketone $C_6H_4COCH_2Br$. On reduction it gives *eso* methyl atrolactic acid (Bottinger, *B* 14, 1597)

BROMO OXY VALERIC ACID *Lactone*. $CH_2CHCHBrCH_2COO$ From β di bromo-valeric acid by boiling with water (Messer-

schmidt, *A* 208, 102) Non volatile oil, converted by boiling baryta-water into di-oxy valeric acid

Di-bromo-oxy valeric acid

Lactone $\text{CH}_2\text{Br CBr CH}_2\text{CH}_2\text{CO O}$ or

$\text{CH}_2\text{Br CBr CHBr CH}_2\text{CO O}$ [78°-81°] From

(a) angelico lactone and bromine Thick white hygroscopic needles (from CS_2) Water converts it into HBr and bromo levulic acid (Wolff, *A* 229, 264)

DI BROMO-PALMITIC ACID $\text{C}_{16}\text{H}_{32}\text{Br}_2\text{O}_2$ [29°] From hypogaeic acid and Br (Schröder, *A* 143, 24) Amorphous and insol water Alcoholic KOH converts it into bromo hypogaeic and palmitic acids Aqueous alkalis form di-oxy palmitic acid

Di bromo palmitic acid $\text{C}_{16}\text{H}_{32}\text{Br}_2\text{O}_2$ From gaidic acid and Br Crystalline, converted by alcoholic KOH into palmitic acid (S)

Tri bromo palmitic acid $\text{C}_{16}\text{H}_{24}\text{Br}_3\text{O}_2$ [39°] From bromo hypogaeic acid and Br Amorphous (S)

Tetra bromo palmitic acid $\text{C}_{16}\text{H}_{16}\text{Br}_4\text{O}_2$ Yellow crystals

BROMO PALMITIC ACID $\text{C}_{16}\text{H}_{32}\text{BrO}_2$ [31°] From tri bromo-palmitic acid (*v sup*) and alcoholic KOH (S)

BROMO PENTANE *v* AMYL BROMIDE

***as* Di bromo pentane** $\text{C}_5\text{H}_8\text{Br}_2$ *ie* $\text{CH}_3\text{CH}_2\text{CHBr CHBr CH}_3$ *Amylene bromide* (178°) S G $\frac{1}{4}$ 1 6868 From the corresponding amylenes and Br (Wagner *a* Saytzeff, *A* 179, 307)

***as* Di bromo isopentane** Pr CH CHBr_2 *Isoamylidene bromide* (170°-180°) From iso valeric aldehyde and PCl_3Br_2 (Bruylants, *B* 8, 406) Alcoholic KOH gives PrCH CHBr (111°) and Pr C CH

***as* Di bromo pentane** $\text{Pr CBr}_2\text{CH}_2$ From methyl propyl ketone and PCl_3Br_2 (B) Split up by distillation into HBr and Pr CBr CH_2 (123°)

***as* Di bromo isopentane** $(\text{CH}_3)_2\text{CBr CHBr CH}_3$ (170°-175°) S G $\frac{1}{4}$ 1 6370 M M 12 947 at 126° From tri methyl ethylene and Br (Wurtz, *A Ch* [3] 35, 458, Bauer, *Bl* 2, 149) Converted by water (20 vols) and PbO at 150° into methyl iso propyl ketone (Eltekoff, *J R* 10, 215)

Isoamylenes dibromide, formed by combination of Br with isoamylenes from crude fusel oil, is a mixture of several of the preceding di bromo pentanes (Cahours, *C R* 31, 291, Wurtz, *A Ch* [3] 4, 458, *A* 123, 202, Reboul, *C R* 58, 1058, *A* 133, 84, Bauer, *Bl* 1860, 148, *A* 120, 167, *Z* 1861, 590, Golowsinsky, *A* 111, 252, Olevinsky, *Z* 1861, 674)

Valerylene dihydrobromide (170°-175°), formed by the union of HBr with crude valerylene is also a mixture of di bromo pentanes

Tri bromo-pentane $\text{C}_5\text{H}_6\text{Br}_3$. From bromo-isoamylenes and Br

Tetra-bromo pentane $\text{C}_5\text{H}_4\text{Br}_4$ *Valerylene tetrabromide* [-10°] From crude valerylene and Br (Reboul, *A* 132, 119, 135, 372)

Tetra-bromo-pentane $\text{C}_5\text{H}_4\text{Br}_4$ *Piperylene tetrabromide*. [115°] From piperylene and Br (Hofmann, *B* 14, 664) A liquid isomeride is also formed (Magnanini, *G*. 16, 890)

Tetra-bromo-pentane $\text{C}_5\text{H}_4\text{Br}_4$ *Isoprene tetrabromide* From isoprene (Tilden, *C N* 46, 120)

Penta bromo-pentane $\text{C}_5\text{H}_2\text{Br}_5$. Two bodies of this composition are formed by the action of Br on valerylene in sunlight (R)

BROMO - PENTENYL ALCOHOL *Ethyl ether* $\text{C}_5\text{H}_9\text{BrO}$ *ie* $\text{C}_5\text{H}_9\text{BrOEt}$ (177°-180°) S G 1 23. From tri bromo pentane and alcoholic KOH (Reboul, *A* 133, 84)

BROMO PENTINENE *v* BROMO VALERYLENE
BROMO PHENANTHRAQUINONE *v* PHENANTHRAQUINONE

BROMO - PHENANTHRENE *v* PHENANTHRENE

BROMO DI PHENIC ACID

$\text{CO}_2\text{H C}_6\text{H}_4\text{C}_6\text{H}_4\text{Br CO}_2\text{H}$ [236° uncor] Formed, together with its di bromide, by heating diphenic acid with bromine at 80°-100° Small white prisms Sublimes with difficulty Not volatile with steam V sol alcohol, ether, and acetic acid, sl sol benzene, chloroform and CS_2 , insol cold water

Salts - $\text{A}''\text{Na}_2$ white v sol amorphous powder - $\text{A}''\text{Ba}$ 3aq sparingly soluble needles - $\text{A}''\text{Ag}_2$ white insol pp - $\text{A}''\text{Cu}$ sl. sol amorphous green powder

Diethyl ether $\text{A}''\text{Et}_2$ [65°], crystals (Claus *a* Erler, *B* 19, 3149)

Bromo di phenic acid di bromide

$\text{C}_{12}\text{H}_8\text{Br}_2(\text{CO}_2\text{H})_2$ [256° uncor] Formed in small quantity (15 p c) by heating diphenic acid (1 mol) with bromine (2 mols) for 8 days at 100° Glistening colourless needles (from hot alcohol) Sl sol ordinary solvents Its alkaline solution decomposes very easily on heating, forming salts of di bromo di phenic acid It has a very bitter peculiar taste - $\text{A}''\text{Na}$ soluble silky plates (Claus *a* Edler, *B* 19, 3152)

Bromo di phenic acid

[4 1] $\text{C}_6\text{H}_4(\text{COOH})\text{C}_6\text{H}_4\text{Br COOH}$ [1 4 2] [208°] Formed by oxidation of the liquid (1,4,1',4',2') mono bromo ditolyl with CrO_3 and acetic acid (Carnelley *a* Thomson, *C J* 47, 590)

Di bromo di phenic acid $\text{C}_{12}\text{H}_6\text{Br}_2\text{O}_4$ [296°] From di bromo phenanthraquinone, $\text{K}_2\text{Cr}_2\text{O}_7$, and H_2SO_4 Geodes of small crystals, v sl sol hot water, insol alcohol and ether (Ostermayer, *B* 7, 1091)

Di bromo-di-phenic acid $\text{C}_{12}\text{H}_4\text{Br}_2(\text{CO}_2\text{H})_2$ [245° uncor] Formed by heating di phenic acid (1 mol) with bromine (2 mols) at 200°, or by heating aqueous solutions of salts of mono bromo di phenic acid di bromide Small glistening needles Not volatile with steam Sublimes with difficulty Sl sol benzene, chloroform, acetone, CS_2 , and hot water, nearly insol cold water, v sol alcohol, ether, and acetic acid

Salts - The alkaline salts are very soluble amorphous glassy masses - $\text{A}''\text{Ag}_2$ white amorphous pp - $\text{A}''\text{Ca}$ 3aq easily soluble plates - $\text{A}''\text{Pb}$ sl sol microcrystalline powder

Diethyl ether $\text{A}''\text{Et}_2$ [106° uncor] crystals (Claus *a* Edler, *B* 19, 3149)

***o* BROMO PHENOL** $\text{C}_6\text{H}_4\text{BrO}$ *ie* $\text{C}_6\text{H}_4\text{Br}(\text{OH})$

[1 2] (195°) From *o* bromo aniline by the diazo reaction (Fittig *a* Mager, *B* 8, 862, Körner) Formed in small quantity in brominating phenol (Hübner *a* Brenken, *B* 6, 171) Oil, volatile with steam Potash fusion gives

resorcin HNO_3 forms bromo di-nitro-phenol [118°]

Methyl ether $\text{C}_6\text{H}_4\text{BrOMe}$ (223°) From the methyl ether of *o* amido phenol by Sandmeyer's reaction (Wallach & Hensler, *A* 243, 288)

m-Bromo-phenol $\text{C}_6\text{H}_4\text{Br(OH)}$ [1 3] [33°] (236°) From *m* bromo aniline by the diazo reaction (Körner, *G* 4, 389, Würster & Nöbling, *B* 7, 905, *F* & *M*) Crystalline Potash-fusion gives resorcin HNO_3 gives bromo di-nitro phenol [92°]

p Bromo phenol $\text{C}_6\text{H}_4\text{Br(OH)}$ [1 4] [64°] (237°) *S* H (18°-77°) 3157 *S* 1422 at 15°

Formation—1 By distilling bromo *o* oxybenzoic acid with BaCO_3 (Cahours, *A Ch* [3] 13, 102)—2 By passing air saturated with Br (160 pts) into cooled phenol (94 pts) (Körner, *A* 137, 197)—3 Bromine (160g) is dissolved in glacial HOAc (200 g) and added to phenol (94 g) dissolved in HOAc (300 g) (Hübner & Brenken, *B* 6, 171)—4 From *p* bromo aniline by the diazo-reaction (*K*, *F* & *M*)

Properties—Large crystals (from chloroform), sl sol water, v sol alcohol Dimetric, $\alpha_c = 1.46$ Its heat of neutralisation has been determined by Werner (*C R* 98, 1333, *Bl* [2] 46, 281) Nitration gives bromo di nitro phenol [76°] Potash fusion gives resorcin SCL_2 forms $\text{S(C}_6\text{H}_4\text{BrOH)}_2$ [176°] (Tassinari, *G* 17, 83)

Methylether $\text{C}_6\text{H}_4\text{BrOMe}$ Bromo-anisol (223° cor) *S* G 2 1494

Ethylether $\text{C}_6\text{H}_4\text{BrOEt}$ (233°)

Isopropylether $\text{C}_6\text{H}_4\text{BrOPr}$ (236°) *S* G 2 1981 μ_D 1.553 From isopropyl phenol and Br (Silva, *Bl* [2] 13, 27)

Benzoyl derivative $\text{C}_6\text{H}_4\text{BrOBz}$ Crystalline.

Bromo-phenol (Fourth) (236°-238°) (Fittica, *J pr* [2] 28, 175 *B* 19, 2632, *A Ch* [6] 4, 561)

Preparation—Phenol (10 g), alcohol (10 g) and amorphous phosphorus (3 g) are mixed and cooled while bromine (17 g) is added through a capillary tube The product is washed with dilute Na_2CO_3 , dried and distilled It contains di bromo phenol and the new body This can only be distilled when in small quantities, in larger masses it undergoes carbonisation

Properties—Not solid at 10°

Nitration—Bromophenol (1 pt), glacial acetic acid (3 pts), and HNO_3 (*S* G 14) added gradually form crystals of a molecular compound $\text{C}_6\text{H}_4\text{Br(NO}_2\text{)OH} \cdot \text{C}_6\text{H}_4\text{Br(NO}_2\text{)OH}$ which crystallises from alcohol and melts at [60°-65°] Fuming HNO_3 converts this into a bromo di-nitro phenol [108°-110°], isomeric with those known By the action of baryta on the above molecular compound a second such body ($\text{C}_6\text{H}_4\text{Br(NO}_2\text{)OH} \cdot \text{C}_6\text{H}_4\text{Br(NO}_2\text{)OH}$) is got

The existence of four bromo phenols would be contrary to the general rule that only three isomeric di derivatives of benzene can be obtained, according to Hand (*A* 234, 129) the fourth bromo phenol is merely *p*-bromo phenol of which the melting point is lowered by a trace of moisture

Di bromo-phenol $\text{C}_6\text{H}_4\text{Br}_2\text{(OH)}$ [1 3 4] [40°] *S* H (18°-73°) 2436 *S* 194 at 15° (*W*)

Formation—1 By distilling di bromo salicylic acid with baryta (Cahours, *A* 52, 329), or

by heating with dilute H_2SO_4 at 230° (Peratoner, *G* 16 402)—2 By passing bromine vapour (2 mols) into cold phenol (1 mol) (Körner, *A* 137, 205)

Properties—Crystalline mass, v sl sol water, v sol ordinary solvents HNO_3 forms picric acid Its heat of neutralisation has been determined by Werner (*C R* 98, 1333) Heated with dilute H_2SO_4 in sealed tubes, it is converted into mono- and tri bromo phenol (Peratoner, *G* 16, 403)

Methyl ether $\text{C}_6\text{H}_3\text{Br}_2\text{(OMe)}$ [59°] (272°) From di bromo-phenol, NaOH , and MeL Formed also by brominating anisol (*C*)

Nitro-benzoyl derivative $\text{C}_6\text{H}_3\text{Br}_2\text{O CO C}_6\text{H}_4\text{NO}_2$ [90°-100°] From benzoyl phenol by bromination followed by nitration

Di bromo phenol $\text{C}_6\text{H}_3\text{Br}_2\text{(OH)}$ [6 2 1] [56°]. Formed by distilling tetra bromo phenol phthalen with conc H_2SO_4 (Baeyer, *A* 202, 138) Also from di bromo *p* amido phenol by displacing NH_2 by H (Möhlau, *B* 15, 2494) Mass of thin needles (from water)

Di-bromo-phenol $\text{C}_6\text{H}_3\text{Br}_2\text{(OH)}$ [1 3 5] [76 5°] Formed, together with its methylether, by heating *s* tri bromo benzene with NaOMe (Blau, *M* 7, 621) Converted by potash fusion into phloroglucin

Methyl ether $\text{C}_6\text{H}_3\text{Br}_2\text{(OMe)}$ [38°]

Ethylether $\text{C}_6\text{H}_3\text{Br}_2\text{(OEt)}$ (268°) Formed by boiling di bromo *o* di azo phenetol nitrate, $\text{C}_6\text{H}_3\text{Br}_2\text{(OEt)N}_2\text{NO}_3$, with water (Möhlau & Oehmichen, *J pr* 132, 482)

Tri bromo phenol $\text{C}_6\text{H}_2\text{Br}_3\text{(OH)}$ [2 4 6 1] [92°] (Wilsing, *A* 215, 235), [95°] (Körner, *S* 007 at 15° (*W*))

Formation—1 From phenol and Br (Laurent, *A Ch* [3] 3, 211, Körner, *A* 137, 208)—2 By distilling tri bromo salicylic acid with sand and baryta (*C*)—3 By treating indigo with bromine water—4 From potassium phenol disulphonate and Br (Schmidt, *B* 11, 852)

Properties—Long silky needles (from dilute alcohol), may be sublimed V sl sol water, v sol alcohol Its heat of neutralisation has been examined by Werner and Berthelot (*C R* 98, 1333, *A Ch* [6] 3, 552)

Reactions—1 Nitric acid forms di bromo-nitro, bromo di nitro, and tri nitro phenol (Armstrong & Harrow, *C J* 29, 476)—2 CrO_3 and HOAc give tetra bromo quinone and amorphous insoluble $\text{C}_6\text{H}_2\text{Br}_4\text{O}_2$ (Benedikt, *A* 199, 134)—3 Bromine water forms $\text{C}_6\text{H}_2\text{Br}_3\text{OBr}$ (?) [118°] which forms yellow plates, insol water, ether, and alcohol, it exhibits the following reactions (a) At 130° it splits up into Br and the compound $\text{C}_6\text{H}_2\text{Br}_3\text{O}_2$ (b) Aniline forms tri-bromo phenol and tri bromo aniline (c) Phenol forms tri-bromo phenol (d) It is also reduced to tri bromo phenol by boiling alcohol or by Sn and HCl (Benedikt, *B* 12, 1005, *M* 1, 360; Werner, *Bl* [2] 43, 373)

Ethyl ether $\text{C}_6\text{H}_2\text{Br}_3\text{OEt}$ [69°], prisms (Purgotti, *G* 16, 526)

Propionyl derivative $\text{C}_6\text{H}_2\text{O}_2\text{C}_2\text{H}_5\text{Br}_3$ [65°] (Guareschi & Daccamo, *B* 18, 1174)

Benzoyl derivative $\text{C}_6\text{H}_2\text{Br}_3\text{OBz}$ [82°], small colourless prisms, soluble in alcohol and ether, nearly insol water (Daccamo, *B* 18, 1168).

Tri bromo-phenol

Ethyl ether $C_6H_3Br_3$, OEt. [78°] Prepared from tri bromo di azo phenetol by boiling with water and extracting the product with ether (Möhlau a Oebmichen, *J pr* [2] 24, 484)

Tetra-bromo phenol $C_6H_2Br_4$, OH [2 3 4 6 1] [120°] From tri bromo phenol and Br at 180° (K). Formed also by warming $C_6H_3Br_3$, OBr (v sup) with conc H_2SO_4 . Needles (from alcohol), may be sublimed. Bromine converts it into $C_6H_2Br_4$, OBr [121°] which separates from chloroform in monoclinic crystals and is reduced by boiling alcohol or by Sn and HCl to tetra bromo phenol (Benedikt, *M* 1, 361)

Penta bromo phenol C_6HBr_5 , OH [225°] Obtained by heating tri or tetra bromo phenol with excess of Br at 220° for some days (Körner, *A* 137, 210). Formed also by heating $C_6H_2Br_4$, OBr with conc H_2SO_4 (Benedikt, *M* 1, 360). Adamantine needles (from CS₂), may be sublimed. Conc HNO_3 forms bromopicroin and tetra bromo quinone. PBr₅ forms C_6Br_5 (Gessner, *B* 9, 1505, Ruoff, *B* 10, 1234)

Hexa bromo phenol C_6Br_6 , OBr [128°] Prepared by heating tri bromo phenol with excess of bromine in sealed tubes at 220°. Yellow crystals of trimetric system ($a b c = 1.82, 1.14, 1.14$), insol cold alcohol, but decomposed by boiling into penta bromo phenol. On heating with aniline it yields penta bromo phenol and tri bromo aniline (Benedikt, *M* 1, 363)

TETRA BROMO *p* DIPHENOL v **TETRA-BROMO DI OXY DIPHENYL**

TETRA BROMO PHENOL PHTHALEIN v **PHENOL-PHTHALEIN**

BROMO-PHENOL *o* SULPHONIC ACID

$C_6H_4Br(OH)SO_3H$. The K salt is formed by adding Br (1 mol) to an aqueous solution of potassium phenol *o* sulphonate. The free acid is very deliquescent—KA' pointed needles— BaA'_2 — CuA'_2 (Senhofer, *A* 156, 114)

Bromo phenol *p* sulphonic acid

$C_6H_4Br(OH)(SO_3H)$ [2 1 4]. Formed as in the preceding case (S), or by passing bromine vapour into a cold conc solution of phenol *p* sulphonic acid (Le Canu, *C R* 103, 385). Deliquescent needles (containing 2aq)—KA'

Bromo phenol sulphonic acid

Ethyl derivative $C_6H_4Br(OEt)(SO_3H)$. From potassium phenetol sulphonate and Br (Lippmann, *J* 1870, 739). Deliquescent mass (containing 4aq)—KA'

Bromo phenol disulphonic acid

$C_6H_3Br(OH)(SO_3H)_2$ [2 1 4 6]. From an aqueous solution of potassium phenol disulphonic acid (1 mol) by adding Br (1 mol) (Armstrong, *C J* 25, 865, Schmidt, *B* 11, 852). Crystalline, v sol alcohol, m. sol ether. $FeCl_3$ gives a red colour. HNO_3 forms bromo nitro phenol sulphonic acid, bromo di nitro phenol, and trinitro-phenol— $BaA''2aq$ — K_2A'' — PbA'' — Ag_2A''

Di-bromo-phenol *o* sulphonic acid

$C_6H_3Br_2(OH)(SO_3H)$ [2 4 1 6] [120°]. Formed by brominating potassium phenol *o* sulphonate or bromo-phenol *o* sulphonic acid (Armstrong, *C J* 25, 867, Senhofer, *A* 156, 110, Schmidt, *B* 11, 855). Concentric needles, deliquescent. The aqueous solution is coloured violet by Fe_2Cl_6 and is ppd by $Pb(OAc)_2$ — HNO_3 forms di-bromo-*o* nitro phenol [117°] $Ba(C_6H_3Br_2SO_3)_2$ —

$BaC_6H_3Br_2SO_4$ — $CdC_6H_3Br_2SO_4$ 1/2 aq— $KC_6H_3Br_2SO_4$ — $K_2C_6H_3Br_2SO_4$ — $PbC_6H_3Br_2SO_4$

Di-bromo-phenol *p* sulphonic acid

$C_6H_4Br_2(OH)(SO_3H)$ [2 6 1 4]. From potassium phenol *p* sulphonate (1 mol) and Br (2 mols) (Senhofer, *A* 156, 103, Armstrong a Brown, *C J* 25, 857), or by passing bromine vapour into an aqueous solution of phenol *p* sulphonic acid (Le Canu, *C R* 103, 385). Fc. med also by diazo reaction from di bromo sulphanilic acid (Schmitt, *A* 120, 161). Rectangular scales (containing aq). The solution is coloured violet by $FeCl_3$ but is not ppd by $Pb(OAc)_2$ —

$KC_6H_4Br_2SO_3$, aq— $K_2C_6H_4Br_2SO_3$, 2aq— $Ba(C_6H_4Br_2SO_3)_2$, 2aq— $BaC_6H_4Br_2SO_4$, 4aq

BROMO PHENOXY ACETIC ACID v **Bromo-phenyl derivative of GLYCOLLIC ACID**

BROMO PHENOXY-PROPIONIC ACID v.

Bromo phenyl derivative of LACTIC ACID

***o* BROMO DIPHENYL** $C_{12}H_9Br$ 1 e

C_6H_5 , C_6H_4Br [1 2] (258°). Formed by decomposing *o* diazo diphenyl perbromide with alcohol (Schultz, Schmidt, a Strasser, *A* 207, 353). Oil, smelling of oranges, oxidised by CrO_3 to *o* bromo benzoic acid

***p* Bromo diphenyl** C_6H_5 , C_6H_4Br [1 4] [89°]

(310° i V). Formed by adding Br to a solution of diphenyl in CS₂. Laminæ, v sol hot alcohol and HOAc, v e sol ether. Smells like oranges. Chromic acid oxidises it to *p* bromo benzoic acid (Schultz, *A* 174, 207)

***pp* Di bromo-diphenyl** [4 1] C_6H_4Br , C_6H_4Br

[1 4] [164°] (G, F), [162°] (C a T) (c 3.8°). Formed by heating diphenyl dissolved in CS₂ with bromine at 100° (Fittig, *A* 132, 204, Carnelley a Thomson, *C J* 47, 588). Also from benzidine by the diazo reaction (Griess, *Pr* 13, 383). Prisms and octahedra (C a T), v sl sol hot alcohol, slightly volatile with steam. Smells like oranges. Oxidised by CrO_3 to *p* bromo benzoic acid

Tri bromo diphenyl [4 1] C_6H_4Br , C_6H_4Br , C_6H_4Br

Formed by the action of bromine on a mixture of diphenyl and *p* tolyl benzene (Carnelley a Thomson, *C J* 47, 587). Colourless silky needles, sl sol alcohol, not volatile with steam. CrO_3 in HOAc gives *p* bromo benzoic acid

DI BROMO DI PHENYL ACETAMIDINE

$C_{12}H_{11}Br_2N_2$ 1 e $CH_3C(NHC_6H_4Br)NC_6H_4Br$. From *p* bromo aniline, HOAc, and $PbCl_2$ (Dennstedt, *B* 13, 233)— $B'HCl$ — $B'H.PtCl_4$

***o* BROMO PHENYL ACETIC ACID** $C_6H_4BrO_2$

1 e [2 1] $C_6H_4BrCH_2CO_2H$ [104°]. From phenyl acetic acid, bromine and HgO . Separated from the *p* compound by its more soluble barium salt (Bedson, *C J* 37, 95). Flat needles (from water). Monoclinic tablets (from glacial acetic acid)— $a b c = 1.657, 1.767, a = 99^\circ 44'$. $KMnO_4$ oxidises it to *o* bromo benzoic acid— CaA' — AgA'

Nitrile $C_6H_4BrCH_2CN$. Oil (Jackson a White, *Am* 2, 816)

***m* Bromo phenyl acetic acid**

[3 1] $C_6H_4BrCH_2CO_2H$ [97°] (J a W), [100°] (G). From (3, 4, 1) bromo amido phenyl acetic acid by removing NH_2 (Gabriel, *B* 15, 841)

Nitrile $C_6H_4BrCH_2CN$. Oil (Jackson a White, *P Am* 4, 16, 256)

***p* Bromo phenyl-acetic acid**

[4 1] $C_6H_4BrCH_2CO_2H$ [115°]. Prepared by treating phenyl acetic acid with bromine and

HgO (Bedson, *C J* 87, 94) — Long flat needles, may be sublimed. Oxidation gives *p* bromobenzoic acid.

Salts — $\text{AgA}' - \text{NH}_4\text{A}' - \text{BaA}'_2 - \text{CaA}'_2 - \text{CuA}'_2$

Nitrile $\text{C}_6\text{H}_4\text{BrCH}_2\text{CN}$ [47°] Prepared by boiling *p* bromo benzyl bromide with alcoholic KCN (Loring Jackson a Lowrey, *B* 10, 1210, *Am* 3, 248)

α Bromo phenyl acetic acid $\text{C}_6\text{H}_4\text{CHBrCO}_2\text{H}$ [84°] From mandelic acid and conc HBrAq at 130° (Glaser a Radziszewski, *Z* 1868, 142) Formed also by brominating phenyl acetic acid at 150° (Radziszewski, *B* 2, 203) Monoclinic crystals (from CS_2) Reduced by sodium amalgam to phenyl acetic acid. Boiling NaOH aq gives mandelic acid $\text{C}_6\text{H}_4\text{CH(OH)CO}_2\text{H}$. Alcoholic KOH gives $\text{C}_6\text{H}_4\text{CH(OEt)CO}_2\text{H}$. The ethyl ether is converted by alcoholic KCy into $\text{CO}_2\text{EtCHPhCHPhCO}_2\text{Et}$, and by Na into $\text{CO}_2\text{EtCPhCPhCO}_2\text{Et}$.

Nitrile $\text{C}_6\text{H}_4\text{CHBrCN}$ Is the chief product of the action of bromine on benzyl cyanide at 120° Sol alcohol and ether. On heating to 170° or with alcoholic KCN it gives di cyano stilbene. With an excess of KCN di cyano di benzyl is also formed. On boiling with alcoholic KOH it gives stilbene di carboxylic acid (Reimer, *B* 14, 1797)

Hydrobromide of the Nitrile $\text{C}_6\text{H}_4\text{CHBrCN}$ Phenyl bromo-acetamide bromide Formed together with the nitrile by the action of bromine on benzyl cyanide at 120°, the yield being 15 p.c. Colourless crystals. Bitter taste. Its vapour attacks the eyes. V sol all solvents, most easily in boiling acetic acid. Decomposed by water and alcohol — HCl at 150° converts it into α bromo phenyl acetic acid (?) and NH_3 . Dilute HCl at 150° converts it into NH_3 , mandelic acid ($\text{C}_6\text{H}_4\text{CH(OH)CO}_2\text{H}$), and HBr (Reimer, *B* 14, 1797)

α Bromo di phenyl acetic acid $(\text{C}_6\text{H}_5)_2\text{CBrCO}_2\text{H}$ From diphenyl acetic acid and Br at 150° Converted by boiling water into benzoic acid $\text{GPh}_2(\text{OH})\text{CO}_2\text{H}$ (Symons a Zincke, *A* 171, 131)

Di bromo phenyl acetic acid $\text{C}_6\text{H}_4\text{Br}_2\text{CH}_2\text{CO}_2\text{H}$ [115°] Formed by action of sunlight on mixture of *o* and *p* bromo phenyl acetic acids and Br. Purified by conversion into the methyl ether, distillation and saponification (Bedson, *C J* 37, 9b) White needles — AgA'

BROMO PHENYL ACRYLIC ACID *v* Bromo CINNAMIC ACID and Bromo ATROPIC ACID

DI BROMO DI PHENYL - ALLOPHANIC ACID $\text{C}_6\text{H}_4\text{N}_2\text{Br}_2\text{O}_{12}$
 $\text{C}_6\text{H}_4\text{BrNHCO N(C}_6\text{H}_4\text{Br)CO}_2\text{H}$

Ethylether [153°] The compound which is formed from *p* bromophenyldicyanate by long boiling with alcohol is probably this ether. Fine white needles. Sol alcohol and ether. By continued action of alcohol it is converted into *p* bromo phenyl carbamic ether (Dennstedt, *B* 13, 229)

p BROMO PHENYL AMIDO ACETIC ACID $\text{CH}_2(\text{NH C}_6\text{H}_4\text{Br})\text{CO}_2\text{H}$ *Bromo phenyl glycol* [98°] Colourless crystals. V sol alcohol, ether and hot water. Forms a light green copper salt. Prepared by the action of chloroacetic acid on *p* chloroaniline.

VOL. I

Ethyl ether A'Et [96°], white needles. Insol water, sol alcohol and ether

***p*-Bromoanilide**

$\text{CH}_2(\text{NH C}_6\text{H}_4\text{Br})\text{CONH(C}_6\text{H}_4\text{Br)}$ [155°–160°]; white microscopic crystals. Sublimes at about 145° Sol hot water, v sol alcohol and ether (Dennstedt, *B* 13, 236)

Di bromo di phenyl amido acetic acid

Nitrile $\text{C}_6\text{H}_4\text{Br}_2\text{NHCHPhCN}$ [92°] From di phenyl amido acetic acid and Br (Tiemann a Piebst, *B* 15, 2032) Yellow rhombohedra (from alcohol)

Tri bromo phenyl amido acetic acid

$\text{C}_6\text{H}_4\text{Br}_3\text{NHCHCO}_2\text{H}$ Formed by adding bromine water to an aqueous solution of phenyl amido acetic acid. Minute needles (from HOAc). Insol water, acids and alkalis (Schwebel, *B* 11, 1181)

BROMO PHENYL AMIDO CHLORO NAPHTHOQUINONE *v* CHLORO NAPHTHOQUINONE-BROMANILIDE

α BROMO PHENYL β AMIDO CROTONIC ACID $\text{CH}_3\text{C(NHPh)CBrCO}_2\text{H}$ *Anil bromo-acetoacetic acid* [138°] Formed by bromination of phenyl β amido crotonic acid (anilacetacetic acid) dissolved in chloroform. Pearly plates, v sol hot alcohol, sl sol water, chloroform and ether. By cold H_2SO_4 it is condensed to (*Py* 2 1 3) bromo oxy methyl quinoline (Knorr, *B* 17, 2874)

BROMO PHENYL - AMIDO (a) NAPHTHOQUINONE *v* (a) NAPHTHOQUINONE BROMANILIDE

TRI BROMO PHENYL AMIDO PROPIONIC

TRILE $\text{C}_6\text{H}_4\text{Br}_3\text{NHCHMeCN}$ [130°] From phenyl α amido propionitrile and Br. Needles (Stephan, *C C* 1886, 470)

p BROMO PHENYL (Py 3) AMIDO-QUINOL

INE $\text{C}_6\text{H}_4\text{CHCH N(CNH C}_6\text{H}_4\text{NO}_2)$ [146°] Sol very scales. Formed by heating (*Py* 3) chloroquinoline with *p* bromaniline (Friedlander a Weinberg, *B* 18, 1534)

DI BROMO DI PHENYL AMINE

$\text{HN(C}_6\text{H}_4\text{Br)}_2$ [107°] Prisms. Sol alcohol and acetic acid. The benzoyl derivative is formed by bromination of benzoyl di phenyl amine

Benzoyl derivative $\text{BzN(C}_6\text{H}_4\text{Br)}_2$ [142°] Colourless plates. Soluble in alcohol and acetic acid (Lellmann, *B* 15, 830)

Tetra bromo di phenyl amine $\text{N(C}_6\text{H}_4\text{Br)}_4$ [182°] Formed by treating an alcoholic solution of di phenyl amine with Br. Needles (Hofmann, *A* 132, 166, Gnehm, *B* 8, 925)

Acetyl derivative $\text{Nac(C}_6\text{H}_4\text{Br)}_2$ [158°]

Hexa bromo di-phenyl amine $\text{NH(C}_6\text{H}_4\text{Br)}_6$ [218°] Formed, together with the preceding, by adding Br to a solution of di phenyl amine in HOAc (G) Reduced by sodium amalgam to di phenyl amine

Octo bromo di phenyl amine $\text{NH(C}_6\text{HBr)}_8$ [c 304°] From di phenyl amine, Br, and I at 250° Prisms (from CHCl_3) (Gessner, *B* 9, 1511)

Deca bromo di phenyl amine $\text{NH(C}_6\text{Br)}_{10}$ From di phenyl amine, Br, and I at 360° Needles (from CHCl_3). Not melted at 310°

BROMO PHENYL BENZENE *v* BROMO DI-PHENYL

Bromo tri phenyl-benzene $\text{C}_6\text{H}_4\text{Br}$ [104°] From Br and tri phenyl benzene in CS_2 . Needles (from alcohol) (Berthold a Engler, *B* 7, 1124).

B R

BROMO PHENYL - BENZOIC ACID *v*
BROMO DIPHENYL-CARBOXYLIC ACID

BROMO PHENYL BENZYL OXIDE
 $C_6H_5Br \cdot OCH_2C_6H_5$ [59°] From phenyl benzyl oxide, Br, and HgO Needles (Sintenis, *A* 161, 335)

DI *p* BROMO DI-PHENYL BIURET
 $C_6H_5O_2Br \cdot N_2$, *s.s.* ($C_6H_5BrNHCO$)₂NH Prepared by the action of alcoholic NH_3 on *p* bromo phenyl dicyanate (Dennstedt, *B* 13, 230) Sl sol alcohol and ether, insol water Begins to sublime at about 240°

γ BROMO γ PHENYL BUTYRIC ACID
 $PhCHBrCH_2CH_2CO_2H$ [69°] From γ phenyl iso crotonic acid and conc HBr at 0° Crystals (from CS_2) (Jayne, *A* 216, 102) By boiling with water or treatment with aqueous Na_2CO_3 , it is converted into the lactone of γ oxy γ phenyl butyric acid (*q v*)

By Di bromo γ phenyl butyric acid
 $PhCHBrCHBrCH_2CO_2H$ [138°] From phenyl-iso crotonic acid in CS_2 by Br at 0° (Jayne, *A* 216, 107) Crusts of small white crystals Sodium amalgam converts it into sodium γ oxy γ phenyl butyrate

exo Di bromo β phenyl isobutyric acid
 $C_6H_5CHBrCBrMeCO_2H$ (?) [135°] From phenyl-methacrylic acid and Br (Conrad a Hodgkinson, *A* 193, 312)

***p* BROMO PHENYL CARBAMIC ACID**
Methyl ether $C_6H_5BrNHCO_2Me$ [124°] From *p* bromo phenyl cyanate and $MeOH$. Needles (Dennstedt, *B* 13, 229)

Ethyl ether $C_6H_5BrNHCO_2Et$ *Bromo-carbamalac ether* [81°] (*B*), [85°] (*D*) From $PhNHCO_2Et$ and bromine water (Behrend, *A* 233, 7) or from *p* bromo aniline and $ClCO_2Et$ Needles (from benzoline) Boiling alcoholic KOH gives K_2CO_3 and *p* bromo aniline

Di-bromo-phenyl carbamic acid *Methyl ether* [4 2 1] $C_6H_5Br_2NHCO_2Me$ [97°] Formed by brominating methyl phenyl carbamate (Hentschel, *J pr* [2] 34, 423) Needles (from alcohol) Warm H_2SO_4 gives CO_2 and di bromo aniline

Hexa bromo di-phenyl-carbamic ether
 $(C_6H_2Br_6)_2NCO_2Et$ *Hexa-bromo di phenyl amine urethane* [184°] Formed by bromination of di phenyl carbamic ether dissolved in acetic acid (Hager, *B* 18, 2577) Long greenish brown needles Sol acetic acid, nearly insol alcohol

***p* BROMO - PHENYL - CARBAMINE DI-CHLORIDE** $C_6H_5BrNCl_2$ (256°) From *p* bromo phenyl carbimide and Cl Yellowish liquid (Dennstedt, *B* 13, 232)

DI-BROMO DI-PHENYL CARBINOL
 $C_6H_5Br_2O$ [163°] *Di-bromo benzhydrol* From di phenyl carbinol and Br Minute needles (from alcohol) Reduced by sodium amalgam to di phenyl carbinol (Linnemann, *A* 133, 6)

DI BROMO PHENYL CARBONATE
 $(C_6H_5Br_2)_2CO_2$ [166°] Silky needles, formed by brominating phenyl carbonate (Löwenberg, *C* 1888, 390)

BROMO-DIPHENYL CARBOXYLIC ACID
[4 1] $C_6H_5BrC_6H_4CO_2H$ [194°] From *p*-bromo-phenyl-toluene [30°] and CrO_3 in $HOAc$ (Carnelley a Thomson, *C J* 51, 88) V sol ether, sl sol alcohol

Di bromo-diphenyl carboxylic acid
 $C_{12}H_8Br_2CO_2H$ [4'.1'.1.2or3 4]. *Di-bromo*

phenyl-benzoic acid [204°] From di bromo-*p* tolyl benzene [115°] by oxidising with CrO_3 in $HOAc$ Needle shaped prisms (from alcohol), sl sol alcohol (Carnelley a Thomson, *C J* 47, 589)

Di-bromo-diphenyl *p* carboxylic acid
 $C_6H_5BrC_6H_4BrCO_2H$ [4' 1' 1.2or3 4] [232°] Formed by oxidising di bromo tolyl-benzene [150°] (*C* a *T*, *C J* 51, 90)

Di bromo-diphenyl carboxylic acid [212°] has been obtained from (β) di bromo fluorene ketone [197°] by potash fusion (Holm, *B* 16, 1081) — BaA'

***p* BROMO PHENYL CYANATE**
 $OCN C_6H_5Br$ [1 4] [39°] (226°) V sol ether Prepared by distilling bromo phenyl carbamic ether with P_2O_5 (Dennstedt, *B* 13, 228)

***p* BROMO-PHENYL DI CYANATE**
 $C_6H_5N_2O_2Br_2$ [199°] Small plates Sl sol ether Prepared by the action of a small quantity of tri ethyl phosphine on bromo phenyl-cyanate heated to 100° By long boiling with absolute alcohol it gives an acid of melting point [153°] and formula $C_6H_5O_2N_2Br$, which is probably ethyl dibromo phenyl allophanate (Dennstedt, *B* 13, 229)

BROMO-PHENYL-CYSTEINE $C_6H_5BrNSO_2$, *s.e.* $C_6H_5BrSCMe(NH_2)CO_2H$ *p Bromo a amido thio lactic acid* [181°] Formed by boiling bromo phenyl mercapturic acid with conc HCl Needles (from dilute alcohol), v sl sol water, v sl sol alcohol, v sol dilute HCl Boiling alkalies slowly separate *p* bromo phenyl mercaptan and form pyruvic acid Sodium amalgam forms NH_3 , lactic acid, and C_6H_5BrSH Acetic anhydride on warming gives an anhydride $C_6H_5BrSCMe \begin{smallmatrix} NH \\ \diagup \diagdown \end{smallmatrix} CO$ [153°]

bromo phenyl cystoin,' but in presence of benzene it forms bromo-phenyl-mercapturic acid $C_6H_5BrSCMe(NHAc)CO_2H$ Potassium cyanate forms $C_6H_5BrSCMe(NHCO_2NH_2)CO_2H$

Salts — CuA' — $HA'HCl$ (Baumann a Preusse, *H* 5, 315, *B* 18, 258)

BROMO *o* PHENYLENE DIAMINE
 $C_6H_5Br(NH_2)_2$ [4 1 2] [63°] From (1,3,4) or (6,3,4) bromo nitro aniline, tin, and HCl (Hubner, *A* 210, 359, Wurster, *B* 6, 1544, Remmers, *B* 7, 347) Needles, v sol water Sodium amalgam reduces it to *o* phenylene diamine

Salts — $B'HCl$ — $B'H_2SO_4$
Di bromo m phenylene diamine
 $C_6H_5Br_2(NH_2)_2$ Dark brown pp formed by adding bromine water to an aqueous solution of *p* phenylene-diamine hydrochloride, may be crystallised from alcohol (Hollemann, *Z* 1865, 555)

BROMO-DIPHENYLENE KETONE
 $C_{12}H_8BrO$ *e* $\begin{smallmatrix} C_6H_5 \\ \diagup \\ C_6H_5Br \end{smallmatrix} CO$. [104°] From bromo fluorene and CrO_3 (Hodgkinson a Matthews, *C J* 43, 165) Dark yellow needles

Bromo - diphenylene ketone $C_{12}H_8BrO$ [122° uncor] Formed by distilling bromo diphenic acid with lime Yellow plates V sol. benzene, ether, and hot alcohol, nearly insol water Sublimes readily in felted needles By distillation with zinc dust it gives fluorene (Claus a Erler, *B* 19, 3155).

(e) Di bromo diphenylene ketone $C_{12}H_8Br_2CO$ [143°] Formed by oxidation of di bromo fluorene [166°] with CrO_3 dissolved in acetic acid (Holm, *B* 16, 1081) Long yellow needles \forall sol ether and benzene

(s) Di bromo diphenylene ketone $C_{12}H_8Br_2CO$ [198°] From (a) - di - bromo fluorene [165°] by CrO_3 in slight excess and $HOAc$ (Hodgkinson & Matthews, *C J* 43, 165, Holm) Yellow needles, sol alcohol, ether, and benzene Potash fusion gives rise to di bromo diphenyl carboxylic acid

Di bromo diphenylene ketone $C_{12}H_8Br_2CO$ [133° uncor.] Formed by distilling di bromo di phenic acid with lime Thin yellow plates or long thin needles Readily sublimable (Claus & Erler, *B* 19, 3156)

DI BROMO DI-PHENYLENE KETONE OXIDE $C_{12}H_8Br_2O_2$ [210°-218°] From di phenylene ketone oxide, and bromine at 180° (A & Perkin, *C J* 43, 193) Long needles (from alcohol) Combines with bromine forming an unstable addition product

BROMO DIPHENYLENE - METHANE ν BROMO-FLUORENE

DI-BROMO PHENYLENE (a) NAPHTHYL ENE OXIDE $C_{12}H_8Br_2O$ [284°] Yellowish white needles Sl sol benzene Prepared by bromination of phenylene (a) naphthylene oxide (Arx, *B* 13, 1727)

BROMO PHENYLENE OXIDE $C_{12}H_8Br_2O$ [195°] From phenylene oxide and Br at 100° Needles (from alcohol) (Marker, *A* 124, 250)

Di bromo diphenylene oxide $C_{12}H_8Br_2O$ [185°] From Br and diphenylene oxide in CS_2 Lamine (from alcohol) (Hoffmeister, *A* 159, 211)

DI BROMO DIPHENYLENE - PHENYL METHANE $C_{13}H_9Br_2$ [182°] From Br and the hydrocarbon in $HOAc$ (Behr, *B* 5, 971)

Tri bromo diphenylene phenyl methane $C_{13}H_9Br_3$ [167°-171°] (B)

BROMO PHENYL ETHANE ν BROMO ETHYL BENZENE

p Bromo di phenyl ethane $C_{11}H_{11}Br$ ν e $C_6H_5CH_2CH_2C_6H_5Br$ [14] Bromo dibenzyl *SG* 21 40 From *s* di phenyl ethane, Br, and water (Fittig & Stelling, *A* 137, 266) Oil, boils above 320°

pp Di bromo di phenyl ethane $C_{11}H_{11}Br_2$ ν e [4 1] $C_6H_5BrCH_2CH_2C_6H_5Br$ [14] [115°] From *s* di phenyl ethane, water, and Br (F & S) Needles (from alcohol) CrO_3 gives *p* bromo-benzoic acid.

Exo di bromo *s* di phenyl ethane $C_{11}H_{11}Br_2$ [237°] (Z), [235°] (K) Stilbene dibromide Di-bromo dibenzyl

Formation —1 From stilbene and Br (Lumprecht & Schwanert, *A* 145, 336) —2 From di-benzyl and dry Br (Marquardt, *A* 151, 364) —3 From hydrobenzoin and PBr_3 (Zincke, *A* 198, 127)

Properties —Silky needles Decomposes at 235° (Kade, *J pr* 127, 465) \forall sl sol boiling alcohol, m sol boiling xylene Alcoholic KOH gives $C_6H_5CHCHBrC_6H_5$ and $C_6H_5CC(C_6H_5)_2$ Converted by benzene and $AlCl_3$ into *s* tetra phenyl ethane some tri phenyl methane being also formed (Anschutz, *A* 235, 207)

Tri bromo - *s* di phenyl ethane $C_{11}H_9Br_3$ From *s* di phenyl ethane, water, and Br (F & S)

Nacreous lamine, \forall sl. sol. alcohol, decomposes at 170°

Tri - bromo - *s* - di - phenyl - ethane $C_{11}H_9Br_3$ [207°-211°] From *s* di phenyl ethane and dry Br (M)

Tri bromo *s* di phenyl ethane $C_{11}H_9Br_3$ *Bromo stilbene dibromide* [100°] From bromo-*s* diphenyl ethylene and Br (L & S) Needles (from alcohol) De composed by distillation into HBr , $PhCBr$, $PhCBr$, and $PhC CPh$ Alcoholic KOH gives $PhC CPh$

Tri bromo *u*-di phenyl ethane $(C_6H_5)_2CH CBr_2$ [89°] From bromal (1 mol), benzene (2 mols) and conc H_2SO_4 (Goldschmidt, *B* 6, 985) Monoclinic prisms (from ether) Alcoholic KOH gives HBr and di bromo di phenyl-ethylene

Hexa-bromo *s* di phenyl ethylene $C_{11}H_7Br_6$ From *s*-di phenyl ethane and excess of Br Hard prisms (from benzene) (F & S)

BROMO PHENYL ETHYL-AMINE ν BROMO AMIDO PHENYL ETHANE

BROMO *u*-DI PHENYL ETHYLENE $C_{11}H_9Br$ ν e $(C_6H_5)_2C CHBr$ [50°] (H), [40°] (A) (c 170°) at 11 mm (A), (above 300°) (H) Formed by warming the di bromide of *u* di phenyl ethylene (Hepp, *B* 7, 1410, Anschutz, *A* 235, 160) Prisms, sl sol cold alcohol

Bromo *s* di phenyl ethylene $C_{11}H_9Br$ *Bromo stilbene* [25°] From stilbene di bromide by distillation or treatment with alcoholic KOH Prisms $AgOAc$ gives $PhC(OAc)CHPh$ (Lumprecht & Schwanert, *A* 145, 340, 155, 72)

Di bromo *u*-di phenyl-ethylene $(C_6H_5)_2C CBr_2$ [83°] (above 300°) From $C_6H_5H CBr_2$ and alcoholic KOH (Goldschmidt, *B* 6, 985) Needles (from alcohol ether)

Di bromo *s* di phenyl ethylene $C_{11}H_9Br$ *Bromo stilbene* [208°] Leaflets Prepared by the action of bromine on toluene An isomeride [64°] is also formed in small quantity (Lumprecht & Schwanert, *A* 145, 348, Liebermann & Homeyer, *B* 12, 1974) Converted by benzene and $AlCl_3$ in presence of CS_2 into *s* tetra phenyl ethane (Anschutz, *A* 235, 209)

BROMO PHENYL GLYCOCOLL ν BROMO-PHENYL AMIDO ACETIC ACID

DI BROMO DI PHENYL GUANIDINE $C_{11}H_{11}Br_2N_3$ From di phenyl guanidine hydrochloride, water, and Br (Hofmann, *A* 67, 148) Scales (from alcohol) — $BHCl$ — $B_2H_2PtCl_6$

Tri bromo tri phenyl guanidine $C_{11}H_9Br_3N_3$ ν e $(C_6H_5BrNH_2)CNC_6H_5Br$ White amorphous powder Prepared by the action of *p* bromaniline on iso cyan *p* bromo phenyl chloride — $BHCl$ white crystals, easily soluble in alcohol and ether — $(BHCl)_2PtCl_6$ light yellow plates (Dennstedt, *B* 13, 232)

p BROMO PHENYL MERCAPTAN $C_6H_5Br SH$ (75°) (231°) From *p* bromo-benzene sulphochloride, tin, and HCl (Hubner & Alsberg, *A* 156, 327) Formed also by boiling bromo phenyl cysteine or bromo phenyl mercapturic acid with $NaOHAq$ (Baumann & Preusse, *B* 12, 806, *H* 5, 819) Lamine (from alcohol), volatile with steam, sl sol hot water Conc H_2SO_4 at 120° forms a green solution, turning blue Sodium amalgam forms phenyl mercaptan Chloral forms a compound

[72°] HCl passed into a mixture of *p* bromo phenyl mercaptan and benzoic aldehyde forms di *p* bromo di phenyl di thio-benzaldehyde $C_{12}H_8Br_2CH(S C_6H_4Br)_2$, [80°] (Baumann, *B* 18, 885) HCl and acetone form di bromo di thio dimethyl ketate $(CH_3)_2C(S C_6H_4Br)_2$, [90°]

***p* BROMO PHENYL MERCAPTURIC ACID** $C_{11}H_9BrNSO$, *vs* $C_6H_5BrS CMe(NHAc) CO_2H$ Acetyl bromo phenyl amido thio lactic acid [153°] S 14 at 100° Occurs in the urine of animals which have taken bromo benzene Formed also by treating bromo phenyl cysteine with benzene and Ac_2O (Baumann & Preusse, *B* 12, 806, *H* 5, 309, Baumann, *B* 15, 1732, Jaffe, *B* 12, 1092) Needles, insol cold water, sol hot water and alcohol Levorotatory in alcoholic solution, dextrorotatory in alkaline solution Boiling aqueous NaOH gives *p* bromo phenyl mercaptan, NH_3 , HOAc, and pyruvic acid Boiling conc $HClAq$ or dilute H_2SO_4 gives acetic acid and bromo phenyl cysteine Conc H_2SO_4 gives a blue solution

Salts — BaA' , 2aq S 2 at 15° — MgA' , 9aq — NH_4A' S 3 at 15°

BROMO DI PHENYL METHANE $C_{12}H_{10}Br_2$ *vs* $CHPh_2Br$ [45°] From di phenyl methane (1 mol) and Br (1 mol) at 150° (Friedel & Baisohn, *Bl* [2] 33, 339, 587) Crystals, *vs* sol benzene Water at 100° forms di phenyl carbinol and its anhydride Boiling alcohol forms $CHPh_2OEt$ Conc NH_4Aq gives $CHPh_2NH_2$

Di bromo di phenyl-methane CPh_2Br_2 From di phenyl methane (1 mol) and Br (2 mols) at 150° Liquid Water at 150° converts it into benzophenone Decomposed on distillation giving tetra phenyl ethylene Sodium and water form tetra phenyl ethane

Bromo tri phenyl methane $C_{12}H_9Br_3$ *vs* Ph_3CBr [152°] Obtained by brominating triphenyl methane in sunlight or at 150° (Allen & Kollieker, *A* 227, 107, Henderson, *C J* 51, 224, Schwarz, *B* 14, 1520) Yellow hexagonal rhombohedra (from CS_2) $a c = 1.784$ (Hintze, *Z K* 9, 536) Decomposed above 200° into HBr and phenylene di phenyl methane Successive treatment with boiling HOAc and water forms tri phenyl carbinol NH_3 forms Ph_3CNH_2 KCy gives $Ph_3C Cy$ Potassium sulphocyanide gives $Ph_3C SCN$

TRI BROMO DI PHENYL METHYL AMINE *vs* **TRI BROMO METHYL DI PHENYL AMINE**

BROMO PHENYL-METHYL FURFURANE **TETRA BROMIDE** $C_{11}H_5Br_4O$ [210°] Bronzy plates Formed by the action of bromine on

phenyl - methyl furfurane
$$\begin{array}{c} HC-CH \\ || \quad || \\ PhC-O-CMe \end{array}$$

(Paal, *B* 17, 2760)

BROMO-PHENYL METHYL PYRAZOLONE *vs* **BROMO-OXY PHENYL METHYL PYRAZOL**

γ -BROMO- γ -PHENYL-DI-METHYL SUCCINIC ACID $Ph CHBr CH(CO_2H) CHMe CO_2H$ From the lactone of γ oxy γ phenyl di-methyl-succinic acid (*q v*) and conc HBr at 0° (Fittig & Penfield, *A* 216, 123) Small crystals (from benzene) V sol alcohol or ether, m sol benzene Warmed with water it gives off CO_2 and forms plates of an acid which appears to be $Ph CH CH_2CHMe.CO_2H$

TETRA BROMO PHENYL METHYL-THIO-PHENE $C_{11}H_5Br_4S$ [187°] Formed by bromination of phenyl methyl thiophene Fine needles or plates V sol benzene, ether, and petroleum spirit, m sol alcohol and acetic acid (Paal & Puschel, *B* 20, 2559)

BROMO PHENYL METHYL URETHANE *vs* **Methyl ether of BROMO PHENYL CARBAMIC ACID**

BROMO PHENYL MUSTARD *vs* **BROMO-PHENYL THIO CARBIMIDE**

DI BROMO PHENYL (β) NAPHTHYL-AMINE $C_{16}H_{13}Br_2NH$ [140°] White needles Prepared by bromination of phenyl (β) naphthyl amine (Streiff, *B* 13, 1853, *A* 209, 158)

Tetra bromo-phenyl (β) naphthyl-amine $C_{16}H_9Br_4NH$ [138°] Sl sol alcohol, ether and C_6H_6 , m sol CS_2 and $CHCl_3$ Prepared by further bromination of the dibromo derivative

Tri bromo phenyl (α) naphthyl-amine $C_{16}H_9Br_3NH$ [137°] Colourless prisms Soluble in alcohol and benzene Prepared by bromination of phenyl (α) naphthylamine (S)

Tetra bromo phenyl (β) naphthyl amine $C_{16}H_9Br_4NH$ [203°] Formed by the action of bromine upon an acetic acid solution of benzene-azo phenyl (β) naphthyl-amine, or by bromination of phenyl (β) naphthyl amine Long white silky needles (Zincke & Lawson, *B* 20, 1170)

BROMO PHENYL OCTANE *vs* **BROMO OCTIL-BENZENE**

***p* BROMO PHENYL OXAMIC ACID** $C_6H_4Br NH CO CO_2H$ [198°] S 194 at 25° From di bromo di phenyl oxamide and alcoholic KOH (Dyer & Mixer, *Am*, 8, 355) Crystalline fibres, sol alcohol and ether KOHAg liberates *p* bromo aniline Salts — KA' monoclinic scales — CaA' — AgA' — BaA'

Ethyl ether EtA' [156°] From phenyl-oxamic ether and Br (Klinger, *A* 184, 263)

DI BROMO DI PHENYL OXAMIDE $(C_6H_4Br NH)_2C_2O_2$ [above 300°] From Br and di phenyl oxamide in HOAc (D & M)

DI BROMO DI PHENYL OXIDE $(C_6H_4Br)_2O$ [58°] (above 360°) From Br and di phenyl oxide in CS_2 Long plates (from alcohol) (Merz & Weith, *B* 14, 191)

TRI BROMO TRI PHENYL PHOSPHATE $(C_6H_5BrO)_3PO$ From tri phenyl phosphate and Br at 180° Nacreous scales (Glutz, *A* 143, 193)

***p* BROMO PHENYL PHTHALIMIDE**

$$C_6H_4 \begin{array}{c} \diagup C=O \\ \diagdown C=O \end{array} N C_6H_4Cl$$
 [204°] Fine flat needles or scales Sol C_6H_6 and acetic acid, less in ether Prepared by heating *p* bromo aniline with phthalic anhydride (Gabriel, *B* 11, 2261)

BROMO-PHENYL-PROPANE *vs* **BROMO PROPYL BENZENE**

***o* BROMO β PHENYL PROPIONIC ACID** [21] $C_6H_4Br C_2H_4 CO_2H$ *o* **Bromo hydrocinnamic acid** [99°] Scales Formed by reduction of *o* bromo cinnamic acid with HI and P (Gabriel, *B* 15, 2295)

***m* Bromo β phenyl propionic acid** [31] $C_6H_4Br C_2H_4 CO_2H$ *m* **Bromo hydrocinnamic acid** [75°] Formed by reduction of *m*-bromo cinnamic acid with P and HI Also by eliminating the NH_2 group from (341) bromo-amido-phenyl propionic acid by diazotising and treatment with alcohol (Gabriel, *B* 15, 2294).

Short thick prisms V sol alcohol, ether, benzene, chloroform, and CS₂.

p Bromo- β phenyl propionic acid

[41] C₆H₄BrCH₂CH₂CO₂H [135°] From β phenyl propionic acid and Br in the cold (Goring, C C 1877, 793, 808, Gabriel & Zimmermann, B 13, 1683) Flat needles (from CS₂) Oxidation gives *p* bromo benzoic acid

β Bromo β phenyl propionic acid

C₆H₄CHBrCH₂CO₂H [137°] From cinnamic acid and HBr (Fittig & Binder, B 10, 518, A 195, 132, Anschütz & Kinnicutt, B 11, 1221) Also from β bromo β oxy phenyl propionic acid and HBr (Glaser, A 147, 96) Laminæ Decomposed by heat into HBr and cinnamic acid Boiling water forms β oxy β phenyl propionic acid Cold NaOHAq gives styrene and CO₂

α Bromo phenyl propionic acid

CH₃CPHBrCO₂H Bromo hydratropic acid [94°] From atropic or atrolactic acids and cold conc HBrAq (Fittig & Wurster, A 195, 145, Merling, A 203, 13) Tables, insol water, sol ordinary solvents Boiling Na₂CO₃Aq produces atrolactic acid

β Bromo α phenyl propionic acid

CH₃BrCHPhCO₂H [94°] Formed by heating atropic acid with conc HBrAq at 100° Prisms, insol water Boiling Na₂CO₃Aq produces tropic acid, styrene, and a very little atropic acid Ammonia forms β amido α phenyl propionic acid [169°] (M)

$\alpha\beta$ Di bromo β phenyl propionic acid

C₆H₄CHBrCHBrCO₂H [195°] (G), [201°] (S) From cinnamic acid and bromine vapour (Schmidt, A 127, 320, Fittig & Binder, A 195, 140) Also from α bromo β oxy phenyl propionic acid and HBr (Glaser, A 147, 91) Laminæ (from alcohol), v sol ether and alcohol, v sl sol CS₂

Reactions — 1 Sodium amalgam forms phenyl propionic acid — 2 Boiling water gives cinnamic acid, bromo oxy phenyl propionic acid, phenyl acetic aldehyde and ω bromo styrene 3 Alcoholic KOH gives α and β bromo cinnamic acids

Salts — NaA' — BaA',

Methyl ether MeA' [117°] (Anschütz, B 12, 538)

Ethyl ether EtA' [69°] From cinnamic ether and bromine (Perkin, jun, C J 45, 172)

n Propyl ether PrA' [23°]

$\alpha\beta$ Di bromo α phenyl propionic acid

CH₃BrCPHBrCO₂H [116°] From Br and atropic acid in CS₂ (Fittig & Wurster, A 195, 145) Needles (from CS₂) Decomposed by boiling water into CO₂, HBr, and acetophenone Sodium amalgam forms α phenyl propionic acid and oxy phenyl propionic acid Excess of NaOHAq gives atroglyceric acid C₆H₁₀O₄ (Fittig & Kast, A 206, 80)

Tri bromo-phenyl propionic acid

C₆H₄CHBrCBr₂CO₂H [151°] From bromo cinnamic acid [120°] and Br (Glaser, A 143, 335, Stookmeier, Bn 2, 872, Kinnicutt, Am 4, 25) Small flat monoclinic needles (from dilute alcohol) Boiling water gives CO₂, di bromo styrene, bromo-cinnamic acid, and di bromo oxy phenyl propionic acid

Tri bromo phenyl propionic acid

C₆H₄CBr₃CHBrCO₂H [148°] Formed by the combination of the bromo cinnamic acid [159°]

with Br Trichlinic prisms Sol hot benzene, v e sol alcohol and ether, sl sol cold CS₂ It decomposes at its melting point evolving HBr By standing for a short time with water it is converted into a neutral oil, hot water decomposes it at once (Michael & Brown, B 19, 1880)

Tri bromo α phenyl propionic acid

C₆H₄Br₃CO₂H [150°] From bromo-atropic acid and Br (F & W) Needles (from ligroin)

$\alpha\beta$ DI BROMO PHENYL PROPIONIC ALDEHYDE C₆H₄CHBrCHBrCHO Cinnamic aldehyde dibromide [c 100°] Small needles Formed by the direct combination of cinnamic aldehyde and bromine It readily splits off HBr on heating, giving bromo cinnamic aldehyde (Zincke & Hagen, B 17, 1814)

DI BROMO β PHENYL PROPYL ALCOHOL C₆H₄Br₂CH₂CH₂CH₂OH C₆H₄CHBrCHBrCH₂OH Stycerin dibromhydrin Styrene dibromide [74°] From Br and cinnamyl alcohol in CHCl₃ (Grimaux, Bl [2] 20, 120) Tables or needles (from ether) Insol water Boiling water converts it into C₆H₄CH(OH)CH(OH)CH₂OH

Acetyl derivative

C₆H₄CHBrCHBrCH₂COAc [86°], prisms

DI - BROMO PHENYL PROPYLIDENE - ANILINE C₆H₄NCHCHBrCHBrPh [175°] From cinnamylene aniline and bromine (Schiff, A 239, 384) Needles (from alcohol).

DI-BROMO-PHENYL-PYRAZOL DIHY-DRIDE C₆H₄Br₂N₂ [93°] Di bromo phenyl

pyrazoline From phenyl pyrazoline and Br in chloroform (Fischer & Knoevenagel, A 239, 199) Plates (from alcohol), v sl sol water In dilute acid solution it gives a violet colour with K₂Cr₂O₇ Alcoholic KOH forms C₆H₄Br(OEt)N₂ [66°], which crystallises from alcohol in pale yellow prisms Boiling HClAq gives off EtCl and forms bromo oxy phenyl pyrazol C₆H₄Br(OH)N₂ [214°], this has acid characters and forms greenish yellow crystals (from alcohol)

DI BROMO (α) PHENYL PYRIDINE DI-CARBOXYLIC ACID C₆H₄Br₂NO₂ [205°] From [2] C₆H₄(CO₂H)C₆H₄N(CO₂H) [3 2] and bromine (Skraup & Cobenzil, M 4, 469) Granules, v sl sol water, m sol warm alcohol

DI BROMO DI PHENYL SULPHIDE

(C₆H₄Br)₂S [110°] From di phenyl sulphide and Br, or from (C₆H₄NH₂)₂S by diazo reaction Nacreous laminæ (Krafft, B 7, 1166)

Di *p* bromo di phenyl disulphide (C₆H₄Br)₂S [94°] From *p* bromo phenylmercaptan by atmospheric oxidation Plates, not volatile with steam (Hubner & Alsberg, A 156, 328, Baumann & Preusse, H 5, 320)

DI *p* BROMO DI PHENYL SULPHONE

(C₆H₄Br)₂SO₂ [172°] From *p* bromo benzene and ClSO₃H (Armstrong, C J 24, 174) or SO₂ (Nöling, B 8, 594) Also from bromo benzene, benzene sulphochloride, and Al₂Cl₆ (Beckurts & Otto, B 11, 2066) Needles, sl sol hot alcohol

p BROMO PHENYL THIO CARBAMIC ETHER C₆H₄BrNSO \approx C₆H₄BrNHCSOEt Bromo phenyl thio urethane [105°] From *p* bromo phenyl thio carbimide and alcohol at 120° (Dennstedt, B 13, 231) Slender needles

p Bromo phenyl di thio carbamic ether C₆H₄BrNHCSSEt Bromo di thio carbimide ether [89°] From *p* bromo phenyl thio carbimide and mercaptan at 140° (D)

p-Bromo phenyl thio-carbimide.
 C_6H_4BrNCS *p*-Bromo phenyl mustard oil. [61°] Prepared by heating *p* bromo aniline with CS_2 in alcoholic solution with a little aqueous KOH, the resulting thio urea being distilled with P_2O_5 or heated with conc HCl at 160° (Dennstedt, *B* 13, 230, Weith and Landolt, *B* 8, 716)

DI p-BROMO DI PHENYL DI THIO CINNAMIC ALDEHYDATE $C_6H_4BrSCH_2CH(S_2C_6H_4Br)_2$ *p*-Bromo phenyl mercaptal of cinnamic aldehyde [107°] Formed by passing HCl gas into a mixture of *p* bromo phenyl mercaptan and cinnamic aldehyde (Baumann, *B* 18, 885) Long colourless needles Sl sol cold alcohol and ether

BROMO PHENYL THIO GLYCOLLIC ACID $C_6H_4BrSO_2$ & $C_6H_4BrSCH_2CO_2H$ [112°] From $C_6H_4SCH_2CO_2H$ and Br in CS_2 (Claesson, *Bl* [2] 23, 444)

DI p-BROMO DI PHENYL DI THIO DI METHYL KETATE $(CH_3)_2C(S_2C_6H_4Br)_2$ *p*-Bromo phenyl mercaptal of acetone [90°] Long transparent prisms V sol hot alcohol, ether, and benzene Formed by passing HCl gas into a mixture of *p* bromo phenyl mercaptan and acetone (Baumann, *B* 18, 888)

p-BROMO PHENYL THIO UREA
 $NH_2CSNHC_6H_4Br$ [183°] From bromo phenyl thio carbimide and alcoholic NH_3 (Dennstedt, *B* 13, 231) Needles

p-Bromo di phenyl thio urea
 $NHPhCSNH C_6H_4Br$ [158°] From bromo phenyl thio carbimide and aniline (D)

Di. p-bromo-di phenyl-thio-urea
 $CS(NHC_6H_4Br)_2$ [178°] From *p*-bromo aniline, CS_2 , and alcohol in presence of some KOHAq (D, Otto, *B* 2, 409) Prisms

BROMO PHENYL-THIO URETHANE v BROMO-PHENYL THIO CARBAMIC ETHER.

TETRA-BROMO PHENYL p-TOLUIDINE
 $C_6H_2Br_4N$ [156°] Formed by adding a solution of Br in glacial HOAc to an alcoholic solution of *p* phenyl toluidine (Bonna, *A* 239, 58)

Hepta bromo phenyl p toluidine $C_6H_2Br_7N$ [185°] From phenyl *p* toluidine and Br at 280°

Endeca bromo phenyl p toluidine
 $C_6H_2Br_{11}N$ [296°] Formed from phenyl *p*-toluidine and Br at 310°

BROMO-p-PHENYL TOLUENE $C_{11}H_{11}Br$ [127°-131°] From *p* phenyl toluene and Br Small tables (from alcohol) (Carnelley & Thomson, *C J* 47, 589)

DI p-BROMO DI PHENYL UREA
 $C_6H_4Br_2N_2O$ & $CO(NH C_6H_4Br)_2$ *Di bromo carbamimide* From di phenyl thio urea and Br (Otto, *B* 2 409) Formed also by decomposition of the product from $COCl_2$ and diazobenzene-*p*-bromanilide Prepared by the action of carbonyl chloride on *p* bromaniline (Saraauw, *B* 15, 45) White glistening plates Sublimes at 225° without melting Sl. sol alcohol and benzene

Tetra bromo di phenyl urea
 $CO(NH C_6H_4Br)_2$ Sublimes in needles (O)

BROMO PHENYL URETHANE v Bromo PHENYL-CARBAMIC ETHER

DI BROMO PHENYL VALERIC ACID
 $C_6H_4CHBrCHBrCH_2CH_2CO_2H$ [109°] From styryl propionic acid and Br (Baeyer & Jackson, *B* 18, 124)

BROMO PHLOBAPHENE v PHLOBAPHENE, BROMO-PHLORETIC ACID v. PHLORETIC

ACID

TRI BROMO PHLOROGLUCIN $C_6Br_3(OH)$, [151°] Formed by brominating phloroglucin (Hasiwetz, *A* 96, 118, Herzig, *M* 6, 885) Long needles (containing 3aq) (from water) Reduced by tin and HCl to phloroglucin Converted by cold HNO_3 (SG 14) into tri bromo di nitro propionic acid (Benedikt, *A* 184, 255) *Tri acetyl derivative* $C_6Br_3(OAc)_3$ [183°] (Herzig, *M* 6, 887)

Hexa bromo phloroglucin dibromide
 $C_6Br_8(OBr)_2$, [118°] The final product of the bromination of phloroglucin (Hazura & Benedikt, *M* 6, 702) Small golden needles (from $CHCl_3$) At 190° it gives off Br (1 mol) Aqueous SO_2 reduces it to $C_6Br_3(OH)$. Tin and HCl form $C_6H_3Cl_3(OH)_3$.

DI-iso BROMO- v -PHOSPHO-AMIDO-BENZENE SULPHONIC ACID

$(HO)_2PONH C_6H_4Br_2SO_3H$ The *chloride* $Cl_2PONH C_6H_4Br_2SO_3Cl$ is formed by treating di bromo amido benzene sulphonic acid with PCl_5 . It is converted by alcohol into the *ether chloride* $(EtO)_2PONH C_6H_4Br_2SO_3Cl$ [c 170°] (Laar, *J pr* [2] 20, 257).

BROMO PHTHALACENE v PHTHALACENE
BROMO PHTHALIC ACID $C_8H_4Br_2(CO_2H)_2$, [134] [140°] Formed, together with its isomeride, by brominating phthalic acid (Faust, *A* 160, 62, Pechmann, *B* 12, 2124, cf Guareschi, *A* 222, 295, Stallard, *C J* 49, 187) Powder, v sol water, alcohol, and ether

Salts— K_2A'' 2aq long needles (from alcohol)— BaA'' 2aq crystalline powder, sl sol water— CuA'' — AgA'' cheesy pp, sl sol water *Anhydride* $C_8H_2Br_2(CO)_2O$ [65°] (300°-340°)

Ethyl ether $Et.A''$ (295°), liquid
c Bromo phthalic acid $C_8H_4Br_2(CO_2H)_2$ [1 2 3] [176°] (G), [174°] (M), [197°] (C & T)

Formation—1 Together with the preceding, by brominating phthalic acid (Pechmann)—2 By the oxidation of bromo nitro naphthalene [122 5°] with $KMnO_4$ (Guareschi, *A* 222, 292), of bromo (8) naphthol with $KMnO_4$ (Meldola, *C J* 47, 512), of liquid bromo ditolyl (Carnelley & Thomson, *C J* 47, 591), of di bromo naphthalene [130°] with CrO_3 in HOAc (Guareschi, *B* 19, 134), of $C_{10}H_6Br_2(OH)$ [1 x 3 4 2] with $KMnO_4$ (Smith, *C N* 40, 87), and of (a) bromo naphthalene, and bromo o toluidic acid [167°] with dilute HNO_3 (Racine, *A* 239, 76) The bromo o toluidic acid may be prepared from bromo o toluidine $C_6H_4MeBr(NH_2)$ [1 5 2?] by Sandmeyer's method, 70 g of bromo toluidine gave 53 g of bromo phthalic acid

Properties—White prisms (from water), v sl sol chloroform, m sol water, alcohol, and ether With resorcin it gives a fluorescein (Nourisson, *B* 20, 1016) The salt BaA'' forms pearly plates, sl sol water

Anhydride $C_8H_2Br_2(CO)_2O$ [185°] (Meldola), [139°] (G), [125°] (Smith), [108°] (Nourisson), [95°] (Racine) Needles Heated with phenol and H_2SO_4 it forms a body (? bromo-phthalide) that dissolves in alkalis forming a purple solution

Di bromo phthalic acid $C_8H_4Br_2(CO_2H)_2$, [1 4 2 3] [135°] From di bromo naphthalene

[82°] and HNO_3 . White crystalline powder, sol boiling water and alcohol (Guarreschi, *A* 222, 274). On melting it changes to its anhydride
Salt— Na_2A

Anhydride [208°] Pearly needles (by sublimation). Heated with phenol and H_2SO_4 it forms a product (dibromophthalen) that dissolves in potash forming a purple solution

Di bromophthalic acid $\text{C}_6\text{H}_2\text{Br}_2(\text{CO}_2\text{H})_2$ [206°] Formed by oxidation of penta bromo-(a) naphthol or of tetra bromo (a) naphthoquinone by means of dilute HNO_3 at 150° (Blumlein, *B* 17, 2490). Colourless needles. V e sol al cohoh, ether, and hot water

Salts— $\text{A}''\text{Ag}_2$ small colourless plates, sparingly soluble— $\text{A}'\text{Ca}$ pp— $\text{A}'\text{Ba}$ pp

Anhydride $\text{C}_6\text{H}_2\text{Br}_2\langle\frac{\text{CO}}{\text{CO}}\rangle\text{O}$ [208°] Sublimes in long colourless needles. Easily soluble in alcohol, sparingly in water and ether. Formed by heating the acid. Heated with resorcin it yields a di bromo fluorescein

Di bromo tetra hydro phthalic acid $\text{C}_6\text{H}_4\text{Br}_2(\text{CO}_2\text{H})_2$ *Di bromo tetra hydro benzene di o carboxylic acid*. Formed by the direct combination of dry di hydro phthalic acid with bromine vapour. Rhombohedra (Baeyer, *B* 19, 1810)

Tri bromo phthalic acid $\text{C}_6\text{HBr}_3(\text{CO}_2\text{H})_3$ [191°] Formed by oxidation of penta bromo (b) naphthol or of tetra bromo (b) naphthoquinone with HNO_3 (Flessa, *B* 17, 1482). Small silvery plates or needles. Nearly insoluble in petroleum ether and in cold water

Salts— $\text{Ag}_2\text{A}''$ — $\text{CaA}''2\text{aq}$ — $\text{BaA}''2\text{aq}$

Anhydride $\text{C}_6\text{HBr}_3\langle\frac{\text{CO}}{\text{CO}}\rangle\text{O}$ [157°], sublimes in white plates, easily soluble in alcohol and ether, nearly insoluble in cold water

Tetra bromo phthalic acid $\text{C}_6\text{Br}_4(\text{CO}_2\text{H})_2$ [266°] Formed by oxidation of tetra bromo o xylene by heating with dilute HNO_3 and bromine at 170° (Blumlein, *B* 17, 2493). Small needles or colourless prisms. V sl sol water. With resorcin it yields a tetra bromo fluorescein

Salts— $\text{A}'\text{Ca}$ — $\text{A}'\text{Ba}$

Anhydride $\text{C}_6\text{Br}_4\langle\frac{\text{CO}}{\text{CO}}\rangle\text{O}$ [259°] Formed by heating the acid. Sublimes in colourless glistening needles. Sl sol almost all solvents. V also Bromo TEREPHTHALIC ACIDS

BROMO-PHTHALIDE $\text{C}_6\text{H}_2\text{Br}\langle\frac{\text{CH}_2}{\text{CO}}\rangle\text{O}$

[306 $\frac{1}{2}$]. [100°] Formed in small quantity, together with bromo o toluic acid, by the action of bromine water on o toluic acid (Racine, *A* 239, 76). Needles (from dilute alcohol), sublimes readily. Insol cold water or $\text{Na}_2\text{CO}_3\text{Aq}$. Gives bromo o toluic acid [167°] on oxidation

(a) Bromo phthalide $\text{C}_6\text{H}_3\langle\frac{\text{CHBr}}{\text{CO}}\rangle\text{O}$ [86°]

From phthalide and bromine at 140° (Racine, *A* 239, 79, *B* 19, 778). Small cubes or tables (from ether). May be distilled. Hygroscopic. Slowly decomposed by cold, quickly by hot water, forming phthalic aldehyde acid $\text{C}_6\text{H}_4(\text{CO}_2\text{H})(\text{CHO})$. Alcohol converts it into $\text{C}_6\text{H}_4(\text{CO}_2\text{Et})(\text{CHO})$. KMnO_4 oxidises it to phthalic acid. Ammonia forms amido phthalide, $\text{C}_6\text{H}_3\langle\frac{\text{CH}(\text{NH}_2)}{\text{CO}}\rangle\text{O}$ [167°]

Di-bromo phthalide $\text{C}_6\text{H}_2\text{Br}_2\text{O}$, i.e.

$\text{C}_6\text{H}_2\text{Br}_2\langle\frac{\text{CH}_2}{\text{CO}}\rangle\text{O}$ [148°]. [188°] S. (94 p.c. alcohol) 37 at 15°. From di-bromo naphthalene, CrO_3 and glacial acetic acid (Guarreschi, *A* 222, 282). Prisms or needles (from alcohol). Neutral reaction. Does not reduce ammoniacal AgNO_3 . With phenol and H_2SO_4 gives no dye on heating

DI-BROMO-PICENE v **PICENE**

BROMO - PICRIN v **TRI BROMO - NITRO - METHANE**

BROMO PIPER HYDRONIC ACID v **BROMO-DI-OXY PHENYL VALERIC ACID**

BROMO PIPERIC ACID *Anhydride*.

$\text{C}_{12}\text{H}_{11}\text{BrO}_4$ or

$\text{CH}_2\langle\frac{\text{O}}{\text{O}}\rangle\text{C}_6\text{H}_2\text{BrCH}_2\text{CH}_2\text{CHCO}_2\text{H}$

Bromo (b) hydro piperic acid [171°] From bromine and (b)-di hydro piperic acid (Fittig a Buri, *A* 216, 177, Weinstein, *A* 227, 42). Streaky white plates (from benzene)—Salt— CaA_2

Reactions—1 Not affected by boiling aqueous KOH —2 KMnO_4 oxidises it, in neutral solution, to bromo piperonylic acid [204°], bromo-pipero propionic acid (q v) and bromo-piperonal, hence Br is in the benzene nucleus.—3 *Sodium-amalgam* forms piperhydronic or methylene di oxy phenyl valeric acid $\text{C}_{12}\text{H}_{11}\text{O}_4$
DI BROMO PIPERINIDE v **BROMO-TRI OXY-PHENYL VALERIC ACID**

BROMO PIPERONYLIC ACID v **BROMO-DI-OXY BENZOIC ACID**

BROMO PIPERO PROPIONIC ACID v *Methylene derivative of Bromo di oxy-phenyl-propionic acid*

DI BROMO - PREHNITOSE v **DI BROMO-DURENE**

BROMO PROPANE v **PROPYL BROMIDE**

Di bromo propane $\text{C}_3\text{H}_5\text{Br}_2$, i.e.

$\text{CH}_3\text{CHBrCH}_2\text{Br}$ (141.5°) *Propylene bromide* S G 19617 (Zander, *A* 214, 175) S V 1189 (Z), 1184 (Schiff)

Formation—1 From propylene and Br (Reynolds, *A* 77, 120, Cahours, *C R* 31, 291, Wurtz, *A* 104, 244)—2 From bromo propylene and HBr —3 Together with trimethylene bromide by the union of HBr with allyl bromide (Geromont, *Bl* [2] 16, 118, Reboul, *Bl* [2] 17, 350)—4 From propyl bromide and Br (Linnemann, *A* 161, 41)

Properties—Liquid with sweet smell

Reactions—1 Alcoholic KOH forms two bromo propylenes and, finally, allylene (Sawitsch, *C R* 52, 399)—2 AgOAc gives the di acetyl derivative of propylene glycol (Wurtz, *A Ch* [3] 4, 438) AgOBr gives the corresponding benzoyl derivative (Friedel a Silva, *C R* 73, 1379)—3 Converted into propylene by Zn and HOAc or *sodium amalgam* in alcohol (Linnemann, *B* 10, 1111)—4 Aqueous HI at 150° gives isopropyl bromide—5 Heated to 100° with Ag O and water it gives propionic aldehyde but no propylene glycol (Beilstein a Wiegand, *B* 15, 1496)—6 Water (20 vols) and PbO at 150° gives acetone, propionic aldehyde and propylene glycol (Eltekoff, *J R* 10, 212)—7 Protracted boiling with water gives propylene glycol (Niederst, *A* 196, 349)

aa **Di bromo propane** $\text{CH}_3\text{CBr}_2\text{CH}_3$, *Methyl bromacetol Bromacetol Acetone bromide* (115°)

SG 45 18476, 25 18314 M M 10 137 at 20.7° (Perkin) Formed in small quantity from acetone and PBr₃ or PCl₅Br₃ (Linnemann, A 138, 125, Friedel & Ladenburg, Z 1868, 48) Also from allylene and conc HBr (Reboul, C R 74, 669), and from a bromo propylene and HBr
Reactions—1 Water at 160° gives acetone—2 Zn and HCl give propane (Linnemann, A 161, 67)—3 Alcoholic KOH gives a bromo propylene CH₂ CBr CH₂

ωω Di bromo propane

CH₂ CH₂ CHBr₂ (c 130°) From ω bromo propylene CH₂ CH CHBr and conc HBr (Reboul, A Ch [5] 14, 467)

ω, ω, ω-Di-bromo-propane CH₂Br CH₂ CH₂Br

Trimethylene bromide (165°) SG 2 006 (Z), 2 018 (G), 17 6 19228 (F) S V 1178 (Z) Formed from ω, ω, ω di oxy propane and HBr (Freund, M 2, 639)

Preparation—Allyl bromide is saturated with very nearly dry HBr at -16°, sealed up and left at 80° for 24 hours The tube is opened and the operation repeated as long as any gas is absorbed (Geromont, A 158, 370, Reboul, A Ch [5] 14, 472, Erlenmeyer, B 12, 1354, A 197, 184, Roth, B 14, 1351, Bogomolitz, Bl [2] 30, 23)

Reactions—1 Alcoholic KOH forms allyl bromide or allyl ethyl oxide—2 Alcoholic NH₃ forms some amorphous bases (Niederist, M 3, 840)—3 Heated to 100° with Ag₂O and water it gives tri methylene glycol thus differing from the isomeric propylene bromide which gives propionic aldehyde (Beilstein & Wiegand, B 15, 1496)—4 Al₂Br₃ converts it into propylene bromide (Gustavson, J pr [2] 36, 303)

ωωω-Tri-bromo-propane CH₂ CHBr CHBr₂

(201°) From ω bromo propylene and Br (Reboul, A Ch [5] 14, 481)

ωωω-Tri - bromo - propane CH₂ CBr₂ CH₂Br

(191°) SG 2 235 Formed by the union of bromo propylene with Br (Reboul, A Ch [5] 14, 481, C Kolbe, J pr 133, 393)

α-Tri-bromo-propane CH₂Br CHBr CH₂Br

Tri-bromhydrin [17°] (220°) SG 23 244

Formation—1 From tri bromhydrin or epibromhydrin and PBr₃ (Berthelot & de Luca, A 101, 76, Henry, A 154, 369)—2 From allyl bromide and Br (Tollens, A 156, 168)—3 By bromination of isopropyl bromide (Linnemann, A 136, 63)—4 From allyl iodide and Br (Wurtz, A 104, 247)

Properties—Prisms or liquid

Reactions—1 Alcoholic KOH gives CH₃ CCH₂ OEt—2 Solid KOH gives two di bromo propylenes—3 AgOAc gives triacetin C₃H₅(OAc)₃—4 KCy gives C₃H₅(C₂H₅)₃—5 Alcoholic NH₃ forms di bromo di allyl amine and then methyl pyridine

Tetra-bromo-propane CH₂ CBr₂ CHBr₂

Allylene tetra bromide (225°-230°), (110°-130°) at 10 mm SG 2 294 From allylene and Br (Oppenheim, Bl [2] 2, 6, 4, 434, A 132, 124) Liquid, decomposed by alcoholic KOH into HBr and tri bromo propylene (c 193°) (Pinner, A 179, 59)

Tetra bromo propane CH₂Br CBr₂ CH₂Br

[195°] From iso allylene and Br (Hartenstein, J pr [2] 7, 317).

The following tetra-bromo-propanes have also been prepared

(a) (251°), SG 264 From propylene bromide and Br (Reboul, A Suppl 1, 332)

(b) [69°], (c 235°) By brominating isopropyl bromide (Linnemann, A 136, 64)

(c) (226°), SG 2 47 From propylene bromide, and Br (Cahours, A 76, 284)

Penta bromo propanes C₃H₂Br₅ The following have been described

(a) (255°), SG 2 60 From propylene bromide and Br (Cahours, C R 31, 291)

(b) [173°] From tri bromo propylene and Br (Pinner, A 179, 60)

(c) CHBr₂ CBr₂ CHBr₂ SG 12 3 01 From propargyl bromide and Br (Henry, B 7, 761)

BROMO-PROPIOLIC ACID CBr C CO₂H

Formed by decomposing mucobromic acid with baryta (Jackson & Hill, B 11, 1675, Am 3, 121) Prisms (from ether) V e sol water (crystallising therefrom, with zeaq), may be partially sublimed at 100° Boiling water liberates bromo acetylene, boiling baryta forms bromo acetylene and also malonic acid The acid gives with di bromo acrylic acid a compound C₃HBrO₂C₃HBr H₂O₂ [105°]

Salts—BaA', zeaq—AgA'

α BROMO PROPIONIC ACID C₃H BrO₂ v c

CH₂ CHBr CO₂H [25°] (W) (206° cor)

Formed by heating propionic acid (1 mol⁺ with Br (1 mol) for several days at 150° (Friedel & Machuca, C R 53, 408, A 120, 286) Formed also from lactic acid and HBrAq at 100° (Kekule, A 130, 16)

Reactions—1 Sodium amalgam forms propionic acid—2 Boiling water and ZnO give lactic acid The K salt changes slowly to lactate in cold aqueous solution—3 Alcoholic NH₃ forms alanine—4 Finely divided Ag at 150° gives α di methyl succinic acid

Ethyl ether EtA' (162°), (180°) at 160 mm SG 11 1 40 From the acid (Dischoff, A 206, 319) Also from lactic ether and PBr₃ (Henry, A 156, 176) **Preparation**—Propionic acid (300 g) is converted into the bromide by adding amorphous phosphorus (31 g) and slowly running in bromine (400 g) After the evolution of HBr has ceased the mixture is brominated by heating to 40°-50° and slowly running in more bromine (640 g) When the whole of the bromine has disappeared the bromo propionyl bromide is converted into the ethyl ether by the addition of absolute alcohol It is then treated with water, washed and fractionated The yield from 800 g of propionic acid amounts to 640 g of boiling point 156°-160° (Zelinsky, B 20, 2026)

Bromide CH₂ CHBr CO₂Br (155°) From propionyl bromide and Br, also from propionic acid, P, and Br (Wernig, A 242, 163) ZnMe₂, followed by water, gives methyl isopropyl ketone and di methyl isopropyl carbinol (Kashirski, C C 1881, 278)

Imide (CH₂ CHBr CO)₂NH [148°] Formed by the action of water on the compound (C₃H₂NBr₂) of propionitrile with Br (Engler, A 142, 71) Needles, m sol hot water

β Bromo propionic acid CH₂Br CH₂ CO₂H [62°] Small glistening plates Formed by heating hydracrylic acid with HBr at 120° (Beckurts & Otto, B 18, 227).

$\alpha\beta$ Di bromo propionic acid

$\text{CH}_2\text{BrCHBrCO}_2\text{H}$ [64°] (227°) S 1945 (219 45) at 11°, S (ether) 804 (78 04) at 10°

Formation—1 Got by oxidising di bromo-propyl alcohol with HNO_3 . The yield is bad (Munder a Tollens, *B* 5, 73, *A* 167, 222)—2 Also by union of acrylic acid with Br (Caspary a Tollens, *A* 167, 256)—3 From acrolein di bromide and HNO_3 (Linnemann a Penl, *B* 8, 1097)—4 By the action of HBr upon α bromo acrylic and $\alpha\alpha$ di bromo propionic acids (Philippi a Tollens, *A* 171, 333)

Properties—Monoclinic crystals (Haushofer, *J* 1881, 687, Zepharovich, *J* 1878, 693) It crystallises in two forms tables [64°] and prisms [51°], the latter slowly change into the former. The salts readily split off bromide, forming β bromo acrylic acid

Reactions—1 Converted into acrylic acid by KI and water, or by Zn and H_2SO_4 (v Zottia, *A* 192, 102, C a I)—2 Water at 120° gives bromo oxy propionic acid (Melikoff, *J R* 13 227)

Salts— AgA' — $\text{NH}_4\text{A}'$ — KA' — CaA'_2 aq— SrA'_2 6aq

Methyl ether MeA' (205 8° cor) (Weger, *A* 221, 84)

Ethyl ether EtA' (214 6° cor)

Allyl ether $\text{C}_3\text{H}_5\text{A}'$ (215°-220°)

Propyl ether PrA' (233° cor)

$\alpha\alpha$ Di bromo propionic acid $\text{CH}_2\text{CBr}_2\text{CO}_2\text{H}$ [65°] (F a M), [61°] (P a T) (c 224°) From α bromo propionic acid and Br (Friedel a Machuca, *C R* 54, 220, Philippi a Tollens, *B* 6, 515) Trimetric tables

Reactions—1 Zn and H_2SO_4 reduce it to propionic acid—2 Alcoholic KOH gives α bromo acrylic acid—3 Ag_2O forms pyruvic acid—4 Finely divided silver in benzene gives di methyl maleic anhydride—5 The salts are more stable than those of the preceding acid, but the silver salt warmed with water changes to pyruvic acid (Beckurts a Otto, *B* 18, 235)

Salts— $\text{NH}_4\text{A}'$ 4aq— NaA' — KA' aq— BaA'_2 9aq— CaA'_2 2aq— SrA'_2 6aq

Methyl ether MeA' (c 177°) SG $\frac{1}{2}$ 1904

Ethyl ether EtA' (191°) SG $\frac{1}{2}$ 1754

Propyl ether PrA' (c 202°) SG $\frac{1}{2}$ 1681

Isobutyl ether $\text{tCH}_2\text{A}'$ (c 216°) SG $\frac{1}{2}$ 1578

 $\alpha\alpha\beta$ Tri-bromo-propionic acid

$\text{CH}_2\text{BrCBr}_2\text{CO}_2\text{H}$ [95°]

Formation—1 By oxidation of acrolein bromide (Linnemann a Penl, *B* 8, 1097)—2 From α bromo acrylic acid and Br (Mauthner a Suida, *M* 2, 99, Michael a Noiton, *Am* 2, 17)

Properties—Monoclinic prisms $a:b:c = 1.83:1.315, \beta = 66^\circ$, m sol water, v sol alcohol and ether. On heating the Ba salt CH_2CBr_2 is formed. Alcoholic KOH gives $\alpha\beta$ di bromo acrylic acid

Salt— BaA'_2 2aq needles

 $\alpha\beta\beta$ Tri bromo propionic acid

$\text{CHBr}_2\text{CHBrCO}_2\text{H}$ [118°] Prepared by heating $\alpha\beta$ di bromo acrylic acid for eight hours with conc HBrAq (Hill a Andrews, *Am* 4, 180, *P Am* 4 17, 133) Rectangular plates, v sol hot water, ether, and alcohol— AgA' small rhombic plates— CaA'_2 2aq

Tetra bromo propionic acid $\text{C}_2\text{HBr}_2\text{CO}_2\text{H}$ s $\text{CHBr}_2\text{CBr}_2\text{CO}_2\text{H}$ [120°] Prepared by the combination of $\alpha\beta$ di bromo acrylic acid with Br

Trichinic prisms v e sol alcohol and ether. The Ba salt is decomposed by boiling water with formation of tri bromo ethylene. Alcoholic KOH gives tri bromo acrylic acid

Salts— AgA' — KA' 2aq— BaA'_2 4aq— CaA'_2 aq (Mauthner a Suida, *M* 2, 107, Hill a Mabery, *P Am* 4 17, 140, *Am* 4, 266, 5, 251).

 $\alpha\beta$ DI BROMO PROPIONIC ALDEHYDE

$\text{CH}_2\text{BrCHBrCHO}$ *Acrolein dibromide* (c 82°) at 5 mm (Grimaux a Adam, *Bl* [2] 36, 136) From acrolein and Br (Aronstein, *A Suppl* 3, 185, Henry, *B* 7, 1112, Linnemann a Penl, *B* 8, 1097) Pungent oil. Reduces Fehling's solution. Readily polymerises, becoming crystalline [84°] in presence of HCl. HNO_3 oxidises it to di and tri bromo propionic acids

Tri bromo propionic aldehyde. A liquid combination of this body with propyl alcohol $\text{CH}_2\text{CH}(\text{OH})(\text{OPr})$ appears to be formed on treating propyl alcohol with Br (Hardy, *C R* 79, 806)

 γ BROMO α PROPYL ACETO ACETIC ETHER

$\text{CH}_2\text{BrCH}_2\text{CH}_2\text{CH}(\text{COCH}_3)\text{CO}_2\text{Et}$ Liquid. Insol water, sol alcohol and ether. Heavier than water

Preparation—6 grms of sodium are dissolved in 60 grms of absolute alcohol and added to 32 grms of aceto acetic ether. The sodio aceto acetic ether is then added to 80 grms of tri methylene bromide and heated on the water bath for half an hour, the yield is 75 p.c of the theoretical

Reactions—By boiling with dilute acids it yields acetyl butyl bromide and finally acetyl butyl alcohol $\text{CH}_3\text{COCH}_2\text{CH}_2\text{CH}_2\text{CH}_2\text{OH}$. Alcoholic NH_3 eliminates HBr forming so called 'tri methylene aceto acetic ether' (Lipp, *B* 18, 3277. V also pp 24 and 40 *supra*)

β BROMO PROPYL ALCOHOL $\text{C}_3\text{H}_7\text{Br}$ s $\text{CH}_2\text{BrCHCH}_2\text{OH}$ *Bromhydrin of tri methylene glycol* (98°-112°) at 185 mm SG $\frac{1}{2}$ 1537 S 17 at 15°. From tri methylene glycol (s di oxy propane) and HBr (Fuehling, *M* 3, 697)

α Bromo isopropyl alcohol $\text{CH}_2\text{CH}(\text{OH})\text{CH}_2\text{Br}$ (?) *Bromhydrin of Propylene glycol* (145°-148°) From propylene oxide and HBr (Markownikoff, *Z* 1870, 423)

$\alpha\beta$ Di-bromo propyl alcohol $\text{CH}_2\text{BrCHBrCH}_2\text{OH}$ *Dibromide of allyl alcohol* (219°) (Weger, *A* 221, 83) V p 134

Methyl derivative $\text{CH}_2\text{BrCHBrCH}_2\text{OMe}$ (185°) (Henry, *B* 5, 455)

Ethyl derivative $\text{CH}_2\text{BrCHBrCH}_2\text{OEt}$ (194°)

α Di bromo isopropyl alcohol $\text{CH}_2\text{BrCH}(\text{OH})\text{CH}_2\text{Br}$ *Glycerin di-bromhydrin* (219°) SG $\frac{1}{2}$ 21. From glycerin and PBr₃ (Berthelot a de Luca, *A Ch* [3] 48, 313, Reboul, *A Ch* [3] 60, 32) Also from glycerin and Br (Barth, *A* 124, 349) V also GLYCERIN

DI-BROMO-PROPYL-AMINE $\text{C}_3\text{H}_7\text{Br}_2$ s $\text{CH}_2\text{BrCHBrCH}_2\text{NH}_2$ From allylamine hydrochloride and Br. Oil. Salts— $\text{B}'\text{HCl}$ needles— $\text{B}'_2\text{H}_2\text{PtCl}_4$ (Henry, *B* 8, 399)

BROMO-PROPYL-BENZENE v Bromo CUMENE

Di bromo p di propyl benzene $\text{C}_6\text{H}_4\text{Br}_2\text{Pr}_2$ [48°] From di propyl benzene and Br (H Kainer, *A* 216, 227) Needles or rectangular tables (from alcohol)

BROMO-PROPYL-BENZOIC ACID *v* Bromo-
succinic acid.**DI-BROMO PROPYL BORATE**B(O CH₂CHBr CH₂Br)₃, Hexabromide of ALLYL
BORATE (*q v*) Oil**BROMO-PROPYL BROMIDE** *v* Di BROMO
PROPANE**TETRA-BROMO-DI-PROPYL-CARBINOL** *v*
Tetra bromo HEPTYL-ALCOHOL**BROMO - PROPYLENE** C₃H₅Br *tc*
CH₂CHCHBr (60°) SG ²⁰ 1.43 Formed,
together with CH₂CHBrCH₂, by heating propylene
bromide with alcoholic KOH (Reboul, *A Ch* [5]
14, 479) One of the products obtained by boiling
α β di bromo butyric acid with aqueous Na₂CO₃,
HBr reunites with it forming chiefly propylene
bromide, but the combination is very much
slower than with its isomeride (48°) Alcoholic
KOH gives allylene Br forms CH₂CHBrCHBr₂
(201°)*α* Bromo - propylene CH₂CHBrCH₂ (48°)
SG ²⁰ 1.39 Formed as above (Reynolds, *A* 77,
122) Also by the action of alcoholic KOH
on CH₂CHBrCH₂ (Reboul), and by union
of HBr with allylene (Reboul, *C R* 74, 669)
Oil Readily combines with HBr forming
CH₂CHBrCH₂ Br forms CH₂CHBrCHBr (191°)
Mercuric acetate in HOAc at 100° forms acetone
Bromo propylene CH₂CHBrCHCH₂ *v* ALLYL
BROMIDE p 185**Di bromo propylene** C₃H₄Br₂ *tc*
CH₂CHBrCH₂Br (140°-143°) (*a*) *Epi dibrom*
hydrin From CH BrCHBrCH Br and solid
KOH (Henry, *A* 154, 371, *B* 14, 404) or sodium
in ether (Tollens, *A* 156, 168) Converted by
water at 130° into bromo allyl alcohol**Di bromo propylene** CHBrCHCHBr (152°)
SG ²⁰ 1.206 Formed, together with the pre-
ceding and propargyl bromide, from *s tri bromo*
propane and KOH (Reboul, *A Suppl* 1, 230,
Henry, *B* 5, 186, 452) Alcoholic AgNO₃ forms
CHBrCHCH₂NO₂, AgOAc and potassium sul-
phocyanide also form *β* bromo allyl salts**Di bromo propylene** CH₂CHBrCHBr *Allylene*
di bromide (132°) SG ²⁰ 2.05 From allylene
and Br (Oppenheim, *Bt* [2] 2, 6, 4 434, *A*
132, 126) Also from CH₂CHBrCHBr₂ and
AgOAc at 120° (Linnemann, *A* 136, 56)**Tri bromo propylene** CH₂CHBrCHBr₂ (?)
(181°) (O), (*c* 193°) (P) From allylene tetra-
bromide and alcoholic KOAc (O) or aqueous
NaOH (Pinner, *A* 179, 59)**Tri bromo - propylene** CH₂CHBrCHBr
SG ²⁰ 2.53 *Propargyl tribromide* From
propargyl bromide and Br Non volatile oil
(Henry, *B* 7, 761)**Penta bromo propylene** C₃HBr₅ From allyl
bromide, Br, and I at 210° Non volatile oil
(Merz & Weith, *B* 11, 2243)**BROMO PROPYLENE-GLYCOL** *v* GLYCERIN**BROMO-PROPYLENE-UREA** C₃H₅BrN₂O *tc*CO <NH>C₃H₅Br (?) [120°] Formed by
warming an aqueous solution of di bromo propyl
urea (Andreassch, *M* 5, 40) Silky needles, sl
sol cold water —B'HCl [143°] —B'HBr [158°]
—B'H₂PtCl₆**DI-BROMO PROPYL MALONIC ACID**C₃H₄Br₂O₄ *tc* (CO₂H)₂CHCH₂CHBrCHBr
[121°] From allyl malonic acid and Br in CS₂,
(Hjelt, *A* 216, 58, *B* 15, 624) Needles in stars(from ether) *V e* sol ether, *m* sol water.
Boiled with baryta, it forms di oxy propyl-
malonate of barium (*q v*)**BROMO - PROPYL - PHENOL** *v* BROMO
CUMFOL**BROMO PROPYL THIOPHENE**C₃SH₂(C₃H)Br (189°) Colourless oil Formed
by bromination of *n* propyl thiophene (Ruffi, *B*,
20, 1741)**Di-bromo propyl-thiophene** C₃SH(C₃H)Br
(248°) Oil Formed by bromination of propyl
thiophene with 2 mols of bromine By further
bromination it is converted into tetra bromo-
thiophene (Ruffi, *B* 20, 1741)**DI BROMO PROPYL UREA** C₃H₅Br₂N₂O *tc*
NH CO NH CH₂CHBrCHBr [109°] From
allyl urea and Br (Andreassch, *M* 5, 38) Needles
or leaflets, sl sol cold water Decomposed by
heating with water into the isomeric hydro-
bromide of bromo propylene urea (*q v*)**BROMO PYRIDINE** C₅NH₄Br [3] (174° i V)
SG ²⁰ 1.645**Formation** — 1 By brominating pyridine
(Hofmann, *B* 12, 990) — 2 By the action of
bromoforn upon an alcoholic solution of pyrrol
and NaOEt or upon potassium pyrrol in ether
(Ciamician & Silber, *B* 18, 721, Ciamician &
Dennstedt, *G* 12, 211, *B* 15, 1173, Danes, *G*
12, 150)**Properties** — Alkaline liquid, sl sol water
Reduced to pyridine by zinc and HCl**Salts** — B'H₂PtCl₆ 2aq yellow monoclinic
crystals, *a b c* = 1.207 1.188 *β* = 107° 7' —
L HCl**Di-bromo pyridine** C₅NH₂Br₂ [2.6] [111°]
(222°)**Formation** — 1 From pyridine and Br (Hof-
mann, *B* 12, 988) — 2 Together with pyridine
and mono bromo pyridine by the action of bro-
mine on acetyl pyridine (Hofmann, *B* 16, 587,
cf Schotten, *B* 15, 421) — 3 From tropidine
hydrobromide and bromine at 170° (Ladenburg,
A 217, 148), di bromo methyl pyridine being
first formed, and ethylene bromide being the
other product — 4 Formed by heating the tri-
carboxylic acid [206°]**Properties** — Long flat pearly needles, insol
cold water, sl sol cold alcohol Very weak
base (difference from bromo pyridine)**Salt** — B'H₂Cl₂PtCl₆ golden yellow needles
(Pfeiffer, *B* 20, 1349)**Methylo chloride** C₅NH₂Br₂MeCl Formed
by heating di bromo apophyllin (*q v*) with HCl
(Anderson, *A* 94, 358, Hofmann, *B* 14, 1498,
v Gerichten, *A* 210, 99) Moist Ag₂O liberates
an alkaline hydroxide — B'₂Me₂PtCl₆**Di bromo pyridine** C₅NHBr₂ [165°] Formed
by adding bromine to a boiling aqueous solution
of pyridine sulphonic acid Long white needles
Begins to sublime at about 80° Sl water,
alcohol, ether and benzene — B'₂H₂Cl₂PtCl₆ 2aq
large orange needles, sl sol water (Fischer &
Raimers Schmid, *B* 16, 1184, *cf* Konigs, *B*
17, 589)**DI BROMO PYRIDINE BETAINE**C₅NH₂Br₂<CH₂>CO Anhydride of di bromo-
oxy pyridyl acetic acid Formed by heating di-
bromo pyridine with chloro acetic acid —
BHCl colourless needles — B'₂H₂Cl₂PtCl₆ large
soluble brown prisms (Gerichten, *B* 15, 1263)

BROMO PYRIDINE DI-CARBOXYLIC ACID

v BROMO APOPHYLLENIC ACID

Bromo pyridine di-carboxylic acid

$C_6H_4Br(CO_2H)_2$ [165°] Formed, together with oxaly anthranilic acid, by oxidation of (Py) bromo quinoline with $KMnO_4$. Crystals V sol water, alcohol, ether, &c. It evolves CO_2 at its melting point, yielding bromo pyridine mono carboxylic acid (bromo nicotinic acid) [183°] (Claus, A. Collischonn, B. 19, 2767)

Di bromo pyridine tri carboxylic acid

$C_6H_3Br_2(CO_2H)_3$ [26135] [206° anhydrous] Obtained by oxidation of di bromo s tri methyl pyridine [81°] with $KMnO_4$. Flat plates (containing 4aq) V sol hot water, sl sol alcohol, nearly insol ether. $FeSO_4$ gives a red colouration. Heated to 165° it gives a sublimate of di bromo pyridine [111°]

Salts— AgA'' aq crystalline powder— KH_2A'' 6aq glistening colourless needles, sol hot water— Cu_2A'' 2aq microcrystalline blue powder (Pfeiffer, B. 20, 1347)

a BROMO a PYRIDYL (Py 2) PROPIONIC ACID

$C_6H_4BrNO_2$ i.e. $C_6H_4N CBrMe CO_2H$ From the corresponding oxy acid and PBr_3 in CS_2 .

Salt— $(C_6H_3BrNO_2)HAuBr_4$ (Hardy & Calmels, Bll [2] 43, 232)

DI BROMO PYROCATECHIN $C_6H_2Br_2(OH)_2$

Di methyl ether $C_6H_2Br_2(OMe)_2$ [93°] Prepared by bromination of the di methyl ether of pyrocatechin (Tiemann & Koppe, B. 14, 2018) Formed also by the action of Br on veratric acid Colourless prisms Sol alcohol, ether and benzene

Tri bromo pyrocatechin $C_6HBr_3(OH)_2$

Mono methyl ether $C_6HBr_3(OMe)(OH)$

Tri bromo guaiacol [102°] White felted needles Formed by bromination of guaiacol (Tiemann & Koppe, B. 14, 2017)

Tetra bromo pyrocatechin $C_6H_2Br_4(OH)_2$

[123456] [193°] Formed by bromination of pyrocatechin in chloroform solution Colourless prisms (from acetic acid) or long fine needles (from alcohol) On oxidation it yields tetra bromo o quione C_6Br_4O . Bromine water at 80° forms $C_6H_2Br_4O$ [139°] (Zincke, B. 20, 1777, cf Stenhouse, C. J. 27, 586, 28, 6, Hlasiwetz, A. 142, 251)

TETRA BROMO PYROCOLL $C_6H_2Br_4O_N$

Formed by heating pyrocoll with bromine at 100° Small yellow needles Insol alcohol, ether, chloroform and toluene, almost insol acetic acid By boiling with KOH it yields di bromo pyrrol carboxylic acid (Ciamician & Silber, B. 16, 2388)

TRI BROMO PYROGALLOL $C_6H_2Br_3O$, i.e. $C_6Br_3(OH)_2$

Tri bromo pyrogallol acid From tannin, glacial acetic acid and bromine at 100° (Stenhouse, C. J. 27, 586, 28, 7, Webster, C. J. 45, 207) From pyrogallol and Br (Hlasiwetz, A. 142, 250) Flat needles, sol hot water Bromine-water converts it into 'xanthogallol' $C_6H_2Br_3O_2$ [122°] whence alkalis form $C_6H_2Br_3O$, [130°] (S)

β BROMO PYROMUCIC ACID $C_6H_4BrO_2$

Bromo furfurane carboxylic acid [129°] S 126 at 20° From either di bromo pyromucic acid [168°], or [192°] by reduction with zinc dust and ammonia (Hill & Sanger, A. 232, 58) On adding HCl the acid separates in matted

needles Silky needles (from water, separating at first as an oil) Sol chloroform and benzene, sl sol light petroleum or CS_2 . Dry Br forms di bromo pyromucic acid [166°] Dilute H_2SO_4 gives bromo fumaric acid [177°]

Salts— BaA' aq S 213 at 20°— CaA' 3aq S 177 at 20°— AgA' — NaA' — KA'

Ethyl ether EtA' [29°] (235° i V)

Amide— $C_6H_4BrO_2NH_2$ [156°] Silky needles (from water)

(δ) Bromo pyromucic acid $C_6H_4BrO_2$ [184°] S 22 at 16°

Formation—1 By the action of alcoholic KOH on the dibromide of pyromucic acid (Schiff & Tassinari, B. 11, 842, G. 8, 297) An isomeride [155°] said to be formed at the same time has not been observed by others. The dibromide of pyromucic ether when saponified also produces di bromo pyromucic acid (Canzoneri & Oliveri, G. 14, 172)—2 From pyromucic acid (20 g) and Br (36 g) at 100°, the yield being 50 p.c. of the theoretical (Hill & Sanger, A. 232, 46, B. 16, 1130)

Properties—Pearly leaflets (from water), sl sol cold water, cold benzene, and $CHCl_3$, m sol alcohol and ether. Aqueous bromine forms fumaric, and the two di bromo succinic acids, and di bromo furfurane tetrabromide $C_6H_2Br_4O$ [111°] Dilute HNO_3 produces maleic acid

Salts— KA' — NaA' — AgA' — BaA' 4aq (H. a S) pearly plates S (of BaA'_2) 347 at 18°— BaA'_2 2aq (C a O)— CaA' 3aq clumps of prisms S (of CaA') 107 at 20°

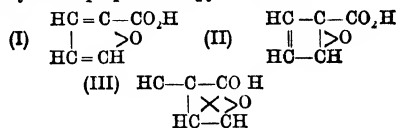

Ethyl ether EtA' [17°] (235° i V)

Amide $C_6H_4BrO_2(NH_2)$ [145°], needles (from water)

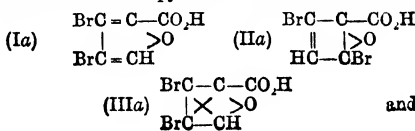

Tetrabromide $C_6H_2Br_4O_2$ [173°], needles (from HOAc)

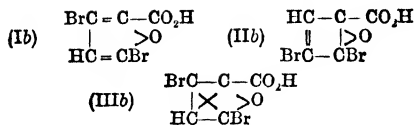

Di-bromo pyromucic acids Pyromucic acid combines with bromine forming a tetrabromide which when boiled with alcoholic NaOH forms a mixture of two di-bromo pyromucic acids (βγ and βδ), (δ) bromo pyromucic acid and a tri bromopyromucic acid (the latter from tetra bromide of (δ) bromopyromucic acid present in the crude bromide) The calcium salt of the (βδ) acid is ppd from dilute (1 in 30) solutions of the mixed acids by NH_3 and $CaCl_2$. Of the remaining acids, the (δ) acid is present in very small quantity, while the tri bromo-acid is very sparingly soluble in hot water (Hill & Sanger, A. 232, 67, B. 17, 1759, cf Tönnies, B. 11, 1085, 12, 1202, Canzoneri & Oliveri, G. 14, 177)

Constitution—(Hill & Sanger, A. 232, 97). Baeyer has proposed for pyromucic acid

The two di bromo pyromucic acids would then be

inasmuch as they are formed from the tetrabromide

by removing 2HBr. One of these acids produces, on oxidation with HNO_3 , di bromo maleic acid, the other gives mono bromo maleic acid. Neither of the di bromo pyromucic acids derived from (II) could produce di bromo maleic acid, hence that formula is disproved. Formula (III) is unusual in form. Assuming formula (I) (8γ) di bromo pyromucic acid is represented by (Ia) while its (ββ) isomer is (Ib), and (δ) bromo pyromucic acid is $\text{CH}=\text{C}-\text{CO}_2\text{H}$, since on oxidation it gives maleic acid, while (β) bromo pyromucic acid is $\text{CH}=\text{C}-\text{CO}_2\text{H}$, since it may be got by reducing $\text{CBr}=\text{CH}$.

Either of the di bromo pyromucic acids. It will be noticed that in the preceding argument it has been assumed that the bromo pyromucic acids are similar in constitution to pyromucic acid itself.

(8γ) di-bromo pyromucic acid $\text{C}_2\text{H}_2\text{Br}_2\text{O}_4$ [192°] S 21 at 20°. From the tetrabromide of pyromucic acid and alcoholic NaOH (see above). Short prisms grouped concentrically (from benzene) or bulky feathery crystals (from water). Sol alcohol or ether, m sol chloroform, sl sol CS, boiling water or light petroleum (Hill & Sanger, A 232, 82).

Reactions —1 Dry bromine forms tri bromo pyromucic acid —2 Bromine vapour passed into an aqueous solution of the acid forms tetra bromo furfuran, $\text{C}_4\text{Br}_4\text{O}$, [65°] and a little of a body $\text{C}_4\text{H}_2\text{Br}_2\text{O}$, [89°] (di bromo maleic aldehyde). 3 Dilute HNO_3 on warming gives mucrochromic and di bromo maleic acids —4 Zinc dust and NH_3 from bromo pyromucic acid [129°].

Salts — AgA' — NaA' 2aq — KA' — BaA' 3aq S 35 at 20° — CaA' 5aq S 117 at 20°

Ethyl ether — EtA' [68°] M sol alcohol

Amide $\text{C}_2\text{HBr}_2\text{O}_4\text{NH}_2$ [196°] Slender needles (from dilute alcohol). Insol CS_2 or light petroleum. Sl sol boiling water.

(8δ) di-bromo pyromucic acid $\text{C}_2\text{H}_2\text{Br}_2\text{O}_4$ [168°] S 28 at 20°. From pyromucic acid and bromine at 100° (Hill & Sanger, A 232, 73). Also from the tetrabromide of pyromucic acid and alcoholic NaOH (see above). Small prisms, often in twins (from water). Very soluble in alcohol, ether, and boiling chloroform, less in benzene, sparingly in CS_2 or light petroleum.

Reactions —1 Aqueous bromine in the cold forms bromo maleyl bromide —2 Dilute HNO_3 forms bromo fumaric acid, bromo maleic acid probably being an intermediate product of the reaction.

Salts — BaA' aq S 10 at 16° — CaA' 2aq S 30 at 17° — AgA' — NaA' 2aq — KA'

Ethyl ether EtA' [58°] (271° i V with decomposition). V sol ether, chloroform, benzene, and boiling alcohol, m sol cold alcohol or CS_2 . **Bromide** — $\text{C}_2\text{HBr}_2\text{O}_4\text{Br}$ [46°] (c 154°) at 24 mm. One of the products of the action of bromine upon pyromucic acid.

Amide $\text{C}_2\text{HBr}_2\text{O}_4\text{NH}$ [176°] Silky needles. **Tri bromo pyromucic acid** $\text{C}_2\text{HBr}_3\text{O}_4$ [219°] S 072 at 19°. From the tetrabromide of (δ) bromo pyromucic acid and alcoholic NaOH (Hill & Sanger, A 232, 91). Some tri bromo furfuran is also formed. Small needles united in clumps. V sol alcohol and ether, sl sol chloroform or benzene, nearly insol CS_2 , light petroleum or cold water.

Reactions —1 Water and bromine form tetra bromo furfuran [64°], thus $\text{C}_2\text{HBr}_3\text{O}_4 + \text{Br}_2 = \text{C}_4\text{Br}_4\text{O} + \text{CO} + \text{HBr}$ —2 Dilute HNO_3 forms di bromo maleic acid.

Salts — BaA' 3aq S (of BaA') 20 at 20° — CaA' 4aq S (of CaA') 56 at 20° — AgA' — NaA' aq — KA' aq

Ethyl ether EtA' [104°] Rectangular prisms (from alcohol).

Amide $\text{C}_2\text{HBr}_3\text{O}_4\text{NH}$ [223°] Slender needles. Almost insol CS_2 , light petroleum or water, m sol ether, chloroform or benzene, v sol alcohol.

Ita-BROMO PYROTARTARIC ACID

$\text{C}_2\text{H}_2\text{Br}_2\text{O}_4$ $\text{CH}_2\text{Br}-\text{CH}(\text{CO}_2\text{H})-\text{CH}_2-\text{CO}_2\text{H}$. **Bromo methyl succinic acid** [137°] (c 230). From itaconic acid and conc HBrAq at 0° (Beer, A 216, 79, cf Fittig, A 188, 73, Swarts, Z 1866, 722). Monoclinic crystals, v sol hot water. Boiling NaCO_3aq gives itaconic and itamalic acids, boiling water produces paraconic acid.

Ethyl ether EtA'' (270°–275°)

Citra bromo-pyrotartaric acid $\text{C}_2\text{H}_2\text{BrO}_4$ [148°] From citraconic anhydride and conc HBrAq at 0°. Also from mesaconic acid and fuming HBrAq at 140° (F). Monoclinic crystals. Decomposed by heating alone or with $\text{Na}_2\text{CO}_3\text{aq}$ into methacrylic acid, CO , and HBr . The silver salt on heating with water at 130° gives off allylene CH_2CHCH_2 (Bourgois, B 12, 28, 459).

Bromo pyrotartaric acid $\text{C}_2\text{H}_2\text{BrO}_4$ [204°] White prisms. Formed together with bromocrotonic acid by the action of Br on propane tricarboxylic acid $\text{CH}_2\text{CH}(\text{CO}_2\text{H})\text{CH}(\text{CO}_2\text{H})_2$ (q v) (Bischoff & Guthzeit, B 14, 616).

Ita di bromo-pyrotartaric acid $\text{C}_2\text{H}_2\text{Br}_2\text{O}_4$. From itaconic acid, Br, and water (Kekulé, A Suppl 1, 339). Crystals, v sol water, alcohol, and ether.

Reactions —1 Sodium amalgam reduces it to pyrotartaric acid —2 Moist Ag_2O forms di-oxy pyrotartaric acid —3 Boiling aqueous Na_2CO_3 forms acconic acid.

Anhydride $\text{C}_2\text{H}_2\text{Br}_2\text{O}_3$ [50°] Formed by adding Br to a solution of itaconic acid in chloroform (Petr, B 14, 1637).

Citra di bromo pyrotartaric acid $\text{CO}_2\text{H}-\text{CBr}_2-\text{CHMe}-\text{CO}_2\text{H}$ [150°] S 193 at 18°. From citraconic acid and Br (Kekulé, A Suppl 2, 86, Krusemark, A 206, 1). Groups of needles, v e sol water, alcohol, and ether. Heated with water or aqueous Na_2CO_3 it yields propionic aldehyde, bromo propionic aldehyde, bromomethacrylic acid, and HBr — CaA''

Anhydride $\text{C}_2\text{H}_2\text{Br}_2\text{O}_3$. From citraconic

anhydride and Br, formed also by heating the following acid with water

Mesa di bromo pyrotartaric acid

$\text{CO}_2\text{H} \cdot \text{CHBr} \cdot \text{CBrMe} \cdot \text{CO}_2\text{H}$ [194] and [204°] S 81.5 at 18° From mesaconic acid and Br on warming (Kekulé, *A Suppl* 2, 102, Fittig, *A* 188, 86, 206, 1) Nodules Heated with $\text{Na}_2\text{CO}_3\text{Aq}$ it gives propionic aldehyde, two bromo methacrylic acids, CO_2 , and HBr Heated with water it gives propionic aldehyde and bromo citraconic anhydride

Di bromo pyrotartaric acid [102°] Formed by brominating pyrotartaric acid (Reboul & Bourgoin, *Bl* [2] 27, 348)

Di bromo pyrotartaric acid [128°] From propane tri carboxylic acid and Br (Bischoff & Emmett, *B* 15, 1107)

Tri-bromo pyrotartaric acid $\text{C}_3\text{H}_3\text{Br}_3\text{O}_3$ From pyrotartaric acid, Br, and water at 120° (Lagermark, *Z* 1870, 299) Hexagonal prisms, sublimes above 240° —Ag, A'

TETRA BROMO PYROTTRITRIC ACID

$\text{C}_4\text{H}_2\text{Br}_4\text{O}_4$ *Tetra bromo uric acid* [162°] Obtained by exposing powdered dry pyrottritic acid to the vapour of dry bromine at the ordinary temperature Large colourless crystals V sol alcohol, ether, acetone, acetic acid, chloroform, benzene, and CS₂, insol water and petroleum ether The bromine is removed by alkalis and by aniline By sodium amalgam in slightly acid solution it is reduced back to pyrottritic acid By the action of an excess of bromine at 100° it yields penta bromo pyrottritic acid

Tetra bromide $\text{C}_4\text{H}_2\text{Br}_4\text{O}_4$ [180°] Formed by dissolving tetra bromo pyrottritic acid in an excess of dry bromine Small prisms, v sol acetic acid, sl sol benzene, chloroform, and CS₂, insol water and ligroin Decomposed by alkalis Reduced to pyrottritic acid by sodium amalgam (Dietrich & Paal, *B* 20, 1078)

Penta bromo pyrottritic acid

$\text{C}_4\text{H}_2\text{Br}_5\text{O}_4(\text{CO}_2\text{H})$ [c 197°] Obtained by heating the tetra bromo derivative with excess of bromine at 100° White glistening crystals V sol ordinary solvents except water and ligroin (Dietrich & Paal, *B* 20, 1082)

TRI BROMO PYRROL (a) CARBOXYLIC ACID $\text{C}_3\text{H}_2\text{Br}_3(\text{CO}_2\text{H})$ *Tri bromo (a) carbo pyrrolic acid* Long colourless needles V sol alcohol, ether, acetone, sl sol hot water, insol petroleum-ether The methyl ether is formed by bromination of the methyl ether of pyrrol (a) carboxylic acid

Methyl ether A'Me [210°] Long slender needles, v sol ether and hot alcohol, sl sol benzene and petroleum ether, insol water (Ciamician & Silber, *B* 17, 1153)

Di-bromo-pyrrol di-carboxylic acid *Methyl ether* $\text{C}_3\text{H}_2\text{Br}_2(\text{CO}_2\text{Me})_2$ [222°] From di methyl pyrrol di carboxylate and Br (Ciamician & Silber, *G* 17, 269) Long white needles, insol water, sol ether and hot alcohol Converted by cold fuming HNO_3 into $\text{C}_3\text{H}_2\text{Br}_2\text{NO}_4$ [c 171°]

BROMO PYRREYL METHYL KETONE

$\text{CH}_3\text{CO} \cdot \text{C}_3\text{H}_4\text{Br} \cdot \text{NH}$ *Pseudo acetyl bromo-pyrrol* [108°] Long colourless needles, obtained by bromination of pyrrol methyl ketone (Ciamician & Dennstedt, *B* 16, 2354)

Di bromo-pyrrol methyl ketone
 $\text{CH}_3\text{CO} \cdot \text{C}_3\text{H}_4\text{Br}_2 \cdot \text{NH}$ [144°], white needles

Formed by bromination of pyrrol methyl ketone

Tri bromo pyrrol methyl ketone $\text{C}_4\text{H}_4\text{Br}_3\text{ON}$ [179°] White silky needles Sol hot alcohol, ether, and aqueous alkalis, insol water Formed by the action of bromine upon pyrrol methyl ketone in aqueous solution (Ciamician & Silber, *B* 18, 1765)

Penta bromo pyrrol methyl ketone

$\text{C}_4\text{H}_2\text{Br}_5\text{ON}$ [200°] Small white needles Formed by bromination of the tri bromo derivative dissolved in acetic acid (C & S, *B* 18, 1765) or of pyrrol methyl ketone (C & D)

BROMO PYRUVIC ACID $\text{C}_3\text{H}_2\text{Br}_2\text{O}_3$ *ie*

$\text{CH}_2\text{Br} \cdot \text{CO} \cdot \text{CO}_2\text{H}$ From pyruvic acid, Br, and water at 100° (Wichelhaus, *B* 1, 265) Syrup

Di bromo pyruvic acid $\text{CHBr} \cdot \text{CO} \cdot \text{CO}_2\text{H}$ [91°] (W), [93°] (C) From pyruvic acid (15g), water (10g), and Br (45g) at 100° (Bottinger, *B* 14, 1236, cf Grimaux, *Bl* [2] 21, 231, Clermont, *Bl* [2] 19, 103, Wislicenus, *A* 148, 208) Monoclinic efflorescent tables (containing 2aq), sol water and ether Baryta converts it into tartaric acid Benzene and conc H₂SO₄ form $\text{CHBr} \cdot \text{C}(\text{OH})\text{Ph} \cdot \text{CO}_2\text{H}$ (Bottinger *B* 14, 1235) —Di bromo pyruvic acid (1 mol), urea (1 mol) and conc H₂SO₄ form di bromo pyruvureide $\text{C}_3\text{H}_2\text{Br}_2\text{N}_2\text{O}_4$, whence bromine-water forms tri bromo pyruvurin $\text{C}_3\text{Br}_3\text{N}_2\text{O}_4\text{H}_2$, a body which is decomposed by cold ammonia into bromoform and ammonic oxalurate Ammonia converts di bromo pyruvureide into di bromo pyruvuramide $\text{C}_3\text{H}_2\text{Br}_2\text{N}_2\text{O}_4$ which is decomposed by boiling baryta water into NH₃, urea, HBr, tartaric acid, and amido uracil $\text{C}_3\text{H}_4\text{N}_2\text{O}_4$ (E Fischer, *A* 239, 185)

Tri bromo pyruvic acid $\text{CBr}_3 \cdot \text{CO} \cdot \text{CO}_2\text{H}$ [90°], [104°, hydrated] Formed, together with the preceding, by brominating pyruvic acid (Grimaux, *Bl* [2] 21, 390) Also from lactic acid and Br Laminæ resembling naphthalene (containing 2aq), sl sol cold water Decomposed by boiling water into bromoform and oxalic acid

Ethyl ether EtA' [97°] Formed by adding Br to a solution of lactic acid in ether (Klimentko, *J R* 8, 145, Wislicenus, *A* 143, 10)

DI BROMO PYRUVURAMIDE $\text{C}_3\text{H}_2\text{N}_2\text{Br}_2\text{O}_4$

Di bromo pyruvuramide [170°-180°] From di bromo pyruvureide and conc NH₃Aq in the cold (Fischer, *A* 239, 191) Slender needles (from alcohol) V sol warm water, but slowly decomposed by boiling water Decomposed by boiling baryta water into NH₃, urea, HBr and tartaric acid, another portion forming amido uracil

DI BROMO PYRUVUREIDE $\text{C}_3\text{H}_2\text{Br}_2\text{N}_2\text{O}_4$

Di bromo pyruvureide From di bromo pyruvic acid (q v), urea, and conc H₂SO₄ (Fischer, *A* 239, 188) Granular crystals (from HOAc), v sl sol alcohol, water, and acids, sl dilute alkalis Decomposed by boiling alkalis Decomposed by heat above 280° Its ammonium and guanidine salts are sl sol water

TRI BROMO-PYRUVURIL ANHYDRIDE

$\text{C}_3\text{H}_2\text{Br}_3\text{N}_2\text{O}_4$ *Tri bromo-anhydro pyruvuril* [180°] Formed by heating tri bromo pyruvic acid and urea at 100° (Grimaux, *A Ch* [5] 11, 373) Light needles (from water)

TRI BROMO PYRUVURINE $\text{C}_3\text{H}_2\text{Br}_3\text{N}_2\text{O}_4$, *ie* $\text{CBr}_2 \cdot \text{CO} \cdot \text{CO} \cdot \text{NH} \cdot \text{CO} \cdot \text{NH}_2$ *Ureide of tri-bromo pyruvic acid* *Tri bromo pyruvurine* [247°]

From di bromo pyruvureide and excess of bromine water at 100° or HNO₃ (S G 14) (Fischer, A 239, 189). Glittering plates, m sol boiling water and alcohol, v sl sol ether. Decomposed even by cold alkalis into bromoform and ammonium oxalurate.

(B 2) **BROMO-QUINOLINE** C₈H₆BrN (278°) C₈H₆Br(C₂H₅N) Benz bromo quinoline (278°) Liquid. Volatile with steam. Prepared by heating *p* bromo aniline with glycerin, nitrobenzene and H₂SO₄, the yield is 80 pc.

Salts — B'HCl small white needles — (B'HCl).PtCl₄ microscopic needles (La Coste, B 15, 558).

Bromo quinoline C₈H₆BrN (270°) Yellowish oil. Prepared by bromination of quinoline. Perhaps identical with the preceding.

Salts — B'HCl monoclinic prisms (B'HCl).PtCl₄ fine orange red needles.

Methylo iodide C₈H₆BrNMe. By the action of Ag O on an aqueous solution of the iodide, a strongly alkaline solution of the hydrate is produced (C₈H₆BrNMeOH), this is transformed on standing or warming, by splitting off H₂O, into the much more stable methylo oxide.

Methylo oxide (C₈H₆BrNMe)₂O [147°] This is also formed by the action of KOH on the iodide. Colourless needles. Soluble in hot alcohol, sparingly in cold, very slightly soluble in water and ether. Combines with acids very slowly (La Coste, B 14, 915, 15, 188).

(Py 1 or 2) **Bromo-quinoline** C₈H₆ $\begin{matrix} \text{CBr} & \text{CH} \\ & \diagdown & \diagup \\ & \text{N} & \\ & \diagup & \diagdown \\ \text{CH} & & \text{CBr} \end{matrix}$ (274° uncor) Formed, to

gether with propyl bromide, propylene bromide, quinoline hydrobromide, &c., by heating the propyl bromide of quinoline di bromide to 170°–190°. Prepared by heating to 180° the hydrobromide of quinoline di bromide C₈H₆Br₂N.HBr = C₈H₆BrN.HBr + HBr, the quinoline di bromide is formed by the action of bromine on an ethereal solution of quinoline. Oil of aromatic smell resembling quinoline. On oxidation with KMnO₄, it yields oxaloxyl anthranilic acid C₈H₆(CO₂H)NH CO CO H and bromo pyridine di carboxylic acid C₈H₆BrN(CO₂H)₂.

Salts — B'HCl needles or tables, sublimes without melting — B'HBBr foursided tables or prisms, sublimes at c 190° without melting, sol alcohol, sl sol cold water — B'HNO₃* [180° uncor], small concentric prisms — B'₂H₂SO₄* [183° uncor], small needles, disassociated by water — B'₂H₂Cr₂O₇ [145°], sparingly soluble flat yellow prisms (from hot water) — B'₂H₂Cl₂.PtCl₄ small orange yellow needles — B'₂AgNO₃ [173°], needles (Claus a. Colischonn, B 19, 2763).

(B 1 4) **Di bromo quinoline**

CH CBr $\begin{matrix} \text{CH} & \text{CH} \\ & \diagdown & \diagup \\ & \text{C}_8\text{H}_4\text{N} & \\ & \diagup & \diagdown \\ \text{CH} & & \text{CBr} \end{matrix}$ [128°] (a) *Di bromo quinoline*

Formation — 1 By bromination of quinoline by heating the hydrochloride with bromine at 180° (La Coste, B 14, 917, 15, 191) — 2 By heating di bromo aniline [1 4 5] with a mixture of glycine, nitrobenzene and H₂SO₄ (Metzger, B 17, 186).

Properties — Distils without decomposition. Volatile with steam. Long white needles. Almost

insol water, v sol. alcohol, ether, benzene and aqueous acids.

Salts — B'HCl small needles — B'₂H₂Cl₂.PtCl₄ fine yellow needles — B'₂H₂Cr₂O₇, orange red microcrystalline powder, decomposed by water into the base and CrO₃. The picrate forms long yellow needles, decomposed by water.

Methylo iodide B'MeI Slender red needles. Sol hot water, insol ether and cold alcohol.

Methylo oxide B'MeO Formed by the action of NaOH on the iodide. Microscopic needles.

(B 2, 4) **Di bromo quinoline** C₈H₄Br₂(C₂H₅N) [101°] Slender colourless needles. Volatilises undecomposed. Formed by heating di bromo aniline with glycerin, nitrobenzene and H₂SO₄ (B'HCl).PtCl₄ (La Coste, B 15, 559).

Di bromo quinoline (probably B 2 Py 1) C₈H₄Br₂N [124° uncor] Formed by the action of bromine (2 mols) upon quinoline (B 2) sulphonic acid (1 mol) in cold aqueous solution. Long colourless needles (from ether). Sublimable. It is oxidised by KMnO₄ to bromo pyridine di carboxylic acid [165°] (Claus a. Kuttner, B 19, 2884).

Di bromo quinoline tetrahydride C₈H₆Br₂N [66° uncor] Formed by reduction of tetra bromo quinoline with sodium amalgam. Colourless tables. Volatile with steam. Sol alcohol and ether, insol water.

Salts — B'HCl [75°], acicular crystals — (B'HCl).PtCl₄ 2aq yellow crystalline powder — B'HNO₃ [189°] prisms — B'H₂SO₄ white plates, decomposes at 246° uncor — B'H₂CO₃ colourless tables, decomposes at 171° uncor (Claus a. Istel, B 15, 822).

Tri bromo quinoline C₈H₄Br₃N [170° uncor] Formed by the action of bromine (3 mols) upon an aqueous solution of quinoline (B 2) sulphonic acid (1 mol) at 100°. Long silky needles. Sl sol cold ether (Claus a. Kuttner, B 19, 2885).

Tri bromo quinoline C₈H₄Br₃N [175°] From quinoline and Br (Lubavin, A 155, 318). Silky needles, v sol hot alcohol. Possibly identical with the preceding.

Tri bromo quinoline C₈H₄Br₃N [198° uncor] Formed by the action of bromine upon an aqueous solution of quinoline (B 4) sulphonic acid at 100°. White felted silky needles. V sol ether and hot alcohol. Sublimable (Claus a. Kuttner, B 19, 2882).

Tetra bromo quinoline C₈H₄Br₄N [119° uncor] Long colourless needles or thick prisms. Insoluble in water. Formed by bromination of quinoline in CS₂ (Claus a. Istel, B 15, 820).

Hexa bromo quinoline C₈HBr₆N [90°] From pyridine (2, 3) di carboxylic acid, Br, and water (Weidel, A 173, 95). Needles (from alcohol). Reduced to quinoline by sodium amalgam.

(B 4) **BROMO QUINOLINE** (B 1) **CARBOXYLIC ACID** C₈H₆BrN(CO₂H) [275°] From bromo amido benzoic acid C₈H₆Br(NH₂)CO₂H [1 2 4] (10g), glycerin (22.5g), o nitro-phenol (6g), and H₂SO₄ (20g) by heating for 5 hours at 160° (Lellmann a. Alt, A 237, 313). White powder, v sl sol water and ether, sl sol hot alcohol. Salt — (HA'), H'.PtCl₄ 4aq

(a)-BROMO QUINOLINE SULPHONIC ACID

$C_8H_6(Br)N(SO_3H)$ S 08 at 22°, 9 at 100° Short thin needles Sl sol alcohol Formed together with the β acid by sulphonating bromo quinoline

Salts— A_2Mn4aq small yellow needles— $A'Ag$ spangles or needles— $A'K$ short prisms, S 137 at 17°— $A'NH_4$ felted needles— $A'Ba$ nearly insoluble crystalline pp— $A'Mg10aq$ colourless plates— $A'Zn4aq$ thin colourless needles (La Coste, B 15, 1910)

(B) Bromo quinoline sulphonic acid

$C_8H_6N(Br)(SO_3H)$ S 15 at 22°, 275 at 100° Short thick needles (containing aq) Formed together with the (a) acid by sulphonation of bromo quinoline

Salts— $A'KI1aq$ large tables, S 1725 at 22°— $A'Ag$ colourless needles— $A'Ba2aq$ sparingly soluble needles— $A'Mg9aq$ small needles— $A'Zn9aq$ six sided tables— $A'Mn4aq$ colourless tables (La Coste, B 15, 1915)

BROMO QUINONE $C_8H_4BrO_2$ [56°] Formed by oxidising bromo hydroquinone with $FeCl_3$ (Sarauw, A 209, 106) Groups of needles, v sol alcohol, ether, and benzene, sl sol hot water Ammonia gives a green colouration, turning black on warming

Di bromo quinone $C_8H_2Br_2O_2$ [188°] Formed by oxidation of di bromo hydroquinone (S, Benedikt, M 1, 346) Small golden crystals, insol water, sol alcohol, ether, and benzene Boiling KOHAq gives di bromo di oxy quinone (dibromanilic acid)

Di bromo quinone $C_8H_2Br_2O_2$ [76°]

Formation—Di bromo -p diazo phenol,

$C_6H_4Br_2 \xrightarrow{O} N_2$ is converted by a boiling solution of calcium chloride into di bromo hydroquinone, $C_6H_4Br_2(OH)_2$. This solution is mixed with $FeCl_3$ and distilled, when the quinone passes over The yield is small

Properties—Long, extremely slender needles, sol in alcohol, ether, $CHCl_3$, CS_2 , benzene, and alkalis Pungent May be sublimed (Bohmer, J pr 132, 465)

Di bromo quinone $C_8H_4Br_2O_2$ [122°] From tri bromo phenol and fuming HNO_3 at 0° (Levy a Schultz, A 210, 158) Yellow laminae (from dilute alcohol)

Di bromo quinone? [88°] From quercite and $HBrAq$ at 160° (Prunier, A Ch [5]15, 67) Three di bromo quinones are indicated by theory

Tri bromo quinone $C_6H_3Br_3O_2$ [147°] Formed by oxidising tri bromo hydroquinone in dilute alcoholic solution (Sarauw, A 209, 120) Golden leaflets (from alcohol), sol alcohol, ether, and benzene Alkalis give a green colouration, followed by separation of red prisms Boiling conc NaOH gives di bromo di oxy quinone and tri bromo hydroquinone A tri bromo quinone [108°] is got by heating quercite with HBr (P) A tri bromo quinone is also formed by reduction of tetra bromo quinone (Stenhouse, A Suppl 8, 20, cf Herrmann, B 10, 110)

Tetra bromo quinone $C_6Br_4O_2$ *Bromanil*

Formation—1 By treating phenol with Br and I (Stenhouse, C J 23, 10)—2 By boiling picric acid with Br and water (Stenhouse, A 91, 307)—3 From quinone and Br (Sarauw, B 12, 680, A 209, 126)—4 A product of the action of Br

and water on benzoic acid (Hübner, A 148, 255), and on proteids (Hlasiwetz a Habermann, A 159, 320)—5 From tri bromo phenol and HNO_3 (Losanitsch, B 15, 474)—6 From di oxy dihydro terephthalic (succinyl succinic) acid and Br (Herrmann, A 211, 341)—7 From (1,3,5,4)-bromo di nitro phenol by heating with Br (Ling, C J 51, 147)

Properties—Golden laminae (from HOAc), sublimes as sulphur yellow crystals Insol water, m sol boiling alcohol, sl sol ether HIAq reduces it to tetra bromo hydroquinone Potash forms a greenish black solution turning purple

Tetra bromo ortho quinone $C_6Br_4O_2$

[1 2 3 4 5 6] [151°] Obtained by oxidation of tetra bromo pyrocatechin in acetic acid solution with HNO_3 . It can also be prepared directly from pyrocatechin by adding bromine (10 to 12 pts) to a boiling solution of the latter (1 pt) in acetic acid (20 pts) Dark red thick prisms, tables, or transparent plates V sol alcohol, ether, acetic acid, and benzene, sl sol petroleum spirit It is a powerful oxidising agent, being readily reduced to tetra bromo-pyrocatechin With aniline it gives a compound which crystallises in bluish black glistening plates or thick needles [173°] (Zincke, B 20, 1776)

DI BROMO QUINONE CHLORIMIDE

$C_8H_2Br_2 \begin{matrix} \diagup NCl \\ | \\ O \end{matrix}$ [2 6 4] [80°] Long yellow

prisms Prepared by adding a solution of chloride of lime to an acidified solution of di-bromo amido phenol [2 6 4 1] (Möhlau, B 16, 2845)

DI BROMO QUINONE PHENOL IMIDE

$N \begin{matrix} \diagup C_6H_4OH \\ | \\ C_8H_2Br_2O \end{matrix}$ [4 2 6 1]

Formation—1 By adding di bromo quinone chlorimide to an alkaline solution of phenol—2 By oxidising an alkaline solution of di bromo-amido phenol [2 6 4 1] and phenol with $K_2Cr_2O_7$

Properties—Dark red prisms with metallic reflection Sol alcohol, ether and acetic acid with a magenta red colour, insol water

Reactions—On heating with HCl it is split up into quinone and di bromo amido phenol On reduction it yields di-bromo-di-oxy di-phenylamine $HN \begin{matrix} \diagup C_6H_4OH \\ | \\ C_8H_2Br_2OH \end{matrix}$

Sodium salt $C_8H_2Br_2ONa$ long blue prisms with golden green reflection Soluble in water and alcohol with a blue colour Heated with an excess of aqueous NaOH the blue colour changes to red, but reappears on cooling (Möhlau, B 16, 2845)

BROMO-RESORCIN $C_6H_4Br(OH)_2$ [91°]

Formed by boiling bromo di oxy benzoic acid with water for some hours (Zehenter, M 8, 293) Groups of needles, v sol water and ether, m sol alcohol Fe_2Cl_3 colours the aqueous solution bluish violet, a red pp being subsequently formed Heated with water, K_2CO_3 , and $SnCl_4$ it gives resorcin and di oxy benzoic acid

Bromo resorcin Di propyl derivative $C_6H_4Br(OPr)_2$ [71°] Formed by brominating di propyl-resorcin (Karof, B 13, 1679) Colourless silky needles, may be sublimed, V sol alcohol and HOAc, sl sol water.

Di-bromo-resorcin $C_6H_2Br_2(OH)_2$ [98°]
Formed, together with 'di bromo mono resorcin phthalein,' by heating tetra bromo fluo resorcin (eosin) with dilute NaOH aq at 140° (Baeyer, *A* 183, 57, Hofmann, *B* 8, 64)
Formed also by boiling di bromo (1,3,2) di oxy benzoic acid with water (Zehenter, *M* 2, 478, 8, 293) Needles (from water), m sol hot water, v e sol alcohol and ether Fe_2Cl_6 gives a transient violet colour

Di methyl ether $C_6H_2Br_2(OMe)_2$ [141°]
Slender needles Insol water, sol alcohol and ether Prepared by bromination of the dimethyl ether of resorcin (Tiemann a Parrissus, *B* 13, 2365, cf Honig, *B* 11 1041)

Di bromo resorcin $C_6H_2Br_2(OH)_2$ [112°]
From Br and resorcin in CS_2 (Zehenter, *M* 8, 293) Colourless needles (containing aq) (from water), m sol hot water Fe_2Cl_6 gives a blue colour followed by a dark pp

Tri bromo resorcin $C_6HBr_3(OH)_2$ [104°]
(Typke, *B* 10, 1578) From resorcin, Br, and water (Hlasiwetz a Barth, *A* 130, 357), or Br, and HOAc (Benedikt, *M* 4, 227) Formed also by heating penta bromo resorcin with aldehyde or formic acid (Claassen, *B* 11 1439) Small needles, sl sol water, v sol alcohol

Mono acetyl derivative
 $CHBr_2(OH)(OAc)$ [114°] From mono acetyl resorcin and Br (C), sol hot water

Di acetyl derivative $C_6HBr_2(OAc)_2$ [108°]
From penta bromo resorcin and Ac O Sol hot water

Mono methyl ether $C_6HBr_2(OH)(OMe)$ [104°]
From mono methyl resorcin and Br Slender white needles, sol alcohol and ether, insol water (Tiemann a Parrissus *B* 13, 2364)

Tetra bromo resorcin $C_6Br_4(OH)_2$ [163°]
(C), [167°] (B) Formed by treating penta bromo resorcin with H_2SO_4 (Claassen, *B* 11, 1440, Benedikt, *M* 1, 366) Small needles (from alcohol)

Di-acetyl derivative $C_6Br_2(OAc)_2$ [169°], v sol hot water

Penta bromo resorcin $C_6Br_5(OH)(OBr)$? [114°]
Formed by adding an aqueous solution of resorcin to a cooled mixture of Br and water (Stenhouse, *A* 163, 184) Dimetric crystals, $a c = 0.076$ 1 V sl sol water Alcoholic $AgNO_3$ pps more than two thirds of its Br At 160° it splits up into bromine and tri bromo resorcin $C_6HBr_3(OH)_2$ (Liebemann a Dittler, *B* 5, 1090, *A* 169, 256) Converted into tri bromo resorcin by conc HI, H_2S , $SnCl_2$, warm alcohol, aldehyde, or formic acid (Benedikt, *M* 1, 351, Claassen, *B* 11, 1433) Boiling AcO gives di acetyl tri bromo resorcin Aniline forms tri bromo aniline and tri bromo resorcin, phenol acts similarly (Benedikt, *B* 11, 2168) Boiling dilute KOH produces bromoform

Hexa bromo resorcin $C_6Br_6(OBr)_2$? [136°]
SG 153 8 188 Prepared by heating tetra bromo resorcinol with excess of bromine Monoclinic crystals $a b c = 983$ 1 1 687, $\beta = 85^\circ 86'$ Decomposed by alcohol forming tetra bromo resorcin (Benedikt, *M* 1, 365)

TRI BROMO-RESOQUINONE $C_6HBr_3O_2$ or $C_6H_2Br_3O_2$ Formed by heating penta bromo-resorcin at 160° (Liebemann a Dittler, *B* 5, 1090) Orange needles, insol water, v sol alcohol and ether At 250° it gives off Br

leaving amorphous $C_{12}H_2Br_4O_4$ Reduced by Sn and HCl to tetra-bromo tetra oxy diphenyl (Benedikt, *M* 1, 350, *B* 11, 2170)

DI-BROMO-RESORCIN-PHTHALEIN so-called $C_{12}H_2Br_2O_4$ \pm CO_2H C_6H_4 CO $C_6HBr_2(OH)_2$ *Di bromo di-oxy benzoyl benzoic acid* [220°]
Formed, together with di bromo resorcin, by heating tetra bromo fluorescein with dilute NaOH aq (Baeyer, *A* 183, 56) Plates, v sl sol water

BROMO-RETENE v RETENE

BROMO-RICINELAIDIC ACID $C_{18}H_{33}BrO_4$
From the dibromide of ricinelaic acid and alcoholic KOH Oil Alcoholic KOH forms an acid [71°] (Ulrich, *Z* 1867, 549)

BROMO RICINOLEIC ACID $C_{18}H_{33}BrO_4$
From ricinoleic acid by successive treatment with Br and alcoholic KOH (Ulrich, *Z* 1867, 546) Oil, converted by alcoholic KOH into ricin-stearic acid $C_{18}H_{33}O_4$

Di bromo ricinoleic acid $C_{18}H_{32}Br_2O_4$ From ricin-stearic acid and I² Oil

BROMO ROSANILINE v ROSANILINE

TETRA BROMO ROSOLIC ACID $C_{20}H_{12}Br_4O_4$
From Br and rosolic acid in HOAc (Graebe a Caro, *A* 179, 201) Lustrous green plates, insol water Its alkaline solutions are violet —A"Ag, dark violet pp

Ethyl ether A"Et [110°–115°], soluble in alcohol, ether, and benzene, insoluble in water (Ackermann, *B* 17, 1627)

BROMO ROSOQUINONE $C_{12}H_2Br_2O_2$ \pm $C_6H_2Br_2O$

| (?) Red and steel blue crystals
 $C_6H_2Br_2O$ (?)
Prepared by the oxidation of tetra bromo phenol phthalein (5 pts) dissolved in H_2SO_4 (250 pts) with a mixture of HNO_3 (5 pts) and H_2SO_4 (50 pts)

Bromo rosohydroquinone $C_{12}H_2Br_2O_2$ \pm $C_6H_2Br_2OH$

| (?) Tetra bromo di oxy diphenyl
 $C_6H_2Br_2OH$ [264°] Sublimable Prepared by the reduction of the corresponding quinone (Baeyer a Schraube, *B* 11, 1301)

BROMO SALICYLIC ACID v Bromo o oxy-BENZOIC ACID

BROMO SALICYLIC ALDEHYDE v Bromo-o oxy BENZOIC ALDEHYDE

BROMO STEARIC ACID $C_{18}H_{34}Br_2O_4$ [41°]
SG 22 1 0653 From stearic acid (7 pts), bromine (4 pts), and water at 135° (Oudemans, *J pr* 89, 195) Crystalline mass, insol water, v sol alcohol and ether The silver salt heated with water forms stearic acid $C_{18}H_{34}O_2$

Di bromo stearic acid $C_{18}H_{32}Br_2O_4$ From oleic acid and Br (Overbeck, *A* 140, 42) Oil Alcoholic KOH forms bromo oleic and stearic acids Moist Ag_2O gives oxy oleic acid $C_{18}H_{34}O_2$ and di oxy stearic acid $C_{18}H_{32}O_4$

Di bromo stearic acid $C_{18}H_{34}Br_2O_4$ [27°]
From elaidic acid and Br Reduced to elaidic acid by sodium amalgam

Tri bromo stearic acid $C_{18}H_{31}Br_3O_4$ From bromo oleic acid and Br Oil

Tetra bromo stearic acid $C_{18}H_{28}Br_4O_4$ [70°]
From stearic acid and Br Lamine (from alcohol)

BROMO STILBENE v BROMO DI PHENYL-ETHYLENE

BROMO STRYCHNINE *v* **STRYCHNINE****BROMO STYRENE** C_6H_5Br *is*

$C_6H_5CHCHBr$ *Bromo phenyl ethylene* Formed by boiling styrene dibromide with alcoholic KOH or by heating it with water at 190° (Glaser, *A* 154, 168, Radziszewski, *B* 6, 493) Heavy pungent oil, decomposed by distillation Converted by heating with water into phenyl acetic aldehyde (Erlenmeyer, *B* 14, 323)

a **Bromo styrene** $C_6H_5CBrCH_2$ [7°] (220° i v)

Formation—1 From styrene dibromide and alcoholic KOAc at 160° (Zincke, *A* 216, 290)—2 By boiling *a* *β* di bromo phenyl propionic acid with water (Barisch, *J pr* [2] 20, 179, Fittig *a* Binder, *A* 195, 141)—3 From bromo oxy phenyl propionic acid and water at 200° (G)

Properties—Oil, with pleasant odour of hyacinths May be distilled Does not readily give up its Br Converted into acetophenone by heating with water at 180° (Friedel *a* Balsahn, *Bl* [2] 32, 614)

Di bromo styrene $C_6H_4Br_2$ (254°) From tri bromo *β* phenyl propionic acid and water at 100° (Kinnicutt *a* Palmer, *Am* 5, 384) Oil

Tri bromo styrene $C_6H_3Br_3$ From the preceding and Br Oil (K *a* P)

BROMO STYRENE DIBROMIDE *v* **DI BROMO ETHYL BENZENE**

BROMO SUBERIC ACID $C_6H_8Br(CO_2H)_2$ [103°] Prepared, together with di bromo suberic acid, by the action of bromine and phosphorus on suberic acid Crystalline powder Sol alcohol and ether By alcoholic KOH it gives suberic acid (Ganttner *a* Hell, *B* 15, 142)

Di bromo suberic acid $C_6H_8Br_2(CO_2H)_2$ [173°] Formed by bromination of *n* suberic acid Glutening needles V sol alcohol, ether, and hot water, v sl sol benzene, chloroform, ligroin, and cold water By heating with alcoholic KOH it gives di ethoxy suberic acid to gether with a small quantity of suberic acid $C_6H_8(CO_2H)_2$ (Hell *a* Kempel, *B* 18, 813)

BROMO SUCCINIC ACID $C_4H_5BrO_3$ *is* $CO_2HCH_2CHBrCO_2H$ [160°] S 192 at 155°

Formation—1 By heating succinic acid (5g) with Br (2½ c c) and water (40 c c) at 120° (Kekulé, *A* 117, 125, Carius, *A* 129, 6, Hell, *B* 14, 892)—2 From succinic acid (5g), Br (2½ c c) and chloroform (5 c c) at 160° (Orlowsky, *J R* 9, 277)—3 From succinic ether and Br (Schacherl, *B* 14, 637)—4 By the action of HBr on fumaric, tartaric, malic, and racemic acids (Kekulé, *A* 130, 21, Fittig, *A* 188, 88, Anschütz *a* Bennert, *B* 15, 643)—5 By decomposing its bromide with water (Volhard, *A* 242, 153)

Properties—Small prisms, v sol water Its silver salt rapidly decomposes Moist Ag O gives malic acid Sodium amalgam produces succinic acid Boiling water slowly forms fumaric acid

Anhydride $C_4H_3BrO_2$ [31°] (187°) at 11 mm From the acid and $AsCl_3$ at 100° (A *a* B) Decomposed by heat into HBr and maleic anhydride

Methyl ether MeA (c 134°) at 30 mm *Ethyl ether EtA* (226°) Inflames the skin Cold aqueous or alcoholic NH_3 convert

VOL. I.

it into fumaramide Aqueous NH_3 at 110° gives asparagine (Korner *a* Menozzi, *G* 17, 171)

Bromide $C_4H_3Br(CO_2Br)_2$ Formed by adding Br (1100 g) gradually to a mixture of succinic anhydride (800 g) and amorphous P (36 g) (Volhard, *A* 242, 151)

Di bromo succinic acid
 $CO_2HCHBrCHBrCO_2H$ S 204 at 100°

Formation—1 By heating succinic acid (12 g) with Br (11 c c) and water (12 c c) at 180° (Kekulé, *A* 117, 123, *Suppl* 1, 131, Bourgoin, *Bl* [2] 19, 148)—2 From fumaric acid and Br (K, Baeyer, *B* 18, 676)

Properties—Opaque prisms, sl sol cold water, v sol alcohol and ether

Reactions—1 *Sodium amalgam* reduces it to succinic acid—2 *Boiling water* converts the sodium salt into hydro sodic bromo malate, the Ba salt into hydro baric bromo maleate and barium racemate, the silver salt into inactive tartaric acid, and the acid itself into HBr and bromo maleic acid—3 *Water* at 140° gives iso bromo maleic acid—4 NH_3 gives bromo amido succinic acid—5 *Reduction* in acid solution gives fumaric acid (Ossipoff, *Bl* [2] 34, 346)—6 *Heating with *thio urea** gives fumaric acid (Nencki *a* Sieber, *J pr* [2] 25, 79)

Salts— $(NH_4)_2A$ — Na_2A 4aq— AgA — CaA 2aq

Mono methyl ether MeHA decomposes about 245°— $NaMeA$ 4aq (Claus, *B* 15, 1844)

Mono ethyl ether EtHA [275°]— $KEtA$ 1½aq— $NaEtA$ 2aq— $AgEtA$ 1½aq (C)

Methyl ether MeA [62°] Mono symmetrical crystals Prepared by the action of bromine on methyl fumarate

Ethyl ether EtA [58°] (K, A), [68°] (Lehrfeld, *B* 14, 1820) Rhombic crystals Prepared by the action of bromine on ethyl fumarate On heating to 170° it decomposes into bromo maleic ether and HBr (Anschutz, *B* 12, 2281) Aniline converts it into $C_6H_5(NPhH)_2(CO_2Et)$ [145°] (Lopatine, *C R* 105, 230)

Methyl ethylether MeEtA [63°] (C)

Chloride $C_4H_3Br_2O_2Cl_2$ [63°] From Br and succinyl chloride or fumaryl chloride (Perkin *a* Duppa, *C J* 13, 102, K)

Amic acid $CO_2HCH_2CHBrCONH_2$ Unstable crystals (C, Michael *a* Wing, *Am* 6, 421)

Anilide (°)

$NHPhCOCHBrCHBrCONHPh$ From the anilide of fumaric acid and bromine (Anschutz *a* Wirtz, *A* 239, 138, *Am* 9, 240) White powder, does not melt below 300°

Phenyl imide NPh(CO) $_2$ C $_4$ H $_3$ Br $_2$ [159°] From the phenyl imide of maleic acid (maleanil) in chloroform by adding Br (A *a* W)

Iso (or allo) di bromo succinic acid

(cf Anschütz, *A* 239, 181) [160°]

Formation—1 From maleic acid and Br (Kekulé, *A* *Suppl* 2, 89)—2 Together with its isomeride, by heating bromo maleic anhydride with HBr, or succinic acid with water and Br at 140° (Franchimont, *B* 6, 199, Bourgoin, *B G* 624)—3 From (b) bromo pyromucic acid, Br, and water (Hill *a* Sanger, *A* 239, 53)

Preparation—By dissolving its anhydride in water (Pictet, *B* 13, 1070)

Properties—Large crystals, more soluble in water than its isomeride. At 180° it gives off HBr, bromo fumaric acid being formed

Reactions—1 Boiling water converts the acid and its Ba salt into bromo maleic acid, but the Ag salt into racemic acid—2 Moist Ag₂O gives pyruvic acid (Beilstein & Wiegand, *B* 15, 1499)—3 Sodium amalgam produces succinic acid

The Di methyl ether A"Me, and the Di ethyl ether A"Et, are oily liquids, insol water (Pictet, *B* 13, 1670)

Anhydride C₂H₂Br₂CO, [32°] Prepared by heating maleic anhydride with bromine at 100° (Pictet, *B* 13, 1669) Colourless tables Has a great affinity for water, with which it forms iso dibromo succinic acid On heating to 100° it evolves HBr forming bromo maleic anhydride

Tri bromo succinic acid
CO₂H CBr₂ CHBr CO₂H [137°] From bromo maleic or bromo fumaric acid and Br (Petri, *A* 195, 69) Deliquescent needles, boiling water converts it into di bromo acrylic acid

BROMO SULPHI BENZOIC ACID
C₆H₄Br(SO₂H)(CO₂H) [4 2 or 3 1] [238°–245°] From C₆H₄Br(SO₂Cl)CO₂H by treatment with alcohol and zinc dust (C Böttinger, *A* 191, 24) — BaA''—BaH₂A'', 2aq — CaH₂A'', 8aq

BROMO SULPHI BENZOIC ALDEHYDE
C₆H₄Br(SO₂H)CHO [131°] One of the products got by reducing, by zinc dust and alcohol, the mixture of chlorides got by acting on C₆H₄Br(SO₂Na)(CO₂Na) by PCl₅ It is formed from C₆H₄Br(SO₂Cl)(COCl) present in the mixture Salt—BaA'', 5aq

BROMO SULPHO BENZOIC ACID
C₆H₄Br(SO₂H)(CO₂H) [2 3 or 5 1] From the corresponding bromo toluene sulphonic acid by chromic mixture (Retschy, *A* 169, 45) — KHA'' 3aq — BaA'' 2aq — PbA'' 2aq

Bromo-sulpho benzoic acid
C₆H₄Br(SO₂H)(CO₂H) [1 3 5] From *m* bromo benzoic acid and SO₂ (Hubner & Upmann, *Z* [2] 6, 295, Roeters van Leenen, *Z* [2] 7, 67, Böttinger, *B* 7, 1779) Delicate deliquescent needles Potash fusion converts it into *s* di oxy benzoic acid

Salts —NaHA'' — Ag₂A'' — CaA'' 1½aq — BaA'' 2½aq — BaH₂A'', aq — CuA''

Bromo sulpho benzoic acid
C₆H₄Br(SO₂H)(CO₂H) [4 2 1] From bromo toluene *o* sulphonic acid by chromic mixture (Weiss, *A* 169, 26) —KHA''—CaA''—BaA'' V sol water

Imide C₆H₄Br<SO₂>NH. **Bromo benzoic sulphimide** [217°] From (4, 1, 2) bromo toluene sulphamide and KMnO₄. Also from the acid K salt by successive treatment with PCl₅ and NH₃ (Remsen & Bayley, *Am* 8, 229) Long needles (from water), v sol alcohol and hot water, v sl sol HCl aq Sublimes at 200° Its taste is extremely sweet at first and then extremely bitter —Ba(C₆H₄BrNSO₂), 7½aq — Ca(C₆H₄BrNSO₂), 7½aq — Ag(C₆H₄BrNSO₂), — C₆H₄(C₆H₄BrNSO₂), [199°], formed by successive treatment with PCl₅ and alcohol.

Bromo sulpho benzoic acid
C₆H₄Br(SO₂H)(CO₂H) [4 3.1]. Formed by oxy

dation of the corresponding bromo toluene sulphonic acid (Hasselbarth, *A* 169, 12) —KHA'' aq —BaA'' ¾aq —PbA'' 2aq

Bromo sulpho benzoic acid
C₆H₄Br(SO₂H)(CO₂H) [4 2 or 3 1]. Probably identical with the preceding From *p* bromo benzoic acid and fuming H₂SO₄ heated for 8 hours at 130° (Böttinger, *A* 191, 13) Matted needles, v sol water

Salts —NaHA'' 2aq —Ag A'' 3aq —BaA'' 3aq —BaH₂A'', 4aq —CuA'' 3aq —PbA'' 7aq

Chloride C₆H₄Br(SO₂Cl)CO₂H [197°] (with decomposition) Needles (from ether) M sol cold ether, which separates it from another chloride

Acid ether C₆H₄Br(SO₂Et)(CO₂H) [84°] From the chloride and alcohol

Amic acid C₆H₄Br(SO₂NH₂)(CO₂H) [230°] —BaA'', 12aq

Amic acid C₆H₄Br(SO₂H)(CONH₂) [262°]

Amic ether C₆H₄Br(SO₂Et)(CONH₂) [128°]

Bromo-di-sulpho-benzoic acid

C₆H₄Br(SO₂H)CO₂H From *p* bromo toluene disulphonic acid and boiling fuming HNO₃ (Kornatzki, *A* 221, 196) —K₂A'' aq —Ba₂A'' 12aq

Chloride [151°] Trimetric tables from ether)

Amide [above 260°] Small prisms in stars

BROMO - SULPHO - PHENYL - PROPIONIC

ACID C₆H₄BrSO₂CH₂CH₂CO₂H [4 3 1] C₆H₄Br(SO₂H)CH₂CH₂CO₂H Prepared by the action of fuming sulphuric acid on *p* bromo phenyl propionic acid (Goring, *C* 1877, 793 808) Non deliquescent rhombic plates (containing 2½aq) *a* *b* *c* = 1.3013 : 1.07831

Salts —NaHA'' 3aq —BaA'' 2aq —H₂BaA'' 8aq, triclinic crystals *a* *b* *c* = 0.9491 : 1.05046, *α* = 68° 36', *β* = 93° 22', *γ* = 83° 38' —CaA'' 3aq —CaH₂A'' 8aq monoclinic crystals *a* *b* *c* = 0.7062 : 1.07774, *β* = 86° 45'

DI-BROMO-SULPHO-PYROMUCIC ACID

CB₂ = C—CO₂H

| >O **Di bromo. sulpho furfurane-**

CB₂ = C—SO₂H

carboxylic acid Formed by sulphonation of di bromo pyromucic acid [192°] with fuming H₂SO₄. By the action of bromine upon its barium salt, di bromo maleic acid is formed By zinc dust and aqueous NH₃ it is debrominated, yielding sulpho pyromucic acid A''Ba 5aq easily soluble long fine needles (Hill & Palmer, *B* 13, 2096)

BROMO SULPHHYDRO-BENZOIC ACID

C₆H₄Br(SH)CO₂H(?) [256°] (U), [243°] (L) From the chloride of sulphonated *m* bromo-benzoic acid by tin and HCl (Upmann, *Z* 1870, 295, Van Lennen, *Z* 1871, 67) Needles, insol water Reduced by sodium amalgam to C₆H₄(SH)CO₂H Iodine converts its Na salt into an acid [130°]

Salts —ZnA'', —PbA'', —BaA''.

Bromo sulphhydro-benzoic acid
C₆H₄Br(SH)CO₂H [194°] From the chloride of (1, 3, 5) bromo sulpho benzoic acid by tin and HCl (Frensch, *B* 7, 795) Laminæ —PbA'', 3aq

BROMO-TEREPHTHALIC ACID

C₆H₄Br(CO₂H)₂ [2 1.4] [306° cor] Needles

containing aq (Fis) or anhydrous (Fil). Prepared by oxidation of bromo toluic acid with KMnO_4 (Fischli, *B* 12, 619), by oxidation of bromo cymene (Fileti, *G* 16, 286), or of *p*-phenyl toluene [129°] (Carnelley & Thomson, *C J* 51, 88) It gives a sublimate (? anhydride) [245°]

Salts — K_2A needles — Ag_2A aq White insoluble flocculent pp — A^*Cu light blue pp

Chloride $\text{C}_6\text{H}_4\text{Br}(\text{COCl})_2$ (305° cor)

Amide $\text{C}_6\text{H}_4\text{Br}(\text{CONH}_2)_2$ [270°] insoluble needles

Methyl ether $\text{C}_6\text{H}_4\text{Br}(\text{CO OEt})_2$ [42°] (Fis), [52°] (Fil) (above 300°) Needles

Di-bromo-terephthalic acid $\text{C}_6\text{H}_2\text{Br}_2(\text{CO}_2\text{H})_2$ [6341] Formed by oxidation of di bromo *p* toluic acid [195°] with KMnO_4 (Schultz, *B* 18, 1762) or of di bromo cymene with dilute HNO_3 (Claus & Wimmel, *B* 13, 902) Laminæ (from HOAc), does not melt below 320°

Salts — $\text{A}^*\text{Ca}4\text{aq}$, easily soluble microscopic needles — $\text{A}^*\text{Ba}2\text{aq}$ and $\text{A}^*\text{Ba}5\text{aq}$ microscopic needles

Ethyl ether A^*Et_2 , [121°] (c 335°) Pearly plates

o-Di-bromo-terephthalic acid

Hexa hydride $\text{C}_6\text{H}_2\text{Br}_2(\text{CO}_2\text{H})_2$ [2314] *Di o bromo hexa hydride benzene di p carboxylic acid* Formed by direct combination of tetra hydride terephthalic acid with Br in the cold Granular crystals (containing aq) Nearly insol cold water, sparingly in hot By Ag_2O it is converted into an acid (probably $\text{C}_6\text{H}_2(\text{OH})_2(\text{CO}_2\text{H})_2$) which by treatment with bromine yields tetra bromo pyrocatechin (Baeyer, *B* 19, 1808)

DI-BROMO-TETRADECANE $\text{C}_{14}\text{H}_{26}\text{Br}_2$ *Tetradecylene bromide* [0°] Colourless liquid Formed by addition of Br to tetradecylene (Krafft, *B* 17, 1372)

HEXA BROMO DITHIENYL $\text{C}_8\text{Br}_6\text{S}_2$ [255°] $\text{C}_8\text{Br}_6\text{S}_2$

uncor] Formed by heating an acetic acid solution of dithienyl with an excess of bromine (Nahnsen, *B* 17, 2198) Small needles V sol hot benzene, v sl sol cold benzene and hot alcohol

TRI o BROMO DI THIENYL ETHANE $\text{CBr}_2\text{CH}(\text{C}_6\text{H}_3\text{S})_2$ [102°] Obtained by adding H_2SO_4 to a mixture of thiophene and bromal dissolved in acetic acid Small pyramids V sol ether, CS_2 , and hot alcohol With isatin and H_2SO_4 it gives a violet red colour (Peter, *B* 17, 1344)

DI o BROMO DI THIENYL ETHYLENE $\text{CBr}_2\text{C}(\text{C}_6\text{H}_3\text{S})_2$ Formed by boiling tri bromo di thieryl ethane with alcoholic KOH, or better HCN (Peter, *B* 17, 1344) Colourless oil Volatile with steam Gives a violet red colour with isatin and H_2SO_4

BROMO THIENYL METHYL KETONE $\text{C}_6\text{SH}_4\text{Br CO CH}_3$ *Bromo acetothiophenone* [94°] Formed by the action of acetyl chloride upon mono- or di bromo thiophene in presence of Al_2Cl_3 Stout colourless needles Sol hot alcohol, less in cold Very volatile with steam By alkaline KMnO_4 it is oxidised to bromo-thiophene carboxylic acid [140°]

Phenyl hydrazide $\text{C}_6\text{SH}_4\text{Br C}(\text{N}_2\text{HPh})\text{CH}_2$ [122°], tables, sl sol alcohol (Gattermann & Römer, *B* 19, 689)

BROMO-THIO CRESOL v BROMO TOLYL MERCAPTAN

DI-BROMO-THIOHYDANTOIN $\text{C}_8\text{H}_6\text{ON}_2\text{SBr}_2$ Formed by the action of bromine on a solution of thiohydantoin in aqueous HCl (Mulder, *B* 8, 1263, Kramps, *B* 13, 789) Colourless crystals Insol cold water, sol alcohol and ether Decomposed by hot water

BROMO THIO OXY BENZOIC ACID

BROMO SULPHYDRO BENZOIC ACID

(a) **BROMO THIOPHENE** $\text{C}_6\text{SH}_4\text{Br}$ ' β '. *Bromo thiophene* (150°) SG $\frac{21}{23}$ 1.652 Colourless liquid Formed by bromination of thiophene (Meyer, *B* 16, 1472) Isolated from the crude di bromo thiophene obtained by fractional bromination of benzene that contains thiophene By EtBr and Na it is converted into ' β '-ethylthiophene (Schleicher, *B* 18, 3015)

Di bromo thiophene $\text{C}_6\text{SH}_2\text{Br}_2$ (211° cor) SG $\frac{23}{23}$ 2.147 Colourless oil Formed by dropping bromine into thiophene cooled with water Prepared by fractional bromination of benzene that contains thiophene With isatin and H_2SO_4 it gives a deep blue colour (Meyer, *B* 16, 1469, Meyer & Stadler, *B* 18, 1488)

Tri bromo thiophene C_6SHBr_3 [29°]. (260° cor) Formed by further bromination of di-bromothiophene Long white glistening crystals V sol hot alcohol and ether, sl sol cold alcohol Gives the indophenine reaction By sulphonation and debromination it yields thiophene (β)-sulphonic acid (Rosenberg, *B* 18, 1773)

Tetra-bromo-thiophene C_6SBr_4 [112°] (326° cor) Long white needles Formed by further bromination of di bromo thiophene (Meyer & Kreis, *B* 16, 2172)

BROMO-THIOPHENE-CARBOXYLIC ACID

$\text{C}_6\text{SH}_4\text{Br}(\text{CO}_2\text{H})$ [140°] Formed by oxidation of bromo thienyl methyl ketone with alkaline KMnO_4 Colourless glistening needles (from water) Sublimes in pearly spikes M sol hot water, nearly insol cold water (Gattermann & Römer, *B* 19, 690)

Di bromo thiophene (a) carboxylic acid

$\text{C}_6\text{SHBr}_2\text{CO}_2\text{H}$ *Di bromo thiophenic acid* [222°] Obtained by bromination of (a) thiophene carboxylic acid (v) White monoclinc needles Sublimes on heating V sol alcohol and ether, sl sol hot water, insol cold water Sparingly volatile with steam Isatin and H_2SO_4 yield a dirty green colouration quickly becoming brown A solution of the ammonium salt gives white pps with AgNO_3 , $\text{Pb}(\text{OAc})_2$, HgNO_3 , and SnCl_4 , yellow pp with Fe_2Cl_6 , and greenish-white pp with CuSO_4

Salts — A^*Ag white curdy pp becoming crystalline — A^*K easily soluble crystals — $\text{A}^*\text{Ba}3\frac{1}{2}\text{aq}$ white needles, v sol hot water, sl sol cold

Chloride $\text{C}_6\text{SHBr}_2\text{COCl}$ (250°–270°), silky needles

Amide $\text{C}_6\text{SHBr}_2\text{CONH}_2$ [167°], fine white felted needles, v sol alcohol and ether, sparingly in hot water

Methyl ether $\text{C}_6\text{SHBr}_2\text{CO}_2\text{Me}$ [80°], white needles (Peter, *B* 18, 543, Bonz, *B* 18, 2308)

DI BROMO THIOPHENE-SULPHONIC ACID

$\text{C}_6\text{HBr}_2\text{S SO}_3\text{H}$ Formed by sulphonating di-bromo thiophene. By sodium amalgam it is

reduced to thiophene 'B' sulphonic acid.—PbA', 5' aq small crystals, sol hot water

Chloride $C_4HBr_2SO_2Cl$ [83°]

Amide $C_4HBr_2SO_2NH_2$ [147°], felted needles, sparingly soluble in water (Langer, *B* 17, 1566, 18, 553, Rosenberg, *B* 18, 3030)

Di-bromo thiophene-di sulphonic acid

$C_4SBr_2(SO_3H)_2$. Obtained by boiling the anhydride with alkalis. It very readily splits off H_2O with conversion into the anhydride

Salts — Na_2A'' 3aq very soluble silky needles — $(NH_4)_2A''$ aq — PbA' plates, sol hot water — BaA'' aq sparingly soluble white glassy tening spikes

Anhydride $C_4SBr_2\langle\begin{smallmatrix} SO \\ SO \end{smallmatrix}\rangle O$ white glassy tening plates, v sol alcohol and benzene, insol water and ligrom. Obtained by the action of fuming sulphuric acid (4 vols) on di-bromo thiophene (1 vol)

Chloride $C_4SBr_2(SO_2Cl)_2$ [220°], glistening white needles, sol ether

Amide $C_4SBr_2(SO_2NH_2)_2$ [c 270°], crystalline powder, nearly insol water (Langer, *B* 17, 1569, 18, 554, Rosenberg, *B* 18, 3030)

Tri-bromo thiophene sulphonic acid

$C_4SBr_3(SO_3H)$ Formed together with the anhydride by sulphonation of tri-bromo thiophene [29°] — BaA'_3 aq sparingly soluble white warty crystals

Anhydride $(C_4SBr_3SO_2)_2O$ [116°], volatile with steam, white solid, v sol alcohol and ether, v sl sol water

Chloride $C_4SBr_3(SO_2Cl)$ [126°], needles

Amide $C_4SBr_3(SO_2NH_2)$ needles (from water) (Rosenberg, *B* 18, 1774, 3023)

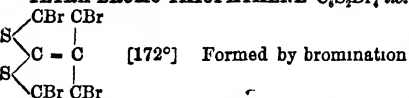

DI-BROMO THIOPHENIC ACID v DI-BROMO

THIOPHENE CARBOXYLIC ACID

BROMO THIO-PHENOL v BROMO PHENYL

MERCAPTAN

TETRA-BROMO THIOPHTHENE $C_4S_2Br_4$, *v.e.*

of thiophthene. Long white needles (from benzene). V sol hot benzene, sl sol alcohol (Biedermann & Jacobsen, *B* 19, 2447)

BROMO-THIOTOLENE v BROMO METHYL THIOPHENE

BROMO THIOXENE v BROMO DI METHYL THIOPHENE

m-BROMO THYMOHYDROQUINONE

$C_8H_6MePrBr(OH)_2$ [1 4 5 3 6] [53°] Formed by the action of conc HBr upon thymoquinone at a low temperature. Colourless needles (Schniter, *B* 20, 1318). Formed also by reduction of the corresponding quinone with SO_2 (Mazzara & Discalzo, *G* 16, 195). Changes spontaneously to a substance melting at 37° (M & D)

Di-acetyl derivative $C_8H_6MePrBr(OAc)_2$ [91°] From thymoquinone and $AcBr$ (Schulz, *B* 15, 657)

Di-bromo-thymo-hydroquinone

Di-acetyl derivative $C_8MePrBr_2(OAc)_2$ [122°] From di-bromo thymo-hydroquinone and Br (S)

BROMO-THYMOLS and their ethyl derivatives appear to have been obtained by Paterno & Caizoneri, *G* 10, 238, Armstrong & Thorpe,

Brit Assoc Reports, 1875, 112, and Lallemand, *A Ch* [3] 49, 148

BROMO THYMOL SULPHONIC ACID

$C_{10}H_7BrSO_3$, *v.e.* $C_8H_6MePrBr(OH)(SO_3H)$ From potassium thymol (a) sulphonic acid and Br — $KA'1\frac{1}{2}$ aq — BaA'_2 (Engelhardt & Latschinoff, *Z* 1871, 261)

m-BROMO THYMOQUINONE $C_8H_6MePrBrO$, [1 4 5 3 6] [48°] (M & D), [45°] (S). Formed by oxidation of the corresponding bromo thymo hydroquinone with $FeCl_3$. Glistening yellow plates (Schniter, *B* 20, 1318). From bromo-amido thymol and nitrous acid (Mazzara & Discalzo, *G* 16, 195). A crystalline bromo thymoquinone was got by Carstanjen (*J pr* [2] 3, 55) in brominating thymoquinone. Andresen (*J pr* [2] 23, 184) obtained a liquid isomeride by brominating thymoquinone chloro imide

Di-bromo thymo-quinone C_8Br_2MePrO , [74°] The ethereal extract from the product of the action of HBr on thymo quinone chloro imide (*q v*) is evaporated and the residue distilled with steam (Andresen, *J pr* [2] 23, 184). From thymoquinone and Br (C). Lemon yellow plates (by adding water to the alcoholic solution)

o-BROMO TOLUENE C_7H_7Br *v.e.* C_6H_4MeBr [1 2] (182°) $SG \frac{1}{2} 12031$ SV 141 95 (Schiff, *B* 19, 564)

Formation — 1 Together with *p* bromo toluene, by brominating cold toluene, in the dark, in daylight, or with addition of iodine (Hubner & Wallach, *Z* [2] 5, 22, 138, 499, *A* 154, 293, Demochowsky, *B* 5, 333, Kekule, *A* 137, 192, Beilstein, *A* 143, 369, Cannizzaro, *A* 141, 198, Glinzer & Fittig, *A* 133, 47, 136, 301, Fittig, *A* 147, 39, Rosenstiehl & Nikiforoff, *Z* [2] 5, 635, Hubner & Retschy, *Z* [2] 7, 618, Lauth & Grimaux, *Bl* 1866, 1, 347, 1867, 1, 108, Korner, *G* 4, Hubner & Jannasch, *A* 170, 117, Louguinine, *B* 4, 514, Reyman, *Bl* [2] 26, 533, Schramm, *B* 18, 607) — 2 From *o* toluidine by the diazo reaction (Wroblewsky, *A* 168, 171, Jackson, *Am* 1, 93) — 3 Together with naphthalene, by the action of (a) bromo naphthalene on toluene in presence of Al_2Cl_3 (Roux, *Bl* [2] 45, 520)

Properties — Oil

Reactions — 1 Converted by dilute HNO_3 into *o* bromo benzoic acid (Zincke, *B* 7, 1502) — 2 Sodium has no action at 15° — 3 Sodium and MeI form *o* xylene — 4 The copper zinc couple has no action (Gladstone & Tribe, *C J* 47, 448)

m-Bromo-toluene C_8H_7MeBr [1 3] (184°) $SG \frac{1}{2} 1401$ (W)

Formation — 1 From $C_8H_7MeBr(NH_2)$ [1 3 4] by the diazo reaction (Wroblewsky, *Z* [2] 7, 609, *A* 168, 155, Grete, *A* 177, 231) — 2 From the same bromo *p* toluidine by successive conversion into $C_8H_7(NO_2)MeBr(NH_2)$ [5 1 3 4], $C_8H_7(NO_2)MeBr$ [5 1 3], $C_8H_7(NH_2)Me$ [5 1], and C_8H_7BrMe [5 1] (Wroblewsky, *A* 192, 206)

Properties — Liquid, even at -20° Oxidised by chromic mixture to *m*-bromo benzoic acid

p-Bromo toluene C_8H_7MeBr [1 4] [28 5°] (185° 1 V) (Hubner & Post, *A* 169, 6) $SG \frac{1}{2} 1411$ (Kekule, *A* 187, 192)

Formation — Together with *o* bromo toluene (*q v*) by brominating toluene

Properties — Trimetric crystals

Reactions — 1 CrO_3 forms *p* bromo benzoic acid — 2 Sodium even at 15° forms ditolyl (Zincke, *B* 4, 396, Louguimne, *B* 4, 514) — 3 Sodium and MeI gives *p* xylene — 4 The copper zinc couple has no action (G & T) — 5 Taken internally, it is excreted as *p* bromo benzoic and *p* bromo hippuric acids (Prousse, *H* 5, 63) — 6 CrO_3/Cl forms $\text{C}_6\text{H}_4\text{BrCH}(\text{O CrOCl})_2$ (Etard, *A Ch* [5] 22, 241)

***o* Bromo-toluene or BENZYL BROMIDE**

Di bromo toluene $\text{C}_6\text{H}_3\text{MeBr}_2$ [1 2 3] [28°] From $\text{C}_6\text{H}_5(\text{CH}_2)(\text{NH}_2)\text{Br}$ [86°] by displacing NH by H (Neville & Winther, *C J* 37, 434) Gives on oxidation with HNO_3 di bromo benzoic acid [146°–148°] On nitration it gives a mono nitro derivative [57°] which reduces to an amido compound [54°]

Di bromo toluene $\text{C}_6\text{H}_3\text{MeBr}_2$ [1 2 4] From di bromo *m* toluidine [75°] by eliminating NH_2 . Also from $\text{C}_6\text{H}_4(\text{CH}_2)(\text{NH}_2)\text{Br}$ [1 2 4] by diazo perbromide reaction. Oil On nitration gives di bromo nitro toluene [80°] On oxidation with HNO_3 gives di bromo benzoic acid [169°]

Di-bromo-toluene $\text{C}_6\text{H}_3\text{MeBr}_2$ [1 2 5] (236°) SG 1st 1813 Formed by brominating toluene (Wroblewsky, *Z* [2] 6, 239) From acetyl *o* toluidine by brominating, saponifying and displacing NH_2 by Br by the diazo reaction (N & W) Also from acetyl *m* toluidine in the same way. Thus $\text{C}_6\text{H}_4(\text{CH}_3)(\text{NH}_2)\text{Br}$ [1 2 5] and $\text{C}_6\text{H}_4(\text{CH}_3)\text{Br}(\text{NH}_2)$ [1 2 5] give the same $\text{C}_6\text{H}_3(\text{CH}_3)\text{Br}_2$ Oil On nitration it gives a nitro compound [88°], which reduces to an amido compound [85°] Oxidised by dilute HNO_3 , it gives di bromo benzoic acid [149°–153°], this distilled with lime gives a solid, [86°], probably *p* di bromo benzene

Di-bromo-toluene $\text{C}_6\text{H}_3\text{MeBr}_2$ [1 2 6] (246°) SG 2nd 1812 From di bromo *m* toluidine [35°] (Wr, N & W) or from di bromo *p* toluidine [88°] by diazo reaction Oil On nitration it gives two nitro compounds, [161°], and [c 80°] On oxidation it gives di bromo benzoic acid [150°–167°]

Di-bromo-toluene $\text{C}_6\text{H}_3\text{MeBr}_2$ [1 3 4] (241°) SG 1st 1812 Formed in brominating toluene containing iodine in sunlight (Jannasch, *A* 176, 236) Also from bromo *p* toluidine by the diazo perbromide reaction (N & W, Wr) Oil Gives a nitro derivative, [87°], reducing to an amido derivative [98°] By oxidation with CrO_3 it gives di bromo benzoic acid [233°]

Di-bromo-toluene $\text{C}_6\text{H}_3\text{MeBr}_2$ [1 3 5] [39°] (246°) From $\text{C}_6\text{H}_4(\text{CH}_2)(\text{NH}_2)\text{Br}$ [73°] and its isomeride [46°] (N & W, Wr) With HNO_3 it gives two di nitro compounds, [158°] and [105°] On oxidation with CrO_3 it gives di bromo benzoic acid [208°–210°]

Di-bromo-toluene $\text{C}_6\text{H}_3\text{MeBr}_2$ [108°] The existence of this body, said to be formed in brominating toluene (Fittig, *A* 147, 39), is called in question by Neville and Winther

Other Di-bromo-toluenes are described as BENZYLIDENE BROMIDE and BROMO BENZYL BROMIDE.

Tri-bromo-toluene $\text{C}_6\text{H}_2\text{MeBr}_3$ [1 2 3 4] [44°] From $\text{C}_6\text{H}_5(\text{CH}_2)(\text{NH}_2)\text{Br}$, [97°], by nitrous gas (Neville & Winther, *C J* 37, 447) On nitration it gives a nitro compound [107°]

Tri-bromo-toluene $\text{C}_6\text{H}_2\text{MeBr}_3$ [1 2 3 5] [58°] From di bromo *o* toluidine [46°] by diazo

perbromide reaction (N & W) Long flat needles

Tri bromo toluene $\text{C}_6\text{H}_2\text{MeBr}_3$ [1 2 5 6] [59°] From [1 3 2 5 6] $\text{C}_6\text{H}_4(\text{CH}_2)(\text{NH}_2)\text{Br}$, [94°] by nitrous gas On nitration it gives a nitro compound [91°]

Tri bromo toluene $\text{C}_6\text{H}_2\text{MeBr}_3$ [1 2 4 6] [64°], (290°) From tri bromo *m* toluidine [101°] by nitrous gas (N & W, Wroblewsky, *A* 168, 194) On nitration it gives a di nitro compound [c 220°]

Tri bromo toluene $\text{C}_6\text{H}_2\text{MeBr}_3$ [1 3 4 5] [89°] From di bromo *p* toluidine by diazo perbromide reaction (N & W)

Tri bromo toluene $\text{C}_6\text{H}_2\text{MeBr}_3$ [1 3 4 6] [112°], From di bromo *m* toluidine [75°] and from di bromo toluidine [85°] by diazo perbromide reaction (N & W)

Tri bromo toluene? [150°] Formed by heating potassium tri bromo phenol with KOAc (Piankuch, *J pr* [2] 6, 103)

Tetra bromo toluene C_6HMeBr_4 [1 2 3 4 6] [105° 108°] From tetra bromo *m* toluidine [224°] by alcohol and nitrous gas Also from tri bromo *m* toluidine [100°] by diazo perbromide reaction (Neville & Winther, *C J* 37, 449) Fuming HNO_3 forms the nitro compound [216°]

Tetra bromo toluene C_6HMeBr_4 [1 3 4 5 6] [111°] From tri bromo *m* toluidine [96°], by diazo perbromide reaction (N & W) Its nitro compound melts at [212°]

Tetra bromo toluene C_6HMeBr_4 [1 2 3 5 6], [117°] From tri bromo *m* toluidine [94°] by diazo perbromide reaction Its nitro derivative melts at [213°]

Penta bromo toluene C_6MeBr_5 [285°] From tetra bromo *m*-toluidine by diazo perbromide reaction (Neville & Winther, *C J* 37, 460) From toluene, Al_2Br_6 , and Br at 0° (Gustavson, *Bl* [2] 28, 347, *B* 10, 971) Long needles (from benzene)

***o* BROMO-TOLUENE SULPHONIC ACID**
 $\text{C}_6\text{H}_3\text{BrSO}_3$, *ie* $\text{C}_6\text{H}_3\text{MeBr}(\text{SO}_3\text{H})$ [1 2 5?] From *o* bromo toluene by sulphonation (Hubner & Post, *A* 169, 314 *cf* Dmochowsky, *B* 5, 333). Also from brominated (1, 4, 3) *p* toluidine sulphonic acid by displacement of NH_2 by H (Pechmann, *A* 173, 212) Reduced by sodium-amalgam to toluene *m* sulphonic acid

Salts — $\text{KA}'\frac{1}{2}\text{aq} - \text{NaA}'\frac{1}{2}\text{aq} - \text{BaA}'_2\text{aq} - \text{BaA}'_3\frac{1}{2}\text{aq}$ S (of BaA'_2) 35 at 14° — $\text{PbA}'_2\text{aq}$. S (of PbA'_2) 52 at 18° — $\text{PbA}'_2\text{aq}$

Chloride $\text{C}_6\text{H}_3\text{MeBr}(\text{SO}_2\text{Cl})$ [53°]

Amide $\text{C}_6\text{H}_3\text{MeBr}(\text{SO}_2\text{NH}_2)$ [134°]

***o* Bromo toluene sulphonic acid**
 $\text{C}_6\text{H}_3\text{MeBr}(\text{SO}_3\text{H})$ [1 2 5] From *o* toluidine by sulphonating and displacing NH_2 by Br (Pagel, *A* 176, 294, Neville & Winther, *B* 13, 1943, *cf* Gerver, *A* 169, 384) Reduced by sodium-amalgam to toluene *m* sulphonic acid

Salts — $\text{KA}'\text{aq} - \text{CaA}'_2\text{aq} - \text{BaA}'_2\frac{1}{2}\text{aq}$ S. 1 2 at 25° (P) — $\text{BaA}'_2\frac{1}{2}\text{aq} - \text{BaA}'_2\frac{1}{2}\text{aq}$ S 8 9 at 17.5° (G) — $\text{PbA}'_2\text{aq} - \text{CuA}'_2\text{aq}$

Chloride [53°] (P), [56°] (N & W)

Amide [c 135°] (P), [147°] (N & W)

This acid is probably identical with the preceding.

***o* Bromo toluene sulphonic acid**

$\text{C}_6\text{H}_3\text{MeBr}(\text{SO}_3\text{H})$ [1 2 4] From *o*-toluidine *p*-sulphonic acid by the diazo reaction (Hayduck,

A. 172, 206 — KA' nodules of minute needles — $\text{BaA}'_2, 2\text{aq}$ — $\text{PbA}'_2, 2\text{aq}$

Chloride $\text{C}_6\text{H}_4\text{MeBr}(\text{SO}_2\text{Cl})$ [54°]

Amide $\text{C}_6\text{H}_4\text{MeBr}(\text{SO}_2\text{NH}_2)$ [151°]

Bromo toluene sulphonic acid

$\text{C}_6\text{H}_4\text{MeBrSO}_3\text{H}$ [1 3 5] From bromo *o* toluidine sulphonic acid or from bromo *p* toluidine sulphonic acid by displacement of NH_2 by H Potash fusion gives *orecin* (Neville & Winther, *B* 13, 1944, *C* *J* 41, 420)

Chloride $\text{C}_6\text{H}_4\text{MeBr SO}_2\text{Cl}$ [52°]

Amide $\text{C}_6\text{H}_4\text{MeBr SO}_2\text{NH}_2$ [139°]

***m* Bromo toluene sulphonic acid**

$\text{C}_6\text{H}_3\text{MeBr}(\text{SO}_3\text{H})$ Formed by sulphonating *m* bromo toluene (Grete, *B* 7, 795, 8, 565, *A* 177, 233) — BaA'_2, aq — SrA'_2, aq — $\text{CaA}'_2, 2\text{aq}$ — $\text{MgA}'_2, 6\text{aq}$ — $\text{CuA}'_2, 4\text{aq}$ — $\text{PbA}'_2, 4\text{aq}$ According to Wroblewsky (*A* 108, 160, *Z* [2] 7, 6, three bromo toluene sulphonic acids are formed by sulphonating *m* bromo toluene, the *Ba* salts being BaA'_2, aq *S* 528, $\text{BaA}'_2, 8\text{aq}$ *S* 1452, and $\text{BaA}'_2, 2\frac{1}{2}\text{aq}$ *S* 5248 at 19°, Grete, however, could only obtain the acid just described

Bromo toluene *o* sulphonic acid

$\text{C}_6\text{H}_3\text{MeBr}(\text{SO}_3\text{H})$ From (1, 4, 2) toluidine sulphonic acid by bromination and elimination of NH_2 (Weckwarth, *A* 172, 196) — NaA'_2, aq — KA'_2, aq — $\text{BaA}'_2, 2\frac{1}{2}\text{aq}$ — $\text{SrA}'_2, 2\frac{1}{2}\text{aq}$ — $\text{PbA}'_2, 3\frac{1}{2}\text{aq}$ — $\text{CuA}'_2, 4\text{aq}$

Chloride $\text{C}_6\text{H}_3\text{MeBr}(\text{SO}_2\text{Cl})$ crystalline at -20°

Amide $\text{C}_6\text{H}_3\text{MeBr}(\text{SO}_2\text{NH}_2)$ [*c* 164°], needles

Bromo toluene sulphonic acid

$\text{C}_6\text{H}_4\text{MeBr}(\text{SO}_3\text{H})$ From toluene by sulphonation, nitration, reduction, and displacement of NH_2 by Br (Weckwarth, *A* 172, 193, Hayduck, *A* 177, 57) — BaA'_2, aq

Chloride Oil, slowly solidifying

Amide Does not melt below 230°

***p* Bromo toluene *m* sulphonic acid**

$\text{C}_6\text{H}_3\text{MeBr}(\text{SO}_3\text{H})$ [1 4 3] [*c* 108°] From *p* toluidine *m* sulphonic acid by exchange of NH_2 for Br Formed also in sulphonating *p* bromo toluene (E. Richter, *A* 230, 319, Post & Retschy, *A* 169, 7, v Pechmann, *A* 173, 208, Neville & Winther, *C* *J* 37, 631) Laminæ (containing *aq*) — $\text{BaA}'_2, 7\text{aq}$ — $\text{SrA}'_2, 7\text{aq}$ — $\text{PbA}'_2, 3\text{aq}$

Chloride $\text{C}_6\text{H}_3\text{MeBr}(\text{SO}_2\text{Cl})$ [61°]

Amide $\text{C}_6\text{H}_3\text{MeBr}(\text{SO}_2\text{NH}_2)$ [152°]

***p* Bromo toluene sulphonic acid**

$\text{C}_6\text{H}_4\text{MeBr}(\text{SO}_3\text{H})$ [1 4 2] The chief product of the sulphonation of *p* bromo toluene (Hubner, *A* 169, 6, *Z* [2] 7, 618) Formed also from *p* toluidine *o* sulphonic acid by exchange of NH_2 for Br (Jenssen, *A* 172, 237) Reduced by sodium amalgam to toluene *o* sulphonic acid — NaA'_2, aq — $\text{CaA}'_2, 4\text{aq}$ — BaA'_2, aq *S* 53 at 8° — SrA'_2, aq — $\text{PbA}'_2, 8\text{aq}$ — $\text{CuA}'_2, 7\text{aq}$

Chloride $\text{C}_6\text{H}_4\text{MeBr}(\text{SO}_2\text{Cl})$ [85°]

Amide $\text{C}_6\text{H}_4\text{MeBr}(\text{SO}_2\text{NH}_2)$ [167°]

***p* Bromo toluene *exo* sulphonic acid**

$\text{C}_6\text{H}_4\text{Br CH}_2\text{SO}_3\text{H}$ [1 4] ***p* Bromo benzyl sulphonic acid** From *p* bromo benzyl bromide and K_2SO_4 (Jackson & Hartshorn, *Am* 5, 264) Also from $\text{C}_6\text{H}_4(\text{NH}_2)\text{CH}_2\text{SO}_3\text{H}$ by diazo-reaction (Mohr, *A* 221, 222) — KA'_2, aq *S* 62 at 18° — CaA'_2, aq — $\text{BaA}'_2, 1\frac{1}{2}\text{aq}$ — BaA'_2, aq *S* (of BaA'_2) 67 at 18° — PbA'_2, aq *S* 2 at 18°

Chloride. [107°] (*M*); [115°] (*J* & *H*)

Bromo toluene disulphonic acid

$\text{C}_6\text{H}_3\text{MeBr}(\text{SO}_3\text{H})_2$ [1 2 3 5] From $\text{C}_6\text{H}_4\text{Me}(\text{NH}_2)(\text{SO}_3\text{H})_2$ by diazo reaction (Limp-richt, *B* 18, 2177, Hasse, *A* 230, 294) — $\text{K}_2\text{A}'_2, 4\text{aq}$ — $\text{BaA}'_2, 1\frac{1}{2}\text{aq}$

Chloride [90°]

Amide [238°]

***p* Bromo toluene disulphonic acid**

$\text{C}_6\text{H}_3\text{BrMe}(\text{SO}_3\text{H})_2$ From *p* bromo toluene, H_2SO_4 and SO_2 (Kornatzki, *A* 221, 192) Cauli flower like deliquescent crystals Boiled for sixteen hours with conc nitric acid it forms sulphuric acid $\text{C}_6\text{H}_3\text{Br}(\text{CO}_2\text{H})(\text{SO}_3\text{H})_2$ with $\text{C}_6\text{H}(\text{NO})\text{Br}, \text{MeSO}_3\text{H}$, and $\text{C}_6\text{H}(\text{NO})\text{Me}(\text{SO}_3\text{H})_2$ Salts — $\text{K}_2\text{A}'_2, \text{aq}$ — $\text{BaA}'_2, 5\text{aq}$ — $\text{PbA}'_2, 2\text{aq}$

Chloride [99°] Trimetric plates (from ether)

Amide $\text{C}_6\text{H}_3\text{MeBr}(\text{SO}_2\text{NH}_2)_2$ [above 260°]

Bromo toluene disulphonic acid

$\text{C}_6\text{H}_3\text{MeBr}(\text{SO}_3\text{H})_2$ [1 4 3 *x*] Prepared from $\text{C}_6\text{H}_3\text{Me}(\text{NH}_2)(\text{SO}_3\text{H})_2$ by diazo reaction (Limp-richt, *B* 18, 2179, E. Lichter, *A* 230, 324) — $\text{BaA}'_2, 6\text{aq}$ — $\text{K}_2\text{A}'_2, \text{aq}$

Chloride $\text{C}_6\text{H}_3\text{MeBr}(\text{SO}_2\text{Cl})_2$ [129°–133°]

Amide $\text{C}_6\text{H}_3\text{MeBr}(\text{SO}_2\text{NH}_2)_2$ [above 210°]

***D*₁ bromo toluene sulphonic acid**

$\text{C}_6\text{H}_3\text{MeBr}(\text{SO}_3\text{H})$ From *o* bromo toluene *m* sulphonic acid by nitration, and displacement of NO_2 by Br (Schafer, *A* 174, 365) — $\text{NaA}'_2, 2\text{aq}$ — $\text{BaA}'_2, 2\frac{1}{2}\text{aq}$

Tri bromo toluene sulphonic acid

$\text{C}_6\text{H}_3\text{MeBr}_3(\text{SO}_3\text{H})$ From *o* toluidine *p* sulphonic acid by bromination and exchange of NH_2 for Br (Hayduck, *A* 174, 354) — KA'_2, aq — $\text{BaA}'_2, 1\frac{1}{2}\text{aq}$ The *chloride* is a syrup, the *amide* an amorphous powder

BROMO-(*a*)-TOLUIC ACID v BROMO PHENYL-ACETIC ACID

***p* Bromo *o* toluic acid** $\text{C}_6\text{H}_3\text{MeBr}(\text{CO}_2\text{H})$ [1 4 2] [118° uncor] Fine white needles Formed by oxidation of bromo *o* ethyl toluene with dilute HNO_3 (1 1) at 200° (Claus & Pieszeck, *B* 19, 3088)

Bromo toluic acid $\text{C}_6\text{H}_3\text{MeBr CO}_2\text{H}$ [1 3or4 2] [167°] From *o* toluic acid and bromine in the cold (Jacobsen & Wiers, *B* 16, 1959, Racine, *A* 239, 74) Needles, volatile with steam On oxidation it gives bromo phthalic acid [157°]

Salt — $\text{BaA}'_2, 6\text{aq}$

Methyl ether MeA'_2 [46°]

Bromo *o* toluic acid $\text{C}_6\text{H}_3\text{MeBrCO}_2\text{H}$

[1 4or5 2] [176°] Glistening needles *V* sol hot water Formed by oxidation of bromo *o* xylene with dilute HNO_3 — $\text{CaA}'_2, 2\text{aq}$ (Jacobsen, *B* 17, 2375) This acid is perhaps identical with the following

Bromo *o* toluic acid $\text{C}_6\text{H}_3\text{MeBr}(\text{CO}_2\text{H})$ [1 5 2] [187°] Formed by saponification of the nitrile Sublimes in needles *V* sol alcohol, *v* sol water By alkaline KMnO_4 it is oxidised to bromo phthalic acid [168°] (Nourrisson, *B* 20, 1016)

Amide $\text{C}_6\text{H}_3\text{MeBr}(\text{CONH}_2)$ [182°], pearly plates (from alcohol), sublimes in needles

Nitrile $\text{C}_6\text{H}_3\text{MeBr}(\text{CN})$ [1 5 2] [70°]

Formed from bromo *o* toluidine by diazotisation and treatment with cuprous cyanide Long needles Easily volatile with steam

Bromo *m* toluic acid $\text{C}_6\text{H}_3\text{MeBr}(\text{CO}_2\text{H})$ [1 4 3] [153°].

Formation—1 From bromo isocymene, $C_6H_5MePrBr$ [1 3 4] by treatment with dilute HNO_3 (Kelbe a Czarnomski, *A* 235, 296)—2 Together with the following acid, by brominating *m* tolucic acid in the cold (Jacobsen, *B* 14, 2351)—3 From bromo nitro toluene [45°] by treatment with KCN and alcohol at 220°, and saponification of the resulting nitrile (Richter, *B* 5, 425)

Properties—Slender needles, sl sol cold HOAc Oxidation gives (4, 1, 3) bromo iso phthalic acid

Bromo *m* tolucic acid $C_6H_5MeBrCO_2H$ [1 6 3] [209° cor]

Formation—1 By oxidation of bromo *m*-xylene (Fittig, *A* 147, 32, Jacobsen, *B* 14, 2352)—2 Together with the preceding by brominating *m* tolucic acid (J)—3 By oxidising the corresponding bromo *m* isocymene (Kelbe, *B* 15, 41)—4 From the corresponding amido tolucic acid by exchange of NH_2 for Br (Remsen a Kuhara, *Am* 3, 431)

Properties—Crystalline powder, sol hot alcohol, insol water— $CaA', 3aq$ — $BaA', 4aq$ — AgA'

Ethyl ether EtA' [c -5°], (270°-275°)

Bromo *p* tolucic acid $C_6H_5MeBr(CO_2H)$ [1 2 4] [204°]

Formation—1 By the oxidation of bromo cymene $C_6H_5MePrBr$ [1 4 2] (Landolph, *B* 5, 268), bromo *p* xylene (Jannasch a Dieckmann, *A* 171, 83), bromo *p* ethyl toluene (Remsen a Morse, *Am* 1, 138)—2 By brominating *p* tolucic acid in the cold (Bruckner, *B* 9, 407)

Properties—Thin needles or laminæ (from water), m sol hot water

Salts— $BaA', 4aq$ — $CaA', 3aq$ — $CaA', 3aq$

Bromo *p* tolucic acid $C_6H_5MeBr(CO_2H)$ [1 3 4] [196°] Formed by oxidising bromo *p* cymene $C_6H_5MePrBr$ [1 4 3] (Kelbe a Koschnitzky, *B* 19, 1731)

Di bromo *m* tolucic acid $C_6H_5MeBr_2(CO_2H)$ [186°] Formed by oxidising crude di bromo xylene with CrO_3 (Fittig, Ahrens, a Mattheides, *A* 147, 36) Minute needles (from alcohol)— $BaA', 9aq$ — AgA'

Di bromo *p* tolucic acid $C_6H_5MeBr_2CO_2H$ [4 3 1] [195°] Needles (from alcohol) V sl sol hot water Formed by oxidation of di bromo *p* xylene $C_6H_5(CH_3)_2Br_2$ [1 4 3 6] in acetic acid solution with CrO_3 By further oxidation with $KMnO_4$ it gives di bromo terephthalic acid $C_6H_3Br_2(CO_2H)_2$ [6 3 4 1]

Salts— $CaA', 4aq$ *S* 1 at 20°— $BaA', 2aq$

Ethyl ether $A'Et$ [49°], (c 310°), long needles (Schultz, *B* 18, 1762)

BROMO *o* TOLUIDINE $C_6H_5Me(NH)Br$ [1 2 3] Formed by reducing bromo nitro toluene, itself got by the diazo reaction from bromo nitro toluene [88°] Oil Gives with bromine-water di bromo *o* toluidine, $C_6H_3(CH_3)(NH)_2Br_2$ [47°] Heated with conc HCl at 160° it forms the above di bromo toluidine and a crystalline bromo toluidine [55°] (Nevile a Winther, *C J* 87, 630)

Bromo-*o*-toluidine $C_6H_5Me(NH_2)Br$ [1 2 4] [92°] (c 255°) Formed by reducing the corresponding bromo nitro toluene, [45°] (Hubner a Wallach, *A* 154, 298, Korner, *Z* 1869, 636, Hubner a Roos, *B* 6, 799, Wroblewsky, *A* 168, 177, Heynemann, *Z* [2] 6, 402, *A* 158, 340,

Nevile a Winther, *C J* 87, 442) Laminæ— $B'HCl$ six sided trimetric tables, *S* 827 at 11 5°— $B'_2H_2SO_4$

Bromo *o* toluidine $C_6H_5Me(NH_2)Br$ [1 2 5] [58°] Formed by brominating acetyl *o* toluidine (Wroblewsky, *A* 168, 162, *Z* [2] 7, 135) Also from bromo nitro toluene [55°] by tin and HCl (Grete, *B* 8, 565, *A* 177, 249) Rhombohedra (from alcohol) Its constitution is known because it gives the same di bromo toluene (*q v*) as bromo *m* toluidine By displacement of NH_2 by H it yields *m* bromo toluene— $B'_2H_2SO_4$ — $B'H_2SO_4, 1\frac{1}{2}aq$ — $B'HCl$ — $B'HNO_3$ [183°], *S* 492 at 17°

Acetyl derivative $C_6H_5Me(NHAc)Br$ [157°]

Bromo toluidine $C_6H_5Me(NH)Br$ [1 3 4] [32°] (*N a W*), [67°] (*Wr*), [75°] (*H a R*) By reducing the corresponding bromo nitro toluene (*q v*) (Nevile a Winther, *C J* 37, 442, Wroblewsky, *A* 168, 177, Hubner a Roos, *B* 6, 800)

Acetyl derivative $C_6H_5Me(NHAc)Br$ [114°] (*N a W*)

Bromo toluidine $C_6H_5Me(NH_2)Br$ [1 3 5] [36°] (c 258°) *SG* 11442 Formed by reducing bromo nitro toluene, [81°] Crystallises with difficulty (*N a W*, Wroblewsky, *A* 192, 203) Reduced by sodium amalgam to *m*-toluidine— $B'HCl$ — $B'HNO_3$ *S* 25 at 13°— $B'_2H_2SO_4$

Acetyl derivative $C_6H_5Me(NHAc)Br$ [168°]

Bromo *m* toluidine $C_6H_5Me(NH)Br$ [1 3 6] [78°] (240°) Formed by brominating acetyl *m* toluidine and boiling the product with alcoholic potash (*N a W*) Formed also by reducing (1,2,5) $C_6H_3(CH_3)Br(NO_2)$ It gives the same di bromo toluene (*q v*) as bromo-*o* toluidine— $B'HNO_3$ prisms

Bromo toluidine $C_6H_5Me(NH_2)Br$ From *o*-bromo toluene by nitration and reduction (Hubner a Roos, *B* 6, 801) Oil— $B'HCl$ *S* 31 at 16 5°— $B'HNO_3$ 1 25 at 19° Perhaps identical with the preceding

Bromo *p* toluidine $C_6H_5Me(NH_2)Br$ [1 4 8] [26°] (Claus a Steinberg, *B* 16, 914) (240°), *SG* 22 150 From acetyl *p* toluidine by bromination and saponification (Wroblewsky, *A* 168, 153) Elimination of NH_2 gives *m* bromo toluene— $B'HNO_3$ [182°], *S* 2533 at 19°— $B'H_2SO_4, aq$ — $B'H_2C_2O_4$

Acetyl derivative $C_6H_5Me(NHAc)Br$ [117 5°]

Bromo *p* toluidine $C_6H_5Me(NH_2)Br$ [1 4 2], [26°] Formed by reducing the corresponding bromo nitro toluene (Nevile a Winther, *C J* 39, 85)— $B'HBr$ — $B'HCl$ (Wallach, *A* 235, 255)

Di bromo *o* toluidine $C_6H_3(CH_3)(NH)_2Br_2$ [1 2or6 3 5] [46°] (*N a W*), [50°] (Wroblewsky, *A* 168, 187, *Z* [2] 7, 210) From *o* toluidine and bromine (Nevile a Winther, *C J* 37, 436) Forms unstable compounds with strong acids

Di-*o*-bromo toluidine $C_6H_3(CH_3)(NH)_2Br_2$ [1 2 3 4] [98°] (*N a W*), [85°] (*Wr*) By reducing the corresponding nitro-compound (Nevile a Winther, *C J* 37, 439, Wroblewsky, *A* 168, 184) Does not combine with acids

Di bromo *m* toluidine $C_6H_3Me(NH_2)Br_2$ [1 5 3 4] [59°] Formed by reducing the corre-

sponding di bromo-nitro toluene (Nevile & Winther, *C J* 37, 447)

Acetyl derivative $C_6H_4(CH_3)(NHAc)Br$, [168°]

Di bromo *m*-toluidine $C_6H_4Me(NH_2)Br$, [1325] [73°] From the corresponding di bromo nitro toluene [70°] by reduction *V sol* alcohol (Nevile & Winther, *C J* 37, 448)

Acetyl derivative $C_6H_4(CH_3)(NHAc)Br$, [145°]

Di bromo *m* toluidine $C_6H_4Me(NH_2)Br$, [1346] [75°] **Formation**—1 Acetyl *m* toluidine is brominated The product is boiled with alcoholic KOH and then distilled with dilute acid This retains bromo toluidine By fractionally distilling the rest with steam, two di bromo-*m* toluidines [75°] and [35°], and one tri bromo toluidine [101°] may be isolated (Nevile & Winther, *C J* 37, 440)—2 By brominating the acetyl derivative of bromo toluidine [32°], and removing acetyl by heating with H_2SO_4 (2 vols) and water (1 vol)

Acetyl derivative $C_6H_4(CH_3)(NHAc)Br$, [168°]

Di bromo *m* toluidine $C_6H_4Me(NH_2)Br$, [1326] [35°] Prepared as above

Di bromo *m* toluidine $C_6H_4Me(NH_2)Br$, [1356] [86°] Prepared by reducing di bromo nitro toluene [105°] (Nevile & Winther, *C J* 37, 434) Formed also by heating the acetyl derivative with equal volumes of H_2SO_4 and water—*B'HC*

Acetyl derivative $C_6H_4(CH_3)(NHAc)Br$, [205°] Formed by acetylation of the base, also from Br and bromo acetyl toluidine [168°]

Di bromo *p* toluidine $C_6H_4Me(NH_2)Br$, [1435] [73°] (N & W), [76°] (Wroblewsky) From *p* toluidine and bromine (Wroblewsky, *A* 168, 188, Nevile & Winther, *C J* 37, 436) From *p* toluidine *m* sulphonic acid and Br (Pechmann, *A* 173, 216) Converted by N_2O_5 into di bromo toluene [39°]

Di bromo *p* toluidine $C_6H_4Me(NH_2)Br$, [1425] [85°] Formed by reducing the corresponding nitro compound [87°] (Nevile & Winther, *C J* 37, 445, Wroblewsky, *A* 168, 185) Yields tri bromo toluene [111°]

Di bromo *p* toluidine $C_6H_4Me(NH_2)Br$, [1426] [88°] Formed by reduction of the corresponding nitro compound [57°]

Di-bromo toluidine $C_6H_4Me(NH_2)Br$, [140623] [53°] From the corresponding di bromo-nitro toluene [57°] (N & W)

Tri bromo -*o* toluidine $C_6H_4Me(NH_2)Br$, [106°] Described by Gerver (*A* 169, 379) as formed by brominating *o* toluidine Nevile & Winther (*C J* 37, 438) say that no such body is so formed

Tri bromo *m* toluidine $C_6H_4Me(NH_2)Br$, [13256] [94°] From the acetyl derivative by boiling with alcoholic potash

Acetyl derivative $C_6H_4(CH_3)(NHAc)Br$, [181°] From $C_6H_4(CH_3)(NHAc)Br$, [1325] [144°] and Br (Nevile & Winther, *C J* 37, 448)

Tri - bromo *m* - toluidine $C_6H_4Me(NH_2)Br$, [15234] [96°] From its acetyl derivative by alcoholic KOH (N & W)

Acetyl derivative $C_6H_4(CH_3)(NHAc)Br$, [15342] [173°] Formed by brominating $C_6H_4(CH_3)(NHAc)Br$.

Tri - bromo *m* toluidine $C_6H_4Me(NH_2)Br$, [15246] [101°] (N & W), [97°] (Wr) Formed by brominating di bromo *m* toluidine (Nevile & Winther, *C J* 37, 448, Wroblewsky, *A* 168, 195)

Tri bromo *p* toluidine $C_6H_4Me(NH_2)Br$, [14235] [83°] From the hydro chloride of $C_6H_4(CH_3)Br(NH_2)$ [124] and bromine water (N & W) Needles (from alcohol)

Tri - bromo *p* toluidine $C_6H_4Me(NH_2)Br$, [14562] [118°] Formed by reducing the corresponding nitro compound [106°] by iron and acetic acid (Nevile & Winther, *C J* 39, 85)

Tri bromo toluidine $C_6H_4Me(NH_2)Br$, [113°] From *p* toluidine *m* sulphonic acid and Br (Pechmann, *A* 173, 217)

Tri bromo toluidine $C_6H_4Me(NH_2)Br$, [82°] From *o* bromo toluene *m* sulphonic acid by nitration, reduction and bromination (Selafert, *A* 174, 362, *B* 7, 1355)

Tri bromo toluidine $C_6H_4Me(NH_2)Br$, [72°] From *p* bromo toluene *o* sulphonic acid by similar treatment (S)

Tetra bromo-*m* toluidine $C_6Me(NH_2)Br$, [132456] [224°] From bromo *m* toluidine, [37°], aqueous HCl, and bromine (Nevile & Winther, *C J* 37, 449) White needles (from alcohol)

Tetra bromo *p* toluidine $C_6Me(NH_2)Br$, [142356] [227°] From $C_6H_4Me(NH_2)Br$, [1426] dissolved in dilute HCl and treated with bromine water (Nevile & Winther *C J* 39, 85) Also from *p* nitro toluene, $FeBr_3$, and Br at 90° (Scheufelen, *A* 231, 179)

BROMO TOLUIDINE SULPHONIC ACID *v*

DI BROMO TOLUQUINONE $C_6H_4MeBr_2O_2$, [85°] Formed together with the tri bromo derivative by the action of bromine on tolu quinone, and separated from it by crystallisation from dilute acetic acid in which it is the more soluble Yellow needles, *m sol* water and alcohol (Canzoneri & G Spica, *G* 12, 472)

Tri bromo toluquinone $C_6MeBr_3O_2$, [134625] [235°]

Formation—1 From toluquinone and Br—2 From tri bromo hydrotoluquinone and $FeCl_3$ 3 In small quantities, by heating cresol with H_2SO_4 , MnO_2 , and KBr (*C* A S)

Properties—Pale yellow laminae, insol water, sl sol alcohol Aniline forms black crystalline $C_6MeBr(NPhH)O_2$. Aqueous KOH forms $C_6MeBr_2(OH)O_2$ [197°] (Spica & Magnanimi, *G* 13, 312)

BROMO *op* DITOLYL

[43or2 1] $C_6H_4MeBrC_6H_4Me$ [12] [95° cor] From di tolyl and Br (Carnelley & Thomson, *C J* 47, 590) Purified by crystallisation from alcohol, from which an oily isomeride first separates Oxidation gives bromo terephthalic acid [309° cor]

Bromo *op*-ditolyl [41] $C_6H_4MeC_6H_4MeBr$ [123or6] Oil, prepared as above Oxidation gives bromo diphenic acid [208°] and *c*-bromo phthalic acid [197°]

Di bromo ditolyl $C_6H_4BrC_6H_4Br$, [152°] From Br and ditolyl in CS_2 (Carnelley & Thomson, *C J* 47, 591) Long hair like needles, less soluble in alcohol than the preceding compound CrO_3 in $HOAc$ gives $C_{12}H_8Br_2O_4$ [166°] and $C_{12}H_8Br_2O_4$ (?) [198°], neither of which compounds dissolves in $KOHaq$

BROMO-TOLYL AMIDO CHLORO-NAPHTHOQUINONE *v* **CHLORO NAPHTHOQUINONE BROMO TOLUIDE**

DI BROMO-*o* TOLYL-AMIDO PROPIONITRILE $C_6H_4MeBr.CHMe.CN$ [105°] From *o* tolyl amido propionitrile and Br (Stephan, *C* 1886, 470)

Di bromo *p*-tolyl amido propionitrile $C_6H_4MeBr.CHMe.CN$ [117°] (*S*)

TETRA BROMO DI-TOLYL AMINE $(C_6H_4MeBr)_2NH$ [162°] From Br and di tolyl nitrosamine in alcohol (Lehne, *B* 13, 1544) Small needles

BROMO *p*-TOLYL-BENZENE C_6H_4Br *z* e [4 1] $C_6H_4Br.C_6H_4Me$ [1 4] *Bromo phenyl toluene* [*c* 30°] A product of the bromination of *p* tolyl benzene. Oxidation gives bromo diphenyl carboxylic acid [194°] and *p* bromo benzoic acid (Carnelley & Thomson, *C* *J* 51, 88)

Bromo *p* tolyl benzene $C_6H_4.C_6H_4MeBr$ [1 2or3 4] [129°] From tolyl benzene in *CS*, by Br (Carnelley & Thomson, *C* *J* 47, 586, 51, 87) Pearly plates sl sol hot alcohol, *v* *e* sol benzene. Oxidises to bromo terephthalic acid [306° cor]

Di bromo *p* tolyl benzene [4 1] $C_6H_4Br.C_6H_4BrMe$ [1 2or3 4] [115°] From *p* tolyl benzene in *CS*, and Br (Carnelley & Thomson, *C* *J* 51, 89) Oxidation gives di bromo diphenyl carboxylic acid [204°] and *p* bromo benzoic acid

Di bromo tolyl benzene [4 1] $C_6H_4Br.C_6H_4BrMe$ [1 3or2 4] [150°] Formed, together with the isomeride [115°] in brominating *p* tolyl benzene. Oxidation gives di bromo diphenyl carboxylic acid [232°] and *p*-bromo benzoic acid

BROMO-TOLYLENE *m* DIAMINE $C_6H_3(CH_3)(NH_2)(Br)$ [1 2 4 *z*] [104°] Colourless plates. Sol alcohol, ether, and *CS*. Prepared by bromination of the di benzo₂l derivative of (1 2 4) tolylene diamine and subsequent saponification

Di benzoyl derivative [214°] White needles (Ruhemann, *B* 14, 2678)

Bromo tolylene diamine $C_6H_3(CH_3)(NH_2)Br$ [107°] Formed by reducing bromo di nitro toluene [104°] (Grete, *A* 177, 262) —*B*" 2HCl —*B*" 2HNO₃ —*B*" H₂SO₄ —*B*" H₂CO. This body is perhaps identical with the preceding

Bromo tolylene *o* diamine $C_6H_3(CH_3)(NH_2)_2Br$ [1 2 3 4] [59°] Obtained by nitration and reduction of *p* bromo *o* toluidine (Hubner & Schupphaus, *B* 17, 775) Small colourless needles. *V* sol water, alcohol, and benzene

Salts —*B*'HCl very soluble colourless needles —*B*'H₂SO₄ colourless tables

*Anhydro formyl derivative v METH-ENYL BROMO TOLYLENE-*o* DIAMINE*

BROMO TOLYL-ETHANE *v* **BROMO ETHYL-TOLUENE**

***α* BROMO *α m* TOLYL-ETHYLENE** $C_6H_4.CBr.CH_3$ Formed by boiling *m* tolyl di-bromo ethane $C_6H_4.CHBr.CH_2Br$ with alcoholic KOH. Very unstable body begins to blacken even at 100° (Muller, *B* 20, 1216)

***ω* Bromo *α m* tolyl ethylene** $C_6H_4.CH.CHBr$ *m* *Methyl bromo styrene* (242°) Oil. Formed by adding bromine to a warm solution of sodium

m tolyl acrylate (methyl cinnamate) (Müller, *B* 20, 1216)

BROMO TOLYL MERCAPTAN $C_6H_4MeBr.SH$ [*c* 7°] (*c* 245°) From *p* bromo toluene sulphochloride, tin, and HCl (Hubner & Wallach, *Z* [2] 5, 560)

Bromo tolyl mercaptan $C_6H_4MeBr.SH$ (246°) From *o* bromo toluene *m* sulphochloride [53°] by Zn and H₂SO₄ (Hubner, *A* 169, 41) Oil

DI-BROMO-DI TOLYL-METHANE $C_6H_4Br_2$ [115°] From the hydrocarbon and Br (Weiler, *B* 7, 1181)

BROMO *p* TOLYL *p* METHYL IMESATIN *v* *p* METHYL ISATIN BROMO *p* TOLUIDE

TETRA-BROMO-*p*-TOLYL-(*β*)-NAPHTHYL-AMINE $C_{10}H_6Br_4N$ [169°] Formed by bromination of *p* tolyl (*β*) naphthyl amine (Friedlander, *B* 16, 2080) White silky needles. Sol alcohol and ether

BROMO-DI-*α* TOLYL-PROPIONIC ACID $C_6H_4MeBr.C(C_6H_4Me)Me.CO.H$ [144°] Colourless crystals. Sol alcohol, ether, &c. Formed by bromination of di *α* tolyl propionic acid (Hais, *B* 15, 147b)

***αβ* DI BROMO *m*-TOLYL PROPIONIC ACID** $C_{10}H_{10}Br_2O_2$ *z* e [3 1] $C_6H_4Me.CHBr.CHBr.CO.H$ [167°] From *m* naphthyl cinnamic acid and Br (Muller, *B* 20, 1215)

DI-BROMO-DI-*l*-TOLYL-DI-SULPHIDE $(C_6H_4MeBr)_2S_2$ [78°] From *o* bromo tolyl mercaptan and dilute HNO₃ (Hubner & Post, *A* 169, 42)

BROMO-UMBELLIFERON

[154°] Formed by the action of bromine upon a solution of umbelliferon methyl ether in *CS*. Long white needles, *m* sol hot alcohol and ether, sl sol cold alcohol and ether, insol water, its dilute alcoholic solution has a green fluorescence. By alcoholic KOH it is converted into methoxy coumaric acid

silvery tables, sol boiling alcohol and ether, sl sol cold alcohol, its dilute alcoholic solution has a violet fluorescence. Analogous to the methyl ether in its formation and properties (Will & Beck, *B* 19, 1782)

Di bromo umbelliferon

[251°], formed by bromination of umbelliferon methyl ether dissolved in acetic acid, white glistening needles, sl sol alcohol

[216°], formed by bromination of umbelliferon-ethyl ether in acetic acid (Will & Beck, *B* 19, 1786)

Tri-bromo umbelliferon $C_6H_3Br_3O_2$ [194°] From umbelliferon and bromine water (Posen, *P* 14, 2746, Mossmer, *A* 119, 261) The alcoholic solution shows greenish yellow fluorescence

BROMO-UVITIC ACID $C_6H_4Br(CH_3)(CO_2H)_2$ [α 13.5] Prepared by oxidising bromo ω, ω_2 di oxy mesitylene with $KMnO_4$ (Colson, *A Ch* [6] 6, 102) White crystals, carbonises at 285° without melting. Sol alcohol—Na A" tables
 α BROMO n VALERIC ACID $C_6H_5BrO_2$ *ie* $C_6H_5CHBrCO_2H$ Formed by bromination of valeric acid (propyl acetic acid) (Jushin, *B* 17, 2504)

Ethyl ether A'Et (191°), SG $\frac{18}{4}$ = 1.226, colourless fluid

γ Bromo n valeric acid
 $CH_3CHBrCH_2CH_2CO_2H$ From allyl acetic acid and conc. $HBrAq$ at 0° (Messerschmidt, *A* 208, 94) Boiling water or cold $Na CO_3Aq$ convert it into the lactone of γ oxy valeric acid (*q v*)

α -Bromo isovaleric acid
 $(CH_3)_2CHCHBrCO_2H$ (chiefly) [40°] (230°) 1 mol ordinary valeric acid and Br (Cahours, *A Suppl* 2, 74, Borodine, *A* 119, 121, Fittig, *A* 139, 199, Ley, *A* Popoff, *A* 174, 63, Schmidt, *A* 193, 104) Formed also by the action of water on its bromide which is formed by treating isovaleric acid with Br and P (Volhard, *A* 242, 163) Oil

Ethyl ether EtA' (186°) Is best purified by distillation with steam, the liquid is collected as soon as the oily drops sink under water (Lovén, *J pr* [2] 33, 112)

Bromo valeric acid $CMeEtBrCO_2H$ or, possibly, $CH_3CHBrCHMeCO_2H$ *Bromo methyl-ethyl acetic acid* *Bromo hydro tiglic acid* [66°] From tiglic and angelic acids with conc. $HBrAq$ at 0° (Fittig, *A* Pagenstecher, *A* 195 108 128, *cf p* 267) Monoclinic tables (from CS_2), insol cold water Boiling water forms tiglic acid and some pseudo butylene (*s di* methyl ethylene) $Na CO_3Aq$ produces chiefly pseudo butylene Sodium amalgam forms methyl ethyl acetic acid

Bromo - valeric acid $C_6H_5BrO_2$ *ie* $CMeEtBrCO_2H$? From methyl ethyl acetic acid and Br at 160° (Bocking, *A* 204, 23) Liquid Should be identical with the preceding

Ethyl ether EtA' (185°) SG $\frac{18}{4}$ 1.2275 Decomposed by boiling $Na CO_3Aq$ into α methyl α oxy butyric ether $CMeEt(OH)CO_2H$

γ -Di bromo n valeric acid
 $CH_3BrCHBrCH_2CH_2CO_2H$ [58°] From allyl acetic acid and Br in CS_2 (Messerschmidt, *A* 208, 100) Thin laminae Converted by sodium amalgam into allyl acetic acid Boiling water forms the lactone of bromo oxy valeric acid, and finally $C_6H_5O_2$

Di bromo-valeric acid $CMe_2BrCHBrCO_2H$ [108°] Solidifies at 70° From CMe_2CHCO_2H and bromine (Ustinoff, *J pr* [2] 34, 483)

Di-bromo-valeric acid
 $CH_3CHBrCBrMeCO_2H$ [86°] From tiglic acid and Br (Schmidt *a Berendes*, *A* 191, 119), also from angelic acid and Br (Jaffé, *A* 185, 293, Pagenstecher, *A* 195, 123) Triclinic crystals (from CS_2), insol cold water Converted by distillation or by sodium amalgam

into tiglic acid (Demarcay, *B* 8, 830) Boiling water decomposes its salts forming bromo-butene (87°)—KA' insol conc. $KOHAq$

Ethyl ether EtA' (185°) (*J*)

DI BROMO VALERIC ALDEHYDE $C_6H_4Br_2O$ *ie* $CH_3CHBrCBrMeCHO$ From tiglic aldehyde and Br (Lieben *a* Zeisel, *M* 7, 55)

BROMO VALERO LACTONE *v* *Bromo oxy-VALERIC ACID*

BROMO VALERYLENE $C_6H_4Br_2$ (125°–130°) From valerylene dibromide and alcoholic KOH (Reboul, *A* 135, 372) Forms a yellow pp of C_6H_5Cu with ammoniacal cuprous chloride

BROMO-VANILLIC ACID *v* *Methyl derivative* of *Bromo di oxy BENZOIC ACID*

BROMO VERATRIC ACID *v* *Methyl derivative* of *Bromo di oxy BENZOIC ACID*

BROMO-VINYL ACETATE $C_6H_4BrO_2$ *ie* $CHBrCH_2OAc$ From acetylene di bromide and $KOAc$ at 160° for 2 days (Sabanejeff, *A* 216, 272) Crystals Explc. when quickly heated Forms with bromine a compound $C_6H_4Br_2O_2$, which solidifies at 0°

ω BROMO p VINYL-PHENOL *Methyl ether* $C_6H_4(OMe)CHCHBr$ [55°] From the di methyl ether of *as di* bromo p oxy phenyl propionic acid $C_6H_4(OMe)CHBrCHBrCO_2Me$ by boiling with aqueous KOH (30 p c) Plates, of pleasant smell and taste (Engel, *B* 20, 2537)

iso *Bromo o* vinyl phenol

$C_6H_4(OH)BrCHCH_3$ *Bromo oxy styrene* (265°) Formed by distilling di bromo ethyl phenol, $C_6H_4(OH)BrCH_2Br$ obtained by brominating *o* ethyl phenol (Suida *a* Plohn, *M* 1, 180) Liquid, sl sol water Gives a reddish brown pp with $FeCl_3$

Di bromo *o* vinyl phenol *Methyl ether* $C_6H_4Br_2O$ *ie* $C_6H_4(OMe)BrCH_2Br$ From the methyl derivative of tri bromo *oxy* phenyl propionic acid $C_6H_4(OMe)BrCHBrCHBrCO_2H$ and $Na CO_3Aq$ (Perkin, *C J* 39, 418) Oil, slightly volatile with steam

BROMO-VINYL-PIPERIDINE

$C_6H_5N(C_2H_5)Br$ *Piper ethyl alkane bromide* Formed by heating the hydrobromide of piper ethyl alkane (oxethyl piperidine) with 1 mol of bromine at 100°–120° On reduction with sodium amalgam it yields ethyl-piperidine— $B'HB r$ thin colourless prisms, sol water, v. sl sol cold alcohol— $B'HB r$ — $B_2H_4Cl_2PtCl_4$ — $B'HCl$, $AuCl_3$ (Ladenburg, *B* 17, 154)

BROMO-*o*-XYLENE $C_6H_4Br_2$ *ie* $C_6H_4(CH_3)_2Br$ [124] [0°] (214° v) Mol w 185° SG $\frac{18}{4}$ 1.37 Formed by the action of bromine in presence of iodine upon *o* xylene in the cold and in the dark (Jacobsen, *B* 17, 2372, Schramm, *B* 18, 1278)

ω Bromo *o* xylene $C_6H_4(CH_3)CH_2Br$ *o*-xylyl bromide [21°] (217°) at 742 mm SG 1.381 Colourless liquid Prepared by the action of bromine vapour upon boiling *o* xylene, or in the cold upon *o* xylene exposed to direct sun shine (Radziszewski *a* Wispek, *B* 15, 1747, 18, 1281, Schramm, *B* 18 1278, Colson, *A Ch* [6] 6, 115)

Bromo *m* xylene $C_6H_4(CH_3)_2Br$ [134] (206°) Formed by the action of bromine upon cold *m* xylene in the dark (Fittig, *A* 147, 31, Schramm, *B* 18, 1277) MeI and Na give ψ cumene.

(8) **Bromo *m* xylene** $C_6H_4Me_2Br$ [182] (c 206°) Liquid at -10° Obtained by adding a HCl solution of bromine to a solution of sodium *m* xylene (8) sulphonate, which is prepared by debrominating di bromo *m* xylene sulphonate acid $C_6H_4Me_2Br(SO_3H)$ [13462] with zinc dust and aqueous ammonia. By methyl iodide and sodium it gives hemimellithene $C_6H_4Me_2$ [123] (Jacobsen & Deike, *B* 20, 903)

Bromo-xylene $C_6H_4Me Br$ [135] (204°) SG $\frac{22}{1}$ 1362 Oil From $C_6H_4Me(NH)$ [134] and $C_6H_4Me HHAc$, $C_6H_4BrMe NHAc$ and $C_6H_4BrMe(NH_2)$ (Wroblewsky, *A* 192, 215, *B* 9, 495)

***o*-Bromo *m* xylene** $C_6H_4(CH_3)CH Br$ *m Xylyl bromide* (215°) at 735 mm (*R* & *W*), (c 218°) (C) SG $\frac{22}{1}$ 1371 Colourless liquid, with pungent vapour Prepared by the action of the vapour of bromine on boiling *m* xylene, or from *l*r (1 mol) and cold *m* xylene exposed to direct sunlight (Radziszewski & Wispek, *B* 15, 1745, 18, 1282, Schramm, *B* 18, 1277, Colson, *A Ch* [6] 6, 117)

Bromo *p* xylene $C_6H_4Br(CH_3)_2$ [214] [10°] (206° i V) Formed by the action of bromine upon cold *p* xylene in the dark (Fittig, *Jannasch*, *A* 151, 283, 171, 82, *B* 17, 2709, Jacobsen, *B* 18, 356, Schramm, *B* 18, 1276) Large plates

***o*-Bromo *p* xylene** $C_6H_4(CH_3)CH Br$ *p Xylyl bromide* [36°] (219°) at 740 mm Long colourless needles Sol ether and chloroform Pungent smell Prepared by the action of bromine vapour on boiling *p* xylene, or of *Br* (1 mol) upon cold *p* xylene exposed to direct sunshine (Radziszewski & Wispek, *B* 15, 1743, *B* 18, 1279, Schramm, *B* 18, 1277)

Di bromo-*o* xylene $C_6H_2(CH_3)_2Br_2$ [1234?] [7°] (277°) SG $\frac{1}{17}$ 17842 Liquid at ordinary temperatures Formed together with the isomeride [86°] by the action of bromine (2 mols) in presence of iodine upon *o* xylene (1 mol) in the cold (Jacobsen, *B* 17, 2376)

Di bromo-*o* xylene $C_6H_2(CH_3)_2Br_2$ [1245] [88°] (278°) Large trimetric plates, or long needles V sol hot alcohol, v sl sol alcohol at 0° Formed as above (Jacobsen, *B* 17, 2376)

Di-*o* bromo xylene $C_6H_4(CH Br)_2$ [12] *o Xylylene bromide* [95°] SG $\frac{0}{1}$ 1934 S (ether) 20 SH (15°-40°) 183 Splendid large trimetric crystals Prepared by heating *o* xylene with bromine (2 mols) at 130°-155° Also by the action of *Br* (2 mols) in the cold upon *o* xylene (1 mol) exposed to direct sunshine Trimetric crystals, *a b c* = 8581 1 5014, v sol ether and chloroform By boiling with a solution of $Na CO_3$ for 3 hours it yields phthalyl alcohol (Bayer & Perkin, *B* 17, 123, Radziszewski & Wispek, *B* 18, 1281, Schramm, *B* 18, 1278, Colson, *A Ch* [6] 6, 105, *C R* 104, 428, Perkin, jun, *C J* 53, 5)

Di-bromo-*m*-xylene $C_6H_2(CH_3)_2Br_2$ [72°] (256°) From *m* xylene and *Br* (Fittig, *A* 147, 25, 156, 286)

Di bromo-*m*-xylene $C_6H_2(CH_3)_2Br_2$ (252°) Liquid From brominated *m* xylylene by the diazo reaction (Wroblewsky, *A* 192, 216)

***o*,*o*, Di bromo *m* xylene** $C_6H_2(CH_3)_2Br_2$ [13] *Xylylene dibromide* [77°] SG $\frac{1}{1}$ 1734, $\frac{22}{1}$

(liquid) 1615 S (ligroin) 33 SH (15°-40°) 184 Formed by the action of bromine (2 mols) in the cold upon *m* xylene exposed to direct sunshine, also by adding *Br* (2 mols) to *m* xylene at 130°-180 (Schramm, *B* 18, 1277, Radziszewski & Wispek, *B* 18, 1282, Colson, *A Ch* [6] 6, 109, *C R* 104, 428, Kipping, *C J* 53, 26) Prismatic needles (from $CHCl_3$) Attacks the eyes Converted by alcohol or boiling water into $C_6H_4(CH OH)_2$ Alkaline permanganate forms isophthalic acid

Di bromo *p* xylene $C_6H_2(CH_3)_2Br_2$ [1425] [76°] (261°) From *p* xylene, *Br*, and *I*. A small quantity of a liquid isomeride, $C_6H_4(CH_3)_2Br_2$ [1426] (?) is formed at the same time Large triclinic crystals, plates, or flat needles (Jacobsen, *B* 18, 358, Fittig, Ahrens, Mattheides, *A* 147, 26, Jannasch, *B* 10, 1357)

***o*,*o* Di bromo *p* xylene** $C_6H_4(CH Br)_2$ [14] *p Xylylene bromide* [144°] (c 245°) S (ether) 265 at 20° SH (15°-40°) 180 Formed by the action of bromine (2 mols) in the cold upon *p* xylene exposed to direct sunshine, or by the action of bromine vapour on boiling *p* xylene (Grimaux, *Z* 1870, 394, Schramm, *B* 18, 1277, Radziszewski & Wispek, *B* 15, 1744, 18, 1279, Low, *A* 231, 362, *B* 18, 2072, Colson, *C R* 104, 428, *A Ch* [6] 6, 119, Kipping, *C J* 53, 34) Plates, sol $CHCl_3$ Boiled with water (20 pts) and lead nitrate (1 pt) it forms terephthalic aldehyde and some terephthalic acid and *p* aldehyde benzoic acid Fuming HNO_3 acts similarly Alcohol converts it into $C_6H_4(CH OH)_2$, the rate of this saponification is less than with the *o*, and still less than with the *m* isomeride

***exo* Tri bromo *p* xylene** $C_6H_3(CHBr)(CH Br)$ [106°] Formed from *p* xylene and impure bromine vapour (Low, *A* 231, 363) Boiling water gives *o* oxy toluic aldehyde

Tetra bromo-*o* xylene $C_6(CH_3)_2Br_4$ [262°] (J), [255°] (B) (575°) From *o* xylene and *Br* (Jacobsen, *B* 17, 2376) in presence of *Al Br_3* (Blumlein, *B* 17, 2192) Long glistening needles V sl sol hot alcohol, v sol hot benzene

Tetra bromo *p* xylene $C_6(CH_3)_2Br_4$ [253°] (355°) From *p* xylene and *Br* (Jacobsen, *B* 18, 359)

BROMO-*o*-XYLENE-SULPHONIC ACID

$C_6H(CH_3)(Br)(SO_3H)$ [1245] Formed by sulphonation of bromo-*o* xylene Crystals (containing *aq*) Very soluble in water, sparingly in cold dilute H_2SO_4

Salts— NaA 14aq long fine needles, v sol hot water— KA aq— BaA , 3aq long thick prisms, sol hot water

Amide $C_6H_4(CH_3)_2(Br)(SO NH_2)$ [213°], long fine needles, v sl sol water, sl sol cold alcohol (Jacobsen, *B* 17, 2376)

Bromo-*o* xylene sulphonic acid $C_6H_2(CH_3)_2Br(SO_3H)$ Formed by the action of bromine upon an aqueous solution of *o* xylene sulphonic acid— BaA , 4aq sparingly soluble needles

Amide $C_6H_4Me_2Br SO NH_2$ [187°], thick needles, v sol hot alcohol (Kelbe & Stein, *B* 19, 2157)

Bromo *m* xylene sulphonic acid
 $C_6H_4(CH_3)_2Br(SO_3H)$ [1 3 2 4] From di bromo-*m* xylene sulphamide by sodium amalgam (Jacobsen a Weinberg, *B* 11, 1535)

Amide $C_6H_4Me_2BrSO_2NH_2$ [161° cor]

Bromo *m* xylene sulphonic acid
 $C_6H_4Me_2Br(SO_3H)$ [1 3 6 4] From $C_6H_4Me_2Br(SO_3H)$ [1 3 4] bv Br or from $C_6H_4Me_2Br$ [1 3 6] by fuming H_2SO_4 (Weinberg, *B* 11, 1062) From $C_6H_4Me_2(NH_2)(SO_3H)$ by diazo reaction (Sartig, *A* 230, 335, Nolting a Kohn, *B* 19, 139, Limpriht, *B* 18, 2188) Slender needles, v e sol water

Salts — BaA' , aq — NaA' , aq — ZnA' , 9aq — CuA' , 7aq

Chloride [61°] large prisms

Amide [194°] small trimetric prisms

Bromo *p* xylene sulphonic acid
 $C_6H_4Me_2BrSO_3H$ [1 4 2 5] Formed by heating diazo *p* xylene sulphonic acid $CH_3Me_2<\underset{SO_3}{N_2}>$ [1 4 2 5] with strong HBr — BaA' , 2aq small white plates

Chloride [78°], small white prisms

Amide [201°], small white plates, v sol alcohol and ether, sl sol water, benzene, and chloroform (Nolting a Kohn, *B* 19, 141)

Bromo *p* xylene sulphonic acid
 $C_6H_4(CH_3)_2Br(SO_3H)$ [1 4 2 x] Pearly plates or flat needles Formed by sulphonation of bromo *p* xylene

Salts — NaA' , aq long thin prisms, trimetric plates, or six sided plates — BaA' , small prisms or thin six sided plates

Amide $C_6H_4(CH_3)_2Br(SO_2NH_2)$ [206°, flat prisms, v sol hot alcohol (Jacobsen, *B* 17, 2378) This acid is perhaps identical with the preceding

Di bromo *m* xylene sulphonic acid
 $C_6H_3(CH_3)_2Br_2(SO_3H)$ [1 3 4 6 2] From di bromo *m* xylene [72°] and fuming H_2SO_4 (Jacobsen a Weinberg, *B* 11, 1534) Leaflets, sl sol cold water Reduced by sodium amalgam to (1,3,2)-*m* xylene sulphonic acid

Salts — BaA' , — NaA' , 2aq leaflets

Chloride [107°] rhombic leaflets

Amide [220°] slender needles

BROMO *m* XYLENOL $C_6H_4(CH_3)_2Br(OH)$ [1 3 x 4] From Br and *m*-xylenol in HOAc Liquid (Jacobsen, *B* 11, 24)

Bromo *p* xylenol $C_6H_4(CH_3)_2Br(OH)$ [1 4 x 2] [87°] From *p* xylenol and Br (Jacobsen, *B* 11, 27)

Di bromo *m*-xylenol $C_6H_3(CH_3)_2Br_2(OH)$ [1 3 ? ? 4] [73°] (*J*)

α, α_2 **Di bromo *p* xylenol** $C_6H_3(CH_3)_2Br_2(OH)$ [1 4 2] [74°] S (alcohol) 200 From *p* xylenol and Br at 160° (Adam, *Bl* [2] 41, 288) Needles, insol water, but decomposed on boiling with it, HBr coming off

Tri- bromo - *o*-xylenol $C_6H_3(CH_3)_2Br_3OH$ [1 2 4 5 6 3] [184°] Fine needles Formed by bromination of *o* xylenol $C_6H_3(CH_3)_2OH$ [1 2 3] (Thöl, *B* 18, 2562)

Tri- bromo - *o* xylenol $C_6H_3(CH_3)_2Br_3(OH)$ [1 2 3 5 6 4] [169°] From (1, 2, 4) *o* xylenol Felted needles (Jacobsen, *B* 11, 28)

Tri- bromo - *m*-xylenol $C_6H_3(CH_3)_2Br_3(OH)$ [1 2 3 5 6 4] [179°] From (1, 3, 4) *m* xylenol (*J*) Long needles.

Tri- bromo - *m* xylenol $C_6H_3(CH_3)_2Br_3OH$ [1 2 4 6 5] [166°] Fine white needles From *m* xylenol $C_6H_4(CH_3)_2OH$ [1 3 5] (Nolting a Forel, *B* 18, 2679, cf Thöl, *B* 18, 362)

Tri bromo *p* xylenol $C_6H_3(CH_3)_2Br_3(OH)$ [175°]. Golden yellow needles (Jacobsen, *B* 11, 26)

BROMO *m* XYLIDINE C_6H_4BrN $C_6H_4(CH_3)_2Br(NH_2)$ [1 3 5 4] [97°] From acetyl *m* xylidine by bromination and saponification Minute needles (from dil. alcohol) Converted by the diazo reaction into *s* bromo xylene (Genz, *B* 3, 225, Wroblewsky, *A* 192, 215)

Di bromo *o* xylidine $C_6H_3(CH_3)_2Br_2NH_2$ [1 2 4 5 3] [103°] Obtained by reduction of the corresponding nitro compound with iron and acetic acid Colourless needles v sol alcohol ether, and acetic acid Does not form salts By sodium amalgam it is debrominated (Thöl, *B* 18, 2562)

Di bromo *m* xylidine $C_6H_3(CH_3)_2Br_2(NH_2)$ From acetyl *m* xylidin by brominating and saponifying (Genz, *B* 3, 225) Needles (from alcohol)

Di bromo *p* xylidine $C_6HMe_2Br_2(NH_2)$ [1 4 5 x 2] [65°] Formed by acidifying an alkaline solution of (1 mol of) *p* xylidine sulphonic acid $C_6HMe_2(NH_2)(SO_3H)$ [1 4 2 5] and (2 mols of) bromine Also formed by bromination of *p* xylidine (Nolting a Kohn, *B* 19, 142)

BROMO-*m*-XYLIDINE SULPHONIC ACID
 $C_6HMe_2(Br)(NH_2)(SO_3H)$ [1 3 5 ? 4 6] Small white needles Sol hot, v sl sol cold water, insol alcohol Formed by bromination of *m* xylidine sulphonic acid $C_6HMe_2(NH_2)(SO_3H)$ [1 3 4 6] (Nolting a Kohn, *B* 19, 140)

Bromo *p* xylidine sulphonic acid
 $C_6HMe_2Br(NH_2)(SO_3H)$ [1 4 x 6 2] Small white plates Nearly insoluble in cold water Formed by bromination of *p* xylidine sulphonic acid $C_6HMe_2(NH_2)(SO_3H)$ [1 4 6 2] — *A* K (Nolting a Kohn, *B* 19, 143)

DI BROMO *m* XYOQUINONE $C_6Br_2Me_2O$ [1 3 4 6 2 5] [174°] From mesitol, $C_6H_3Me_3(OH)$ and Br in water (Jacobsen, *A* 195, 271) Golden laminæ (from alcohol), insol water and Na_2CO_3 aq, decomposed by KOH aq

Di- bromo *p* xyloquinone $C_6Br_2Me_2O$ [1 4 5 2 3 6] [184°] Formed by the action of bromine upon *p* xyloquinone under water Thin golden plates Insol water and cold alcohol, sol ether and benzene (Carstanjen, *J pr* [2] 23, 434)

BRONZE v COPPER, ALLOYS OF

BRUCINE $C_{22}H_{27}N_3O_4$ aq [105°, hydrated], [178°, anhydrous] (Claus, *B* 14, 773), [151°] (Blyth) S 12 at 15°, 2 at 100° [α_D^{20} = -85° (in alcohol), -110° to -127° (in $CHCl_3$) (Oudemans, *A* 166, 69)

Occurrence — Together with strychnine in *nux vomica* (the seeds of *Strychnos nux vomica*), in the bean of *St Ignatus* (the seed of *Strychnos Ignatus*), in the wood of *Strychnos colubrina*, in *upas tiente*, extracted from the bark of *S tiente*, and in the bark of *Strychnos nux vomica* (*Falsæ Angustura bark*) (Pelletier a Caventou, *A Ch* [2] 12, 118, 26, 53, Pelletier a Dumas, *A Ch* [2] 24, 176, Corriol, *J Ph* 11, 495, Liebig, *A Ch* [2] 47, 172, *A* 26, 50, Regnault, *A Ch* [2] 68, 113) Brucine, free from strychnine,

occurs in the bark of *Strychnos Ligustrina* (*Budara Lauti*) (Greenish, *Ph* [3] 9, 1013)

Preparation—Nux vomica seeds (56 lbs) are powdered and exhausted with alcohol, to which one sixth part of water has been added. The alcohol is boiled off and the residue treated with water (40 lbs) containing H_2SO_4 (12 lbs). The filtrate is neutralised with Na_2CO_3 . The pp is collected after a few hours, dissolved in chloroform, and the solution shaken with very dilute H_2SO_4 , which dissolves brucine. The solution is placed under a bell jar together with a beaker containing ammonia so that neutralisation proceeds very slowly. The crystalline pp is extracted with dilute alcohol, which dissolves brucine, and the solution allowed to evaporate. The brucine, containing strychnine, is dissolved in dilute H_2SO_4 , and the faintly alkaline solution mixed with KI. The brucine hydriodide that is pptd is crystallised several times from alcohol. It is then shaken with aqueous Na_2CO_3 and chloroform, the chloroform is then shaken with dilute acid and the base pp with ammonia (W A Shenstone, *C J* 39, 453).

Properties—Monoclinic efflorescent prisms (from dilute alcohol), v sol alcohol, chloroform, and essential oils, insol ether and fatty oils. Feebly alkaline to litmus or phenol phthalein (Plügge, *Ar Ph* [3] 25, 45). It is levorotatory, the extent of rotation depending upon the nature of the solvents and the concentration of the solution. In presence of free acids $[\alpha]_D$ varies from -29° to -36.5° (Tykociner, *R T C* 1, 144). Commercial brucine usually contains strychnine, but the colour which strychnine gives with oxidising agents is masked by the presence of brucine. The strychnine may, however, be detected by adding dilute HNO_3 and then extracting the strychnine with chloroform in presence of excess of KOH (Shenstone, *Ph* [3] 8 445, Hanriot, *C R* 97, 267). Brucine is affected by heating with acids, alkalis, or even water, and hence much is lost by the usual method of preparation, but the products being usually amorphous, the unaltered brucine is easily separated in a pure state.

Colour tests—V p 124. The most characteristic is the red colour with nitric acid, which, after warming, is turned violet by excess of ammonium sulphide (v also Cotton, *Z* [2] 5, 728, *J Ph* [4] 10, 18, Luck, *Z* [2] 6, 275, Le Linde, *C N* 37, 98, Fluckiger, *Fr* 15, 342, Hager, *Fr* 11, 201, Dragendorff, *Fr* 18, 108, Pandis, *C C* 1872, 440, Struve, *Fr* 12, 164, Buckingham, *Ph* [3] 3, 884).

Reactions—1 Brucine (60 g) heated with alcohol (600 cc) and NaOH (30 g) at 100° for 12 hours forms a solution which, after neutralisation with CO_2 , filtration and evaporation, leaves a varnish containing some crystals. The crystals (7 g) separated from the varnish by washing with water and purified by solution in very little dilute HCl and ppn by NH_3 are thrown down as microscopic crystals of $\text{C}_8\text{H}_9\text{N}_3\text{O}_5$ (2½ g). This gives a yellow colour with HNO_3 , a pp with bromine, and on boiling a magenta colour. An ammoniacal solution turns purple in air and finally green (Shenstone).—2 HNO_3 (SG 12 to 14) forms a red solution, producing 'cacotheline' $\text{C}_{21}\text{H}_{27}\text{N}_3\text{O}_8$, oxalic acid, and methyl nitrite (Strecker, *A* 91,

76, Hanssen, *B* 20, 451). $\text{K}_2\text{Cr}_2\text{O}_7$ and H_2SO_4 oxidise cacotheline to $\text{C}_{21}\text{H}_{25}\text{N}_3\text{O}_8$, which is also formed by the oxidation of brucine.—3 Brucine (1 mol) heated with HCl at 140° gives off MeCl (between 1 and 2 mols). Brucine is therefore possibly $\text{C}_8\text{H}_9\text{N}_3(\text{OMe})_2\text{N}_2\text{O}$, strychnine being $\text{C}_8\text{H}_9(\text{OH})\text{N}_3\text{O}$ (Shenstone, *C J* 43, 101, cf Hanssen, *B* 17, 2266).—4 Yields on distillation with potash several pyridine bases. Amongst others (8) di methyl pyridine and (8) tri methyl pyridine, quinoline tetrahydride, together with probably a di methyl pyridine (Oechsner de Coninck, *A Ch* [5] 27, 507, *C R* 99, 1077, *Bl* [2] 42, 100).—5 Distilled *in vacuo* with zinc dust it yields carbazol (Lobisch a Schoop, *M* 7, 613).—6 Alkaline KMnO_4 gives off about half the nitrogen in the free state (Wanklyn a Chapman, *C J* 21, 161).—7 ICl forms a light flocculent pp in solutions of salts of brucine (Dittmar).

Salts—B'HCl crystalline tufts, m sol water.—B'HCiHCl₂ long needles (from alcohol).—B'H PtCl₆ yellow pp.—B'HI aq rect angular lamina or very short prisms, m sol hot water.—B'HI₃ brown violet needles (Jorgensen, *A Ch* [4] 11, 114, *J pr* [2] 3, 160).—B' HLi, unstable orange needles.—B'HNO₃ 2aq four sided prisms, less soluble in water than strychnine nitrate.—B'H SO₄ 7aq long needles, v sol water, sl sol alcohol.—B'H₂SO₅ 5aq, S 1 at 15° (How, *N Ed P J* [new] 98).—B'H₂SO₆ 6aq [125°], insoluble yellow needles, formed by atmospheric oxidation of an alcoholic solution containing H S (Schmidt, *A* 180, 296, *B* 8, 1267, 10 838, 1288).—B'H₂Si₂.—B'H₂PO₄ 2aq (Anderson, *P M* [3] 33, 163).—B'H₂FeCy₃ 2aq hygroscopic needles, m sol hot water (Brandis, *A* 66 266).—B'H₂FeCy₄ 4aq.—B'H₂FeCy₅ white powder (Holst a Beckurts, *Ar Ph* [3] 25, 313).—B'H₂FeCy₆ 6aq.—B'H₂CoCy₁₀ 10aq (Lee, *Am S* [2] 2, 44).—B'H NiCy₄ (L).—B'HCyS scales, sol water.—Periodate needles (Bödeker, *A* 71, 64, Langlois, *A Ch* [3] 34, 278).—Nitroprusside S 15 at 15° (Davy, *Ph* [3] 11, 756).—Acetate crystalline, but gummy if impure (Shenstone).—Dextro tartrates B'C₂H₃O₅ 5½aq.—B'C₂H₃O₈ 8aq.—B'C₂H₃O₉.—Lavo tartrates B'C₂H₃O₁₀ 14aq.—B'C₂H₃O₁₁ 5aq (Pasteur, *A Ch* [3] 38, 472).—B'C₂H₃(SO₃)₂ (Stenhouse, *A* 129, 26).

Methylo iodide B'MeI 8aq laminae (from water), resinsified by boiling KOH (Stahl schmidt, *P* 108, 513).—B'MeI₂.—B'MeI₃.—**Methylo bromide** B'MeBr 2½aq.—**Methylo-chloride** B'MeCl 5aq v sol water and alcohol.—B₂Me PtCl₆.—B'HaAuCl₄.—**Methylo-sulphate** B'MeSO₄ 8aq radiate crystalline mass, v sol water.—B'Me SO₅ 2aq.—**Methylo-nitrate** B'MeNO₃ 2aq. The physiological action of these salts has been studied by Crum Brown (*T E* 25).

Ethylo iodide B'EtI ¼aq not decomposed by KOH but converted by moist AgO into a very soluble alkaline hydroxide.—B'EtI, —B'EtI₂ aq.—**Ethylo-platino chloride** B₂Et₂PtCl₆. Silky needles (Gunning, *J pr* 67, 46).—**Bromo-ethylo bromide** B'C₂H₅Br 3aq from brucine and ethylene bromide at 100° , forms fuscate groups of nacreous laminae (from water) AgNO₃ pps half the Br. Moist AgO

forms the *vinyl hydroxide* $B'C_2H_3OH$ which is strongly alkaline, two of its salts are $B'_2(C_2H_3Cl)_2PtCl_4$ and $B'C_2H_3SO_4H_3aq$ — *Bromo ethyl platinochloride*

$B'_2(C_2H_3Br)_2PtCl_4$ (Schad, A 118, 207)

Allylo-iodide $B'C_2H_3Iaq$ — $B'C_2H_3I_2$ — $B'C_2H_3I_3aq$ — *Allylo platino-chloride* $B'_2(C_2H_3Cl)_2PtCl_4$ — *Isoamyllo-chloride* $B'_2(C_2H_3Cl)_2aq$ — $B'_2(C_2H_3I)_2PtCl_4$ — *Isoamyllo iodides* $B'_2(C_2H_3I)_2$ — $B'_2(C_2H_3I_3)$

Bromo brucine $C_{22}H_{15}BrN_2O_4$ Formed by adding an alcoholic solution of Br to an aqueous solution of brucine sulphate. Small needles (Laurent, A Ch [3] 24, 314, cf Beckurts, B 18, 1238)

Nitro brucine $C_{22}H_{15}(NO)_3N_2O_4$ Formed by nitration of brucine methyl iodide suspended in absolute alcohol. Large red trimetric crystals. Carbonises at about 240° without melting, sol water. Salts — $B'HNO_3$, glistening yellow needles, v sol water, sl sol alcohol and ether — $B'H_2Cl_2PtCl_4$, fine yellow needles (Hanssen, B 19, 520)

Amido-brucine $C_8H_7(NH)_2O_4N_2$ Formed by reduction of nitro brucine with tin and HCl. V sol water. Not isolated. $FeCl_3$ produces a green colouration changing to brown. Very dilute K Cr O₇ produces a fugitive blue violet colour. Strong HNO_3 gives a yellow solution which is turned red by $SnCl_4$ — $B'H_2Cl_4$, colourless prisms — $B''H_2Cl_4PtCl_4$, * yellow amorphous pp (Hanssen, B 19, 523)

Dinitro-brucine $C_{22}H_{15}(NO)_2N_2O_4$ Prepared by the action of HNO_3 on an alcoholic solution of brucine. Red amorphous powder. V sol water, sl sol alcohol, insol ether — $(B'HCl)_2PtCl_4$, yellow pp (Claus & Rohre, B 14, 765)

BRYONIN $C_{26}H_{30}O_8$ An amorphous bitter substance in the rind of the red berried bryonia (*Bryonia dioica*) from which it may be extracted by boiling water. It appears to be resolved by dilute H_2SO_4 into glucose and two amorphous bodies, bryoretin $C_{12}H_{14}O_4$, sol ether, and hydro-bryoretin $C_8H_{10}O_4$, insol ether (Brandes & Firnhaber, Brandes' Ar Ph 3, 356, Walz, C C 1809, 5)

BUCHU The leaves of several species of *Barosma* growing at the Cape contain a volatile oil and a crystalline substance [85°] (Fluckiger, Ph [3] 4, 689, Jones, Ph [3] 9, 673)

EURETTE v ANALYSIS, p 248

BUTALANINE v AMIDO BUTYRIC ACID

n-BUTANE C_4H_{10} , v $CH_3CH_2CH_2CH_3$ Diethyl Methyl propyl Butyl hydride. Mol w 58 (1°) (Butlerow, Z 1867, 363) SG d 60 VD 2.11 (calc 2.01) (Ronalds, C J 18, 54, Pelouze & Cahours A Ch [4] 1, 5) S (gas in alcohol) 18 at 14° . Occurs in petroleum (B). Formed by the action of Zn on EtI at 150° (Frankland, A 77, 221, Schöyen, A 130, 273). Also, together with butylene, by heating butyl alcohol with $ZnCl_2$ (Wurtz, A 93, 112). Prepared by the action of sodium amalgam on EtI (Lowig, J 1860, 397)

Iso-butane $(CH_3)_2CHCH_3$ Trimethyl methane, Secondary butane (-17°) H.F. p 42,450 H.F. v 40,180 (2h) Prepared by slowly pouring *tert*-butyl iodide into water containing zinc, the equation being $2(CH_3)_3CI + H_2O + Zn = 2(CH_3)_3CH + ZnO + ZnI_2$. Also from iso butyl

iodide and $AlCl_3$ at 120° (Köhnlein, B 16, 562) Colourless gas. Chlorine converts it into $(CH_3)_3CCl$ (Butlerow, A 144, 10) Br at 100° forms di bromo butane (Carius, A 126, 195) Excess of Br at 300° forms C_2Br_4 (Merz & Weith, B 11, 2244)

BUTANE CARBOXYLIC ACID v BUTYRIC ACID

Butane di carboxylic acid v PROPYL MALONIC ACID, ISO PROPYL MALONIC ACID, METHYL ETHYLMALONIC ACID, ETHYL SUCCINIC ACID, two DI METHYL SUCCINIC ACIDS, ADIPIC ACID, α METHYL GLUTARIC ACID, and β METHYL GLUTARIC ACID

Butane aaaa tri carboxylic acid $C_8H_{10}O_6$, v $MeCH(CH(CO_2H))CH(CO_2H)_2$ Ethyl ethenyl tri carboxylic acid [119°] Got by saponifying the ether with alcoholic potash (Polko, A 242, 115) White rhombic crystals. V sol water, alcohol, ether, acetone, v sol chloroform — Salts — $A'''Ba$, insol water and alcohol — $A'''Ag$, 1 $^{1/2}$ aq, sl sol water — $A'''CaH$, insol alcohol, v sol water — $A'''CaH$ 2 $^{1/2}$ aq — $A'''Ca$, hygroscopic — $A'''Zn$, 6aq, v e sol water, insol alcohol — $A'''Sr$, 6aq

Ethyl ether $MeCH(CH(CO_2Et))CH(CO_2Et)_2$ (276°) (189° at 60 mm) SG d 1.065 Formed by acting on sodium malonic ether with a bromo butyric ether in alcoholic solution (P)

Butane aab tri carboxylic acid $CH_3CH(CO_2H)C(CO_2H)CH_3$ Butenyl tri carboxylic acid [157°] V sol water, alcohol and ether. On warming it yields *s* di methyl succinic anhydride [87°] (Bischoff & Rachi, A 234, 54) Salts — BaA'''_2 — CaA'''_2

Ethyl ether EtA''' (c 190°) at 50–60 mm, (273° – 275°) at ordinary pressure. Liquid. Formed by the action of a bromo propionic ether upon sodio methyl malonic ether. By boiling with HCl it is converted into *s* di methylsuccinic acid [189°] (Leuckart, B 18, 234b)

Iso butane tri-carboxylic acid $MeC(CO_2H)CH(CO_2H)_2$ [120°] Prepared by saponifying the ether with alcoholic potash (Barnstein, A 242, 128) Needle shaped crystals (from water). V sol water, alcohol, ether, acetone, v sl sol chloroform, benzene, petroleum ether, carbon disulphide. Decomposed by boiling with water, giving off CO_2 . Salts — $K_2A'''_2$ 2aq Quadratic prisms v e sol water, insol alcohol — CaA'''_2 , 9aq m sol water — CaA'''_2 , 2aq v e sol water — SrA'''_2 , 7aq

Ethyl ether EtA''' (181° – 185°) at 30–40 mm, (279° – 281°) at ordinary pressure (L), (273°) (B) SG d 1.064 Liquid. Formed by the action of a bromo isobutyric ether upon sodio malonic ether. By boiling with HCl it is converted into *u* di methyl succinic acid [139°] (Leuckart, B 18, 2350, Barnstein, A 242, 126)

Butane wavy tetra carboxylic ether $C_8H_{10}O_8$, v $(CO_2H)_2CHCH_2CH_2CH(CO_2H)_2$ (275° – 280°) at 225 mm. Formed, together with trimethylene dicarboxylic acid, by the action of ethylene bromide on sodium malonic ether (Perkin, jun, C J 51, 17, B 19, 2038) The yield is very small. The corresponding acid splits up when heated into CO_2 and adipic acid. By treatment with sodium ethylate it gives a di sodio derivative which by the action of bromine yields tetra-

$CH_2C(CO_2Et)_4$
methylene-tetra carboxylic ether
 $CH_2C(CO_2Et)_4$

Iso butane tetra-carboxylic ether

(CO.Et)₂CH CHMe CH(CO.Et)₂ (c 211°) at 20 mm. A by product in the preparation of ethylidene malonic ether from aldehyde and malonic ether, it is formed by the addition of malonic ether to ethylidene malonic ether CH₂CH C(CO.Et)₂ (Kommenos, A 218, 158, Claisen, J pr [2] 35, 414). The corresponding acid is split up by distillation into CO₂ and β methyl glutaric acid CO₂H CH CHMe CH₂ CO₂H.

Butane ααββ tetra carboxylic ether

(CO Et)₂CMe CMe(CO₂Et) Du methyl acetulene tetra carboxylic ether SG $\frac{1}{2}$ 1114 From sodio methyl malonic ether by the action of iodine or of chloro methyl malonic ether. From sodio ethane tetra carboxylic ether and MeI (Bischoff a Rach, B 18, 1202, A 234, 70).

Butane tetra carboxylic ether

CH(CO₂H)₂ C(C₂H₅)(CO₂Et)₂ Ethyl acetulene tetra carboxylic acid. Thick colourless oil, formed by the action of chloro malonic ether on sodio ethyl-malonic ether (Bischoff a Rach, B 17, 2785).

Butane hexa carboxylic ether

CO₂Et CH₂C(CO Et) C(CO Et) CH CO Et [57°] Six sided tables. From sodium ethane tri carboxylic ether (CO Et) CNa CH CO Et by the action of iodine or of (CO₂Et) CCl CH₂ CO₂Et (Bischoff, B 16, 1046, 17, 2786).

ISO-BUTANE SULPHINIC ACID

(CH₃)₂CH CH₂ SO₂H From iso butane sulpho chloride by zinc dust (Pauly, B 10, 942). Liquid. Reduced by nascent hydrogen to iso butyl mercaptan—ZnA₂. Plates (from alcohol).

n BUTANE SULPHONIC ACID C₄H₉SO₃H

Formed by the action of HNO₃ on n butyl mercaptan (Grabowsky, A 170, 344). Thick syrup, v sol water and alcohol, m sol ether—AgA plates—PbA₂ plates, sl sol alcohol—PbA₂·2Pb(OH)₂ crystalline powder, sl sol water—BaA₂·aq plates—CaA₂·2aq—NaA plates.

Iso butane sulphonic acid

(CH₃)₂CH CH SO₂H From iso butyl mercaptan and HNO₃ (Mylus, B 5, 978). Syrup. Its salts are v sol water—AgA' scales—BaA₂' needles.

Chloride C₄H₉SO₂Cl (190°) (Paulv, B 10, 912).

ISO-BUTENYL ACETATE CH CMe CH₂OAc (120°) (Scheschukoff, J R 16, 502).

BUTENYL ALCOHOL C₄H₉O

CH₂CH CH CH₂OH (117°) A product of the action of iron and acetic acid upon crotonic and tri chloro butyric aldehydes (Lieben a Zeissel, M 1, 825). HI gives CH₃CH₂CHI CH₂.

Isobutenyl alcohol CH CMe CH OH (113°)

SG 2 8695 Formed by boiling isobutenyl chloride with very dilute K₂CO₃ (Scheschukoff, J R 16, 499). Dilute H₂SO₄ changes it to iso butyric aldehyde. HI forms tert butyl iodide.

Ethyl ether CH₂ CMe CH₂ OEt (78°-85°)

From isobutenyl chloride and KOEt.

Sec isobutenyl alcohol CMe CH OH

Methyl ether CMe CH O Me Methyl isocrotyl oxide (70°-74°) From bromo iso butylene and NaOMe at 140°. Dilute H₂SO₄ at 140° gives HOME and isobutyric aldehyde (Elte koff, B 10, 705, J R 9, 163).

Ethyl ether CMe CH OEt (93°) Similarly prepared (E, S, Butlerow, Z 1870, 524).

BUTENYL-TRI-AMINE CH(CH NH₂),

(above 150°) From the nitrile of methane tri-carboxylic acid CH(CN)₃, tin, and HCl—B₂S₃H₂PtCl₆ (Fairlie, C J 16, 362).

BUTENYL BENZENE v PHENYL BUTYLENE**BUTENYL CHLORIDE v CHLORO BUTYLENE**

(a) **BUTENYL-CUMENE** C₆H₅PrC₄H₇ Iso propyl butenyl benzene (243°) SG 8875 Obtained from bromo-cumyl-valeric acid C₆H₅Pr CH CB₂Et CO Hand Na CO₂Aq (Perkin, C J 32, 662). Forms a dibromide [77°].

(B) Butenyl cumene C₆H₅PrC₄H₇ (235°)

SG 1¹ 889 Cumic aldehyde (10 g), sodio isobutyrate (5 g) and isobutyric anhydride (15 g) are heated together. The oily product is distilled with water and then over solid KOH and Na (Perkin, C J 35, 141). It forms a liquid dibromide.

BUTENYL-GLYCERIN v TRI OXY BUTANE

DI BUTENYL KETONE v DI ALLYL ACETONE (p 134).

o BUTENYL PHENOL**Methyl ether**

[2 1] MeO C₆H₄CH CH CH CH₂ (233°) SG $\frac{1}{2}$ 9817, $\frac{3}{10}$ 9740 From the methyl derivative of oxy phenyl angelic acid by successive treatment with HI and Na CO₂Aq (Perkin, C J 33, 213). Oil. Combines with bromine. Forms a red solid with H₂SO₄.

p Butenyl phenol Methyl ether

[4 1] MeO C₆H₄CH₂CH₂ [17°] (243°) SG $\frac{3}{2}$ 973 Prepared like the preceding (Perkin, C J 32, 671).

o Iso - butenyl - phenol C₆H₄O

C₆H₄CH₂OH (223°-225°) SG $\frac{1}{2}$ 1017 Salicylic aldehyde (30 g) sodic isobutyrate (22 g) and isobutyric anhydride (45 g) are heated together for 4 hours. Water is added to the product, and the oily butenyl phenyl isobutyrate saponified by alcoholic KOH. The alcohol is boiled off, dilute HCl is added and the oil which separates is distilled (Perkin, C J 35, 142). **Properties**—Oil, with smoky and cedar-like odour. Sol potash but insol NH₃. With salicylic aldehyde and conc H₂SO₄ it forms a purple solution.

p Iso butenyl phenol C₆H₄O

C₆H₄CH₂OH (230°-235°) From p oxy benzoic aldehyde, sodic isobutyrate and butyric anhydride. Yield small (Perkin, C J 35, 145). An oil which solidifies in a freezing mixture.

Methyl ether C₆H₄OMe

[9°] (237°) From anisic aldehyde (20 g), sodic isobutyrate (15 g) and isobutyric anhydride (30 g) by boiling at 180°. The product is distilled with steam and the oil dried over K₂CO₃. Cooled by ice and HCl it solidifies. On oxidation it yields anisic and acetic acid.

ω - BUTENYL STYRENE C₆H₅CH CH C₄H₇

(245°-248°) Phenyl heximene Cinnamic aldehyde (10 g), sodium isobutyrate (15 g) and isobutyric anhydride (10 g) are heated together for two hours. CO₂ comes off, and the residue is distilled with steam, washed with NH₃, dried and rectified over Na (Perkin, C J 35, 141).

Properties—Lighter than water. Rapidly oxidises in air, becoming a resin. It combines with bromine.

Iso EUTENYL TOLYLENE o DIAMINE

C₁₁H₁₇N₂ s.s. C₆H₄< $\begin{smallmatrix} \text{NH} \\ \text{N} \end{smallmatrix}\rangle$ C₆H₄ [168°].

Formed, together with a small quantity of tolu butyraldehyde $C_4H_7 \begin{smallmatrix} \diagup N CH C_2H_5 \\ \diagdown N CH C_2H_5 \end{smallmatrix}$, by shaking a cold acetic acid solution of tolylene-diamine (1 mol) with an aqueous or alcoholic solution of butyric aldehyde (2 mols). Small colourless needles V sol alcohol and ether, sl sol water Very bitter taste (Hinsberg, *B* 20, 1589)

BUTINENE C_8H_{16} , \pm $CH_2CHCHCH_2$. *Erythrene* *Vinyl ethylene* *Pyrrulylene* Occurs in the liquid got by compressing coal gas (Caventou, *B* 6, 70, Grimaux & Cloez, *C R* 104, 118). Formed also (?) by passing fusel oil through a red hot tube (Caventou, *A* 127, 93). Obtained by boiling erythrite with conc formic acid (5 pts) (Henninger, *B* 6, 70), and by the action of KOH on di methyl pyrrolidone methylo iodide (Ciamcian & Magnaghi, *B* 19, 569). A gas. It forms a tetrabromide [119°]. Pyrrolylene and the butinene from erythrite form also a second tetrabromide [40°] so that they are probably mixtures of two butinenes

Butinene $CH_3CH_2CCH_3$ *Ethyl acetylene* *Crotolyene* (18°) From methyl ethyl ketone by successive treatment with alcoholic KOH and PCl_5 (Bruylants, *B* 8, 412). Gives a white pp in ammoniacal $AgNO_3$ and a yellow pp in ammoniacal cuprous chloride. Mercuric chloride solution gives a pp of $(C_4H_7)(HgOHgCl)_2$ (Kutscheroff, *B* 17, 24), whence HCl produces methyl ethyl ketone. The same butinene appears to be formed when a mixture of acetylene and ethylene is passed through a red hot tube. It forms a tetrabromide [118°] (Berthelot, *A Ch* [4] 9, 406, Prunier, *Bi* 20, 72, *A Ch* [5] 17 *C R* 76, 1410)

Butinene CH_3CCH_3 (?) *Crotolyene* (18°) From crude butylene bromide and alcoholic KOH (Caventou, *A* 127, 347). From $\alpha\beta$ di bromo butane and alcoholic KOH (Almldin gen, *J R* 13, 392). Also formed by distilling barium acetate with S (Pfankuch, *J pr* [2] 6, 110). H_2SO_4 (3 mols) diluted with water (1 mol) converts it into hexa methyl benzene

Butinene C_4H_6 *Caoutchun* [-10°] (15°) SG \pm 65. Formed by the dry distillation of caoutchouc (*q v*) (Bouchardat, *A* 27, 33)

BUTINENE GLYCOL ν DI OXY BUTYFENE
BUTONENE-AMIDO-PHENYL MERCAPTAN $C_{10}H_{12}N_2S_2$ \pm

$C_6H_5 \begin{smallmatrix} \diagup N \\ \diagdown S \end{smallmatrix} CCH_2CH_2C \begin{smallmatrix} \diagup N \\ \diagdown S \end{smallmatrix} C_6H_5$ [187°]
From amido phenyl-o mercaptan and succin amide (Hofmann, *B* 13, 1231). Needles (from alcohol) — $BHAuCl$

BUTYL DERIVATIVES of hydroxylic compounds are described under the compounds of which they are the ethers

DI-BUTYL ν OCTANE

BUTYL ACETATE $C_8H_{16}O_2$ \pm C_4H_9OAc (124.5°) SG $\frac{1}{4}$ 9016 C.E. (0°-10°) 00113 S V 150.6 (Gartenmeister, *A* 233, 259). From butyl iodide and $AgOAc$ (Lieben & Rossi, *A* 158, 170, Linnemann, *A* 161, 193, Pribram & Handl, *M* 2, 693)

Isobutyl acetate $(CH_3)_2CHCH_2OAc$ V D 4.078 (calc 4.017) (116.3°) (Elsasser, *A* 218, 326), (117° cor.) (Perkin, *C J* 45, 495, (112.8°) (R. Schiff, *A* 220, 109) SG $\frac{1}{4}$ 8921 (E); $\frac{1}{2}$ 8774, $\frac{3}{4}$ 8688 (P). C.E. (0°-10°)

001187 (E) M M 6.623 at 10° S V 150.10 (E), 152.5 (S). Formed from isobutyl iodide and $AgOAc$, or by distilling potassium isobutyl sulphate with KOAc (Wurtz, *A* 90, 121)

Sec Butyl acetate CH_3CHCH_2OAc CH, (112°) SG $\frac{1}{4}$ 892. From sec butyl iodide and $AgOAc$ (De Luynes, *J* 1864, 501, Lieben, *A* 150, 112)

Tertiary Butyl acetate $(CH_3)_3COAc$ (93°-96°) From the iodide and $AgOAc$. Readily saponified by baryta water (Butlerow, *A* 144, 7)

ISO-BUTYL-ACETIC ACID ν HEXOIC ACID
ISO-BUTYL-ACETO-ACETIC ETHER ν p 24
BUTYL ACRIDINE $C_{17}H_{17}N_2$ \pm

$C_6H_5 \begin{smallmatrix} \diagup C(C_2H_5) \\ \diagdown N \end{smallmatrix} > C_6H_5$ From valeric acid (30 g), di-

phenylamine (30 g) and $ZnCl_2$ (50 g) heated gradually for 20 hours up to 220° (Bernthsen & J Traube, *A* 224, 41, *B* 17, 1508)

Salts — $BHCl$ [191°] yellow columns, v sol water or alcohol, very dilute solutions show blue fluorescence. Insol ether — $BHNO_3$ [139°] — $BHCrO_4$ [c 100°]

Dihydride $C_{17}H_{15}N(C_2H_5)$ [98°-100°] Got by reducing the hydrochloride with zinc dust. White plates (from alcohol)

BUTYLACTIC ACID ν OXY BUTYRIC ACID

BUTYLAL ν BUTYRIC ALDEHYDE

BUTYL ALCOHOL C_4H_9O Mol w 74. The four butyl alcohols indicated by theory are known

n Butyl-alcohol $CH_3CH_2CH_2CH_2OH$ (117° cor.) SG $\frac{1}{4}$ 8243 (Zander, *A* 224, 79), $\frac{2}{3}$ 8096 (Brühl, *A* 203, 16) S $\frac{3}{4}$ C.E. (0°-10°) 00087 (Z) μ_2 1.4040 S V 101.6 (Schiff, *A* 220, 101) R_∞ 35.45 (B) Critical point 287° (Paulewsky, *B* 16, 2634)

Occurrence — In the heavy oils from brandy. It is completely absent from the products of the fermentation of sugar with elliptical yeast (Claudon & Morin, *C R* 104, 1187)

Formation — 1 From butyrylchloride, butyric acid and sodium amalgam (Saytzeff, *J pr* [2] 3, 76) — 2 By the fermentation of glycine by a *Schizomycetes* or by certain *Bacteria* in presence of $CaCO_3$ and ammonium tartrate, *n* butyric acid and a little alcohol are formed at the same time (Fitz, *B* 9, 1348, Vigna, *B* 16, 1438) — 3 A product of the reduction of butenyl alcohol (Lieben & Zeisel, *M* 1, 825)

Preparation — From butyric aldehyde, water, and sodium amalgam (Lieben & Rossi, *C R* 68, 1561, 78, 1561, *A* 151, 121, 158, 137, 165, 145, *C J* 24, 516, Linnemann, *A* 161, 179)

Properties — Liquid. Separated by $CaCl_2$ from aqueous solution. On oxidation it produces butyric acid. Fused $ZnCl_2$ forms the *n*-butylenes (Le Bel & Greene, *C R* 89, 413)

Combination — $(C_4H_9O)_2CaCl_2$ (Heindl, *M* 2, 200)

Isobutyl alcohol $(CH_3)_2CHCH_2OH$ (106.6°-106.8°) at 763.2 mm (R Schiff, *A* 220, 102) (108°) (Linnemann, *A* 160, 238) SG $\frac{1}{4}$ 8062 (Brühl), $\frac{1}{2}$ 8069, $\frac{3}{4}$ 8009 (P) S $\frac{1}{2}$ at 18° S V 101.63 H.F. p 71.150 H.F. v 68.580 (Th) μ_2 1.4007 R_∞ 35.41 M M 4.986 at 17°

Occurrence — In fusel oil from beet or potatoes and other sources (Wurtz, *A Ch* [3] 42, 129, *A* 85, 197, 93, 107, *C. R* 35, 810).

Isobutyl angelate and isobutyrate occur in Roman oil of chamomile (Köbig, *A* 196, 96)

Formation—1 Isobutylene combines with ClOH forming $(\text{CH}_3)_2\text{CClCH}_2\text{OH}$, which is reduced by sodium amalgam and water (Butlerow, *A* 144, 24)—2 Isobutyl alcohol is produced by the action of *Bacillus butylicus* upon sugar, glycerin, &c., even in presence of 8 p.c. alcohol (Ordonneau, *C R* 102, 219, Claudon & Morin, *C R* 104, 1167)

Properties—Liquid, smelling like fusel oil, separated from its aqueous solution by CaCl_2 . The rate of etherification has been studied by Menschutkin (*A Ch* [5] 23, 14)

Reactions—1 CrO_3 produces isobutyric, acetic and carbonic acids, and acetone (Kramer, *B* 7, 252, Schmidt, *B* 7, 1361)—2 Distilled over zinc dust splits up into isobutylene and H_2O (Jahn, *B* 13, 989)—3 Dropped upon fused ZnCl_2 it forms isobutylene and $\text{CH}_3\text{CHCHCH}_3$ (Le Del & Greene, *Am* 2, 23)—4 Heated with ammoniacal ZnCl_2 at $260^\circ\text{--}280^\circ$ it yields a mixture of mono-, di- and tri-isobutyl amine (the latter in smaller quantity), the yield of mixed bases amounting to 50 to 70 p.c. of the alcohol used (Merz & Gasiorowski, *B* 17, 623)

Combinations— $(\text{C}_4\text{H}_9\text{O})_2\text{CaCl}_2$ (Heindl, *M* 2, 208)

Metallic derivatives— KOC_2H_5 — NaOC_2H_5 , $(\text{C}_4\text{H}_9\text{O})_2$ (De Forcrand, *C R* 101, 169)— $\text{Al}_2(\text{OC}_2\text{H}_5)_6$ (140°) SG \pm 9825 (Gladstone & Tribe, *C J* 39, 6) From Al (4 g.), iodine (2 g.) and isobutyl alcohol 40 c.c. at 100° . The yield is good (16 g.) Once fused it remains long fluid at 70°

Secondary butyl alcohol
 $\text{CH}_3\text{CH}_2\text{C}(\text{CH}_3)\text{H OH}$ *Methyl ethyl carbinol*
Butylene hydrate (99°) at 740 mm SG \pm 827 (Lieben, *A* 150, 114)

Formation—1 From *n*-butylamine by nitrous acid, at the same time some *n*-butyl alcohol is also formed (Linnemann & Zotta, *A* 162, 3, Meyer, *B* 10, 130)—2 By treating the compound of HClO with isobutylene, $\text{CH}_3\text{CHClCH}(\text{OH})\text{CH}_3$, with sodium amalgam (Lieben, *A* 151, 12f)—3 By the action of zinc ethide on glycolic iodhydrin (Butlerow & Ossokin, *A* 145, 263)—4 Symmetrical dichloro diethyl oxide, $(\text{CH}_3\text{CHCl})_2\text{O}$ is converted by ZnEt_2 into $(\text{CH}_3\text{CHEt})_2\text{O}$, a butyl ether which, on treatment with HI at 130° gives secondary butyl iodide (Lieben, *A* 141, 236, Kessel, *A* 175, 44)—5 Zinc ethide forms a crystalline compound with aldehyde, $\text{CH}_3\text{CHEt}(\text{OZnEt})$, which is decomposed by water into secondary butyl alcohol, ethane, and $\text{Zn}(\text{OH})_2$ (Wagner, *J R* 8, 37, *A* 181, 261)—6 From formic ether by treating with a mixture of ZnEt_2 and ZnMe_2 , and decomposing the product with water (Kanonnikoff & Saytzeff, *A* 175, 374)

Preparation—Secondary butyl iodide (*q v*) is treated with silver acetate and the product saponified by potash (De Luynes, *A* 128, 330, 132, 274)

Properties—Liquid with strong odour, ppd from aqueous solution by K_2CO_3

Reactions—1 *Oxidises* to methyl ethyl-ketone and acetic acid (Saytzeff, *Z* 6, 327)—2 The pure alcohol is unaltered when heated at $240^\circ\text{--}250^\circ$ during 8 to 16 hours in a sealed tube,

VOL. I

but the presence of a trace of HCl , HBr , or especially HI , is sufficient to split it up, forming pseudobutylene. The reaction commences at 220° and is complete in 5 or 6 hours (Bougaieff & Wolkoff, *Bl* [2] 45, 249)

Tertiary butyl alcohol $(\text{CH}_3)_3\text{COH}$ *Trimethyl carbinol* (25°) (83° cor) SG \pm 779 (Linnemann), \pm 779 (Butlerow), \pm 786, \pm 780 (Bruhl), \pm 7836, \pm 7761 (Perkin) MM 5 122 at 24.3° d_4^{20} 1.3924 n_D^{20} 1.3553 *Critical point* 235° (Pawlewski, *B* 16, 2634)

Formation—1 Zinc methide (2 mols.) and acetyl chloride (1 mol.) mixed at 0° , foam, after some hours, a crystalline compound, $\text{CH}_3\text{CMe}(\text{OZnMe})\text{Me}$, which is decomposed by water into tertiary butyl alcohol, $\text{Zn}(\text{OH})_2$ and CH_4 (Butlerow, *A* 144 1, Wagner & Saytzeff, *A* 175, 361, Pawloff, *A* 188, 118)—2 Together with isobutyl alcohol by treating isobutyl iodide with acetic acid and Ag_2O (Linnemann, *A* 162, 12, Butlerow, *A* 168, 143)—3 From isobutyl amine and HNO_3 —4 From isobutyl cyanate and KOH (Linnemann, *A* 162, 12)—5 From tertiary butyl iodide (*q v*) and water, even in the cold (Dobbin, *C J* 37, 238)—6 A mixture of *iso* and *tert* butyl chlorides is got by heating isobutyl alcohol with HCl , when heated with water (6 vols.) at 100° the chloride of *tert* butyl alcohol is the only one converted into its alcohol (Freund, *J pr* [2] 12, 25)

Preparation—Liquid isobutylene is sealed up with twice its volume of a mixture of equal parts of water and sulphuric acid, and the contents are left till homogeneous and then distilled (Butlerow, *Z* [6] 237, *A* 180, 246)

Properties—Trimetric prisms. Forms a hydrate $(\text{C}_4\text{H}_9\text{O})_2\text{H}_2\text{O}$ which boils at 80° (Butlerow)

Reactions—1 CrO_3 mixture gives acetone together with acetic, carbonic and a little isobutyric acid (Butlerow, *Z* 1871, 485)—2 Heating with anhydrous $\text{H}_2\text{C}_2\text{O}_4$ produces butylene (Cahours & Demaiçay, *C R* 86, 991)—3 When taken internally it is excreted in the urine as butyl glycuronic acid $\text{C}_4\text{H}_9\text{O}$, (Thierfelder & Mering, *H* 9, 514) which is decomposed by boiling dilute HCl into *tert* butyl alcohol and glycuronic acid

Formation—1 From butyl cyanate and KOH aq (Lieben & Rossi, *A* 158, 172, Meyer, *B* 10, 131)—2 From butyronitrile by reduction

T T

(Linnemann a Zotta, *A* 162, 3) — 3 From nitrobutane, Sn and HCl (Zublin, *B* 10, 2083)

Properties — Miscible with water, dissolves freshly pptd Cu(OH)₂ and Ag₂O. Reduces alkaline solutions of copper, silver, and mercury. Nitrous acid converts it into *sec* butyl alcohol — Platinum chloride (B'HCl)₂PtCl₄, yellow crystalline plates, in sol cold water

Primary isobutyl-amine PrCH₂NH₂ (68°) (R Schiff, *B* 19, 565) SG 2 736 SV 106 16 (S) HF p 88,460 HF v 35,560 (Th)

Formation — 1 By distilling potassium isobutyl sulphate with potassium cyanate and treating the product with KOH (Wurtz, *A* 93, 124, Linnemann, *A* 162, 23) — 2 By heating isobutyl bromide with alcoholic NH₃ and separating the mono-, di-, and tri butylamines by oxalic ether (Reimer, *B* 3, 756, Hughes a Romer, *B* 7, 611, Malbot, *C R* 104, 63, 228) On heating isobutyl chloride with ammonia (molecular proportions) in isobutyl alcoholic solution or in aqueous solution very nearly similar results are obtained, namely one part of mono butyl amine, four of di-, and five parts of tri butyl amines (M) — 3 Formed, together with di and tri isobutylamine, by heating isobutyl alcohol with ammoniacal ZnCl₂ at 260°–280°, the yield of mixed bases amounts to 50–70 p.c. of the alcohol used (Merz a Gasiorowski, *B* 17, 623) 4 By reducing nitro isobutane (Demole, *A* 175, 142) — 5 A mixture of equal mols of valer amide (ordinary) and bromine is run into an excess of a 10 p.c. solution of KOH at 60°, the yield is 90 p.c. (Hofmann, *B* 15, 769)

Salts — B'HCl (160°) S 133 at 15° — (B'HCl)PtCl₄, microscopic rhombic tablets — B'HAuCl₄, — Sulphate cauliflower like groups of needles, not deliquescent

Secondary butyl-amine

CH₃CH₂CH(NH₂)CH₃ (63°) From dilute H₂SO₄ and *sec* butyl thio carbimide (from volatile oil of scurvy grass) (Reyman, *B* 7, 1289) Also from the iodide or cyanate (Hofmann, *B* 7, 513) — B'₂H₂PtCl₆

Tertiary butyl-amine Me₃CNH₂ (46° cor) SG 2 7155, 28 7004 CE (0°–78°) 0014 Formed together with isobutylamine by the successive action of silver cyanate and aqueous KOH on isobutyl iodide Colourless ammoniacal liquid, attacks indiarubber and cork Miscible with water, but separated by K₂CO₃ or KOH from its solution (Brauner, *A* 192, 72, cf Linnemann, *A* 162, 19, Hofmann, *B* 7, 513)

Salts — B'HCl melts at [270°–280°] and boils soon after On solidifying it increases greatly in bulk — (B'HCl)₂PtCl₄, Large monoclinic prisms (from alcohol) — B'HI — B'HNO₂, Sulphate six sided prisms, not deliquescent

Di-*n*-butyl-amine (PrCH₂)₂NH₂ (160°) Formed, together with *n* butylamine, by treating butyl cyanate with KOH (Lieben a Rossi, *A* 158, 175) Converted by nitrous acid into primary and secondary *n* butyl alcohols and *n*-butylene (Meyer, *B* 10, 180) — B'₂H₂PtCl₆, Nitroso-derivative (C₄H₉)₂NNO (236° cor)

Di-iso-butyl-amine (PrCH₂)₂NH₂ (137°) Formed, together with mono- and tri- iso-butylamine, by heating iso butyl alcohol with ammoniacal ZnCl₂ at 260°–280° The secondary amine is isolated from the mixture of bases (which amounts to 50–70 p.c. of the alcohol

used) by means of its nitrosamine (Merz a Gasiorowski, *B* 17, 623) Prepared by heating iso butyl iodide or bromide with alcoholic NH₃ to 180° (Ladenburg, *B* 12, 948) Butyl iodide (1 mol) in the cold acts upon di isobutylamine (1 mol) forming di isobutylamine hydrochloride and free tri iso butylamine (M)

Salts — B'HCl plates or scales S 625 at 15°, S (ether) 07 at 15°, S (alcohol) 06 at 14° (Malbot, *C R* 104, 366) — F₂H₂PtCl₆ — B'HClAuCl₄, Yellow tables, sparingly soluble in cold water

Nitroso-derivative N(NO)(C₄H₉)₂ [0°] (213°–216°) Oil Prepared by the action of KNO₃ on a solution of di isobutylamine hydrochloride

Tertiary di butylamine (C₄H₉)₂NH₂ (CMe₃)₂NH From tertiary butyl iodide and tertiary butylamine at 50° But above 70° iso butylene is given off C₄H₉NH₂ + C₄H₈I = C₄H₉ + C₄H₉NH₂.HI (Runew, *Bl* [2] 33, 299)

Salt — B'HI Very soluble in water and alcohol Converted by potash, or even boiling water, into tertiary butylamine

Tri *n* butylamine (C₄H₉)₃N Mol w 185 (c 213° cor) SG 2 791, 22 778 From *n* butyl iodide and NH₃ (Lieben a Rossi, *A* 165, 115) — B'₂H₂PtCl₆

***n* Butyl iodide** (C₄H₉)₂NI plates (Lieben a Rossi, *A* 165, 113)

Tri isobutylamine (PrCH₂)₃N (185°) SG 2 785 (Sachtleben, *B* 11, 733) Formed, together with mono and di iso butylamine, by heating isobutyl alcohol with ammoniacal ZnCl₂ at 260°–280° The tertiary amine is isolated from the mixture of bases (yield 50–70 p.c. of the alcohol) by means of its sparingly soluble ferrocyanide (Merz a Gasiorowski, *B* 17, 623) Also from di iso butylamine and isobutyl bromide Also from isobutyl iodide (1 mol) and NH₃.Aq (1 mol) at 160° (Malbot, *C R* 105, 575) Does not mix with water With isobutyl bromide it gives off butylene and forms tri iso butylamine hydrobromide (Reimer, *B* 3, 757) Isobutyl iodide (1 mol) at 180° forms hydrioides of di and tri isobutylamine and butylene (M) Isobutyl chloride (1 mol) at 170° gives pure di-iso-butylamine hydrochloride and butyl ene

Salts — B'HCl, B'HNO₂, and B'₂H₂SO₄, are extremely soluble — (B'HCl)₂PtCl₄, orange plates, sol hot water — B'HClAuCl₄, amorphous, insol water

Tert BUTYL tert-AMYL-AMINE

(C₄H₉)(C₅H₁₁)NH₂ The iodide of this base is formed by the slow action of tertiary amyl iodide on tertiary butylamine in the cold It is very unstable, being decomposed by solution in water (?) (Rudneff, *Bl* [2] 33, 297)

***n*-BUTYL-ANILINE** C₆H₅N₂ 28 C₆H₅NHCH₂C₄H₉ (236° at 720°) Colourless oily fluid Extremely volatile with steam

Salts — B'HCl very soluble white needles — B'HNO₂,* easily soluble — B'₂H₂SO₄,* easily soluble fine white needles

Acetyl derivative C₆H₅N(C₂H₅)Ac (274°) at 718 mm, colourless fluid

Nitrosamine C₆H₅N(C₂H₅)NO yellow fluid, easily soluble in alcohol and ether, in soluble in water (Kahn, *B* 18, 3363).

Isobutyl-aniline Pr CH₃.NHPh (242°) (G), (226°) (N) SG 12 926 (G) From isobutyl bromide and aniline (Gianetti, G 12, 268) — B'HC1 — B'HB'r — B'HI

Acetyl derivative (267°) (Nöbling, J 1888, 703)

p Nitroso-derivative

[41] C₆H₄(NO)NHCH₂Pr or C₆H₄ $\begin{matrix} \text{NH CH}_2\text{Pr} \\ \diagup \quad \diagdown \\ \text{N} > \text{O} \end{matrix}$

[94°] From isobutyl aniline, HCl, and NaNO₂ (Wacker, A 243, 297) Steel blue crystals, v sol alcohol, sl sol water **Reactions**—1 **Reduction** gives isobutyl phenylene diamine—2 The chloride boiled with aqueous NaOH gives iso butyl amine and *p* nitroso phenol—3 HCl and NaNO₂ give a nitrosamine C₆H₄(NO)CH₂Pr crystallising in bright green plates, v sol alcohol and ether, insol water

Di-isobutyl aniline (PrCH₂)₂NPh (c 248°) From aniline and isobutyl bromide (Studer, A 211, 235)

DI BUTYL ANILINE AZYLIN v *Di butyl amido benzene azo di butyl aniline*

BUTYL ANISOL v *Methyl ether of BUTYL-PHENOL*

ISO BUTYL-ANTHRACENE C₁₄H₁₈ &c

C₆H₄ $\begin{matrix} \text{C}(\text{C}_6\text{H}_5) \\ \diagup \quad \diagdown \\ \text{CH} \end{matrix}$ C₆H₄ [57°] Fluorescent

needles Prepared by the action of zinc dust, isobutyl bromide and NaOH on anthraquinone (Liebermann a Tobias, B 14, 802, A 212, 107) The picric acid compound forms long brownish red needles

Di-hydrate C₆H₄ $\begin{matrix} \text{CH}(\text{C}_6\text{H}_5) \\ \diagup \quad \diagdown \\ \text{CH}_2 \end{matrix}$ C₆H₄ From isobutyl-oxanthranol, HI, and P (L) Oil, oxidised by CrO₃ in HOAc to isobutyl oxanthranol and finally to anthraquinone

BUTYL-ANTHRANOL-DIHYDRIDE

C₆H₄ $\begin{matrix} \text{CH}(\text{OH}) \\ \diagup \quad \diagdown \\ \text{CH}(\text{C}_6\text{H}_5) \end{matrix}$ C₆H₄ [72°] From anthraquinone, aqueous NaOH and zinc dust, boiled for some time and then iso butyl bromide added (Liebermann, A 212, 103)

ISO BUTYL ANTHRANYL CHLORIDE

C₆H₄ $\begin{matrix} \text{CCl}(\text{C}_6\text{H}_5) \\ \diagup \quad \diagdown \\ \text{CO} \end{matrix}$ C₆H₄ [78°] Tables Prepared by the action of PCl₅ on isobutyl oxanthranol (Liebermann a Walder, B 14, 463)

n BUTYL-BENZENE C₁₀H₁₄ &c C₆H₅.CH₂Pr **Phenyl butane** (180°) SG 12 862 From *n* propyl bromide, benzyl chloride, and Na (Radziszewski, B 9, 260) Also from *n* butyl bromide, bromo-benzene, and Na (Balbiano, B 10, 296)

Bromination—By the action of bromine in the dark, or in presence of iodine, the product is probably a mixture of *o* and *p* bromo butylbenzene By the action of bromine in direct sun shine, the substitution takes place in the γ position of the side chain giving C₆H₅.CHBr.C₆H₅ or C₆H₅.CBr.C₆H₅ If the γ -mono bromo derivative is further brominated in the dark at 100° the second Br atom probably enters the β position, the product being identical with the butylene benzene-dibromide [70°] of Radziszewski (Schramm, B 18, 1275)

ISO-BUTYL-BENZENE C₆H₅.CH₂Pr (167°). SG 2 880 (G), 858 (R) V.D 4 72 (G)

Formation—1 From isobutyl bromide, bromo benzene and Na (Reuss, B 3, 779, Wreden a Znatowicz, B 9, 1606)—2 From benzyl chloride, isopropyl iodide, and Na (Köhler a Aronheim, B 8, 509)—3 By the action of 50 g iso butyl chloride on 150 g benzene in presence of about 50 g Al₂Cl₆ (Gossin, B [2] 41, 446)—4 By heating benzene with isobutyl alcohol and ZnCl₂ (Goldschmidt, B 15, 1066) 5 By distilling *m* or *p* isobutyl benzoic acid with lime (Kelbe a Pfeiffer, B 19, 1728)

Properties—Colourless liquid, CrO₃ oxidises it to benzoic acid Passed over red hot PbO it forms naphthalene

Sec butyl benzene CH₃.CH₂.CH(C₆H₅).CH₃ (171°) SG 12 873 From C₆H₅.CHBr.CH₃ and ZnEt (Radziszewski, B 9, 261)

(a) **n BUTYL-BENZENE SULPHONIC ACID** C₆H₄(CH₂Pr)SO₃H Formed by sulphonating *n* butyl benzene (Balbiano, G 7, 343)—BaA', small laminae, sl sol cold water—ZnA', 7aq—PbA', 2aq—MnA', 6aq

(β) **n Butyl-benzene sulphonic acid** Formed at the same time as the preceding (B)—BaA', 2aq nodules, more soluble than the Ba salt of the (α) acid—PbA', 2aq

Iso Butyl-benzene-sulphonic acid C₆H₄(C₆H₅)SO₃H Formed by sulphonation of isobutyl benzene—A₂Ba2aq glistening plates—A'Kaq plates

Amide C₆H₄(C₆H₅)SO₂NH₂ [137°], glistening needles (Kelbe a Pfeiffer, B 19, 1728)

BUTYL BENZOATE v p 470

BUTYL BENZIMIDO-ETHER v p 479

m ISO-BUTYL-BENZOIC ACID

C₆H₄(C₆H₅)CO₂H [13] [127°] Long stout needles Formed by oxidation of *m* isobutyl toluene with dilute HNO₃ By further oxidation with dilute HNO₃ at 170°–200° isophthalic acid is formed Gives anitro derivative [140°]—AgA' white pp

Amide C₆H₄(C₆H₅)CONH₂ [130°], hair-fine needles from water (Kelbe a Pfeiffer, B 19, 1725)

p Isobutyl-benzoic acid C₆H₄(C₆H₅)CO₂H [14] [164°]

Formation—1 By oxidation of *p*-isobutyl toluene with dilute HNO₃ By further oxidation with dilute HNO₃ terephthalic acid is formed (Kelbe a Pfeiffer, B 19, 1725)—2 By saponification of its nitrile (Pahl, B 17, 1237)

Properties—Monoclinic crystals, gives a nitro derivative [161°].

Salts—AgA' white flocculent pp—BaA', 2aq plates, sol hot water—CaA', 2aq sl sol cold water

Amide C₆H₄(C₆H₅)CONH₂ [171°], long hair fine needles (from water)

Methyl ether MeA' (247°), oil

Nitrile C₆H₄(C₆H₅)CN (249°) (G a M), (244°) (K), (238°) (P) V.D 5 47 (obs) (K), 5 35 (obs) (P) Colourless oil **Formation**—

1 By distilling the formyl derivative of isobutylphenyl amine with zinc dust, the yield is about 12 p.c (Gasiorowski a Merz, B 18, 1009)—2 By heating *p* isobutyl phenyl-thio carbimide with copper powder at 200° (Pahl, B 17, 1236). 3 Formed by heating tri isobutylphenyl phosphate with dry KCN (Kreysler, B 18, 1707)

ISO-BUTYL-BENZOYL-ACETIC ETHER v p

482

ISO-BUTYL BORATE $B(OC_4H_9)_3$ (212°)

Formed by heating B_2O_3 with isobutyl alcohol for 8 hours at 170°. Burns with green flame. Insoluble in water and slowly decomposed by it (Counciler, *J pr* [2] 18, 382). Not acted upon by ammonia.

***n*-BUTYL BROMIDE** C_4H_9Br *tc*

$CH_3CH_2CH_2CH_2Br$ (100° cor) $SG \pm 1305$, ± 1299 . From *n*-butyl alcohol, Br, and P (Lieben a Rossi, *A* 158, 161). With Br at 150° it gives $C_4H_9Br_2$ (167°) (Linnemann, *A* 161, 199). With bromine containing iodine at 250° it reacts thus $C_4H_9Br + 8Br_2 = 2C_4Br_9 + 9HBr$ (Merz a Weith, *B* 11, 2244).

Isobutyl bromide $PrCH_2Br$ (92°) (*L*), (91°) at 758 mm (Schiff, *B* 19, 563) $SG \pm 12722$, ± 12598 (Perkin, *C J* 45, 457) SV 110.39 MM 8 003 at 16° (P). From the alcohol and HI or P and I (Pierre a Puchot, *J Ph* [4] 13, 9, Wurtz, *A* 93, 114, Chapman a Smith, *C J* 22, 153). At 220° it partially changes to tertiary butyl bromide (Eltokoff, *B* 8, 1241).

Tertiary butyl bromide CM_eI (72°) $SG \pm 1215$, ± 12020 , ± 11892 VD 4.7 (obs) MM 8 238 at 18°. From isobutylene and HBr (Roozeboom, *B* 14, 2496). From tri methyl carbinol and PBr_3 (Reboul, *C R* 93, 69).

Reactions—1 Readily decomposes into HBr and isobutylene. This occurs when it is treated with Ag_2O , with KHO , with NEt_3 , or with Zn and water (Butlerow, *Z* 1867, 362)—2 With ZnO it forms tri isobutylene, C_4H_8 ,—3 With water, even in the cold, it forms tertiary butyl alcohol.

BUTYL BUTYRATE *v* BUTYRIC ACID

ISO-BUTYL CARBAMINE C_4H_9NC (c 116°) $SG \pm 787$. Preparation and properties like those of ethyl carbamine. Less readily attacked by HCl than ethyl carbamine (Gautier, *A* 152, 221, *Bl* [2] 11, 211, *Z* [2] 5, 445).

***n*-BUTYL CARBONATE** $(PrCH_2)_2CO_2$ (207° cor) at 740 mm $SG \pm 941$ (Lieben a Rossi, *A* 165, 112).

Isobutyl carbonate $(PrCH_2)_2CO_2$ (190° cor) $SG \pm 919$. From isobutyl iodide and Ag_2CO_3 (De Clermont, *A Ch* [3] 44, 336). From isobutyl alcohol and $CyCl$ (Humann, *A Ch* [3] 44, 340). From sodium isobutylate and chloro pierrin (Roese, *A* 205, 253, *cf* Wurtz, *A* 93, 119).

Isobutyl-orthocarbonate $(PrCH_2O)_3C$ (245° cor) $SG \pm 900$. The chief product of the action of chloropierrin on sodium isobutylate (Roese, *A* 205, 253).

BUTYL-CHLORAL *v* TRI CHLORO BUTYRIC ALDEHYDE

***n*-BUTYL CHLORIDE** C_4H_9Cl *tc* $CH_3CH_2CH_2CH_2Cl$ Mol w 92.5 (78° cor) $SG \pm 907$, ± 897 (Linnemann, *A* 161, 197) SV 114.3 (Ramsay). From *n*-butyl alcohol and HCl (*L*, *cf* Lieben a Rossi, *A* 158, 161). From *n*-butane and chlorine (Schöylen, *A* 130, 235).

Isobutyl chloride $(CH_3)_2CHCH_2Cl$ (69°) $SG \pm 880$ (Linnemann), ± 8836 , ± 8739 (Perkin, *C J* 45, 455) MM 6 144 at 21°. HF p 45, 370 HF v 43, 050 (*Th*) SV 114.26 (R Schiff, *B* 19, 562). From isobutyl alcohol and HCl or PCl_5 (Wurtz, *A* 93, 113, Pierre a Puchot, *C R* 72, 832).

Tertiary butyl chloride $(CH_3)_3CCl$ (51°).

$SG \pm 8471$, ± 8368 MM 6 257 at 15°.

Formation—1 By action of chlorine on $(CH_3)_3CH$ (Butlerow, *J* 1864 497)—2 By heating isobutylene, $(CH_3)_2CCH_2$, with conc HCl at 100° (Salessky, *A* 165, 92, *B* 5, 480, Le Bel, *Bl* [2] 28, 462, Puchot, *A Ch* [5] 28, 549)—3 From tri methyl carbinol and $AcCl$ or PCl_5 —4 From isobutyl iodide and ICl (Linnemann, *A* 162, 18).

Properties—With water (5 vols) at 100° it is readily converted into tertiary butyl alcohol (Butlerow, *A* 144, 33). It partakes, therefore, somewhat of the character of an acid chloride.

BUTYL-CHLORO- *v* CHLORO BUTYL**BUTYL-CINCHONIC ACID** *v* BUTYL QUINOLINE CARBOXYLIC ACID**BUTYL CRESOL** *v* METHYL BUTYL PHENOL

ISO-BUTYL CYANATE $PrCH_2NCO$ (110°) From isobutyl iodide and silver cyanate (Brauner, *B* 12, 1877).

Tertiary butyl cyanate $(CH_3)_3CNCO$ (86° cor) $SG \pm 8676$. The chief product of the action of isobutyl iodide on silver cyanate (*B*).

BUTYL CYANIDE *v* VALERONITRILE

***n*-BUTYLENE** C_4H_8 *tc* $CH_3CHCHCH_2$ *Vinyl ethane Ethyl ethylene* Mol w 56 (c -4°). Occurs in the oils deposited from compressed coal gas (Colson, *Bl* [2] 45 52, *C R* 104 1286).

Formation—1 By boiling *n*-butyl iodide with alcoholic KOH (Grabowsky a Saytzeff, *A* 179, 325, Lieben a Rossi, *A* 158, 164)—2 From bromo ethylene and $ZnEt_2$ (Chapman, *C J* 20, 28, Wurtz, *Z* [2] 5, 407)—3 Together with secondary butyl alcohol by the action of HNO_3 on *n*-butyl amine (Meyer, *B* 10, 136).

Properties—Gas. Forms with Br a dibromide (167°). HI forms $CH_3CH_2CH_2CH_2I$, *ψ* Butylene $CH_3CHCHCH_3$, (*β*) Butylene *a* Di methyl ethylene (1°).

Occurrence—In the oils from compressed coal gas (Colson, *C R* 104, 1286).

Formation—1 From secondary butyl iodide and alcoholic KOH , AgO and water, or $AgOAc$ (De Luynes, *A* 129, 200, 132, 275, Lieben, *A* 150, 108, 151, 121)—2 Together with isobutylene by distilling *tc* or *iso* butyl alcohol with $ZnCl_2$ (Nevolé, *Bl* 24, 122, Le Bel a Greene, *Am* 2, 23, *Bl* [2] 29, 306)—3 By heating secondary butyl alcohol—4 From MeI , allyl iodide, and Na, small quantities of the two other butylenes being also formed (Wurtz, *Bl* [2] 8, 265, Grosheintz, *Bl* [2] 29, 201)—5 H_2SO_4 , acting on isobutyl alcohol forms (1 vol of) $CH_3CHCHCH_3$ and (2 vols of) $(CH_3)_2CCH_2$ (Kononoff, *Bl* [2] 34, 333, *cf* Puchot, *A Ch* [5] 28, 508)—6 By boiling isobutyl iodide with PbO (Eltokoff, *Bl* [2] 34, 347).

Properties—Gas. Br gives $C_4H_8Br_2$ (156°–159°). HI gives $CH_3CH_2CH_2CH_2I$.

Isobutylene $(CH_3)_2CCH_2$ *u* Di methyl-ethyl ene (-6°) $SG \pm 8637$ (Puchot) HF p 10,660 HF v 8920 (*Th*) VD 1.93 (calc 1.94). Occurs in the oils obtained by compressing oil gas (Faraday, *T* 1825, 440) or coal-gas (Colson, *Bl* [2] 48, 52, *cf* Prunier, *Bl* [2] 19, 109).

Formation—1. By electrolysis of potassium

valerate (Kolbe, *A* 69, 269) — 2 From *sec*- or *tert* butyl alcohol and H_2SO_4 or $ZnCl_2$ (Wurtz, *A* 93, 107, Kononoff, *Bl* [2] 34, 333, Lermonoff, *A* 196, 117, Puchot, *A Ch* [5] 28, 508, *C R* 85, 757, Scheschukoff, *Bl* [2] 45, 181, cf Nevole, *Bl* [2] 24, 122) — 3 Together with ethylene and propylene by passing fusel oil through a red hot tube (Wurtz, *A* 104, 249, Butlerow, *A* 145, 277) — 4 From *iso* or *tert*-butyl iodide and alcoholic KOH (De Luynes, *C R* 56, 1175, *A Ch* [4] 2, 385, Butlerow, *A* 144, 19, *Z* [2] 6, 236) — 5 By heating di methyl acrylic acid to 210°–220° during 25–30 hours (Gorboff a Kessler, *Bl* [2] 41, 392)

Preparation — Isobutyl iodide is run into boiling alcoholic KOH and the gas collected

Properties — Gas, sl sol water, v sol alcohol, v sol ether and $HOAc$

Reactions — 1 Conc HCl at 100° forms *tert* butyl chloride — 2 Conc HI aq absorbs it, forming *tert* butyl iodide and tri methyl carbinol (Scheschukoff, *Bl* [2] 40, 823) — 3 Conc H_2SO_4 (3 pts) mixed with water (1 part) absorbs it, and on diluting with water and distilling *tert* butyl alcohol is got — H_2SO_4 (5 pts) mixed with less water (1 pt) forms much acedecylene — 4 Br in CS_2 forms C_4H_8Br (148°) and $C_4H_8Br_2$ (173°–183°) at 235 mm (Nevole, *C R* 83 65, Norton a Williams, *Am* 9, 88) — 5 $HClO$ forms a chloro butyl alcohol (137°) (Butlerow, *A* 144, 1, *Z* [2] 6, 236, Henry, *Bl* [2] 26, 23) — 6 CrO_3 gives acetone, oxalic acid, acetic acid, &c (Zeidler, *A* 197, 251) — 7 Cl forms isobutenyl chlorides C_4H_7Cl (Scheschukoff, *J R* 16, 488)

Combinations — $(C_4H_9) AlCl_3$ From ethylene, $AlCl_3$ and HCl (Gustavson, *J R* 16, 97) — $(C_4H_9) AlBr_3$ oil *S G* 21 *V* p 147

BUTYLENE ALCOHOL v **DI OXY BUTANE**

BUTYLENE DIAMINE $C_4H_{11}N_2$

$C_4H_9(NH_2)_2$ (?) (above 140°) From ethylene cyanide, tin, and HCl (Fairley, *C J* 17, 362, could not be obtained by Ladenburg, *B* 16, 1150, or Lellmann a Würthner, *A* 228, 229) — $B^+H_2PtCl_6$

BUTYLENE BROMIDE v **DI BROMO BUTANE**

BUTYLENE TRI-CARBOXYLIC ACID

$CH_3CH(CO_2H)CH(CO_2H)_2$ *Ethylidene-ethenyl tri carboxylic acid* [185°] Formed by the action of a chloro crotonic ether upon sodio malonic ether, and saponification of the product (Hjelt, *B* 17, 2833) *V* sol water, *m* sol ether — $A''Ag_2$ flocculent pp — $A''Ca_2$ and $A''Ba_2$ easily soluble powders

Mono ethyl ether $A''H_2Et$ 3aq [70°] large triclinic crystals, $abc = 9111$ 1 7553 — $A''H_2Et$ aq [145°]

Tri-ethyl ether Et_3A'' (286°)

BUTYLENE GLYCOL v **DI OXY BUTANE**

BUTYLENE GLYCOL CHLORHYDRIN v **CHLORO-BUTYL ALCOHOL**

BUTYLENE GUANAMINE $C_4H_{11}N_3$ [173°]

Formed by heating guanidine isovalerate at 225° Trimetric needles, *m* sol cold water. Converted by conc H_2SO_4 into butylene guanamide $C_4H_{11}N_3O_2$, whence HNO_3 forms cyanuric acid (Bandrowski, *B* 9, 240) — B^+HCl — B^+AgNO_3 — $B^+H_2SO_4$

BUTYLENE HYDRATE v *Sec* **BUTYL ALCOHOL**

BUTYLENE NITRITE (?) $C_4H_9N_2O$ From isobutylene and conc HNO_3 (Haitinger, *M* 2, 287).

Butylene nitrite (?) [96°] Formed by boiling petroleum of Tiflis with HNO_3 (Beilstein a Kurbatoff, *B* 14, 1621)

ISO-BUTYLENE OXIDE C_4H_8O $\angle \begin{smallmatrix} O \\ CH_2 \end{smallmatrix} < \begin{smallmatrix} CH_3 \\ CH_2 \end{smallmatrix}$

(52°) *S G* 2 8311 From isobutylene with successive treatment with $HClO$ and KOH (Eitekoiff, *Bl* [2] 40, 23, *J R* 14, 468) Water, at ordinary temperatures, unites with it, forming di-oxy-butane

s Butylene oxide $O < \begin{smallmatrix} CHMe \\ CHMe \end{smallmatrix}$ (57°) *S G* 2

8344 Formed similarly from $CH_3CHCHCH_3$ (E) Water at 100° forms di oxy butane $CH_3CH(OH)CH(OH)CH_3$

BUTYL ENNYL KETONE $C_{14}H_{28}O$ (?) or $C_6H_5CO C_8H_{17}$ *Amyl valerone* (209°) *S G* 2 845 From CO on sodium amylate, $NaOC_5H_{11}$, at 160° (Geuther a Fröhlich, *A* 202, 301) Liquid, does not combine with $NaHSO_4$

BUTYL ETHER v **BUTYL OXIDE**

BUTYL-FORMIC ACID v **VALERIC ACID**

BUTYL-GLYCERIC ACID v **DI OXY BUTYRIC ACID**

BUTYL-GLYCIDIC ACID v **DI OXY BUTYRIC ACID**

BUTYL GLYCOL v **DI OXY BUTANE**

BUTYL-GLYOXALINE $C_8H_{12}(C_2H_5)_2$ *Glyoxal amyline* [121°] (274°) Flat needles *Sl* sol water Prepared by the action of valeric aldehyde ammonia on glyoxal (Radziszewski, *B* 16, 747, 17, 1291) Br forms $C_8H_{12}Br_2N_2$ [158°] and $C_8H_{12}Br_2N_2$ [217°]

Salts — B^+HCl [136°] — B^+HBr [100°] — $B^+H_2C_2O$ [196°] — $B^+H_2PtCl_6$

ISO-BUTYL DIGUANIDE $C_6H_{11}N_4$

$C_6H_5N_3(C_2H_5)$ The sulphate of the copper derivative $Cu(C_6H_5N_3)_2H_2SO_4$ is formed by the action of aqueous $CuSO_4$ and isobutylamine on dicyandiamide at 100° (Smolka, *M* 4, 815) Alkaline syrup, absorbing CO_2 from the air

Salts — $B^+H_2SO_4$ 1 3aq *S* 26 8 at 16° Colourless transparent leaflets — $B^+H_2SO_4$ 1 3aq. — B^+HCl [216°] *S* 40 at 16° — B^+HCl [194°] Deliquescent — $B^+H_2PtCl_6$ aq golden four sided tables — $B^+H_2CrO_4$ aq — $B^+H_2C_2O_4$

Metallic derivatives $Cu(C_6H_5N_3)_2$ silky red needles, *sl* sol water, *sol* dilute acids — $Cu(C_6H_5N_3)_2 \cdot 2HNO_3$ — $Cu(C_6H_5N_3)_2 \cdot H_2Cl_2$ aq — $Cu(C_6H_5N_3)_2 \cdot H_2SO_4$ carmine red grains *S* 26 at 18° — $Cu(C_6H_5N_3)_2 \cdot H_2SO_4$ aq pale red grains — $Cu(C_6H_5N_3)_2 \cdot H_2SO_4$ 3aq light rose-red crystals

BUTYL- MUSTARD OIL *v* **BUTYL THIO-CARBIMIDE**

ISO-BUTYL-NAPHTHALENE $\text{C}_{11}\text{H}_{16}$ *se*
 $\text{C}_{11}\text{H}_{16}$ $(\text{C}_4\text{H}_9)_2$ (280°) Prepared together with (α - α) and (α - β) dinaphthyl by heating naphthalene and isobutyl chloride in presence of aluminium chloride Colourless oil, very slightly volatile in steam Picric acid compound [96°] aggregates of golden needles (Wegscheider, M 5, 236)

ISO-BUTYL NITRATE $\text{C}_4\text{H}_9\text{NO}_3$ (123°) SG $\frac{1}{2}$ 1.038 From AgNO_3 , urea, and isobutyl iodide (Wurtz, A 93, 120, Chapman & Smith, Z 1869, 433)

ISO-BUTYL NITRITE $(\text{CH}_3)_2\text{CHCH}_2\text{ONO}$ (67°) SG $\frac{1}{2}$ 894 HF p 47,800 HF v 44,900 (74°) (Chapman & Smith, Z 1869, 433, Pribram & Handl, M 2, 658, Bertoni & Truffi, G 14, 23)

Tertiary butyl nitrite $(\text{CH}_3)_3\text{CONO}$ (63°) (B), (76°-78°) (T) SG $\frac{1}{2}$ 8914 (B) Formed together with a little of the isomeric nitrobutane (110°-130°) by distilling tertiary butyl iodide with silver nitrite (Tacherniak, A 180, 155, B 7, 962) Prepared by distilling tertiary butyl alcohol (1 mol) with glyceryl tri nitrite (1 mol) (Bertoni, G 15, 357)

BUTYL-PSEUDO NITROLE *v* **NITROSO NITRO-BUTANE.**

BUTYL-NITROLIC ACID *v* NITROSO NITRO-**BUTANE**

***n*-BUTYL-OCTYL-OXIDE** $C_8H_{18}O$ C_8H_{17} (225.7°) SG $\frac{2}{3}$ 8069 SV 295.7 CE (0°–10°) 00097 (Dobriner, A 243, 9)

ISO-BUTYL OXALATE *v* OXALIC ACID**ISO-BUTYL-OXAMIC ACID**

$PrCH_2NHCOCO_2H$ From oxalic ether (1 mol) and dry isobutylamine (1 mol) at 160° (Malbot, C 7: 104, 229) — CaA'_2

Di isobutyl oxamic acid

$(PrCH_2)_2NCOCO_2H$ Similarly prepared from di isobutylamine (M)

DI-ISO-BUTYL OXAMIDE $(PrCH_2NH)_2C_2O_2$ [167°] From oxalic ether (1 mol) and iso butylamine (2 mols) Acute plates, insol boiling water, may be sublimed (Malbot, C 104, 228)

DI-BUTYL OXIDE $(C_4H_9)_2O$ Mol W 130 (141°) SG $\frac{2}{3}$ 784 (Lieben a Rossi, A 165, 110), $\frac{2}{3}$ 7865 SV 197.3 CE (0°–10°) 00109 (Dobriner, A 243, 8)

Di isobutyl oxide (100°–104°) From iso butyl iodide and KOC_2H_5 , or Ag_2O (Wurtz, A 93, 117)

Di sec butyl oxide (121°) SG $\frac{21}{2}$ 756 From aldehyde hydrochloride and $ZnEt_2$ (Kessel, A 175, 56, B 7, 291)

***p*-ISO-BUTYL-PHENOL** C_8H_9O [99°] (231°) (S), (237°) (L) 1 From amido iso butyl benzene by the diazo reaction (Studer, A 211, 242, B 14, 1474, 2187) — 2 From phenol (100 g), isobutyl alcohol (80 g) and $ZnCl_2$ (240 g) (Liebmann, B 14, 1842, 15, 150, 1991, Dobrzycki, J pr [2] 36, 390) Needles (from alcohol) Volatile with steam V sol alkalis Gives a pp with bromine water, but no colour with $FeCl_3$ Is antiseptic PCl_5 gives chloro iso butyl benzene, which on oxidation gives *p* chloro benzoic acid Gives a di nitro derivative (93°) Fused with P_2O_5 it gives phenol and isobutylene Ammonia and $ZnCl_2$ give $C_8H_9C_6H_5NH_2$ (Lloyd, B 20, 1254)

Methyl ether $C_8H_9C_6H_5OMe$ (215.5°) SG $\frac{21}{2}$ 937

Ethyl ether $C_8H_9C_6H_5OEt$ (235°) (S), (242°) (L)

Benzoyl derivative $C_8H_9C_6H_5OBz$ [83°] (S), [80°] (Kreysler, B 18, 1717), (335°), (344°) (K) White plates (from alcohol)

Acetyl derivative $C_8H_9C_6H_5OAc$ (245°) SG $\frac{21}{2}$ 999

ISO-BUTYL-PHENOL SULPHONIC ACID

$C_8H_9C_6H_4(OH)SO_3H$ From isobutyl phenol and H_2SO_4 (Liebmann, B 15, 1990) — BaA'_2 , 2aq

ISO-BUTYL-PHENYL-AMINE *v* AMIDO**PHENYL BUTANE****Di isobutyl di phenyl amine**

$(C_8H_9C_6H_5)_2NH$ (290°–315°) Thick oil Formed together with $C_8H_9(C_6H_5)_2NH$ by heating oxy phenyl isobutane $C_8H_9(C_6H_5)_2OH$ [14] with ammoniacal $ZnBr_2$ (or $ZnCl_2$) and NH_4Br (or NH_4Cl) at 320°–330°, the yield is 20–25 p.c. — $B'_2H_2Cl_2PtCl_6$, yellow needles

Acetyl derivative $(C_8H_9C_6H_5)_2NAc$ [75°], glistening white plates, sl sol water, v sol alcohol and benzene (Lloyd, B 20, 1255)

DI-ISO-BUTYL-DI-PHENYL CYANAMIDE

$C_8H_9N_2$, *te* $C(NC_6H_5)_2(Pr)_2$ **Carbo di phen isobutyl imide** [169°] Formed by boiling a solution of di isobutyl di phenyl thio urea in benzene with PbO (Pahl, B 17, 1242) Colour

less crystals Sol hot benzene, sl sol ether By warm dilute alcohol it is converted into di-isobutyl di phenyl urea With amines it combines to form guanidines Heated with CS_2 at 170° it yields isobutyl phenyl-thio carbimide

ISO-BUTYL-PHENYLENE-DIAMINE

$C_8H_9(NH)(NHCH_2Pr)$ [39°] Formed by the reduction of *p* nitroso iso butylaniline (Wacker, A 243, 299) Plates (from ether), can be distilled Its chloride forms white plates, v sol water, sl sol alcohol, insol ether

DI-*p*-ISO-BUTYL-DI-PHENYL-GUANIDINE

$HN(C_6H_5)_2(C_8H_9)_2$ **Di phenisobutyl guanidine** [173°] Formed by heating an alcoholic solution of di *p* isobutyl di phenyl thiourea with NH_3 and lead oxide (Pahl, B 17, 1240) Colourless plates V sol alcohol and benzene — $B'_2H_2Cl_2PtCl_6$, yellow crystalline pp

Tri *p* iso butyl-tri-phenyl-guanidine

$C_8H_9C_6H_5N(C_6H_5)_3$ **Tri-phenisobutyl guanidine** [164°] Obtained by digesting an alcoholic solution of di *p* isobutyl di phenyl thiourea with *p* isobutylphenyl amine and lead oxide (P) Small white needles V sol benzene and hot alcohol — $B'_2H_2Cl_2PtCl_6$, yellow needles

ISO-BUTYL-PHENYL-(β)-NAPHTHYL-THIO-UREA $C_{10}H_9NHCSNH_2C_8H_9$ **Phenisobutyl (β) naphthyl thiourea** [152°] Prepared by warming an alcoholic solution of (β) naphthyl-thio carbimide and isobutylphenyl amine (Mainzer, B 16, 2026) White plates Sol boiling alcohol By phosphoric acid it is split up into isobutylphenyl thio carbimide, (β) naphthyl-thio carbimide, isobutylphenyl amine, and (β)-naphthylamine

ISO-BUTYLPHENYL-PHENYL-THIOUREA

v PHENYL ISOBUTYLPHENYL THIOUREA.

TRI-ISO-BUTYLPHENYL-PHOSPHATE

$PO(OC_8H_9C_6H_5)_3$ (above 400°) Obtained by heating isobutyl phenol with $POCl_3$, the yield is 90 p.c. of the theoretical (Kreysler, B 18, 1700). Thick liquid V sol ether, benzene, and warm alcohol, sl sol petroleum-ether

TETRA-ISO-BUTYLPHENYL SILICATE

$Si(OC_8H_9C_6H_5)_4$ (c 380°) Obtained by heating isobutyl phenol with $SiCl_4$, the yield is 70 p.c. of the theoretical (Hertkorn, B 18, 1692) Thick colourless oil V sol benzene, chloroform, CS_2 , etc

***p* ISO-BUTYL-PHENYL-THIOCARBIMIDE**

$SCN(C_8H_9C_6H_5)_2$ **Phenisobutyl mustard oil** [42°] (277°) Formed by heating di-*p* isobutyl-di phenyl thiourea with phosphoric acid (Pahl, B 17, 1235) Long white needles V sol alcohol and ether

DI-*p*-ISO BUTYL-DI PHENYL-THIOUREA

$SC(NH_2C_8H_9C_6H_5)_2$ **Di-phenisobutyl thiourea**. [193°] Formed by cohabating an alcoholic solution of *p* isobutylphenyl amine with CS_2 (Pahl, B 17, 1235) Fine white needles Sol ether and benzene, sl sol alcohol, insol water

DI *p* ISO BUTYL DI PHENYL UREA

$OC(NH_2C_8H_9C_6H_5)_2$ **Di phenisobutyl - urea**. [284°]

Formation — 1 By the action of carbonyl chloride on *p* isobutylphenyl amine dissolved in benzene — 2 By cohabating an alcoholic solution of the thiourea with mercuric oxide (Pahl, B 17, 1240) Colourless needles Sol. hot alcohol, insol water.

ISO-BUTYL PHOSPHINE C_4H_9PH , (62°)

Prepared, together with the following, from iso butyl iodide, ZnO, and PH_3 at 100° (Hofmann, B 6, 296) Resembles ethyl phosphine in preparation and properties

Di isobutyl phosphine $(C_4H_9)_2PH$ (153°)

Tri isobutyl phosphine $(C_4H_9)_3P$ (215°)

From the preceding and isobutyl iodide

Tetra isobutyl phosphonium iodide

$(C_4H_9)_4P^+I^-$ Crystalline

ISO-BUTYL PHOSPHINIC ACID $C_4H_9PO_2H$, [100°] Paraffin like solid (Hofmann, B 6, 304)

—A'Ag Amorphous pp

Di isobutyl-phosphinic acid $(C_4H_9)_2PO_2H$ Oil —A'Ag Amorphous

ISOBUTYL PHOSPHITE *Dichloride* $C_4H_9O_2P_2Cl_2$ (155°) SG 2 1191 A by product in the conversion of isobutyl alcohol into isobutyl chloride by PCl_3 (Menschutkin, A 139, 347)

DI-ISO-BUTYL-PINACONE $C_{12}H_{20}O_2$ 2 e Fr $CH_3CH_2CMe(OH)CMe(OH)CH_2CH_3$ Fr Di-*oxy-tetra decane Tetra decylene glycol* [30°] (268°) A product of the action of Na upon methyl iso amyl ketone (Rohn, A 190, 305 Purdie, C J 39, 468) Needles, insol water

BUTYL METAPYRAZOLONE v Di oxy BUTYL METAPYRAZOL

(Py 3) **ISO-BUTYL-QUINOLINE** $C_{11}H_{13}N$ 2 e C_4H_7 $\begin{matrix} CHCH \\ | \\ N=C(C_4H_9) \end{matrix}$ (271°) Colourless oily

liquid Formed by distilling its (Py 1) carboxylic acid with lime (Doebner, B 20, 280, A 242, 282)

Picric acid compound $B'C_6H_3N_3O_6$, [161°] Lemon yellow plates (from alcohol) — $(B'HC)_2P_2Cl_4$ Orange red needles (from water)

(Py 3) **ISO-BUTYL QUINOLINE**—(Py 1)—**CARBOXYLIC ACID**

$C_{11}H_{13}NO_2$ 2 e C_4H_7 $\begin{matrix} C(CO_2H)CH \\ | \\ N=C(C_4H_9) \end{matrix}$ *Isobutyl-*

cinchonic acid [186°] Formed by the action of isovaleric aldehyde upon pyruvic acid and aniline White satiny plates (containing 1 aq) (Doebner, B 20, 279, A 242, 280) — $B'HClaq$ plates — $B'H_2P_2Cl_4$ —A'Ag

ISO-BUTYL SILICATE $(PrCH_2)_4SiO_4$ (c 258°) SG 12 953 From $SiCl_4$ and isobutyl alcohol (Cahours, C R 77, 1408) Slowly decomposed by water

BUTYL SULPHATES

n-Butyl-sulphuric acid $PrCH_2SO_3H$

Salt — BaA' aq crystalline plates SG 21 1 778 (Lieben a. Rossi, A 165, 116, Clarke, B 11, 1508)

Isobutyl sulphuric acid $PrCH_2SO_3H$ From the alcohol and H_2SO_4 (Wurtz, C R 35, 810) —KA' laminae (from alcohol)

Chloride $C_4H_9OSO_2Cl$ From isobutyl alcohol and SO_2Cl_2 (Behrend, J pr [2] 15, 34) Liquid.

n-BUTYL SULPHIDE $(C_4H_9)_2S$ Mol w 146 (192°) SG 8 852, 3 839 (Saytzeff, A 171, 268) From butyl iodide and K_2S

Isobutyl sulphide $(PrCH_2)_2S$ (171° 1 V) SG 12 836 Formed by distilling isobutyl sulphate with conc aqueous KHS (Beckmann, J pr [2] 17, 445)

Secondary butyl sulphide $(CMeEtH)_2S$ (165°) SG 23 832 Combines with MeI (Reymann, B 7, 1288)

Isobutyl disulphide $(CH_3)_2Pr_2S_2$ (220°) (Spring a. Legros, B 15, 1938)

ISO-BUTYL SULPHOCYANIDE CH_2PrSCN (175°) (Reimer, B 3, 757)

n BUTYL SULPHONE $(C_4H_9)_2SO$ [44°] From fuming HNO_3 and $(C_4H_9)_2S$ (Grabowsky, A 175, 348)

Di isobutyl sulphone $(C_4H_9)_2SO$ [17°] (265° 1 V) SG 12 1 006 Di isobutyl sulph oxide (100 pts) is dissolved in water (1000 pts) and oxidised by $KMnO_4$ (63 pts) dissolved in water (1900 pts) Excess of permanganate destroyed by sodic formate and the sulphone extracted by ether The yield is quantitative (Beckmann, J pr [2] 17, 448)

Properties —White plates Not affected by reducing agents

n BUTYL SULPHOXIDE $(C_4H_9)_2SO$ [32°] From HNO_3 (SG 1 3) and $(C_4H_9)_2S$ (Grabowsky, A 175, 348)

Di isobutyl sulphoxide $(C_4H_9)_2SO$ [69°] From di isobutyl sulphide (1 pt) and 2 pts of HNO_3 (SG 1 4) in the cold Extracted with ether after neutralisation The yield is quantitative (Beckmann, J pr [2] 17, 446)

Properties —Yellow needles Soluble in 2 parts of cold water, but separates as an oil on warming Readily reduced to di iso butyl sulphide

BUTYL SULPHURIC ACID v BUTYL SULPHATE

DI-ISO-BUTYL THETINE

$CO_2HCH_2S(C_4H_9)_2(OH)$ The hydrobromide is a syrup formed by the action of isobutyl sulphide on bromo acetic acid at 100° Lead converts it into crystalline $C_{12}H_{20}SO_3PbBr_2$ and $C_{12}H_{20}SO_3PbBr_2$ (Letts, Pr E 28, 588)

n BUTYL THIO CARBIMIDE CH_3PrNCS Mol w 115 (167°) Formed by boiling *n* butylamine with CS_2 and alcohol Evaporating the alcohol and heating the residue with aqueous $HgCl_2$ (Hofmann, B 7, 508) NH_3 gives butyl thio urea [79°]

Isobutyl thio carbimide CH_3PrNCS (162°) SG 12 937 Similarly prepared (H) NH_3 gives isobutyl thio urea [94°]

Secondary isobutyl thio carbimide $CHMeEtNCS$ (160°) SG 12 944 Similarly prepared It is the essential constituent of the oil of scurvy grass or spoon wort (from *Cochlearia officinalis*) (Hofmann, Z [2] 5, 400, B 2, 102) NH_3 gives butyl thio urea [135°]

Tertiary butyl thio carbimide CMe_2NCS [11°] (140°) SG 12 900 (Rudneff, J R 11, 179, B 12, 1023)

BUTYL THIO CARBONIC ACID v THIO CARBONIC ACID

n BUTYL THIOPHENE $C_4SH_2(C_4H_9)$ (181°) SG 12 957 Colourless oil Formed by the action of sodium on a mixture of iodothiophene and butyl bromide (Meyer a. Kreis, B 17, 1561)

BUTYL THIO UREAS The preparation and properties of these bodies are analogous to those of the corresponding ethyl thio ureas (q v)

n Butyl thio urea $CH_3PrNHCSNH_2$ [70°] From butyl thio carbimide and NH_3 (Hofmann, B 7, 612)

Isobutyl thio urea [94°] (H).

Sec butyl thio urea [183°] (H)

Tert-butyl thio urea $\text{C}_6\text{H}_5\text{NHCSNH}_2$ [165°] (Rudneff, *Bl* [2] 33, 300) Prisms, sol alcohol

Di-tert-butyl thio-urea $\text{SC}(\text{NHCOMe})_2$ [162°] From tert butyl amine, CS_2 , and alcohol Formed also by the action of tert butyl thiocarbimide on tert butyl amine (Rudneff *Bl* [2] 33, 300)

m ISO-BUTYL-TOLUENE $\text{C}_6\text{H}_4(\text{CH}_3)(\text{C}_2\text{H}_5)$ [1°] (187°) (K & B), (194°) (R), (185°) (E) *Methyl isobutyl benzene* Colourless liquid Occurs in oil of resin (Kelbe & Baur, *B* 16, 619, 2559, Renard, *A Ch* [6] 1, 250) Prepared by the action of isobutyl bromide on toluene in presence of Al_2Br_3 (K & B) Formed by diazotising methyl isobutyl phenyl amine and treating the diazo salt with an excess of SnCl_4 (Effront, *B* 17 2329) On oxidation with HNO_3 it first gives *m* iso butyl benzoic acid and finally isophthalic acid (Kelbe & Pfeiffer, *B* 19, 1723)

p (Iso?) Butyl toluene $\text{C}_6\text{H}_4(\text{CH}_3)(\text{C}_2\text{H}_5)$ [14°] (178°) Occurs in oil of resin HNO_3 oxidises it to *p* toluic acid (Kelbe & Baur, *B* 16, 2562)

p Isobutyl-toluene (c 195°) Formed by heating toluene with isobutyl alcohol and ZnCl_2 (Goldschmidt, *B* 15, 1067) Formed, together with the *m* isomeride, by the action of isobutyl bromide on toluene in presence of Al_2Br_3 (Kelbe & Pfeiffer, *B* 19, 1725) HNO_3 oxidises it to *p* isobutyl benzoic acid

m ISO-BUTYL-TOLUENE-SULPHONIC ACID $\text{C}_6\text{H}_3(\text{CH}_3)(\text{C}_2\text{H}_5)(\text{SO}_3\text{H})$ [13°] [76°] Small hygroscopic plates Formed by sulphonation of *m* iso butyl toluene

Salts — $\text{KA}'\text{aq}$ large soluble pearly plates — $\text{NaA}'\text{aq}$ needles — $\text{CuA}'_2\text{aq}$ large blue soluble plates — $\text{BaA}'_2\text{aq}$ small plates, sl sol cold water and alcohol — $\text{PbA}'_2\text{aq}$ pearly plates **Amide** [75°], small plates, soluble in water (Kelbe & Baur, *B* 16, 2560)

p (Iso?) Butyl-toluene-sulphonic acid $\text{C}_6\text{H}_3(\text{CH}_3)(\text{C}_2\text{H}_5)(\text{SO}_3\text{H})$ [14°] Obtained by sulphonation of *p* isobutyl toluene

Salts — $\text{KA}'_2\text{aq}$ small easily soluble plates — $\text{NaA}'_2\text{aq}$ — $\text{BaA}'_2\text{aq}$ small sparingly soluble plates — $\text{CuA}'_2\text{aq}$ easily soluble blue crystals — $\text{PbA}'_2\text{aq}$ small plates, sol hot water

Amide [113°], large pearly plates, sl sol hot water (Kelbe & Baur, *B* 16, 2563)

ISO-BUTYL-*o*-TOLUIC ACID

$\text{C}_6\text{H}_3(\text{CH}_3)(\text{C}_2\text{H}_5)\text{CO}_2\text{H}$ [13°] [140°] Formed by saponification of its nitrile (Effront, *B* 17, 2334) White needles V sol alcohol and ether, sl sol hot water, insol cold water — $\text{A}'\text{Ag}$ colourless plates, v sol hot water

Nitrile $\text{C}_6\text{H}_3(\text{CH}_3)(\text{C}_2\text{H}_5)\text{CN}$ [13°] [60°] (248°) **Formation** — 1 By distilling the formyl derivative of methyl isobutyl phenyl amine with zinc dust. — 2 By heating isobutyl tolyl thiocarbimide with copper powder (E) Long white needles V sol alcohol and ether, sl sol hot petroleum ether, insol water

Isobutyl toluic acid $\text{C}_6\text{H}_4(\text{CH}_3)(\text{C}_2\text{H}_5)\text{CO}_2\text{H}$ [15°] [132°] Formed by saponification of its nitrile (Effront, *B* 17, 2343) White silvery plates V sol alcohol and ether, sl sol hot water — $\text{A}'\text{Ag}$ colourless plates, sl hot water

Nitrile $\text{C}_6\text{H}_4(\text{CH}_3)(\text{C}_2\text{H}_5)\text{CN}$ [15°] (243°)

Formation — 1 By distilling the formyl derivative of methyl isobutyl phenyl amine with zinc dust — 2 By heating isobutyl tolyl thiocarbimide with copper powder (Effront, *B* 17, 2343) Colourless oil, solidifies on freezing to a white crystalline mass V sol alcohol and ether

ISOBUTYL TOLUIDINE v **METHYL ISOBUTYL-PHENYL AMINE**

BUTYL-TOLYL-AMINE v **METHYL BUTYL-PHENYL AMINE**

ISO-BUTYL-TOLYL-THIOCARBIMIDE

$\text{C}_6\text{H}_4(\text{CH}_3)(\text{C}_2\text{H}_5)\text{NCS}$ [13°] [46°] [275°–290°] Formed by the action of phosphoric acid on di-isobutyl di tolyl thiourea (Effront, *B* 17, 2336) Long white needles V sol alcohol and ether

Isobutyl tolyl thio carbimide

$\text{C}_6\text{H}_4(\text{CH}_3)(\text{C}_2\text{H}_5)\text{NCS}$ [15°] [44°] (267°) Formed by heating di-isobutyl di tolyl thiourea with phosphonic acid (Effront, *B* 17, 2345) White crystalline solid V sol alcohol and ether

DI-ISOBUTYL DI-TOLYL-THIOUREA

$\text{SC}(\text{NH C}_6\text{H}_4(\text{CH}_3)(\text{C}_2\text{H}_5))_2$ [61°] [184°] Formed by digesting methyl isobutyl phenyl amine with CS_2 in alcoholic solution (Effront, *B* 17, 2335) Long thin silky needles V sol ether, sl sol alcohol

Di isobutyl di tolyl thiourea

$\text{SC}(\text{NH C}_6\text{H}_4(\text{CH}_3)(\text{C}_2\text{H}_5))_2$ [61°] [175°] White needles Sol hot alcohol Formed by digesting methyl isobutyl phenyl amine with an alcoholic solution of CS_2 (Effront, *B* 17, 2344)

ISO-BUTYL-UREA *Valeryl derivative*

$\text{NH}(\text{C}_2\text{H}_5)\text{CO NH}(\text{CO C}_6\text{H}_4)$ [102°] Flat needles Sol alcohol and ether, sl sol water Formed by the action of KOH on a mixture of (2 mols of) valeramide (isopropyl acetamide) and (1 mol of) bromine (Hofmann, *B* 15, 758)

Isobutyl di-butyl-urea

$\text{C}_6\text{H}_5\text{NH CO NH CH}_2\text{Pr}$ [163°] From tert-butyl cyanate and isobutylamine (Brauner, *B* 12, 1875)

Di-tert-butyl-urea $(\text{CMe}_2\text{NH})_2\text{CO}$ [242°]

From tert butyl cyanate and tert butylamine (B)

ISO BUTYL-XANTHAMIDE v **THIO CARBONIC****ETHERS****BUTYRAL** v **BUTYRIC ALDEHYDE****BUTYRAMIDE** v *Amide of BUTYRIC ACID***Di-isobutyramide** $(\text{C}_2\text{H}_5\text{CO})_2\text{NH}$ [174°]

Formed by the action of ammonia on isobutyryl chloride (Hofmann, *B* 15, 981) Long needles Sublimable Sol alcohol On distillation it splits up into isobutyric acid and isobutyronitrile

***n* BUTYRIC ACID** $\text{C}_4\text{H}_8\text{O}_2$ etc

$\text{CH}_3\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ Mol w 88 [c – 8°] (162° cor) S G 20 9594 (Bruhl), 976 (Zander), 9670, 9588 (Perkin, *C J* 45) CE (0°–10°) 00104 (Z) MM 4 472 at 18° (P) μ_D 1 4025 R 35 50 S V 107 85 (R Schiff, *A* 220, 105), 108 3 (Z) S H 440 at 0° (Schiff, *A* 234, 300)

Occurrence — 1 Butter contains 2 p.c of glyceryl butyrate (Chevreul, *A Ch* [2] 23, 23) Rancid butter contains free *n* butyric acid (Grunzweig, *A* 162, 193) — 2 In crude wood vinegar — 3 In perspiration (Schotten, *J* 1852, 704) — 4 In muscular juice (Scherer, *A* 69, 196) — 5 In the contents of the large intestine — 6 As hexyl butyrate in oil got from fruit of *Heracleum*

giganteum—7 The fruit of *Pastinaca sativa* contains octyl butyrate—8 In cheese (eg of Lumburg) (Iljenko, *A* 63, 268)

A great many vegetable and animal juices and oils contain butyric acid, but in most cases it has not been determined whether the acid is *n* or *iso* butyric acid (Gorup Besanec, *A* 69, 369, Klinger, *A* 106, 18, Kramer, *Ar Ph* [2] 54, 9, Wagner, *J pr* 46, 155, Scherer, *A* 69, 196, Rebling, *Ar Ph* [2] 92, 83, 93, 300)

Formation—1 A product of the fermentation of sugar, starch, milk, fibrin, and most kinds of vegetable and animal matter (Pelouze a Gélis, *A Ch* [3] 10, 436, Leroh, *A* 49, 216, Bonaparte, *C R* 21, 1070, Erdmann a Marchand, *J pr* 29, 468, Wurtz, *A* 52, 291, Scharling, *A* 49, 313, Schubert, *J pr* 33, 256, Sullivan, *J* 1858, 280, Rithausen, *Z* [2] 4, 314)—2 By fermentation of calcium lactate $2C_2H_5O_2 = C_2H_5O + 2CO + 2H_2$. 3 Along with *n* butylalcohol by the fermentation of glycerin through a Schizomycetes in presence of $CaCO_3$ (Fitz, *B* 9, 1348)—4 By the action of CrO_3 on albuminoids (Guckelberger, *A* 64, 68)—5 By the action of HNO_3 on fats (Redtenbacher, *A* 59, 49) and on Chinese wax (Buckton, *C J* 10, 166)—6 By oxidation of conine (Blyth, *A* 70, 89)—7 By the aceto acetic ether synthesis (Frankland a Duppa, *A* 138, 218) v ACETO ACETIC ETHER—8 By passing CO over a mixture of NaOEt and NaOAc at 200° $C_2H_5NaO + C_2H_5NaO + CO = CHNaO_2 + C_2H_5NaO$ (Frolich, *A* 202, 306)

Preparation—Sugar (6 kilos), water (26 litres), and tartaric acid (30 g) are left for some days, after which there is added putrid cheese (250 g), sour skimmed milk (8 kilos), and chalk (3 kilos). The mixture is kept at 30° to 35° with occasional stirring. Calcium lactate is first formed, and this is afterwards decomposed with evolution of hydrogen (v **Formation** 2), at the end of six weeks the evolution of gas ceases and the whole is now converted into calcic butyrate (Bensch, *A* 61, 177, cf Grillon, *A* 165, 127, Lieben a Rossi, *A* 158, 146, and Fitz, *B* 11, 52). Crude butyric acid may be purified by etherification, followed by saponification of the butyric ether (121) (Bannoff, *B* 19, 2552)

Properties—Liquid, miscible with water, of powerful unpleasant smell. Separated from aqueous solution by $CaCl_2$. Its barium salt is more soluble in alcohol than those of formic, acetic, or propionic acids. Its calcium salt is ppd. by boiling a solution saturated in the cold.

Reactions—1 Boiled with HNO_3 it gives succinic acid (Dessaignes, Erlenmeyer, *A* 180, 207)—2 With CrO_3 it gives CO_2 and acetic acid (Grünzweig a Hecht, *B* 11, 1053)—3 With MnO_2 and dilute H_2SO_4 it gives propyl butyrate (Viel, *A* 148, 164)—4 The silver salt decomposes on dry distillation according to the equation $4C_2H_5CO_2Ag = 3C_2H_5CO_2H + CO_2 + C + 4Ag$ (Iwig a Hecht, *B* 19, 240)—5 Distillation over zinc dust at 350° gives di propyl ketone, propylene, CO , H_2 and other products (Jahn, *B* 13, 2115)

Salts— NaA' — KA' *S* 125 at 15° Very deliquescent.— MgA' aq Very soluble plates— CaA'_2 *S* 20 at 0° , 18 at 22° , 15 at 60° , 16 2 at 100° (Chancel a Parmentier, *C R* 104, 474, Hecht, *A* 218, 69). Trimetric needles— CaA'_2 aq *S* 19 6 at 22° — $(CaA'_2)(C_2H_5O_2)$ 5aq $CaA'_2 \cdot CaCl_2 \cdot (C_2H_5O_2)_2$ — $CaCl_2(C_2H_5O_2)_2$ 2aq (Lie

Benzyl ether v p 493

Amide [129°] (c 218°) Prepared by heating ammonium isobutyrate at 230° under pressure, the yield is 90 p c (Hofmann, *B* 15, 982, cf Letts, *B* 5, 672, Munch, *A* 180, 340, and *Di iso BUTYRAMIDE*)

Bromo amide C₄H₇CO NHBr [92°] Prepared by the action of bromine and KOH on isobutyramide (Hofmann, *B* 15, 755) Large colourless needles, sol ether, sl sol water Decomposed by caustic alkalis into propylamine, HBr, and CO₂, but by carbonated alkalis the reaction stops half way with production of propyl cyanate

Iso propylamide $PrCO NHPr$ [102°] (210°) Formed by the action of acetyl chloride on di isopropyl acetoxy (Meyer & Warrington, *C J* 51, 685) Also by the action of isobutyryl chloride on isopropylamine Colourless transparent needles v sol alcohol and ether, m sol water Sublimes at ordinary temperatures and distils without decomposition Is decomposed by prolonged boiling with alcoholic potash into isobutyric acid and isopropylamine

Anilide C₄H₇CO NHC₆H₅ [103°] From isobutyric acid and aniline (Norton, *Am* 7, 116) Prisms

p-Bromo-anilide C₄H₇CO NHC₆H₄Br [1.4] [128°] From the preceding and Br (N)

Chloride C₄H₇CO Cl (92°) (Markownikoff, *Z* 1866, 501) SG $\frac{1}{2}$ 10174 (Brühl, *A* 203, 20) μ_d 1.4135 R_∞ 41.41 (B) ZnMe₂ (1 mol) followed by water converts isobutyryl chloride into a ketone C₁₁H₂₀O (190°) SG $\frac{1}{2}$ 870 (Pawlow, *A* 188, 139) ZnMe₂ (2 mols.) followed by water forms tertiary butyl alcohol and sometimes a ketone C₁₁H₂₀O (218°) SG $\frac{1}{2}$ 864

Bromide (117°)

Anhydride $(C_4H_6O)_2O$ (182°) SG 1 $\frac{1}{2}$ 9574 (Markownikoff, Z 1866, 501, Tönnies, A. Staub, B 17, 850)

Nitrile $(CH_3)_3CHCN$ (108°) From iso propyl iodide, KCN, and alcohol (Markownikoff, B 1866, 53) From isobutyric acid and potassium sulphocyanate (Letts, B 5, 669)

n-BUTYRIC ALDEHYDE C_4H_8O

$CH_3CH_2CH_2CHO$ (74°) Mol wt 72 SG 1 $\frac{1}{2}$ 8170 (Bruhl) μ_D 1.3893 R_D 32.93 S 3.7 Got by distilling calcium butyrate with calcium formate (Linnemann, A 161, 186, Lipp, A 211, 355) From casein by oxidation with H_2SO_4 and MnO_2 (Guckelberger, A 64, 39)

Reaction — Aqueous NaOH and NaOAc form only C_4H_7O (173°) It is probably $PrCH_2CHCH_2CHO$ as it reacts with phenylhydrazine and combines with bromine (Raupenstrauch, M 8, 108)

Ammonia compound

$(CH_3)_3CHCH(OH)(NH_2)3aq$ [31°] Trimetric pyramids V sol water, v sol alcohol, m sol. ether Deliquesces above 4°, giving off water

Bisulphite compound $C_4H_7ONaHSO_3$ (Jushin, B 17, 2505, Kahn, B 18, 3364)

Butyraldines Dibutyraldine $C_8H_{16}NO$ and tetra-butyraldine $C_{16}H_{32}NO_2$ are formed by the protracted action of alcoholic ammonia on butyric aldehyde (Schiff, A 157, 352) Butyraldine, on distillation, gives para conine $C_8H_{13}N$

Butyral C_4H_6O (?) (95°) SG 2 $\frac{2}{3}$ 821 A product of distillation of calcic butyrate (Chancel, A Ch [3] 12, 146, Lumprecht, A 90, 111, 93, 241) Reduces AgO Does not combine with NH_3 Combines with $NaHSO_3$

Reactions — 1 Air or AgO forms butyric acid — 2 Chlorine forms C_4H_7ClO (141°) and $C_4H_7Cl_2O$ (200°) — 3 PCl_5 forms C_4H_7Cl (100°)

Isobutyric aldehyde $(CH_3)_2CHCHO$ (64°) SG 1 $\frac{1}{2}$ 7972, 2 $\frac{2}{3}$ 7879 (Perkin, C J 45, 476), 3 $\frac{3}{4}$ 7938 (Bruhl, A 203, 18) S 11 a 20° μ_D 1.8777 R_D 32.89 H.F.p 61.340 H.F.v 59.810 M.M 4.321 at 19.3°

Formation — 1 From isobutyl alcohol by chromic mixture (Pfeiffer, B 5, 699, Michaelson, A 133, 182, Pierre a Puchot, C R 70, 434) — 2 By heating iso butylene bromide, $(CH_3)_2CHBrCHBr$, with water (20 vols) at 160° (Linnemann a Zotta, A 162, 36) — 3 By distilling calcium isobutyrate (Popoff, B 6, 1255, Barbaglia a Gucci, B 13, 1572) — 4 By distilling calcium isobutyrate with calcium formate (Linnemann a Zotta, A 162, 7) — 5 By distilling colophony (Tilden, B 13, 1604)

Preparation — A mixture of conc aqueous $K_2Cr_2O_7$ with an equal volume of H_2SO_4 is slowly run into a flask containing iso butyl alcohol (100 g) and water (200 g) until the layer of alcohol has disappeared The product is distilled The yield is 55 p.c of the theoretical (W H Perkin, jun, C. J 43, 91, cf Fossek, M 4, 660)

Properties — Pungent liquid Forms a compound with $NaHSO_3$ from which it is separated by potash without change

Reactions — 1 By the action of potash (4 g) in alcohol (140 g) upon the aldehyde (50 g) the following bodies may be obtained, isobutyric acid, an acid $C_4H_7O_2$ (245°-255°) and an aldehyde $C_4H_7O_2$ — 2 If more potash (8 g) and a

higher temperature be used, the neutral products are $C_4H_7O_2$, $C_4H_9O_2$, $C_4H_7O_3$, $C_4H_9O_3$, and $C_4H_9O_4$ (W H Perkin, jun, C J 43, 101) — 3 Aqueous potash forms an acid $C_4H_7O_3$ (75°-80°), a crystalline body $C_4H_7O_3$ (90°), and di oxycetane (Fossek, M 3, 622) — 4 PCl_5 gives chloroisobutylene Me_2CCHCl (68°) and di chloroisobutane (104°) Me_2CCHCl_2 (Oeconomides, C R 92, 884) — 5 H_2S and aqueous ammonia form isobutyraldine C_4H_7NS (Pfeiffer, B 5, 700), 6 CS_2 and conc NH_3 give $NH_4CSN(C_4H_7)_2$ [91°] Prisms, insol water, v sol alcohol — 7 Alcohol and HCl followed by NaOEt form di ethyl ortho-isobutyric aldehyde $CMe_2CHCH(OEt)_2$ (185°) SG 1 $\frac{1}{2}$ 996, V.D. 143.5, and, when some water is also present, a compound $C_{10}H_{20}O$ (223°) (Oeconomides, B 1 [2] 36, 210, C R 92, 886) — 8 Gives with ammonia a crystalline compound $(C_4H_7)_2N_2H_2O$ (Lipp, A 205, 1, 211, 344, B 13, 906, 14, 1746), $7C_4H_7CHO + 6NH_3 = 6H_2O + (C_4H_7CH)_2N_2H_2O$ When the product, 'oxy hepta iso butylideneamine' [32°], is heated, it first splits up into $2NH_3$, C_4H_7O and $2(C_4H_7)_2N_2$ The latter is hydro butyramide, an oil, nearly insoluble in water, v sol alcohol or ether If quickly heated it distils at 154°, but if heated slowly it splits up into NH_3 and C_4H_7N **Hydro butyramide** or tri isobutylidene diamine is not affected by boiling KOH, but dilute HCl splits it up into butyric aldehyde and NH_3 It is, therefore, $C_4H_7NCH_2NCH_2C_4H_7$ Dry HCN added to its ethereal solution forms the hydrochloride of $(CyC_4H_7NH)_2C_4H_7$ a body that is decomposed by water into isobutyric aldehyde and amidovalero nitrile When hydro butyramide is slowly heated it does not, like hydro benzamide, change into an isomeride, but splits up, giving C_4H_7N This compound, 'iso butenyl butylidene amine,' is a liquid (145°-147°) at 715 mm, nearly insoluble in water, miscible with alcohol or ether It is not affected by aqueous KOH, but acids split it up into isobutyric aldehyde and NH_3 It would thus appear to be $(CH_3)_2CHCHNCH(C_4H_7)_2$ It combines with Br, forming $C_4H_7NBr_2$, a bod. that, when kept for a long time, and then treated with water, gives NH_4Br , isobutyric aldehyde and bromoisobutyric aldehyde, or rather a polymeride of the latter [129°] If $C_4H_7NBr_2$ be at once treated with water, the unstable liquid bromo butyric aldehyde is probably formed (Lipp)

Oxim $C_4H_7CHN(OH)$ [139°] Colourless liquid Sol water Formed by the action of an aqueous solution of hydroxylamine on isobutyric aldehyde (Petraček, B 15, 2784)

Description of condensation products, obtained as above (W H Perkin, jun, C J 43, 90)

Acid $C_4H_7O_2$ (245°-255°) Brownish oil Reduces ammoniacal Ag_2O

Compound $C_{12}H_{22}O_2$ (154°-157°) Oil Etheral odour Reduces ammoniacal Ag_2O Combines slowly with $NaHSO_3$ Decomposes on prolonged heating Is probably Urech's $C_4H_7O_3$ (B 12, 191) With Na and wet ether, it is reduced to $C_{12}H_{22}O_2$ (170°-175°), an alcohol (?) which does not combine with $NaHSO_3$

Compound $C_{20}H_{40}O_4$ (223°-225°) Oil Smells of camphor Very slowly combines with $NaHSO_3$, forming needles Reduces ammoniacal Ag_2O V.D 167 (Theory 342). With Ac_2O it

forms $C_{20}H_{42}AcO_4$ (240°–242°) Oil, which with Ac_2O at 200° gives $C_{20}H_{42}Ac_2O_4$ (248°–252°) When saponified by KOH a body $C_{20}H_{42}O_4$ (c 220°) is formed

Compound $C_{20}H_{44}O_4$ (250°–253°) Oil V D (air = 1) 12.9 (Theory 13.7)

Compound $C_{22}H_{46}O_4$ (227°–229°) at 100 mm Thick oil Decomposed when heated under atmospheric pressure

Di-isobutyric di-aldehyde $C_8H_{16}O_2$ (188°) at 18 mm V D 5.2 (calc 5.0) This polymeric diol of isobutyric aldehyde is obtained, together with octenoic aldehyde (?) $C_8H_{16}O$ (150°) by heating isobutyric aldehyde with conc aqueous NaOAc at 150° (Fossek, *M* 2, 622) It is an oil, sol alcohol and ether, forming a crystalline compound with $NaHSO_3$

Iso-butyric paraldehyde $(C_4H_8O)_3$ [60°] (195°) V D (H=1) 104.8 From iso butyraldehyde by H_2SO_4 , HCl, PCl_5 , Cl, Br, or I (Barbaglia, *B* 5, 1052, 6, 1064, *G* 16, 430, Demtschenko, *B* 6, 1176) Needles (from water or by sublimation) Difficultly attacked by oxidising agents (Urech, *B* 12, 1749) Does not combine with $NaHSO_3$ or react with NH_3 At 150° it partially changes to ordinary isobutyric aldehyde

Iso-butyric poly-aldehyde $(C_4H_8O)_n$ S G 24.969 Prepared by leaving isobutyric aldehyde in contact with dry Na_2CO_3 Thick liquid Sl sol water Decomposed on distillation, with separation of water and formation of isobutyric aldehyde and condensation products (Urech, *B* 12, 191, 1744, 13, 485, 590)

BUTYRIN v GLYCERIN

BUTYRO-CHLORAL v TRI CHLORO-BUTYRIC ALDEHYDE

BUTYRO-COUMARIC ACID v OXY PHENYL PENTENOIC ACID

BUTYRO-CREATININE v METHYL AMIDO BUTYRIC ACID

BUTYRO-FURONIC ACID $C_8H_{12}O_4$ t e $CO_2H \cdot CH \cdot CH \cdot CO \cdot CH_2 \cdot CH_2 \cdot CH_2 \cdot CO_2H$ (?) [142°] Prepared by treating furfuralic acid with bromine water and subsequent action of silver oxide White crystals Sol water and alcohol, sl sol ether By HI and P it is reduced to azelaic acid (Toennies, *B* 12, 1200)

BUTYRO-LACTONE v γ OXY BUTYRIC ACID

BUTYROLIC ACID v TETROLIC ACID

BUTYRONE v DI PROPYL KETONE

BUTYRONITRILE v Nitrile of BUTYRIC ACID

BUTYRO-PINACONE $C_{14}H_{26}O_2$ t e

$CP_2(OH)CP_2(OH)$ Di oxy tetradecane [68°] (260°) From di propyl ketone, water, and Na (Kurtz, *A* 161, 215) Crystals, smelling of camphor, sl sol water

BUTYRO-THIENONE v THIFNYL PROPYL KETONE

DI-BUTYRYL $C_8H_{16}O_2$ t e $PrCOCOPr$ Di-propyl di ketone (245°–260°) From butyryl chloride and sodium amalgam or zinc (Freund, *A* 118, 35) Yellow oil Boiled with potash it forms butyrate of potassium and a liquid $C_8H_{16}O$ which does not unite with NH_3 or $NaHSO_3$

Mono-oxim $C_8H_{16}CO(NOH)C_2H_5$ thick oil, can be distilled in small quantity without decomposition A di-oxim has not been obtained (Munchmeyer, *B* 19, 1846)

BUTYRYL-ACETOPHENONE

$C_8H_8COCH_3COC_6H_5$ Benzoyl methyl propyl ketone. (174° at 24 mm.) S G. 1.001 at 15°

Colourless oil Formed from acetophenone and butyric ether by $EtONa$ (Beyer & Claisen, *B* 20, 2181)

Isobutyryl-acetophenone

$C_8H_8COCH_3COC_4H_9$ Benzoyl methyl iso propyl ketone (170° at 26 mm) Colourless liquid Formed from acetophenone and iso butyric ether by $EtONa$ (Beyer & Claisen, *B* 20, 2181)

BUTYRYL AMIDO-BENZOIC ACID

$PrCO NH C_6H_4 CO_2H$ [209°] From *n*-butyric ether (20 c c) and *m* amido benzoic acid (10 g) at 180° in sealed tubes (Pellizzari, *A* 232, 148) Sol water and alcohol

BUTYRYL BROMIDE v BUTYRIC ACID

BUTYRYL CHLORIDE v BUTYRIC ACID

BUTYRYL CYANAMIDE v CYANAMIDE

n-BUTYRYL CYANIDE C_4H_7NO t e

$PrCO CN$ (133°–137°) From $AgCN$ and $PrCOCl$ (E Moritz, *C* J 39, 16)

n Di-butyryl di cyanide $(PrCO)_2(CN)_2$

(c 234°) By-product in preparation of above Iso butyryl cyanide $PrCO CN$ (117°–120°) From $PrCO Cl$ (40 g) and $AgCN$ (50 g) Bad yield (E Moritz, *C* J 39, 13) The greater part of the product is di iso butyryl di-cyanide (226°–228°) S G 96

BUTYRYL IODIDE v BUTYRIC ACID

BUTYRYL-MALONIC ETHER

$C_6H_8COCH(CO_2Et)_2$ (247°–252°) Formed by the action of butyryl chloride upon sodio malonic ether By nitrous acid it is converted into iso nitroso butyryl acetic ether (Lang, *B* 20, 1326)

BUTYRYL PEROXIDE v BUTYRIC ACID

BUTYRYL PROPYL-UREA v Butyryl derivatives of PROPYL UREA

BUTYRYL SULPHOCYANIDE (180°) From butyryl chloride and lead sulphocyanide Decomposes when boiled (Miquel, *A* Ch [5] 11, 295)

BUTYRYL UREA v UREA

BUXEINE An alkaloid extracted by dilute oxalic acid from the bark of the box tree *Buxus sempervirens* Yellowish-white crystalline substance, sol alcohol and ether, sl sol water HNO_3 gives a greenish yellow colouration turning brick red H_2SO_4 gives a blood red colour Chromic acid mixture gives an orange pp (Alessandri, *G* 12, 96) It is perhaps identical with buxine Barbaglia finds four alkaloids in the leaves and twigs of the box buxine, parabuxine, buxidine, and buximidine (*G* 13, 249, *B* 17, 2655)

BUXINE $C_{18}H_{26}NO_8$ (?) An alkaloid extracted by dilute oxalic acid from the leaves of the box tree White crystalline substance, sol alcohol and ether, sl sol water HNO_3 gives a purple-red colouration H_2SO_4 gives a brick red colour Chromic acid mixture gives a canary yellow pp (Alessandri, *G* 12, 96, Barbaglia, *B* 4, 757, Fauré, *J Ph* 16, 428, Couerbe, *J Ph* 1854, 51) According to Walz (*J* 1860, 548) buxine is identical with bebeerine (*q* v)

Parabuxine $C_{22}H_{34}N_2O_8$ (?) An alkaloid occurring in both leaves and bark of the box tree It is a reddish purple amorphous resin, sol water and alcohol, insol ether HNO_3 gives a permanent greenish yellow colouration H_2SO_4 gives a greenish yellow colour becoming dark Chromic acid mixture gives no pp — $B''H_2SO_4$ — $B''2HCl$ — $B''H.PtCl_4$ (Pavesi & Rondini, *G* 4, 192, Alessandri).

C

CACAO v THEOBROMINE**CACODYL** *v p* 318

CACOSTRYCHINE $C_{21}H_{22}N_4O_{10}$. A product of the action of HNO_3 on strychnine (*q v*). Golden needles (from dilute HNO_3) or hexagonal plates (from conc $HClAq$) Sl sol most menstrua, sol alkalis, forming red solutions— $B^2H.PtCl_4$ (Claus & Glassner, *B* 14, 773)

CACOTHELINE $C_{10}H_{14}N_2O_6$. A product of the action of HNO_3 on brucine (*q v*). Orange laminae (containing aq) Weak base, sol alkalis, v sl sol hot water, insol alcohol and ether— $B^2H.PtCl_4$ — $B^2H.PtCl_4$ (Strecker, *A* 91, 76, *C R* 39, 52, Rosengarten, *A* 65, 111, Claus & Röhr, *B* 14, 765)

CADAVERIC ALKALOIDS v PTOMAINES**CADET'S FUMING LIQUID** *v p* 318

CADMIUM Cd At w 111.7 Mol w 111.7, gaseous molecule is monatomic [320] (Person, *A Ch* [3] 27, 250, Rudberg, *P* 71, 460, v Riemsdyk, *C N* 20, 32) (763°–772°) (Carnelley & Williams, *C J* 33, 254) SG (molten) 8.65, (hammered) 8.8 (Stromeyer, *S* 22, 362, Schröder, *P* 106, 226, 107, 113, Matthiessen, *P* 110, 21, &c) VD 55.8 (Deville & Troost, *C R* 52, 920) SH (0°–100°) 0548 (Bunsen, *P* 141, 1), 0567 (Regnault, *A Ch* [3] 26, 268) GE (linear, 0°–100°) 003323, (cubical for 1°) 000094 (Kopp, *A* 81, 32, Matthiessen, *P* 130, 50, Fizeau, *C R* 68, 1125) TC (Ag=100) 20.06 (Lorenz, *W* 13, 422) EC (Hg at 0°=1) at 0°, 13.46, at 100°, 9.5 (Lorenz, *W* 13, 422 & 582) Heat of fusion 13,660 (Person, *P* 76, 426) SVS abt 12.8 Emission spectrum characterised by lines 3609.6, 3465.4, 2747.7, 2572.2, 2313.6, 2288.9 (Hartley, *T* 1884 63)

Cd was discovered by Stromeyer in 1817 in a specimen of zinc carbonate (*S* 21, 297, 22, 362, v also Hermann, *G A* 59, 95) The name *cadmium* was derived from *cadmia fossilis* by which name zinc ore was then known

Occurrence—With Zn in various native sulphides, carbonates, and silicates, especially in the Silesian zinc ores (v Damour, *J pr* 13, 354, Stadler, *J pr* 91, 359, Blum, *J* 1858 734, Bunsen, *A* 133, 108) CdS occurs nearly pure as *Greenockite* at Bischopton in Renfrew shire

Formation—In the distillation of crude zinc oxide with charcoal, the greater part of the Cd distils over before the Zn

Preparation—ZnO containing CdO, or metallic Zn containing Cd, is dissolved in dilute H_2SO_4 Aq or $HClAq$, the warm solution is saturated with H_2S , the CdS thoroughly washed and dissolved in conc $HClAq$, most of the free HCl is removed by warming, the solution is diluted and filtered, and an excess of $(NH_4)_2CO_3$ is added, the pp of $CdCO_3$ is well washed, dried, and strongly heated, the CdO thus produced is mixed with $\frac{1}{10}$ of its weight of pure powdered charcoal and heated in a retort of hard-glass or porcelain when pure Cd distils over (Stromeyer, *S* 22, 362)

Properties—White with slight blue tinge, very lustrous, soft, but harder than zinc, very

malleable, ductile, and flexible, more tenacious than tin, crystallises easily in monometric forms, chiefly the octahedron (*v* Kammerer, *B* 7, 1724, also G Rose, *P* 85, 293) Vapour is yellow Cd does not decompose water even at 100°, but if Cd vapour and steam are passed through a hot tube the steam is decomposed (Regnault, *A Ch* 62, 351) Cd oxidises slowly on the surface by exposure to air, when heated in air it burns to CdO The atomic weight of Cd has been determined (1) by finding the VD of, and by analysing, $CdBr_2$ (Meyer, *B* 12, 1292, Dumas *A Ch* [3] 55, 158, Huntington, *P Am A* 17, 28), analyses of $CdCl_2O_4$ (Lensesen, *J pr* 79, 281), reduction of $CdSO_4$ to CdS (*v* Hauer, *C C* 1857 897), analyses of CdO (Stromeyer, *S* 22, 366), (2) by determining the SH of Cd (Bunsen, *P* 141, 1, Regnault, *A Ch* [3] 26, 268), (3) by comparing, as regards crystalline form and general reactions, salts of Cd with salts of Zn, Be, Mg and Hg In the gaseous molecule $CdBr_2$ (this is the only compound of Cd whose VD has been determined) the atom of Cd is divalent The gaseous molecule of Cd is monatomic Cd is a distinctly metallic element, it acts on $HClAq$, H_2SO_4 Aq, &c, evolving H and forming salts of the form CdX_2 , where $X = Cl, Br, SO_4, CO_3$, &c, many of these salts combine with the similar salts of the more positive metals (K, Ca, Mg, &c) to form double salts, but few basic salts of Cd are known, the most marked are derived from such weak acids as H_2CrO_4 , H_3BO_3 , &c No compound of Cd exhibits any acidic functions $CdO.H_2$ acts towards acids as a salt forming hydroxide, its heat of neutralisation by H_2SO_4 Aq is about the same as that of the corresponding hydroxide of Mn, Ni, Co, Fe, or Zn, $[CdO.H^2Aq.H^2SO^2Aq] = 23,824$ (*v Th* 1, 339 & 436) $CdO.H_2$ is dehydrated by heat, the oxide CdO is not converted to $CdO.H_2$ by direct addition of H_2O Cadmium is closely related to Zn, it is less positive than that metal, it is also related to Mg on one hand and to Hg on the other (*v* MAGNESIUM GROUP OF ELEMENTS)

Reactions—1 Heated in air, or O, CdO is produced—2 Heated nearly to redness in bromine, $CdBr_2$ is formed—3 Aqueous solutions of hydrochloric, sulphuric, or nitric, acids are decomposed by Cd with formation of chloride, sulphate, or nitrate of the metal—4 Heated with SO_4 Aq to 200° CdS is formed (Geitner, *A* 129, 354), possibly sulphite and thiosulphate are first formed (*v* Schweitzer, *C N* 23, 293, Fordos & Gélis, *A* 50, 260)

Combinations—Most compounds of Cd are formed from the oxide or other salt Cd combines directly with the elements O, Cl, Br, I, P, S, Se, Te, and with many metals (*v* CADMIUM, OXIDE OF, &c, and CADMIUM, ALLOYS OF)

Detection and Estimation—Formation of the yellow sulphide, CdS, insoluble in dilute $HClAq$ and also in solution of ammonium sulphide, characterises Cd salts Cd is usually estimated by ppn as $CdCO_3$ (by K_2CO_3 Aq), the pp is strongly heated, and the CdO is weighed Separation from other metals may be effected

by repeated pptn by H_2S , and solution of CdS in conc $HClAq$. Cd may be pptd as oxalate, on this fact is founded a volumetric method of estimation

Cadmium, Alloys of Usually prepared by melting the metals together. Several are characterised by low melting points. An amalgam with Hg is formed at ordinary temperatures by dissolving Cd in warm Hg , and pressing, a crystalline amalgam, having the composition Hg_2Cd_3 , and SG 12 62, is formed, by completely saturating Hg with Cd , octahedral crystals of Hg_2Cd melting at 75° , are produced (Gaugain, *C R* 42, 430, Regnaud, *C R* 51, 779, Crookewitt, *J pr* 102, 65 a 129, Kopp, *A* 40, 186). Easily fusible alloys with Bi agreeing in composition with the formulæ $BiCd_3$, $BiCd_2$, and $BiCd$, are known (Matthiessen, *P* 110, 21). Various alloys of Cd with (1) Bi and Pb , (2) Bi , Pb and Sn , (3) Bi and Sn , are also known (1) Wood, *D P J* 164, 108, v Hauer, *J pr* 94, 436 [2] Lipowitz, *D P J* 158, 376 [3] Wood, *lc*). Alloys with Pb (Wood, *C N* 6, 135), Na (Sonnenschein, *J pr* 67, 169), Tl , and with Tl and Bi (Carstangjen, *J pr* 102, 65 a 129), and Sn (Rudberg, *J* 1847, 71), have been described. An arsenide, $AsCd_3$, is said to be obtained as a faintly red coloured alloy, SG 6 26, by reducing the arsenate by KCN (Descamps, *C R* 86, 1022 a 1065).

Cadmium, Arsenates of. $Cd_3(AsO_4)_2 \cdot 3H_2O$, and $Cd_2H_2(AsO_4)_2 \cdot 4H_2O$, v ARSENATES, under ARSENIC, ACIDS OF

Cadmium, Arsenide of. Cd_3As v CADMIUM, ALLOYS OF

Cadmium, Bromide of $CdBr_2$. Mol w 271.2 [570°] (Carnelley, *C J* 33, 278) (806° - 812°) (Carnelley a Williams, *C J* 37, 126) SG 4 794 (Clarke, *Am* 5, No 4) H.F. [Cd, Br] = 75,200, [Cd, Br, Aq] = 75,640 (Thomsen)

Preparation.—By heating Cd to redness in Br vapour, or by dissolving $CdCO_3$ in $HBrAq$ and subliming

Properties and Reactions.—White, crystalline, non hygroscopic, solid, soluble in water, ether, and alcohol, decomposed by HNO_3Aq (Bodeker a Giesecke, *J* 1860 17, Croft, *P M* [3] 21, 355, Berthemot, *A Ch* 44, 387, Ram melsberg, *A* 44, 267)

Combinations.—Dissolved in H_2O , and evaporated, yields long white needles of $CdBr_2 \cdot 4H_2O$, these are dehydrated at 200° [$CdBr_2 \cdot 4H_2O$] = 7,780 (Thomsen) $CdBr_2Aq$ and $KBrAq$ mixed and evaporated yield $2CdBr_2 \cdot 2KBr \cdot H_2O$, and on further evaporation $CdBr_2 \cdot 4KBr$. The double salts

$2CdBr_2 \cdot 2NaBr \cdot 5H_2O$, and $CdBr_2 \cdot BaBr_2 \cdot 4H_2O$, have also been obtained (v Hauer, *J pr* 64, 477, 69, 121 Croft, *J pr* 68 399) $CdBr_2$ absorbs NH_3 to form $CdBr_2 \cdot 4NH_3$, all NH_3 is removed by heat. Conc $CdBr_2Aq$ saturated with NH_3 , and evaporated, gives crystals of $CdBr_2 \cdot 2NH_3$, (Croft, *P M* [3] 21, 355, Ram melsberg, *A* 44, 267)

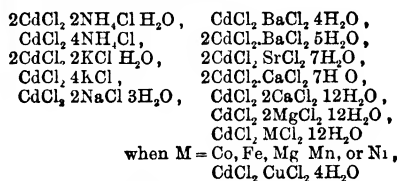

Cadmium, Chloride of $CdCl_2$. Mol w unknown, probably as represented by formula $CdCl_2$. [541°] (Carnelley, *C J* 33, 279) (861° - 954°) (Carnelley a Williams, *C J* 35, 564) SG 17 3 855 (Clarke, *Am* 5, No 4) S (20°) 140, (100°) 150 (Kremers, *P* 103, 57, 104, 133,

105, 360) H.F. [Cd, Cl] = 93,240, [Cd, Cl_2, Aq] = 96,250 (Thomsen)

Preparation.—By dissolving Cd in $HClAq$ and heating to low redness the crystals of $CdCl_2 \cdot 2H_2O$ which separate on evaporation

Properties and Reactions.—Pearly, lustrous plates, white powder after exposure to air for some time S (20° - 100°) abt 140 (Kremers, *P* 103, 57, 104, 133) Insoluble in conc $HClAq$

Combinations.—1 With water to form efflorescent prisms of $CdCl_2 \cdot 2H_2O$, [$CdCl_2 \cdot 2H_2O$] = 2,250 (Thomsen), best obtained by dissolving Cd , CdO , or $CdCO_3$ in $HClAq$, evaporating, and crystallising—2 With hydrochloric acid and water to form $CdCl_2 \cdot 2HCl \cdot 7H_2O$ obtained by passing HCl into $CdCl_2Aq$, easily decomposed in air with evolution of HCl , [$CdCl_2 \cdot 2HCl \cdot 7H_2O$] = 40,200 (Berthelot, *C R* 91, 1024)—3 With ammonia, to form $CdCl_2 \cdot 6NH_3$, and $CdCl_2 \cdot 2NH_3$, $CdCl_2 \cdot 6NH_3$ is obtained by passing NH_3 over $CdCl_2$, or by passing HCl into $CdCl_2Aq$ containing excess of NH_3 , until the NH_3 is partly neutralised. Loses $4NH_3$ by exposure to air, leaving $CdCl_2 \cdot 2NH_3$, this compound is also produced by exposing to air a solution of $CdCl_2$ in excess of warm NH_3Aq (Croft, *P M* [3] 21, 55, Schuler, *A* 87, 34, v Hauer, *J pr* 64, 477, v also André, *C R* 104, 908)—4 With various metallic chlorides to form double salts. These salts have been prepared chiefly by Croft (*P M* [3] 21, 55), and v Hauer (*J pr* 63, 432, 64, 477, 66, 176, 69, 121), their crystalline forms, and the thermal conductivities of some of them, have been determined by Grailich (*J* 1858 182), and v Lang (*P* 135, 29). These double compounds are obtained by evaporating mixed solutions of the two chlorides, the chief are—

5 With the hydrochlorides of many organic bases to form double salts, e.g. with toluidine $4(C_6H_5NH_2) \cdot 3CdCl_2 \cdot 2H_2O$ (Williams, *C R* 1856 47, Galletly, *C C* 1856 606)

Cadmium, Cyanide of $Cd(CN)_2$. Prepared by evaporating $KCNAq$ with $CdCl_2Aq$ (v CYANIDES)

Cadmium, Fluoride of CdF_2 . Mol w unknown, probably as represented by formula [520°] (Carnelley, *C J* 33, 280) SG 5 991 (Clarke, *Am* 5, No 4) Hard, white, crystalline mass, by evaporating solution of CdO in $HFAq$, not easily soluble in water, much more soluble in $HFAq$ (Berzelius, *P* 1, 26) By dissolving CdO and oxide of Sn , Zr , or Mo in $HFAq$, and evaporating, the double compounds $CdF_2 \cdot SnF_2 \cdot 6H_2O$, $2CdF_2 \cdot ZrF_2 \cdot 6H_2O$, and $CdF_2 \cdot 2ZrF_2 \cdot 6H_2O$, were obtained by Marignac (*Ann M* [5] 15, 221, *A Ch* [3] 60, 257), and the double compound $CdF_2 \cdot MoO_3 \cdot F_2 \cdot 6H_2O$ by Delafontaine (*J* 1867 236)

Cadmium, Hydrated oxide of, $CdO \cdot H_2O$ v. next article

Cadmium, Hydroxide of, $\text{CdO} \cdot \text{H}_2\text{O}$. A white, amorphous solid, obtained by adding KOHAq to a dilute aqueous solution of a Cd salt, washing with warm water, and drying at $100^\circ\text{--}200^\circ$ (Schaffner, *A* 51, 168). According to Nicklès (*J Ph* [3] 12, 406) $\text{CdO} \cdot \text{H}_2\text{O}$ is obtained in crystals by keeping Cd in contact with Fe in NH_4Aq . De Schulten (*C R* 102, 72) describes the formation of hexagonal crystals of $\text{CdO} \cdot \text{H}_2\text{O}$, SG 479, by dissolving 10 grams CdI_2 in 150 c.c. H_2O mixed with 360 grams KOH containing 13 p.c. H_2O , heating till all is dissolved, and cooling. Thomsen gives the thermal value $[\text{Cd} \cdot \text{O}, \text{H} \cdot \text{O}] = 65,680$, and the following values for the heat of neutralisation of solid $\text{CdO} \cdot \text{H}_2\text{O}$ (*Th* 3, 285)

Q	[M,QAq]	M = $\text{CdO} \cdot \text{H}_2\text{O}$
H_2SO_4	24,200	
$\text{H}_2\text{N}_2\text{O}_4$	20,620	
$\text{H}_2\text{S}_2\text{O}_8$	20,360	
HCl	20,290	
H_2Br_2	21,560	
H_2I_2	24,210	

The quantity of heat produced with the three haloid acids increases as the atomic weight of the halogen increases, in this respect $\text{CdO} \cdot \text{H}_2\text{O}$ is analogous to the corresponding compounds of Hg and Pb, and differs from those of Ba, Ca, Sr, and Mg. $\text{CdO} \cdot \text{H}_2\text{O}$ loses H_2O at 300° (H. Rose, *P* 20, 152), CdO is not hydrated by contact with H_2O , according to the thermal values given by Thomsen (*Th* 3, 285, and *P* 143, 354 and 497) the reaction $\text{CdO} + \text{H}_2\text{O} = \text{CdO} \cdot \text{H}_2\text{O}$ would require the expenditure of about 10,000 units of heat.

Cadmium, Iodide of CdI_2 . Mol w unknown, but probably as represented by the formula $[404^\circ]$ (Carnelley, *C J* 33, 278) ($708^\circ\text{--}719^\circ$, with decomposition) (Carnelley & Williams, *C J* 37, 126) SG $\frac{\text{th}}{\text{H}_2\text{O}}$ 5644, and 4626 (*v Preparation & Properties*) HF $[\text{CdI}_2] = 48,830$, $[\text{CdI}_2 \cdot \text{Aq}] = 47,870$ (Thomsen) $V_1 = V_0 (1 + 00008748t)$, t not greater than 40° (Fizeau, *C R* 64, 314) S (20°) 926, (60°) 1076, (100°) 1333 (Kremers, *P* 103, 57, 104, 133, 111, 60).

Preparation and Properties—1 By heating together Cd and I, in the ratio Cd I, in absence of air—2 By digesting together Cd and I under water (Stromeyer, *S* 22, 362)—3 By evaporating a solution of 20 parts KI and 15 parts CdSO_4 to dryness, dissolving in alcohol, and crystallising (Vogel, *N R P* 12, 393)—4 By dissolving CdCO_3 in HIAq , decolorising by addition of clippings of Cd, and crystallising (Clarke, *Am* 5, No 4)—5 By dissolving Cd in HIAq , evaporating, and crystallising (Clarke, *lc*) According to Clarke (*lc*) CdI_2 exists in two forms, the normal salt is white, is unchanged by heating to 250° , and has SG 5644, the other salt is brownish, loses weight even at 40° , and has SG 4626. The conditions under which the less stable salt is formed have not yet been exactly determined, Clarke obtained it twice, by the action of HIAq on Cd and on CdCO_3 . The SG of the less stable salt increases by heating to 50° for some time. If the formula weight CdI_2 is divided by the SG, the results are for the stabler salt 64.8, and for the less stable salt 79.2, now SVS of Cd + SVS of $\text{I}_2 = 64.3$ (Clarke, *lc*)

Combinations—1 With ammonia to form $\text{CdI}_2 \cdot 6\text{NH}_3$ and $\text{CdI}_2 \cdot 2\text{NH}_3$, obtained as the corresponding CdCl_2 compounds (*q v*) both are decomposed by H_2O with ppn of $\text{CdO} \cdot \text{H}_2\text{O}$ (Ram melsberg, *P* 48, 153)—2 With some metallic iodides to form double salts, Croft (*J pr* 68, 399) described $\text{CdI}_2 \cdot 2\text{KI} \cdot 2\text{H}_2\text{O}$ (aqueous solution of this salt pps most of the organic bases from plants, Marmé, *N R P* 16, 806), $\text{CdI}_2 \cdot 2\text{NH}_4\text{I} \cdot 2\text{H}_2\text{O}$, $\text{CdI}_2 \cdot 2\text{Na}^+ \cdot 6\text{H}_2\text{O}$, $\text{CdI}_2 \cdot \text{BaI}_2 \cdot 5\text{H}_2\text{O}$, and $\text{CdI}_2 \cdot \text{SrI}_2 \cdot 8\text{H}_2\text{O}$. Clarke (*Am* 5, No 4) obtained $\text{CdI}_2 \cdot 3\text{HgI}_2$ as gold coloured plates.

Cadmium, Oxide of CdO . Mol w unknown SG (amorphous) 695, (crystalline) 811 (Stromeyer, *S* 22, 362, Werther, *J pr* 55, 118, Schuler, *A* 87, 34, Sidot, *C R* 69, 201, Fol lenius, *Fr* 13, 279) HF $[\text{CdO}] = 75,500$ (calculated from data given by Thomsen, *Th* 3, 285, *P* 143, 354 and 497).

Preparation—As a dark brown, amorphous, infusible, powder, by burning Cd in air or O_2 , or by strongly heating $\text{CdO} \cdot \text{H}_2\text{O}$, or CdCO_3 . As black brown very small octahedra (or other forms of the monometric system), by strongly heating Cd 2NO_3 , or CdSO_4 (Werther, *lc*, Schuler, *lc*, Herapath, *B J* 3, 109).

Properties &c—Reduced to Cd by heating with C. At red heat Cl forms CdCl_2 . Readily combines with CO forming CdCO . Dissolves in aqueous acid with production of Cd salts. Thomsen (*P* 143, 354 and 497) gives the thermal values $[\text{CdO} \cdot \text{H} \cdot \text{SO}^+ \text{Aq}] = 14,240$ for crystalline CdO , and 14,510 for amorphous CdO .

Marchand (*P* 38 145) supposed that a lower oxide than CdO was formed when CdC_2O_4 was heated, but Vogel's experiments (*J* 1855 390) seem to prove that the substance was a mixture, in varying proportions, of CdO and Cd.

By the action of $\text{H}_2\text{O} \cdot \text{Aq}$ (about 3 p.c. H_2O_2) on moist $\text{CdO} \cdot \text{H}_2\text{O}$, Haas (*B* 17, 2249) obtained an oxide of Cd containing more O than CdO . Analyses gave results agreeing fairly with the formula Cd_2O_3 , in one case with Cd_3O_4 . These results were confirmed by Bailey (*C J* 49, 484) who obtained Cd_2O_3 by the action of $\text{H}_2\text{O} \cdot \text{Aq}$ on $\text{CdSO}_4 \cdot \text{Aq}$ followed by addition of NH_4Aq . The pp obtained by these methods may have been a mixture, or possibly a loose compound, of CdO and CdO_2 (*v Haas, lc* 2255).

Cadmium, Phosphides of Cd and P are said to combine when heated together to form a grey, slightly metal like, mass, which burns in air to phosphates, and dissolves in HClAq with evolution of PH_3 (Stromeyer, *S* 22, 362). According to B. Renault (*C R* 76, 283) when P vapour is passed over hot Cd, two phosphides are formed, Cd_3P_2 and Cd_2P . Oppenheim (*B* 5, 979) describes Cd_3P_2 as a grey, metal like, crystalline substance, produced by heating CdO with KOHAq and P, and heating in H.

Cadmium, Salts of. Compounds obtained by replacing the H of acids by Cd. The Cd salts form one series CdX_2 , when $\text{X}_2 = \text{Cl}_2$, $(\text{NO}_3)_2$, $(\text{ClO}_3)_2$, SO_4 , CO_3 , HPO_3 , &c. The V D of one salt, CdBr_2 , has been determined, from this result, and from the similarities between the salts of Cd and Zn, it is probable that the gaseous molecules of the haloid Cd salts are

correctly represented by the formula CdX_2 , where $X = F, Cl, Br, \text{ or } I$. The greater number of the salts of Cd are soluble in water, the aqueous solutions reddish blue litmus paper, they are poisonous. The haloid salts are not decomposed by heat, salts of volatilisable acids give CdO when strongly heated. Many Cd salts are isomorphous with corresponding salts of Zn, some, especially more complex double salts, are isomorphous with corresponding salts of Mg, Ni, Co, and Zn. A great many double salts containing CdX_2 ($X = Cl, Br, I$) are known, but few basic salts of Cd have been prepared. The principal Cd salts are borate, bromate, carbonates, chlorate, perchlorate, chromate, cyanates, &c., iodate, periodate, molybdate, nitrates, nitrites, phosphates, phosphite, selenates, selenite, sulphates, sulphite, &c., tungstate, vanadate. v BORATES, CARBONATES, &c.

Cadmium Selenide of CdSe Golden yellow, metal like, crystalline, mass, by heating Cd in Se vapour, S G 879 (Stromeyer, S 22, 362). The same body is said to be formed as a dark-brown pp by passing H Se into solution of a Cd salt (Vigier, *Bl* 1861 5, Renault, *C R* 76, 283).

Cadmium Silicofluoride of $CdSiF_6$ Long, columnar, deliquescent crystals, obtained by action of H_2SiF_6 Aq on CdO (Berzelius, P 1, 26).

Cadmium Sulphide of CdS Occurs native in hexagonal prisms ($a:c=1.81257$) as *Greenockite*. Obtained as an amorphous yellow solid, by repeatedly heating to dull redness $CdSO_4$ in H S (v Hauer, *J pr* 72, 333), by passing H S into a slightly acid solution of a Cd salt, by heating Cd with SO Aq (Geitner, A 87, 34, Fordos a Gélis, A 50, 260 Schweitzer, *C N* 23, 293). Obtained also in crystalline form by fusing the amorphous CdS with K_2CO_3 and S (Schuler, A *87, 34), by heating $CdCl_2$ in H S, or by melting together $CdSO_4$, CaF_2 , and BaS (Troost a Deville, *C R* 52, 920). CdS is also produced in crystals, but in small quantity, by passing S vapour over strongly heated CdO, or Cd (Follenius, *Fr* 13, 411, Sidot, *C R* 62 999). Crystalline CdS is non volatile at any temperature, it dissolves easily in boiling conc HClAq, or dilute H_2SO_4 Aq (Follenius, *lc*, Hofmann A 115, 286), S G 45, when melted 46 Schiff (A 115 74) described CdS, as a yellow powder obtained by the action of K_2S_2Aq on a neutral Cd salt in solution, according to Follenius (*Fr* 13 411) this yellow solid is a mixture of CdS and S.

Cadmium Sulphocyanide of $Cd(CNS)_2$ Obtained by action of $HCNSAq$ on $CdCO_3$, v SULPHOCYANIDES, under CYANIDES.

Cadmium Telluride of $CdTe$ Black crystals, S G 620, by heating Cd with Te, and subliming the product in H (Margottet, *C R* 85, 1142). M M P M

CADMIUM ETHIDE $CdEt_2$ Obtained in impure condition from EtI and Cd. Takes fire in air (Wanklyn, *C J* 9, 193, Sonnenschein, *J pr* 67, 169).

CAESIUM Cs At w 132.7 [26°-27°] (Setterberg, A 211, 100) S G 1.88 (Setterberg, *lc*) S V S 70.7. Discovered by Bunsen and Kirchhoff as chloride in the water of a mineral spring at Dürkheim (P 113, 342).

Vol. I.

Name given because element characterised by two sky blue (*caesius*) lines in the spectrum.

Occurrence—Never free. Salts very widely distributed, but in very small quantities, along with Rb, chiefly as chloride and oxide, in many minerals and mineral waters, in sea water and sea weed, in residues from saltpetre refining, in ash of tobacco, tea, coffee, and oak wood, &c (v especially Laspeyres, A 134, 349, 138, 326 also Smith, *Am S* [2] 49, 335, Erdmann, *J pr* 86, 377, Grandeaun, *C R* 53, 1100, Lonstadt, *C N* 22, 25 a 44). The rare mineral *Pollux*, from Elba, according to analyses by Pisani, contains 34 p c Cs oxide combined with silica, and is free from Rb (A 132, 31).

Preparation—1 The mother liquor, obtained by repeatedly evaporating the water of the mineral spring at Nanheim, and separating from the crystals which form, contains nearly $\frac{1}{2}$ p c CsCl, Fe, Al, and the alkaline earth metals, are removed in the usual way, the liquid is evaporated, and heated to volatilise ammonium salts added in the preceding processes, the residue is dissolved in water and the Cs and Rb are ppd as double chlorides of Cs, or Rb, and Pt, by addition of $PtCl_4$ Aq. The pp is boiled in a very little water, and allowed to settle, the water is poured off while still hot, this process is repeated about 20 times, when the pp will be quite free from K $PtCl_4$ and will consist of Cs $PtCl_4$ mixed with Rb $PtCl_4$. The pp is now reduced in H, CsCl and RbCl are dissolved out in boiling H_2O (Böttger, *J pr* 91, 126). The mixed chlorides are converted into sulphates, these are dissolved in H_2O , BaO Aq is added, $BaSO_4$ is removed by filtration, and the filtrate is evaporated to dryness in a silver dish after addition of $(NH_4)_2CO_3$, the residue is dried, dissolved in water, $BaCO_3$ removed by filtration, and twice as much $H_2C_2H_3O_6$ is added as is required to neutralise the solution of $CaCO_3$ and Rb CO_3 , the liquid is evaporated at 100° and crystallised, the pp consists of $CsH_2C_2H_3O_6$ mixed with Rb $H_2C_2H_3O_6$. As the latter salt requires 8 times as much H_2O as the former for solution, the two salts may be completely separated by fractional precipitation, this process is continued until the crystals of Cs tartrate do not show a trace of Rb in the spectroscopic (Bunsen, P 119, 1, Allen, P M [4] 25, 189). By heating the tartrate, and dissolving the residue in H_2SO_4 Aq, and crystallising, Cs SO_4 may be prepared, this is dissolved in H_2O , decomposed by BaO Aq, and the solution is filtered and evaporated to dryness in a silver dish, when CsOH is obtained. The CsOH is dissolved in absolute alcohol, and dry HCN is passed into this solution. CsCN is thus obtained as a white solid (Setterberg, A 211, 100). A mixture of 4 parts CsCN and 1 part $Ba(CN)_2$ is heated just to melting in a porcelain crucible, and an electric current from 2 or 3 Bunsen cells is passed into the molten mass, in the manner described by Bunsen (P 155, 633). The contents of the crucible are then warmed under petroleum when the metallic Cs melts into globules (Setterberg, A 211, 100).—2 The mixed chlorides of Cs and Rb, obtained as in 1, are converted into sulphates, and then into alums by adding $Al_2(SO_4)_3$ Aq and evaporating. Rb alum is 4 times more soluble than Cs alum, Cs alum

U U

may be obtained quite free from Rb by a few crystallisations. The Cs alum is dissolved in hot H_2O , and pptd by NH_4Aq , the liquid is filtered from Al_2O_3 , evaporated to dryness in a Pt dish and strongly heated to remove $(\text{NH}_4)_2\text{SO}_4$, the residue is dissolved in H_2O , and BaCl_2Aq is added so long as a pp of BaSO_4 forms, the pp is filtered off, NH_4Aq and $(\text{NH}_4)_2\text{CO}_3\text{Aq}$ are added to the filtrate, the liquid is kept warm for some time, and is then filtered from any BaCO_3 which has formed, the filtrate is evaporated to dryness, and heated to fusion, solution in H_2O , treatment with NH_4Aq and $(\text{NH}_4)_2\text{CO}_3$, evaporation, and fusion are repeated, finally CsCl is obtained by dissolving the fused mass in H_2O , and crystallising (Godeffroy, *A* 181, 176, Redtenbacher, *J* pr 95, 148). This is converted into Cs_2SO_4 and then into CsOH which is treated as described in 1—*8 Lepidolite* (a silicate of Al), from Hebron in Maine, U.S.A., contains about 1 pc Cs oxide and 2 pc Rb oxide. The powdered mineral is well mixed with 2 parts freshly slaked CaO , and very strongly heated for some time, the mass is powdered, half its weight of conc $\text{H}_2\text{SO}_4\text{Aq}$ is added, followed by water, the whole is boiled, filtered, and evaporated to dryness, the residue is dissolved in water, filtered from CaSO_4 and evaporated until the alums of K, Cs, and Rb crystallise out. About 4 kilos of the crude mixed alums was prepared by Setterberg (*A* 211, 100), and dissolved in hot water, so that the solution had $\text{SG} = 20^\circ$ Beaumé, this was cooled slowly to 45° , when the Cs and Rb alums were deposited, as they are insoluble in cold conc potash alum solution. The alums were dissolved in a little hot water and again cooled, and then solution and crystallisation was continued until the crystals were free from potash. Cs alum is 4 times less soluble in H_2O than Rb alum, and is insoluble in a saturated solution of the latter, the mixed alums were dissolved in a little hot water, and allowed to cool, when Cs alum separated with a little Rb alum, this process was repeated until pure Cs alum was obtained. The alum was dissolved in hot water, enough BaOAc added to ppt Al_2O_3 , and all the H_2SO_4 , the solution was filtered off and evaporated to dryness. The CsOH thus obtained was dissolved in absolute alcohol, and CsCN was prepared, the CsCN was then electrolysed as described in 1. (For other processes for preparing pure salts of Cs v Godeffroy, *B* 7, 241, Cossa, *B* 11, 812, Stolba, *D P J* 197, 336, 198, 225, Sharples, *Am Ch* 3, 453. For an account of attempts to prepare the metal by various methods similar to those used for preparing Rb, v Smith, *Am Ch* 6, 106.)

Properties.—Silver white, soft, ductile, metal, oxidises rapidly with production of heat and light in air, decomposes H_2O at ordinary temperature with inflammation of H produced. Melts $26^\circ\text{--}27^\circ$, SG at 15° 1.88 (Setterberg, *A* 211, 100). Spectrum characterised by two lines in the blue, $\text{Cs}_\alpha = 4560$, $\text{Cs}_\beta = 4597$, 00005 m μ m. Cs may be detected by the spectroscope, 0.03 CsCl may be detected in presence of 300-400 parts of KCl or NaCl , 0.01 CsCl in presence of 1500 LiCl (Bunsen, *Lc*). The atomic weight of Cs has been determined (1) by determination

of VD of CsCl , and analyses of the same salt; by Bunsen (*P* 113, 353, 119, 4), by Johnson & Allen (*Am S* 35, 94), and by Godeffroy (*A* 181, 185), (2) by comparing the reactions of Cs compounds with compounds of Li, K, Na, and Rb. One gaseous compound of Cs has been obtained, the SH of the metal has not been determined. Cs is positive to all other elements (v ALKALI METALS).

Combinations.—No compounds of Cs have as yet been prepared directly from the metal. When conc CsClAq is electrolysed with Pt as the +, and Hg as the — electrode, an amalgam of Cs and Hg is formed, and solidifies to a white crystalline mass, the Cs in this amalgam very quickly oxidises to CsOH .

Detection and Estimation.—Most of the salts of Cs are easily soluble in water. Cs salts may be detected by the comparative insolubility in H_2O of Cs_2PtCl_6 (v Preparation, No 1), and by the spectroscope. There is no satisfactory method for separating and estimating Cs salts, the pp by PtCl_4 contains Rb_2PtCl_6 and a little K PtCl_6 , by repeating the ppn the pp may be obtained almost free from K PtCl_6 , the pp is then reduced in H, the CsCl and RbCl dissolved out, the liquid evaporated and the residue weighed, the Cl is then estimated and the quantity of CsCl is calculated.

Cesium chloride CsCl Mol w 168.07 (Scott, *Pr E* 1888). For preparation v CAESIUM, Preparation, No 2. Small, white, cubes, not deliquescent when pure, partially decomposed by melting in air, residue is alkaline. Melts at low red heat, and volatilises at a higher temperature. Easily soluble in H_2O and alcohol. CsCl forms several double compounds, insoluble in conc HClAq , with other metallic chlorides, they are obtained by adding CsCl in conc HClAq to a solution of the other chloride also in conc HClAq . The following are known: $2\text{CsCl} \cdot \text{CdCl}_2$, $2\text{CsCl} \cdot \text{HgCl}_2$, $2\text{CsCl} \cdot \text{ZnCl}_2$, $2\text{CsCl} \cdot \text{CuCl}_2$, $2\text{CsCl} \cdot \text{MnCl}_2$, $2\text{CsCl} \cdot \text{NiCl}_2$, $2\text{CsCl} \cdot \text{PdCl}_2$, $6\text{CsCl} \cdot \text{Fe}_2\text{Cl}_6$, $6\text{CsCl} \cdot \text{BiCl}_3$, $6\text{CsCl} \cdot \text{SbCl}_3$, $\text{CsCl} \cdot \text{AuCl}_3$, $2\text{CsCl} \cdot \text{PtCl}_4$ (Stolba, *D P J* 198, 225, Godeffroy, *B* 7, 375, p. 9), $2\text{CsCl} \cdot \text{PtCl}_6$, S (0°) 0.24, (100°) 3.77. When molten CsCl is electrolysed in an atmosphere free from O, a small blue mass is obtained which is dissolved by H_2O with evolution of H, probably this is due to formation of a subchloride.

Cesium cyanide CsCN Prepared by the action of dry HCN on CsOH dissolved in absolute alcohol, v CYANIDES.

Cesium hydroxide CsOH Mol w unknown. Prepared (as described under CAESIUM, Preparation, No 1) by decomposing $\text{Cs}_2\text{SO}_4\text{Aq}$ by BaOAc , filtering off BaSO_4 , and evaporating to dryness in a silver dish. Grey white solid, melting below redness, undecomposed by heat, deliquesces in air, with production of much heat, to form strongly alkaline CsOHAq .

Cesium oxide An oxide of Cs has not yet been prepared.

Cesium, Salts of. Compounds obtained by replacing H of acids by Cs. CsOHAq acts as a very strong base. The salts belong to one series CsX where $\text{X} = \text{Cl}, \text{NO}_3, \frac{\text{SO}_4}{2}, \frac{\text{CO}_3}{2}, \&c.$; the formulæ are established from the vapour

density of CsCl, (Scott, *Pr E* 1888), and also by comparing the salts with those of the other alkali metals. The salts of Cs are very similar to those of Rb, they are well marked, stable, compounds, no basic salts are known, so far as investigation has gone the Cs salts show a marked tendency to form double salts. Most of the salts of Cs are soluble in water, the solutions are ppd by PtCl_4Aq (yellow), by $\text{H}_2\text{C}_4\text{H}_4\text{O}_6\text{Aq}$ (white), by HClO_4Aq (white), and by silicotungstic acid (white). The chief salts are carbonates, nitrate, selenates, silicotungstate, sulphates, tartrate (*v* CARBONATES, &c) M M P M

CAFFEIC ACID $\text{C}_8\text{H}_6\text{O}_4$, *2e*

[4 3 1] $\text{C}_8\text{H}_6(\text{OH})_2\text{CH CH CO}_2\text{H}$ *Di oxy cinnamic acid* *Di oxy phenyl acrylic acid*

Formation —1 By boiling caffeitanic acid with aqueous KOH (Hlasiwetz, *A* 142, 221) —2 From its acetyl derivative —3 Powdered cuprea bark is extracted with ether followed by alcohol, the residue is boiled with aqueous KOH, H_2SO_4 is added, and the liquid filtered while hot. The filtrate, when cold, is exhausted with ether, and the ethereal solution, after decolourising with animal charcoal, is set aside to crystallise (G Korner, *Ph* [3] 13, 246) —4 From hemlock (in which it is combined with conhydrine?) (Hofmann, *B* 17, 1922)

Properties —Yellow monocholic tables (containing aq), *v* e sol alcohol. The aqueous solution is turned green by FeCl_3 , on adding Na_2CO_3 it then changes to blue and violet. It does not reduce Fehling's solution but reduces warm ammoniacal AgNO_3 . Its solution in KOHAq turns brown in air.

Reactions —1 Dry distillation gives pyrocatechin —2 Potash fusion forms protocatechuic acid —3 Sodium amalgam reduces it to di oxy phenyl propionic acid.

Salts — CaA'_2 , 3aq — SrA'_2 , 4aq — BaA'_2 , 4aq $\text{Ba}_2(\text{C}_8\text{H}_4\text{O}_4)_2$, 9aq — $\text{Pb}_2(\text{C}_8\text{H}_4\text{O}_4)_2$, 2aq

Mono-methyl derivative *v* FERULIC ACID

Di methyl derivative $\text{C}_8\text{H}_4(\text{OMe})_2\text{CH CH CO}_2\text{H}$ [180°] Formed by saponifying the ether or by heating caffeic or ferulic acid with MeI and KOH. White needles. Sol alcohol and ether, nearly insol water. On oxidation with KMnO_4 it produces veratric acid. Methyl ether A'Me [64°] Prisms. Prepared by methylation of isoferulic acid (Tiemann & Will, *B* 11, 651, 14, 959).

Methylene ether

$\text{CH}_2\text{<O>C}_8\text{H}_4\text{CH CH CO}_2\text{H}$ [232°] Formed by boiling piperonal $\text{CH}_3\text{O.C}_6\text{H}_4\text{CHO}$ with NaOAc and Ac_2O (Lorenz, *B* 13, 757). Minute crystals (from dilute alcohol). Conc H_2SO_4 forms a brick red solution — AgA'

Acetyl-methyl derivative *v* ACETYL FERULIC ACID

Di acetyl derivative $\text{C}_8\text{H}_4(\text{OAc})_2\text{CH CH CO}_2\text{H}$ [191°] From caffeic acid and Ac_2O or by heating protocatechuic aldehyde (2 pts) with NaOAc (2 pts) and Ac_2O (6 pts). Slender needles. *V* sl sol water, *v* sol alcohol and ether (Tiemann & Nagai, *B* 11, 659).

Hydro-caffeic acid *v* DI OXY PHENYL PROPIONIC ACID

CAFFEIDINE $\text{C}_8\text{H}_{12}\text{N}_2\text{O}$ Formed, together with methylamine, CO_2 , and NH_3 , by boiling caffeine with conc baryta water (Strecker, *A* 123, 860, 157, 1, *C R* 52, 1269, Schmidt, *B* 14, 816, Schultzen, *Z* 1867, 616). Alkaline liquid. Sol water, alcohol, and chloroform, *sl* sol ether. Long boiling with baryta water gives methyl amido acetic acid, formic acid, CO_2 , and NH_3 . Chromic acid oxidises it to di methyl oxamide, methylamine, CO_2 , and NH_3 , (Maly & Andreasch, *M* 4, 381). EtI forms $\text{C}_8\text{H}_{11}\text{EtN}_2\text{O}$

Salts — B'HCl — $\text{B'H.PtCl}_4\text{aq}$

CAFFEIDINE CARBOXYLIC ACID

$\text{C}_8\text{H}_8\text{N}_2\text{O}_4$ Prepared by the gradual solution of caffeine in dilute NaOHAq, this solution is neutralised with HOAc and the copper salt ppd with $\text{Cu}(\text{OAc})_2$ (Maly & Andreasch, *M* 4, 369). Very soluble crystalline mass, its aqueous solution on boiling gives off CO_2 and leaves caffeidine. Salts — KA' , golden syrup — HgA'_2 , 2HgCl₂, bulky pp — CuA'_2 , minute crystalline granules — CaA'_2 , — ZnA'_2 , — CdA'_2 , — MgA'_2

CAFFEINE $\text{C}_8\text{H}_{10}\text{N}_4\text{O}_2$, *Theine* [230 5°] *S G* 12 123 *S* 1 35 at 16°, 45 6 at 65° (Com maille, *C R* 81, 817) *S* (alcohol) 61 at 16°, 3 12 at 78° *S* (ether) 044 at 16° *S* (CS₂) 06 at 16° *S* (chloroform) 13 at 16°

Occurrence —1 In coffee berries and leaves (Runge, *Materialien zur Phytologie*, 1820, Stenhouse, *P M* [4] 7, 21, Pfaff & Liebig, *A* 1, 17). Coffee berries contain from 1 to 1.28 p.c. caffeine, roasted coffee about 1.3 p.c. (Paul & Cownley, *Ph* [3] 17, 566, cf Stenhouse & Campbell, *C J* 9 33 *A* 89, 246) —2 In tea leaves (Oudry, *Mag Pharm* 19, 49, Jobst, *A* 25, 63, Mulder, *P* 43, 160). Tea contains 2 to 4 p.c. —3 In guarana, the dried pulp of *Paulinia sorbilis* (Martius, *A* 36 93). Guarana contains about 5 p.c. of caffeine —4 In Maté or Paraguay tea the leaves and twigs of *Ilex Paraguayensis* (Stenhouse, *P M* [3] 23, 426) —5 In the seeds of the Kola tree (*Cola acuminata*) of West Central Africa, to the amount of 2.13 p.c. of the dried seed (Atfield, *Ph* [2] 6, 457) —6 Present to a small extent in cocoa (E Schmidt, *A* 217, 306)

Formation —By heating silver theobromine with MeI for 20 hours at 160° caffeine is thus shown to be methyl theobromine (Strecker, *A* 118, 151, E Schmidt, *A* 217, 282)

Preparation —1 Tea or coffee is exhausted with boiling water, tannin is ppd by lead subacetate, the filtrate is freed from lead by H_2S and evaporated to crystallisation (Péligot, *A Ch* [3] 11, 129) —2 Raw ground coffee (5 pts) is mixed with moist lime (2 pts) and extracted with alcohol, chloroform, or benzene, from which the caffeine crystallises on evaporation (Versmann, *Ar Ph* [2] 68, 148, Vogel, *C C* 1859, 367, Payen, *A Ch* [3] 26, 108, Paul & Cownley, *Ph* [3] 17, 565) —3 Tea or coffee is boiled with water and either the whole, or else the filtrate, is evaporated to a syrup mixed with slaked lime and extracted with chloroform (Aubert, *Pflüger's Archiv*, 5, 289, Cazeneuve & Caillol, *Bl* [2] 27, 199) —4 By sublimation from tea (Heinyusius, *J pr* 49, 317) —5 A decoction of tea is evaporated with PbO to a syrup, K_2CO_3 is added, and caffeine extracted by alcohol (Grosschoff, *J* 1866, 470)

Properties —Mass of slender silky needles (containing aq), begins to sublime at 79°

(Blyth) Sol cold water and alcohol, v sl sol ether. The crystals from alcohol and ether are anhydrous. Weak base, the salts being decomposed by water, does not affect red litmus. Tastes bitter. Produces tetanus and rigor in the voluntary muscles of frogs (Aubert, Brunton & Cash, *Pr* 42, 238). In men it increases the heart's action, excites the nervous system, and diminishes metabolism (?) (Lehmann, *A* 87, 205). Caffeine gives a yellow pp with phosphomolybdic acid.

Estimation—The various methods of preparation may also be used for estimation (Stenhouse, *A* 102, 126; Lieventhal, *C* 1872, 631; Weyrick *Fr* 12, 104; Péligot, *Rep Pharm* 82, 340; Claus, *J* 1863, 708; Zoller, *J* 1871, 818; Mulder, *J* 15, 280; Commaille, *Bl* [2] 25, 261; Paul & Cowley, *Ph* [3] 17, 565).

Colour Test—Evaporate with chlorine water on platinum foil. A yellowish residue is left, which on further heating becomes red, and is turned purple by ammonia (Schwabenbach *J* 1861, 871, 1865, 730). Xanthine, theobromine and uric acid also give this test. Caffeine evaporated with conc HNO_3 gives a yellow residue (amalic acid) which is also turned purple (murexide) by ammonia (Rochleder, *A* 69, 120).

Reactions—1 Gaseous chlorine or HCl and KClO_3 give in the first place di methyl alloxan and methyl urea (E Fischer, *A* 215, 257). $\text{C}_8\text{H}_{10}\text{N}_2\text{O}_2 + \text{O}_2 + 2\text{H}_2\text{O} = \text{C}_8\text{H}_8\text{N}_2\text{O}_2 + \text{C}_8\text{H}_8\text{N}_2\text{O}$. Part of the di methyl alloxan becomes amalic acid. Chloro caffeine, methylamine, and cyano gen chloride are also formed, and, if the reaction is prolonged, di methyl parabanic acid (choles trophane). Bromine and water at 100° act similarly (Maly & Hinterberger, *M* 3, 85).—2 Cold HNO_3 attacks it slowly, giving off CO_2 (1 vol) and N_2O (about 2 vols) (Franchmont, *R* T C 6, 223).—3 Hot dilute HNO_3 gives di methyl parabanic acid (Stenhouse, *A* 45, 366, 46, 227; Rochleder, *A* 69, 120, 71, 1).—3 Chromic acid gives di methyl parabanic acid, NH_3 , methylamine, and CO_2 (Maly & Hinterberger *M* 2, 87).—4 Boiling baryta water splits up caffeine into caffeineine and CO_2 , the caffeineine then breaks up into CO_2 , NH_3 , methylamine, formic acid, and methylamido acetic acid (sarcosine) (Rosengarten & Strecker, *A* 157, 1). 5 With conc HCl at 250° it forms ammonia, methylamine, sarcosine, formic acid and CO_2 (E Schmidt, *A* 217, 270). The volume of NH_3 is to that of NMeH_2 as 12. Below 200° , HCl has no action. Hence there are three NMe groups in caffeine, $\text{C}_8\text{H}_{10}\text{N}_2\text{O}_2 + 6\text{H}_2\text{O} = 2\text{CO}_2 + 2\text{NMeH}_2 + \text{NH}_3 + \text{CH}_3\text{O} + \text{C}_8\text{H}_8\text{N}_2\text{O}$.

Salts—(E Schmidt, *A* 217, 282; Herzog, *A* 26, 344, 29, 171; Friedemann, *Ar Ph* [3] 21, 175; Tilden, *C* J 18, 99, 19, 145). B^+HCl — B^+HCl 2aq monoclinic, decomposed by moist air into HCl and caffeine— B^+HCl — B^+HCl — $\text{B}^+\text{H}_2\text{PtCl}_6$ (at 100°)— B^+HAuCl_4 2aq glittering plates— B^+HBr 2aq— B^+HI — B^+HI — B^+HI , 1aq (Tilden)— B^+HClI [175°], yellow needles converted by NH_3 into a greenish black pp (Tilden, *J* 1866, 350; Ostermayer, *B* 18, 2298)— B^+HNO_3 aq— B^+HSO_4 — B^+HSO_4 aq.

Formate B^+HCO_2 —**Acetate** B^+HCOAc —**Butyrate** $\text{B}^+\text{C}_4\text{H}_7\text{O}_2$ —**Isovalerate** $\text{B}^+\text{C}_5\text{H}_9\text{O}_2$ —**Citrate** prepared by adding a solution of

citric acid (1 pt) in alcohol ($7\frac{1}{2}$ pts) to one of caffeine (1 pt) in chloroform ($14\frac{1}{2}$ pts) and evaporating. Semi crystalline powder, decomposed by most solvents (Lloyd, *Ph* [3] 11, 760). According to Tanret (*J Ph* [5] 5, 591) the last five salts are merely mixtures—**Caffeate** $\text{B}^+\text{C}_8\text{H}_7\text{O}_2$ 2aq (Hlaaswetz, *A* 142, 226).

Combinations— B^+HgCl_2 (Nicholson, *A* 62, 78; Hinterberger, *A* 82, 316)— B^+HgCy_2 (Kohli & Swoboda, *A* 83, 341)— B^+AgNO_3 .

Methylo chloride B^+MeCl aq. At 200° it splits up into MeCl and caffeine—(B^+MeCl), PtCl_4 , sparingly soluble.

Methylo iodide B^+MeI aq (Tilden, *J* 1894, 374; E Schmidt *A* 217, 286; E Schmitt & E Schilling, *A* 228, 141). From caffeine and MeI at 130° . At 100° it loses aq, at 190° it splits up into caffeine and MeI . Trilaminar $a:b:c = 6962:14161$, $\alpha = 91^\circ 24'$, $\beta = 74^\circ$, $\gamma = 88^\circ$ — B^+MeI .

Methylo hydroxide B^+MeOH aq [91°], and B^+MeOH [138°]. From the methyliodide and AgO (Schmitt & Schilling, *A* 228, 143). Crystals. V sol water alcohol and chloroform, v sl sol ether or light petroleum. Its solutions are neutral. It is not poisonous. Heated at 200° in the dry state it gives off methylamine while caffeine is also formed. HCl or dilute H_2SO_4 convert only part of it into the corresponding salt, the rest gives methylamine, formic acid and dimethyldialuric acid, the latter being converted by atmospheric oxygen into amalic acid. When HCl is used, caffeine methylochloride is one of the products. With water at 200° it gives sarcosine, methylamine, formic acid, and CO . Chromic acid forms choles trophane, methylamine, formic acid and CO .

Ethylo triiodide B^+EtI_3 . From caffeine and EtI at 130° (Tilden, *C* J 18, 99, 19, 145)— B^+EtI_3 .

Chloro caffeine $\text{C}_8\text{H}_8\text{ClN}_2\text{O}_2$ [188°]. Formed by passing chlorine into dry caffeine in dry CHCl_3 . Crystallised from water. V sl sol cold water and ether, v sl strong acids but ppd by water. Reduced to caffeine by zinc dust and HCl (Fischer, *A* 215, 262, 221, 330).

Bromo caffeine v p 561.

Amido caffeine $\text{C}_8\text{H}_8(\text{NH}_2)_2\text{N}_2\text{O}_2$ [above 360°]. From bromo caffeine (2 pts) and alcoholic NH_3 (20 pts) by heating for 7 hours at 130° (Fischer, *A* 215, 265). Slender needles, may be distilled. V sl sol water and alcohol, sol conc HOAc , sol conc HCl aq, but repd by water, being apparently less basic than caffeine.

Oxy caffeine $\text{C}_8\text{H}_8(\text{OH})_2\text{N}_2\text{O}_2$ [c 345°]. From ethoxy caffeine by heating with dilute HCl (Fischer, *A* 215, 268). Mass of white needles (from water). V sl sol alcohol, ether, or cold water. Sol conc HCl but repd by water. Oxy caffeine is an acid— NaA' 3aq. Needles— BaA' 3aq. **Reactions**—1 The silver salt with EtI at 100° gives ethoxy caffeine—2 PCl_5 in POCl_3 gives chloro caffeine—3 Cl at a high temperature gives di methyl alloxan—4 Cl gas at 0° in a solution of oxy caffeine in HCl gives apo and hypo caffeine—5 Dry bromine forms an addition compound $\text{C}_8\text{H}_8(\text{OH})_2\text{N}_2\text{O}_2\text{Br}_2$ (?) as a red mass, decomposed by water or alcohol, the latter giving diethoxy-oxy-caffeine dihydride.

Ethoxy caffeine $\text{C}_8\text{H}_8(\text{OEt})_2\text{N}_2\text{O}_2$ [140°]. From bromo caffeine and alcoholic KOH (Fis-

cher, *A* 215, 266) White needles (from water) Sl sol cold alcohol or ether, v e sol hot alcohol Melts in boiling water, partly dissolving Sol dilute HCl and reppd by KOH

Di-methoxy oxy caffeine dihydride

$C_8H_8N_4O_2(OMe)_2$ OH [179°] Prepared by the action of methyl alcohol on oxy caffeine bromide Colourless crystals Sol water and alcohol By HCl it is decomposed into methyl alcohol, methylamine and apo caffeine (Fischer, *B* 14, 642)

Di ethoxy oxy caffeine dihydride

$C_8H_8(OEt)_2(OH)N_4O_2$ Di ethyl derivative of tri-oxy caffeine dihydride [195°-205°] From oxy caffeine, Br, and alcohol, as above Warmed with HCl it gives alcohol, methylamine, apo caffeine and hypo caffeine Fuming HI or HI gas passed into chloroform solution reduces it to oxy caffeine With phosphorus oxychloride it forms a crystalline substance that appears to be $C_8H_8N_4O_2(OH)(OEt)Cl$ This body is reconverted by alcohol into diethoxy oxy caffeine dihydride but it is decomposed by water, one of the products being di methyl alloxan, although this is not formed from diethoxy oxy caffeine dihydride by water or acids (Fischer & Reese, *A* 221, 337)

allo-caffeine $C_8H_8N_4O_2$ [198°] A by product obtained in the preparation of the preceding body from oxy caffeine, bromine and alcohol, especially when the latter is wet (92 p c) Sandy powder V sl sol, water, sl sol boiling alcohol Decomposed by boiling HCl (Fischer, *A* 215, 276)

Apo-caffeine $C_8H_8N_4O_2$ [148°]

Formation —1 From di ethoxy oxy caffeine dihydride (5 g) by evaporating with (20 g) dilute (20 p c) HCl at 100° (Fischer, *A* 215, 277), the equation is $C_8H_8(OH)(OEt)_2 + 2H_2O = C_8H_8N_4O_2 + MeNH_2 + 2HOEt$ —2 From oxy caffeine and aqueous Cl at -10° —3 From caffeine, HCl and KClO₃ (Maly & Andreasch, *M* 3, 100)

Properties — Monoclinic crystals (from water) *a b c* = 8025 1 6976 V sol hot water, alcohol or chloroform, sl sol cold water, benzene or CS₂ Boiling water decomposes it into CO₂, hypo caffeine and caffeic acid (*q v*)

Hypo-caffeine $C_8H_8N_4O_2$ [182°]

Formation —1 Formed along with apo caffeine by warming the di ethyl derivative of tri oxy caffeine dihydride with hydrochloric acid, thus $C_8H_8(OH)N_4O_2(OEt)_2 + 2H_2O = C_8H_8N_4O_2 + 2HOEt + NH_3.Me + CO_2$ —2 From oxy caffeine, HCl and Cl (Fischer, *A* 215, 238)

Properties — Crystallised from water V sol hot water or alcohol, sl sol cold water May be distilled with but slight decomposition $Ba(C_8H_8N_4O_2)_2.C_8H_8N_4O_2$ v sol water

Reactions —Not affected by boiling fuming HNO₃, chlorine or bromine water, K₂Cr₂O₇, and dilute H₂SO₄, HMnO₄, conc HCl, fuming HI, Sn and HCl, Ac₂O or POCl₃ and PCl₅ Water at 150° completely destroys it Boiled with baryta it givescaffolin (*q v*)

Caffolin $C_8H_8N_4O_2$ [194°-196°] Formed by boiling hypo caffeine with lead sub acetate (Fischer, *A* 215, 292) Slender needles (from alcohol) or long prisms (from warm water) V e sol warm water Sl sol alcohol Does not combine with acids It is but a feeble

acid, for its barium compound is decomposed by CO₂ Boiled with Ag₂O, it forms a crystalline silver compound

Reactions —1 Conc HCl at 100° splits it up into CO₂, NH₃, NMe₃ &c —2 Conc HI forms methyl-urea —3 K₂FeCy₆ gives methyl oxamic acid and methyl urea $C_8H_8N_4O_2 + O + H_2O = MeNH CO CO_2.H + MeNH CO NH_2$ —4 KMnO₄ and KOH give di methyl oxamide and ammonia according to the reaction $C_8H_8N_4O_2 + O + H_2O = MeNH CO CO NHMe + CO_2 + NH_3$ —5 Potassium bichromate and H₂SO₄ give cholestrophan $C_8H_8N_4O_2 + O = C_8H_8N_4O_2 + NH_3$ —6 Nitrous acid completely destroys it —7 Boiled with Ac₂O it forms the acetyl derivative of acecaffin $C_8H_8AcN_4O_2$

Acecaffin $C_8H_8N_4O_2$ [110°-112°] From its acetyl derivative by evaporating with fuming HCl at 100° and decomposing the resulting hydrochloride by Ag O (Fischer, *A* 215, 300) Trimetric crystals (from benzene) *a b c* = 6707 1 1 2445 May be distilled undecomposed V e sol water and alcohol

Acetyl derivative

$C_8H_8AcN_4O_2$ [106°-107°] From caffolin by boiling with Ac₂O as long as CO₂ comes off (12 hours) Monoclinic tables (from chloroform mixed with ether)

Caffuric acid $C_8H_8N_4O_2$ [210°-220°] From apo caffeine by boiling water (Fischer, *A* 215, 280) $C_8H_8N_4O_2 + H_2O = C_8H_8N_4O_2 + CO_2$ Transparent tables (from alcohol) V sol water, sl sol cold alcohol, chloroform or ether Feeble acid, its barium salt being decomposed by CO₂ Salt —AgA' Tables, sl sol water

Reactions —1 Not affected by chlorine- or bromine water —2 HI converts it into hydrocaffuric acid —3 Warmed with lead sub acetate it gives mesoxalic acid, methyl urea and methylamine —4 Hot KOH gives off NH₃.Me

Hydrocaffuric acid $C_8H_8N_4O_2$ [240°-248°] From caffuric acid, fuming HI and PH₃I (Fischer, *A* 215, 285) Colourless prisms (from water) V sol hot water, sl sol cold water

Reactions —1 Gives no pp when boiled with lead sub acetate (unlike caffuric acid) —2 Gives with ammoniacal AgNO₃ a mirror in the cold —4 Chlorine water oxidises it to caffuric acid —3 Hot KOH gives off methylamine —5 Warmed with baryta it forms methylamine and methylhydantoin carboxylic acid, the latter splitting up into CO and methyl hydantoin

Methyl-caffuric acid $C_8H_8N_4O_2$ [167°] From allocaffeine by boiling with water (Schmidt & Schilling, *A* 228, 172) Needles (from water) V sol water, alcohol, and chloroform Basic lead acetate converts it into mesoxalic acid, methylamine and dimethyl urea

Amalic acid v p 149

Constitution of Caffeine — Medicus (*A* 175, MeN—CO

250) proposed the formula $\begin{array}{c} CO-C-NMe \\ | \\ MeN-C-N \end{array} >CH$

while Emil Fischer (*A* 215, 314) proposed MeN—CH

$\begin{array}{c} CO-C-NH_2 \\ | \\ MeN-C-N \end{array} >CO$. Both formulæ readily re-

present the formation by oxidation of di methyl-alloxan and methyl urea According to Fischer's formula the derivatives of caffeine would be represented as follows Oxy caffeine would be

caffeine dihydride would be

caffeine would be

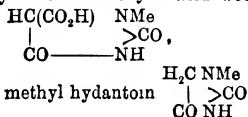

Caffuric acid would be

Hydro caffuric acid might be written*

Methyl hydantoin carboxylic acid would be

whence methyl hydantoin

Hypo caffeine may be

would be its carboxylic acid Caffolin may then be

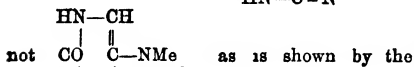

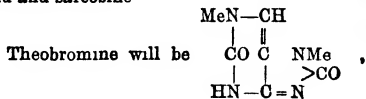

somewhat anomalous

Strecker's caffeldine (from caffeine by alkalis)

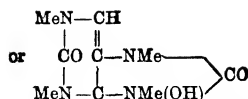

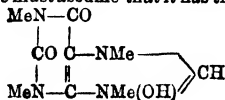

would be MeHNC=N boiling alkalis gives CO_2 , NH_3 , 2NMeH_2 , formic acid and sarcosine

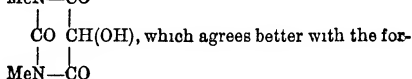

formation of hypo ethyl theobromine

Somewhat similar formulae are arrived at if we start from the formula of Medicus Inasmuch as caffin methylo hydroxide differs from caffeine in giving no NH_3 , but only NMeH_2 , in its decomposition, we must assume that it has the formula

Its decomposition product, di methyl dialuric acid, should, according to Maly a Hintenberger (*M* 3, 85), be represented by the formula

mula of Medicus On the other hand, the frequent occurrence of methyl urea as well as di methyl urea among the decomposition products of caffeine and its derivatives accords best with Fischer's formula (Schmidt a Schilling, *A* 228, 174)

CAFFEOL $\text{C}_8\text{H}_{10}\text{O}_2$ (196°) Given off (to the extent of 05 p c) on roasting coffee together with caffeine (18 p c), palmitic acid, acetic acid, CO_2 , and traces pyrrol, methylamine, and hydroquinone It is extracted by ether from the liquid distillate (Bernheimer, *M* 1, 459) Liquid, smelling like coffee, sl sol hot water, v e sol alcohol and ether, v sl sol conc KOH aq FeCl_3 colours its alcoholic solution red Potash fusion gives salicylic acid It is perhaps a methyl derivative of o oxy benzyl alcohol

CAFFETANNIC ACID $\text{C}_{15}\text{H}_{18}\text{O}_8$ Occurs in coffee berries to the amount of 3 to 5 p c as Ca and Mg salt, and perhaps also as a double salt of K and caffeine (Pfafl, (1830) *Scher* 61, 487, Rochleder, *A* 59, 800, 63, 193, 66, 35, 82, 196, Liebig, *A* 71, 57, Payen, *A Ch* [3] 26, 108) Prepared by mixing an alcoholic fusion of coffee with water, filtering from ppd fatty matter, boiling the filtrate, and ppg as lead salt by $\text{Pb}(\text{OAc})_2$ Colourless mammellated crystalline groups, v sol water, m sol alcohol, has an astringent taste, strongly reddens litmus FeCl_3 colours its solutions green It does not ppt ferrous salts, tartar emetic, or gelatin, but it ppts quinine and cinchonine It reduces AgNO_3 aq, forming a mirror Its salts turn green in air Potash fusion gives protocatechuic acid Boiling conc KOH aq splits it up into caffeo acid and a sugar (Hlasi wetz, *A* 142, 220)

Salts — BaA_2 (at 100°) amorphous, v sol water, addition of baryta forms a yellow pp — $\text{PbC}_8\text{H}_8\text{O}_8$, — $\text{Pb}_2(\text{C}_8\text{H}_8\text{O}_8)_2$ — $\text{Pb}_3\text{C}_8\text{H}_8\text{O}_8$ (at 100°)

Viridic acid. An acid formed by the atmospheric oxidation of an ammoniacal solution of caffetannic acid According to Rochleder the green colour of coffee berries is due to calcium viridate It is ppd by $\text{Pb}(\text{OAc})_2$ Amorphous brown mass, v sol water Conc H_2SO_4 forms a crimson solution whence water gives a flocculent blue pp The aqueous solutions are turned green by alkalis, and give a bluish green pp with baryta water (cf Vlaanderen a Mulder, *J*, 1858, 261)

CAFFOLIN v CAFFEINE

CAFFURIC ACID v CAFFEINE

CAIL-CEDRIN A bitter, neutral, resinous substance present to a minute extent in the bark of the *Cail cedra* (Caventou, *J Ph* [3] 16, 355, 83, 123)

CALCININ $C_{10}H_{16}O_{10}$ *Calcic acid* S 14

Found in Calcearia root (from *Chiococca angustifolia* and *racemosa*) (François, Pelletier, & Caventou, *J Ph* 16, 465, Liebig, *A Ch* [2] 47, 185, Rochleder & Hlasiwetz, *A* 76, 338, Rochleder, *J pr* 85, 275) The root is exhausted with alcohol and the calcin ppd either by milk of lime or $Pb(OAc)_2$. Crystalline flakes, tasteless at first, afterwards very bitter, v sl sol water and ether, v sol alcohol, reddens litmus. Boiling alcoholic HCl splits it up into a sugar ($C_6H_{12}O_6$) and crystalline calcinetin $C_{22}H_{34}O_8$. Calcinetin is resolved by potash fusion into butyric acid and calcinigenin $C_{11}H_{18}O_2$, which is possibly related to asoigenin. Calcein in dilute alcoholic solution is converted by sodium amalgam into crystalline $C_{10}H_{16}O_{10}$, whence fuming HCl forms gelatinous $C_{10}H_{16}O_{10}$.

CAJEPUT OIL OF A light green oil prepared in India by distilling the leaves of *Mela leuca leucodendron* with water. Its chief constituent is cineol $C_{15}H_{26}O$ (*q v*), which is also called cajeputol. P_2O_5 converts it into terpenes (*q v*) which when so obtained may be called cajeputenes (Schmidt, *C J* 14, 63, Wight & Lambert, *C J* 27, 619, Histed, *Ph* [3] 2, 804, Blanchet, *A* 7, 161, Gladstone, *C J* 49, 621).

CALAMUS ROOT According to Geuther (*A* 240, 92) the acorin prepared by Thoms (p 60) from *Acorus calamus* is not a definite substance, but is separated by alkalis into a neutral amorphous brown mass ($C_{10}H_{16}NO_2$?) and an acid ($C_{11}H_{18}O_2$?). Calamus root after extraction with water still contains a combined acid ($C_{11}H_{18}O_2$?) which may be extracted by adding HCl and shaking with ether. When the root is distilled with steam, methyl alcohol and a mixture of terpenes (*q v*) and a compound $C_{10}H_{16}O$?) is obtained (G., Schnedermann, *A* 41, 374, Kurbatow, *B* 6, 1210, Gladstone, *C J* 17, 1).

CALCIUM Ca At w 39.91 Mol w unknown Melts at red heat SG 1.57 (Matthiessen, *A* 93, 27) SH (0° - 100°) 1686 (Bunsen, *P* 141, 1) SVS abt 25 EC (Hg at 0° -1) 12.5 (Matthiessen, *P M* [4] 12, 199, 13, 81) Chief lines in emission spectrum, 6121.2, 5587.6, 4226.3, 3968, 3932.8

Occurrence—Never free. Very widely distributed, and often in large quantities, as silicate, phosphate, sulphate, carbonate, fluoride, &c. Most natural waters contain Ca salts, phosphate and carbonate of Ca are found in plants and animals. Ca salts occur in the sun, fixed stars, and meteorites. Calcium carbonate and burnt lime have been known from very ancient times. In 1722 Fr Hoffmann showed that lime is a distinct earth, Black (1756) was the first to make a quantitative examination of limestone and burnt lime. In 1808 Davy obtained calcium (impure) by the electrolysis of lime.

Formation—1 Dry CaI_2 is heated with Na in an iron crucible with an air tight cover (Lié's Bodart & Jobin, *A Ch* [3] 54, 363, Dumas, *C R* 47, 575, Sonstadt, *C N* 9, 140) — 2 Dry fused $CaCl_2$ (300 parts), Na (100 parts), and pure distilled granulated Zn (400 parts), are heated in a crucible with loosely fitting lid, as high a temperature being maintained as is

possible without volatilisation of much Zn, an alloy of Ca and Zn is thus produced ($Zn_{12}Ca$ according to v Rath, *P* 136, 434). This alloy is heated in a crucible of gas coke until the Zn is all distilled off (Caron, *C R* 48, 450, 50, 547) — 3 A boiling conc solution of $CaCl_2$ is electrolysed, using an amalgamated Pt wire as negative electrode (Bunsen, *A* 92, 248).

Preparation—A mixture of dry $CaCl_2$ and $SrCl_2$, in the ratio 2 $CaCl_2$: $SrCl_2$, mixed with a little NH_4Cl , is melted in an open crucible, the current from 3 or 4 Bunsen cells is passed through the molten mass, the positive electrode being a stick of carbon, and the negative an iron wire as thick as a knitting needle, drawn out to a fine point. The point of the iron wire is kept just under the surface of the molten mass for a minute or so at a time, the Ca separates in small lumps (Matthiessen, *A* 93, 277, 94, 108). Frey obtained lumps of Ca weighing from 2½ to 4 grams (*A* 183, 367), he passed the negative electrode through the stem of a tobacco pipe with the bowl dipping under the molten mass in the crucible, H was then passed into the pipe, when the pipe and bowl were filled with this gas, the H was stopped, and the current was started, the Ca rose into the bowl of the pipe, and being in contact with H remained quite unoxidised.

Properties—Lustrous, clear yellowish white, very ductile, but brittle when hammered out, malleable, about as hard as calcspar. Frey (*A* 183, 367) says it is brittle and cannot be hammered out or drawn into wire. Melts at full red heat, and then burns with yellow flame and production of much heat and light, $[Ca, O] = 130,930$ (*Th* 3, 251). Does not oxidise in dry air, but in ordinary air is quickly covered with CaO . Not volatilised at temperature of inflammation (Caron, *C R* 48, 440). Decomposes cold H_2O rapidly,

(*Th* 3, 251). As no compound of Ca has been gasified, the value to be given to the atomic weight of the metal is decided partly by the SH and partly by purely chemical considerations. The mass of Ca that combines with 15.96 (i.e. with 1 atom) O is 39.91, hence the simplest formula for the oxide is CaO ($Ca = 39.91$), the same mass of Ca combines with 2×35.37 Cl, 2×79.75 Br, &c., the simplest formulae for the chloride and bromide are therefore $CaCl_2$ and $CaBr_2$, respectively ($Ca = 39.91$). These formulae are in keeping with the reactions of the compounds, hence they are adopted. The chief compounds of Ca by analyses of which the value $Ca = 39.91$ has been found are (1) $CaCl$ (Berzelius, *G A* 57, 451, Dumas, *A Ch* [3] 55, 190), (2) $CaCO_3$, converted into CaO (Dumas, *C R* 14, 537, Erdmann & Marchand, *J pr* 26, 472). Ca is a strongly positive metal, forming well marked and stable salts by replacing the H of acids. Salts of Ca derived from almost every acid are known, several of these form double salts, very few basic salts are known. $CaO.H_2O$ is an alkaline hydroxide, CaO combines with H_2O with production of much heat, $CaO.H$ is dehydrated to CaO at a high temperature. $[CaO, H, O] = 15,540$ (*Th* 3, 251). The heat of neutralisation of $CaO.H_2Aq$ is the same as that of $KOHAq$.

NaOH.Aq and BaO.H₂Aq, viz 31,150 for H₂SO₄.Aq and 27,640 for H₂Cl₂.Aq. Ca combines with the halogens with production of heat, [Ca.X²]=169,820 when X=Cl, 140,850 when X=Br, 107,250 when X=I (Th 3, 251)

Reactions and Combinations—1 With water forms CaO.Aq and H⁺ 2 With acids forms salts, usually evolving H⁺, conc HNO₃.Aq only acts at high temperatures—3 Combines directly, when heated, with many non metals, especially Cl, Br, I, O, S, P (v CALCIUM CHLORIDE, &c) —4 Forms alloys with several metals, by heating the metals together Alloys with Al, Sb, Pb, Hg, Na, and Zn have been described (Caron, C R 48 440, 50, 547, Wohler, A 138, 253) Calcium is usually estimated either as carbonate or sulphate, or volumetrically, by K₂MnO₄.Aq, after ppn as CaC₂O₄ and decomposition of this salt by H₂SO₄.Aq

Calcium, Alloys of, v CALCIUM, Combinations, No 4

Calcium, Arsenates of CaHAsO₄ and Ca₃(AsO₄)₂ v ARSENATES, under ARSENIC, ACIDS OF

Calcium, Arsenites of Ca₃(AsO₃)₂, Ca(AsO₃)₂, and Ca₂As₂O₆ v ARSENITES, under ARSENIC, ACIDS OF

Calcium, Bromide of CaBr₂ Mol w unknown, as compound has not been gasified [678°-680°] (Carnelley, C J 29, 497, 33, 279) SG 3.32 (Kopp A 93, 129) S (0°) 125, (20°) 141, (40°) 212, (60°) 277, (105°) 312 (Kremers, P 103, 65) H F [Ca.Br²]=140,850, [Ca.Br₂.Aq]=165 360 (Thomsen)

Formation—CaBr₂ is formed by dissolving CaO or CaCO₃ in HBr.Aq, evaporating, and crystallising, or by decomposing Fe.Br₃.Aq by CaO.Aq

Preparation—1 12½ parts Br and 1 part amorphous P are allowed to react in presence of H₂O, the solution is neutralised by CaCO₃ or CaO.H₂, filtered from Ca₂P₂O₇, evaporated and crystallised (Klein, A 128, 237)—2 20 parts S are dissolved in 240 parts Br, and the liquid is poured into thin milk of lime, containing 140 parts CaO, CaSO₄ is ppd by alcohol, the solution is filtered off, evaporated, and crystallised (Faust, Ar Ph [2] 131, 216)

Properties White, lustrous, deliquescent, needles very soluble in H₂O and alcohol Absorbs NH₃, forming CaBr.6NH₃ (Rammelsberg, P 55, 239) CaBr.Aq boiled with CaO.H₂, and filtered, on cooling yields crystals of CaBr.3CaO.15H₂O

Combinations—With water to form CaBr₂.6H₂O [CaBr₂.6H₂O]=25 600, [CaBr₂.6H₂O.Aq]= -1690 (Th 3 251)

Calcium Bromide hydrated, v CALCIUM, BROMIDE OF, Combinations

Calcium, Chloride of CaCl₂ Mol w unknown, as compound has not been gasified [719°-723°] (Carnelley, C J 29, 497) SG 2.205 (Schiff, A 108, 23) SH (23°-99°) 1642 (Regnault, A Ch [3] 1, 129) S (0°) 49.6, (10°) 60, (20°) 74, (30°) 93, (35°) 104, (40°) 110, (50°) 120, (60°) 121, (70°) 136, (80°) 142, (90°) 147 (95°) 151, (99°) 154 (Mulder, J 1866 66) H F [Ca.Cl²]=169,820, [Ca.Cl₂.Aq]=187,230 (Thomsen)

Formation—In making NH₃ by the action

of CaO.H₂ on NH₄Cl.Aq, also as a by product in many chemical manufactures

Preparation—1 Pure CaCO₃ is dissolved in pure HCl.Aq, the solution is evaporated to dryness and heated to about 200°—2 Ordinary marble or chalk is dissolved in HCl.Aq, Cl is led into the acid liquid until all Fe and Mn salts are completely oxidised Milk of lime is added to alkaline reaction, the whole is digested, the liquid is filtered from lime and p₁l, oxides of Mg, Fe, and Mn, neutralised by HCl.Aq, and evaporated as in 1

Properties and Reactions—A white, porous, very deliquescent, solid after melting and cooling it is distinctly crystalline Absorbs moisture rapidly hence is much used for drying gases, &c, if the CaCl₂ to be used must be free from CaO, e.g for drying CO₂ it should be placed for some time in a stream of CO₂ and then of dry air at the ordinary temperature CaCl₂ is very soluble in water and alcohol, much less soluble in HCl.Aq It is partly decomposed by heating in air (v Weber, B 15, 231b), more completely by heating in O₂ with production of CaO Heated with KClO₄ or KClO₃, part of it is changed to CaO (Schulze, J pr [2] 21, 407) CaCl₂.Aq is used as a bath for maintaining temperatures above 100°, 50 parts CaCl₂ in 100 parts H₂O forms a solution boiling at 112°, 100 CaCl₂ in 100 water, B P 128°, 200 CaCl₂ in 100 H₂O, B P 158°, and 325 CaCl₂ in 100 H₂O, B P 130° (Magnus, P 112, 408, Wullner, P 110, 564, Legrand, A 17, 34)

Combinations—1 With water to form hexagonal crystals of CaCl₂.6H₂O [CaCl₂.6H₂O]=21,750 (Th 3, 251), best prepared by evaporating a solution of CaCO₃, or CaO, in HCl.Aq and crystallising CaCl₂.6H₂O melts at 28° (Tilden, C J 45, 208), heated to 200°, or placed *in vacuo*, the hydrate CaCl₂.2H₂O remains This hydrate is also produced, according to Ditte (C R 92, 242), by saturating HCl.Aq with CaCl₂ at 12 and cooling Hamerl (Sitz W (2nd part) 72, 667) says that CaCl₂.4H₂O is formed by repeatedly melting and cooling CaCl₂.6H₂O According to Dibbits (Ar N 13, 478) CaCl₂.6H₂O loses 4H₂O in a current of dry air, and 6H₂O in dry air at 80° SG 12° of CaCl₂.6H₂O, 1 612 (Kopp, A 93, 129) SH of CaCl₂.6H₂O (-20° to 2°) 345, (4°-28°) 647, melted (34°-59°) 5601, (34°-99°) 552, (100°-127°) 519 (Person, C R 23, 162) CE (cubic) for solid CaCl₂.6H₂O, V₁=V₀ (1 + 0.000 645 14 - 0.000 053 77t + 0.000 001 906 t²) for interval 11° 26° (Kopp, A 93, 129) H F [Ca.Cl₂.6H₂O]=191,980, CaCl₂.6H₂O dissolves in water with disappearance of much heat [CaCl₂.6H₂O.Aq]= -4 340 (Thomsen) This salt mixed with snow produces great lowering of temperature, for use as a freezing mixture the salt is best prepared by boiling a conc solution until temperature rises above 129°, then allowing to cool, shaking well as the solid forms CaCl₂.6H₂O is thus obtained as a fine dry powder, 4 parts are mixed with 3 parts dry snow Hamerl (Sitz W (2nd part) 78, 59) observed -54.9° by mixing this salt with dry snow, both cooled under 0°, in the ratio CaCl₂.6H₂O 8.45 H₂O (as snow) CaCl₂.6H₂O, S (0°) 72.8, (18.8°) 80.9, (24.5°) 89.5, (29.5°) 100 (Hamerl, Sitz W (2nd part) 72, 287) —2 With

ammonia forms $\text{CaCl}_2 \cdot 8\text{NH}_3$, dissociated by heat into CaCl_2 and NH_3 , NH_3 also removed by dissolving in H_2O and passing in a current of air (Weber, *B* 15, 2316) Isambert (*C R* 66, 1259) describes $\text{CaCl}_2 \cdot 4\text{NH}_3$ and $\text{CaCl}_2 \cdot 2\text{NH}_3$, he gives these thermal values $\frac{1}{2}[\text{CaCl}_2 \cdot 2\text{NH}_3] = 14,000$, $\frac{1}{2}[\text{CaCl}_2 \cdot 4\text{NH}_3] = 12,200$, $\frac{1}{2}[\text{CaCl}_2 \cdot 8\text{NH}_3] = 11,000$ (*C R* 86, 968) —3 With alcohol to form $\text{CaCl}_2 \cdot 2\text{C}_2\text{H}_5\text{O}$, decomposed by H_2O (Chodnew, *A* 71, 241* Johnson, *J pr* 62, 264) Forms combinations also with acetone (Hlasiwetz, *A* 76, 294) —4 With lime to form $\text{CaCl}_2 \cdot 3\text{CaO} \cdot 15\text{H}_2\text{O}$, prepared by boiling $\text{CaCl}_2 \cdot \text{Aq}$ with CaO H_2O , filtering while hot, and allowing to cool, decomposed by H_2O or $\text{C}_2\text{H}_5\text{O}$ (Beesley, *Ph* 9, 568, Rose, *S* 29, 155, Bolley, *D P J* 153, 202, Grimshaw, *C N* 30, 280) —5 With platinum chloride to form $\text{CaCl}_2 \cdot \text{PtCl}_2 \cdot 8\text{H}_2\text{O}$, *M P* = 100° (Nilson, *J pr* [2] 15, 260)

Calcium chloride hydrated, v CALCIUM, CHLORIDE OF, Combinations, No 1

Calcium, Cyanide of $\text{Ca}(\text{CN})_2$ Said to be obtained by heating Ca ferrocyanide and dissolving out with water (Schulz, *J pr* 68, 257) v CYANIDS

Calcium, Fluoride of CaF_2 Mol w unknown, as compound has not been gasified [abt 902°] (Carnelley, *C J* 33, '980) $\text{SG} \frac{\text{alt. l. p.}}{\text{q.}} 3.15-3.18$ (Schroder, *Dichtigkeitsmessungen* (Heidelberg, 1873), Kengott, *Sitz W* 10, 245) *S H* (21°-50°) 209 (Kopp, *T* 155, 71), (15°-99°) 2154 (Regnault *A Ch* [3] 1, 124) Index of refraction at 21° for line B = 1.432, line D = 1.4339, line F = 1.43709, line G = 1.43982, line H = 1.44204 (Stefan, *Sitz W* 63 (2nd part), 239) *S* (15°) 0004 (Wilson, *J* 1850 278) $[\text{CaH O}, 2\text{HF}] = 66,600$ (Guntz, *C R* 97, 1483, 1558, 98 816)

Occurrence —As *Fluorspar*, in octahedra, cubes, and other forms of the monometric system, fairly widely distributed in many rocks, in small quantities in many mineral waters, plantash, bones (Lassaigne, *S* 52, 141), enamel of teeth &c

Preparation —1 As a gelatinous mass, by decomposing an aqueous solution of a Ca salt by that of a fluoride —2 As a granular powder by digesting freshly ppd CaCO_3 with HFAq —3 In small octahedra by digesting the gelatinous pp obtained in 1 with dilute HClAq for 10 hours at 240° (Sénarmont, *A Ch* [3] 32, 129, Scheerer & Drechsel, *J pr* [2] 7, 63)

Properties and Reactions —Transparent, colourless crystals, melting without decomposition at about 900° Forms easily fusible mass with BaSO_4 , SrSO_4 , and many other insoluble compounds, hence much used as a flux Soluble in aqueous solutions of NH_3 salts (Rose, *P* 79, 112) Not decomposed by fusion with KOH or NaOH , but partially by fusion with excess of alkali carbonates Decomposed, to CaO and HF , by heating to redness in steam, also decomposed by hot $\text{H}_2\text{SO}_4\text{Aq}$, but only very partially by boiling HClAq or HNO_3Aq Said to be partly decomposed by $\text{Al}_2\text{SO}_4\text{Aq}$ (Friedel, *Bl* [2] 21, 241)

Combinations —With *hydrofluoric acid* and water to form $\text{CaF}_2 \cdot 2\text{HF} \cdot 6\text{H}_2\text{O}$, produced in small crystals by evaporating a solution of CaO in large excess of HFAq , decomposed to CaF_2

and HFAq by hot water (Fremy, *A Ch* [3] 47, 35)

Calcium, Hydrate of, $\text{CaO} \cdot \text{H}_2\text{O}$, v CALCIUM, HYDROXIDE OF
Calcium, Hydrosulphide of, v CALCIUM SULPHYDRATE

Calcium, Hydroxide of, $\text{CaO} \cdot \text{H}_2\text{O}$ (Slaked lime) Mol w unknown compound is decomposed by heat *SG* 2 078 (Fihol, *A Ch* [3] 21, 415) *SG* $\frac{\text{c.}}{\text{c.}}$ (crystalline) 2 236 (Lamy, *A Ch* [5] 14, 145) *S* (15°) 13, (54°) 103, (100°) 08 (Dalton, *New System*, 2, 331) *S* (18°) 13, (100°) 07 (Bineau, *C R* 41, 509, v also Lamy, *C R* 86, 333) $\text{HF} [\text{CaO} \cdot \text{H}_2\text{O}] = 146,470$, $[\text{CaO} \cdot \text{H O}] = 15,540$ (*Th* 3, 251)

Preparation —1 By adding to 1 part H_2O 3.1 parts CaO —2 By allowing Ca to oxidise in moist air —3 By adding KOH Aq , or NaOH Aq , to a conc aqueous solution of a Ca salt, collecting pp , washing well, and drying at 100° Gay-Lussac (*A Ch* 1, 334) obtained $\text{CaO} \cdot \text{H}_2\text{O}$ in small six sided plates by evaporating an aqueous solution over H_2SO_4 *in vacuo*

Properties and Reactions —A white, compact mass, slightly soluble in cold, less soluble in hot, water $[\text{CaO H}_2\text{O Aq}] = 2,290$ (*Th* 3, 251) Strongly alkaline reaction $\text{CaO H}_2\text{O Aq}$ neutralises acids with production of same quantity of heat as when 2NaOH Aq or 2KOH Aq is used, viz about 31,000 for $\text{H}_2\text{SO}_4\text{Aq}$, and about 27,900 for 2HCl Aq (Thomsen), also pps many heavy metals as oxides or hydroxides, and saponifies fats Moist CaH O absorbs CO_2 , forming CaCO_3 , and H_2O CaH O Aq forms insoluble salts when neutralised by $\text{H}_2\text{SiO}_4\text{Aq}$, $\text{H}_3\text{BO}_3\text{Aq}$, $\text{H}_2\text{PO}_4\text{Aq}$, &c, pps are also formed by adding animal char, sand, &c CaH_2O_2 is soluble in solutions of cane sugar, on adding alcohol pps are obtained, said to have the compositions

$\text{CaO C}_1\text{H}_2\text{O}_2\text{O}_{11}$, H_2O , $2\text{CaO C}_1\text{H}_2\text{O}_{11}$, $3\text{CaO C}_1\text{H}_2\text{O}_{11}$, and $6\text{CaO C}_1\text{H}_2\text{O}_{11}$ (Pelouze, *J* 1864 572, Bowin a Loiseau, *A Ch* [4] 6, 203, Pélignot, *A Ch* [3] 54, 383, Déon, *Bl* [2] 17, 155, Berthelot, *A Ch* [3] 46, 173) CaH_2O_2 is much more soluble in glycerin than in water At a bright red heat CaH_2O is decomposed to $\text{CaO} + \text{H O}$ For reaction between Cl and CaH O_2 v *Bleaching Powder* under *HYPOCHLORITES*, under *CHLORINE*, *OXACIDS* or

Calcium, Iodide of CaI_2 Mol w unknown, as compound has not been gasified [631°] (Carnelley, *C J* 33 279) *S* (0°) 192, (20°) 204, (40°) 228, (43°) 286, (92°) 435 (Kremers, *P* 103, 65) $\text{H F} [\text{Ca I}_2] = 107,250$, $[\text{Ca I}_2 \cdot \text{Aq}] = 134,940$ (*Th* 3, 251)

Formation —By the action of HIAq on $\text{CaO H}_2\text{O}$, or of I on CaS suspended in water (Lies Bodart a Jobin, *A Ch* [3] 54, 363)

Preparation —To 1 part amorphous P and 40 parts H_2O , 20 parts I are slowly added the whole is digested at 100°, the colourless liquid is neutralised by milk of lime, and evaporated in an atmosphere free from CO_2 (Liebig, *A* 121, 222, Wagner, *C C* 1862 143)

Properties and Reactions —White, deliquescent mass, very soluble in water and alcohol, undecomposed when melted out of contact with air melted in air gives CaO and I Conc CaI_2Aq dissolves I , on evaporation *in vacuo* crystals of a periodide are said to be obtained.

Absorbs 6NH_3 (Isambert, *C A* 66, 1259) Forms an easily decomposed double compound with AgI , $\text{CaI}_2 \cdot 2\text{AgI} \cdot 6\text{H}_2\text{O}$ (Simpson, *Pr* 27, 120)

Calcium hydroxyhydrosulphide *v post* under **CALCIUM SULPHYDRIATE**

Calcium, Oxides of Two oxides are known, CaO a strongly basic compound, and CaO_2 which acts as a peroxide. CaO_2 cannot be formed by the action of O on CaO (*comp BaO*)

I CALCIUM MONOXIDE CaO (*Lime, burnt lime*) Mol w unknown, as compound has not been gasified. SG 3 15 (Schröder, *P Jubild* 452), SG (crystalline, by heating Ca_2NO_3) 3 271 (Brugelmann, *W* 2, 466, 4, 277) S variable according to state of aggregation of the CaO & Lamy (*A Ch* [5] 14, 145) gives the following numbers representing grams of CaO in 1000 grams of solution, CaO being made (1) by heating Ca_2NO_3 , (2) by heating CaCO_3 , (3) by heating $\text{CaO}_2 \cdot \text{H}_2$ —

Temp 0°	(1)	(2)	(3)

100	0562	0576	0584

H F [Ca , O] = 130,930, [Ca , O , Aq] = 149,260 (*Th* 3, 251)

Preparation—Pure marble or Iceland spar, is strongly heated in a crucible with a hole in the bottom to allow escape of CO_2 , or a piece of charcoal is placed in the crucible beneath the marble, CO is thus formed and sweeps out the CO_2 with it. CaCO_3 is not completely decomposed when heated in an atmosphere of CO_2 , *v* **CALCIUM CARBONATE**, under **CARBONATES** Sestini (*Fr* 4, 51) strongly heats powdered marble with sugar, washes with H_2O dissolves in HNO_3Aq , pps CaCO_3 by $(\text{NH}_4)_2\text{CO}_3\text{Aq}$ and strongly heats the dried pp. By strongly heating Ca_2NO_3 , in quantities of about 15–20 grams at a time, in a porcelain flask, Brugelmann (*W* 2, 466, 4, 277) obtained cubical crystals of CaO , semitransparent, harder than the amorphous form, and less easily acted on by H_2O and CO_2 .

Properties and Reactions—White, amorphous (or crystalline *v supra*) powder does not fuse at full white heat. Strongly basic, reacts with most acids to form salts. CaO is decomposed by heating to whiteness with K , heated in Cl , CaCl_2 is formed. CaS is produced by heating with S , and CaS and CaCO_3 by heating in CS_2 . CaO does not combine with O (*v* Conroy, *C J* [2] 11, 809)

Combinations—With *carbon dioxide* to form CaCO_3 (but dry CaO does not react with CO_2 , Scheibler, *B* 19, 1973), combination begins at about 400° (*v* Birnbaum & Mahn, *B* 12, 1547), [CaO , CO_2] = 42,520 (*Th* 3, 251) Heated with *silica* or silicates, silicates of Ca are formed, which in contact with water set to a hard compact mass (hydraulic mortars). With *water*, $\text{CaO}_2 \cdot \text{H}_2$ is formed with production of much heat [CaO , H_2O] = 15,540 (Thomsen), the lime is said to be slaked

II CALCIUM DIOXIDE, CaO_2 (*Calcium peroxide*) Mol w unknown. Prepared by adding pure $\text{H}_2\text{O}_2\text{Aq}$ to excess of CaO_2Aq , or by adding excess of CaO_2Aq to $\text{Na}_2\text{O}_2\text{Aq}$ containing some

HNO_3Aq , collecting pp, washing well with cold water, and heating the $\text{CaO}_2 \cdot 8\text{H}_2\text{O}$ thus produced in a current of dry air free from CO_2 to 100° – 120° . Forms a snow white crystalline powder, does not melt at red heat but gives off O and forms CaO . The hydrate $\text{CaO}_2 \cdot 8\text{H}_2\text{O}$ is slightly soluble in H_2O , in contact with H_2O it slowly decomposes to $\text{CaO}_2 \cdot \text{H}_2\text{Aq}$ and H_2 , soluble in NH_4ClAq , but not in NH_4Aq , dissolves easily in dilute acids even in $\text{H}_2\text{C}_2\text{O}_4\text{Aq}$, without evolution of O . It forms prismatic dimetric crystals isomorphous with $\text{BaO}_2 \cdot 8\text{H}_2\text{O}$ and $\text{SrO} \cdot 8\text{H}_2\text{O}$ (Schöne) (Thénard, *A Ch* [2] 8, 306, Conroy, *C J* [2] 11, 808, Schöne, *B* 6, 1172)

Calcium oxide, hydrated, $\text{CaO}_2 \cdot \text{H}_2$, *v* **CALCIUM, HYDROXIDE OF**

Calcium Oxybromide of, $\text{CaBr}_2 \cdot 3\text{CaO} \cdot 15\text{H}_2\text{O}$ *v* **CALCIUM, BROMIDE OF**, *Properties*

Calcium, Oxychloride of, $\text{CaCl}_2 \cdot 3\text{CaO} \cdot 15\text{H}_2\text{O}$, *v* **CALCIUM CHLORIDE OF**, *Combinations*, No 4

Calcium, Oxysulphides of *v* **CALCIUM POLY SULPHIDES**, under **CALCIUM, SULPHIDES OF**

Calcium Phosphide of When Ca and P are heated under rock oil, and the unacted on P is dissolved out by CS_2 , a black powder remains which is acted on by H_2O and acids with production of PH_3 , this black powder is said by Vigier to be Ca phosphide (*Bl* 1861 5). By strongly heating CaO in P vapour a brown, amorphous mass is obtained, when heated with conc HClAq , non inflammable PH_3 is evolved, but with dilute HClAq the gas evolved takes fire. Probably in the first case liquid PH is formed and at once decomposed to gaseous PH_3 and solid P_2H_4 , in the second case the decomposition of PH proceeds more slowly, so that some is carried into the air with the PH_3 , and causes the combustion (Thénard *A Ch* [3] 14 12) The brown substance got by heating CaO in P vapour is said to be a mixture of CaP and CaF_2O , (Thénard, *lc*) this brown substance is described by Thénard as a very hard solid, unchanged in dry air, deliquescent in moist air, burns when heated in air, acted on by water free from air gives CaO_2Aq and PH_3 , PH_3 decomposes to PH_2 and P_2H_4 , and the P_2H_4 is decomposed by the CaO_2Aq to $\text{Ca}(\text{H}_2\text{PO}_4)_2\text{Aq}$ and H_2

Calcium, Salts of Compounds obtained by replacing H of acids by Ca . These salts form one series CaX_2 , where $\text{X}_2 = \text{Cl}_2$, $(\text{NO}_3)_2$, SO_4 , CO_3 , $\frac{2}{3}\text{PO}_4$, &c. They are generally formed by the action of CaO or $\text{CaO}_2 \cdot \text{H}_2$ on the acids in aqueous solution, or by the decomposition of salts of the heavier metals by $\text{CaO}_2 \cdot \text{H}_2\text{Aq}$. As none of the Ca salts has been gasified, the formulæ are based partly on similarities between these salts and those of analogous metals which form gasifiable compounds chiefly Zn , Cd , and Hg and partly on the fact that the general formula CaX_2 is the simplest that can be given, provided the atomic weight of Ca is about 40 (this has been established by analyses of CaCl_2 , CaCO_3 , &c and by determinations of the S H of the metal, *v* **CALCIUM**) Salts of Ca derived from a great many acids are known, they are well marked stable bodies, many form double salts, few basic salts are known. Most of the Ca salts are soluble in water, the more insoluble are the arsenite carbonate fluoride oxalate, phosphate sulphate and sulphite. With the exception of CaF_2 , all the salts are more or less

soluble in dilute acids. The Ca salts of non-volatile acids are generally undecomposed by heat. Ca salts derived from a great many acids are known (*v* Borates, Carbonates, Phosphates, Sulphates, &c, &c).

Calcium, Selenide of CaSe Mol w un known. White solid, rapidly changing in air, prepared by heating CaSeO to dull redness in H_2 , $[\text{Ca,Se}] = 78,000$ (Fabre, *C R* 102, 1469).

Calcium, Selenocyanide of ($? \text{CaSe}(\text{CN})_2$) Probably exists. Data very meagre (Crookes, *J pr* 53, 161).

Calcium, Sulphides of One calcium sulphide, CaS , is known as a solid, solutions which most probably contain CaS , and CaS , respectively, have been prepared. The sulphides of Ca are decidedly less basic than those of Ba, *e.g.* they do not react with the sulphides of the negative metals As and Sb to form thic salts.

I CALCIUM MONOSULPHIDE CaS Mol w unknown. H F solid, from solid materials $[\text{Ca,S}] = 92,000$ (Sabatier, *A Ch* [5] 22, 598).

Preparation—1 H_2S is passed over CaO kept at about 60° , the sole products are CaS and H_2O . If the reacting bodies are perfectly dry the change does not occur (Velev, *C J* 47, 478)—2 By gently heating crystals of $\text{CaS.H}_2\text{O}$ (*q v*) in H_2S , the product contains some CaO.H_2 (Divers a Shimidzu *C J* 45, 270). Schöne's method, heating CaCO_3 in a mixture of CO_2 and H_2S (*P* 112, 193) is said by Divers to yield a mixture of CaS and CaO in the ratio 11 CaS 5 CaO (*C J* 45, 282).

Properties and Reactions—A white amorphous solid, soluble in water with gradual decomposition, giving H_2S , and solution of CaSH.OH (*q v*) which then slowly decomposes in air forming $\text{CaS}_2\text{O}_6\text{Aq}$ and CaS.Aq (Divers a Shimidzu, *lc*). The impure CaS produced by heating CaO with CS_2 , or CaSO_4 with C , is not soluble in, although it is partially decomposed by, water. Perfectly dry CaS does not absorb CS_2 , but in presence of H_2O a basic calcium thiocarbonate, $2\text{CaO.H.CaCS}_3.10\text{H}_2\text{O}$, is produced (Velev, *C J* 47, 486). Sabatier (*A Ch* [5] 22, 598) gives the thermal value $[\text{Ca,S}] = 92,000$, $[\text{CaS,Aq}] = 6,010$ ($^\circ$ pure materials).

II CALCIUM POLYSULPHIDES When CaS (prepared by heating CaO in CS_2 and CO_2 and therefore containing some CaO) is boiled with S and H_2O , it dissolves, forming an orange red liquid, the quantity of S which goes into solution corresponds with that required to form CaS_2 and CaS_3 , if more S is used it is deposited on cooling the liquid, if less S than S_2 to CaS is used, some of the CaS remains undissolved. Both solutions are decomposed on concentration with ppn of CaO.H_2 and S , and evolution of H_2S (*v* Schöne, *P* 117, 58). Warm $\text{CaS}_2\text{H}_2\text{Aq}$ dissolves S very readily, forming a solution of CaS_3 and evolving H_2S , this solution is completely decomposed (if cold and dilute) by H_2S forming $\text{CaS}_2\text{H}_2\text{Aq}$ with ppn of S (Divers a Shimidzu, *C J* 45, 270).

CaS.Aq is decomposed in contact with air. By boiling 3 parts CaO , 1 part S , and 20 parts H_2O for some time, and allowing to stand for several days, orange red needles are obtained of $8\text{CaO.CaS}_3.12\text{H}_2\text{O}$ (Herschel, *N Ed. P J* 1, 8,

Schöne, *P* 117, 58), 2CaO.CaS_3 , 10 or 11 H_2O according to Geuther (*A* 224, 178). If CaS (prepared by action of CS_2 and CO_2 on CaO) is boiled with much water and filtered hot, CaSO_4 is said to separate out and then yellow needles of $5\text{CaO.CaS}.20\text{H}_2\text{O}$ (*H Rose, P* 55, 433), or $4\text{CaO.CaS}_3.18\text{H}_2\text{O}$ (Schöne, *P* 117, 58), or 3CaO.CaS_3 , 14 or 15 H_2O (Geuther, *A* 224, 178). These oxysulphides are easily decomposed.

Calcium, Sulphocyanide of $\text{Ca}(\text{CNS})_2$ By saturating HCNSAq with CaCO_3 , *v* sulphocyanidils, under cyanides.

Calcium Sulphydrate (or *hydrosulphide*), and **Calcium hydroxy sulphhydrate** (or *hydroxy hydrosulphide*) CaS.H 6 H_2O , and $\text{CaSH.OH.3H}_2\text{O}$.

By passing H_2S into a solution of CaO containing solid CaH_2O , CaS.H , 6 H_2O is formed. 1 part CaO is added to 3–4 parts warm water, when cold, H_2S is passed into the semi solid substance until all has dissolved, more CaO is added, little by little, the whole being surrounded by ice, and H_2S is passed in until a little CaO remains undissolved, the liquid is quickly decanted into a tube kept in ice, the crystals which separate are drained and a current of dry H_2S is swept over them at 0° . Air must be excluded during the entire operation (Divers a Shimidzu, *C J* 45, 270, Velev, *C J* 47, 478). $\text{CaS.H}_2\text{O}$ forms colourless prismatic crystals, which melt in their water of crystallisation, giving off H_2S and forming CaSH.OHAq and CaO.H_2 . At about 15° – 18° , H_2S is evolved even in an atmosphere of H_2S . CaS.H 6 H_2O is very soluble in water and alcohol. $\text{CaS}_2\text{H.Aq}$ is slowly oxidised in contact with air, giving a little $\text{CaS}_2\text{O}_6\text{Aq}$ and CaS_2Aq . Thomsen (*Th* 3, 251) gives the thermal value $[\text{Ca,S,H,Aq}] = 115,250$.

References—Pelouze, *C R* 62, 108, *H Rose P* 55, 433, Berzelius, *S* 34, 12, *P* 6, 442, Böttger, *A* 20, 79, 33, 344.

When a stream of H_2 is passed through an ice cold solution of CaS.H , crystals of $\text{CaSH.OH.3H}_2\text{O}$ are formed, and H_2S is evolved. The same compound is formed by the combination of H_2O with CaS , as in the interior of heaps of soda waste, and by the mutual action of CaO.H and H_2S , as in the purification of coal gas. Calcium hydroxysulphhydrate crystallises in colourless four sided prisms, it is soluble in water with decomposition into $\text{CaS}_2\text{H}_2\text{Aq}$ and CaO.H_2 , insoluble in, but slowly decomposed by, alcohol (CaS_2H goes into solution and CaO.H_2 remains, Divers a Shimidzu, *C J* 45, 270). It absorbs CS_2 , forming a basic thiocarbonate $2\text{CaO.H.CaCS}_3.10\text{H}_2\text{O}$, it is the active agent for absorbing CS_2 in gas purification (Velev, *C J* 47, 478). **M M P M**

CALLUTANNIC ACID $\text{C}_1\text{H}_1\text{O}_2$. Occurs in *Calluna vulgaris*, the common Ling. The green parts are extracted with alcohol, water is added, and from the filtrate the lead salt is ppd by Pb(OAc)_2 . Amber coloured mass. Its solution in alkalis rapidly absorbs oxygen from the air. Reduces AgNO_3Aq . FeCl_2 gives a green colour. Dyes mordanted wool sulphur yellow—

Salts— $(\text{PbC}_1\text{H}_1\text{O}_2)_2(\text{PbO})_2\text{aq} (?)$ —

$(\text{PbC}_1\text{H}_1\text{O}_2)_2(\text{PbO})_2, 2\text{aq} (?)$ —

$\text{Sn}(\text{C}_1\text{H}_1\text{O}_2)_2(\text{SnO}_2)_2, 2\text{aq} (?)$

Boiling dilute mineral acids convert callutannic acid into calluxanthin $\text{C}_1\text{H}_1\text{O}_2$, a yellow floccu

lent pp, sl sol cold water, v sol hot water and alcohol. Its alkaline solutions rapidly absorb oxygen from the air (Rochleder, *A* 84, 354).

CALMUS *v* **CALAMUS**

CALOMEL Mercurous chloride (HgCl_2) *V* **MERCURY, CHLORIDES OF**

CALOPHYLLUM RESIN $\text{C}_{11}\text{H}_{16}\text{O}_4$ [105°]

SG 112 A resin from *Calophyllum calaba* or *longifolium* of South America. Said to give butyric acid on oxidation (Levy, *C R* 18, 212).

CALORIMETER Instrument for measuring quantities of heat *V* **PHYSICAL METHODS, Sect THERMAL**

CALYCIN $\text{C}_{18}\text{H}_{26}\text{O}_8$ [240° uncor] Occurs in a yellow lichen, *Calycium chrysocepalum*, from which it is extracted by boiling ligroin (Hesse, *B* 13, 1816). Sublimable. Yellow needles or prisms. S sol cold petroleum spirit, petroleum ether, ether, alcohol, and acetic acid, more easily in the hot solvents. By strong aqueous KOH it is split up into oxalic and phenyl acetic acids. Carbonated alkalis give salts of calycic acid.

CAMELLIN $\text{C}_{17}\text{H}_{34}\text{O}_{10}$ A glucoside occurring in the seeds of *Camellia japonica* (Katzujama, *Ar Ph* [3] 13, 334). Extracted by alcohol, and ppd by lead acetate. White powder with bitter taste, insol water. Somewhat resembles digitatin.

CAMPHANIC ACID $\text{C}_{10}\text{H}_{14}\text{O}_2$ *z c*

$\text{C}_6\text{H}_{13}(\text{CO}_2\text{H})\begin{matrix} \diagup \text{O} \\ | \\ \diagdown \text{CO} \end{matrix}$ *Oxy camphoric anhydride*

From bromo camphoric anhydride, the product of the action of bromine on camphoric anhydride, by treatment with water (Wieden, *A* 163, 330; Woringer, *A* 227, 3). From camphoric acid and bromine (Kachler, *A* 162, 264). Formed also as a by product in the preparation of camphoric acid by oxidation of camphor with HNO_3 (Roser, *B* 18, 3112). According to Fittig (*A* 172, 151) it is a lactonic acid, formed *via* $\text{C}_6\text{H}_{13}\text{Br}\begin{matrix} \diagup \text{CO} \\ | \\ \diagdown \text{CO} \end{matrix}\text{O}$ and $\text{C}_6\text{H}_{13}(\text{OH})(\text{CO}_2\text{H})_2$.

Properties — Feathery crystals or prisms (from water). Monoclinic, $a b c = 1.2723 : 1.1522$. $\beta = 66^\circ 34'$.

Salt — $\text{BaA}_2 \cdot 3\frac{1}{2}\text{aq}$

Reaction — 1 On distillation camphanic acid gives CO_2 , campholactone $\text{C}_8\text{H}_{14}\begin{matrix} \diagup \text{O} \\ | \\ \diagdown \text{CO} \end{matrix}$, and lauro-

nolic acid $\text{C}_{18}\text{H}_{36}\text{O}_2$ — 2 $\text{K}_2\text{Cr}_2\text{O}_7$ and H_2SO_4 oxidise it to camphoronic acid $\text{C}_8\text{H}_{14}\text{O}_6$ (Bredt, *B* 18, 2989).

CAMPHENE *v* **TERPENES**

CAMPHENOL *v* **BORNEOL** and **CINEOL**

CAMPHENYL-*p* TOLYL-AMIDINE

$\text{C}_6\text{H}_5\text{C}(\text{NH}_2)\text{NC}_6\text{H}_4$ [115°] Fine white glistening needles (from ligroin). Formed by heating campholenonitrile $\text{C}_6\text{H}_5\text{CN}$ with *p*-toluidine hydrochloride at 250° (Goldschmidt & Koreff, *B* 18, 1633).

CAMPHIC ACID $\text{C}_{10}\text{H}_{16}\text{O}_2$ *S* 14 at 10° [$\alpha_D^{20} = 15^\circ 45'$ (in alcoholic solution)] Formed together with camphoric acid by passing air through a boiling solution of sodium camphor, $\text{C}_{10}\text{H}_{17}\text{NaO}$ in xylene. Thick mass, v sol alcohol and ether. KMnO_4 oxidises it to camphoric acid. The calcium salt distilled with calcium formate gives camphor and camphrene $\text{C}_{10}\text{H}_{16}\text{O}$

(*c* 233°) (Montgolfier, *A Ch* [5] 14, 70, *C R*, 88, 915).

CAMPHILENE *v* **TERPENES**

CAMPIMIDE $\text{C}_{10}\text{H}_{12}\text{N}$ or $\text{C}_8\text{H}_8\begin{matrix} \diagup \text{C} \\ | \\ \diagdown \text{NH} \end{matrix}$ (?)

Formed together with dicamphorimide by distilling the hydrochloride of amido camphor (*v* **CAMPHOR**) with steam (Schiff, *B* 13, 1405).

CAMPHINE *v* **TERPENES**

CAMPHO-CARBOXYLIC ACID *v* **CAMPHOR CARBOXYLIC ACID**

(a) **CAMPHOGLYCURONIC ACID** $\text{C}_{18}\text{H}_{26}\text{O}_8$ [130°] *S* 5 [$\alpha_D^{20} = -33^\circ$] Occurs, together with uramido camphoglycuronic acid in the urine of dogs that have taken camphor (Schmiedeberg & Meve, *H* 3, 422). Small thin laminae (containing aq), v sol alcohol and hot water insol ether. Boiling dilute HCl splits it up into glycuronic acid $\text{C}_6\text{H}_{10}\text{O}_6$ and crystalline campherol $\text{C}_{10}\text{H}_{16}\text{O}$ [194°]. HNO_3 oxidises it to camphoric acid — BaA'' — BaA' 2aq — AgHA' 3aq.

(b) **Camphoglycuronic acid** $\text{C}_{18}\text{H}_{26}\text{O}_8$ An amorphous modification of the preceding, formed by warming it with butyric acid — AgHA'' 3aq crystals, more soluble than the Ag salt of the (a) acid.

CAMPHOL a name for **BORNEOL** (*q v*)

CAMPHOLACTONE $\text{C}_8\text{H}_{14}\begin{matrix} \diagup \text{CO} \\ | \\ \diagdown \text{O} \end{matrix}$ [50°]

(230° – 235°) From camphanic acid by distillation, together with lauronic acid (Woringer, *A* 227, 10). Slender needles (from water). Has a pungent odour of camphor. Like other lactones its solution becomes cloudy when gently heated, but the oily drops afterwards dissolve up again. Volatile with steam. K_2CO_3 separates it from its aqueous solution. When boiled with baryta the salt of the corresponding oxy acid, $\text{C}_6\text{H}_{13}(\text{OH})(\text{CO}_2\text{H})_2$ is formed.

CAMPHOLENE C_8H_{16} (136°) *VD* 435 Prepared by the action of dehydrating agents on campholic acid (Delalande, *A* 38, 340) and by distilling potassium campholate with soda lime (Kachler, *A* 162, 266). Probably identical with the hydrocarbon got by distilling the calcium salt of campholenic acid (Goldschmidt, *B* 20, 483). The name campholenene has also been given to C_8H_{14} (*c* 123°) obtained by the action of dehydrating agents on camphoric acid and its amides (Ballo, *B* 12, 324).

CAMPHOLENIC ACID $\text{C}_8\text{H}_{14}\text{O}_2$ *z c* C_6H_5 , CO_2H or $\text{C}_6\text{H}_5(\text{CO}_2\text{H})\text{CH}_2$ *Oxy camphor* (*c* 260°) Colourless oil. Formed by saponification of its nitrile which is obtained by heating camphoroxim with acetyl chloride. Formed also by treating an alcoholic solution of (8) di-bromo camphor with sodium amalgam (Goldschmidt & Zurier, *B* 17, 2069; Kachler & Spitzer, *B* 17, 2400; *M* 3, 216, 4, 643). The Ca salt on dry distillation yields C_8H_{14} , possibly campholenene (Goldschmidt, *B* 20, 483). Oxidising agents give oxy camphoronic acid. At 250° the NH_4 salt gives the amide [127°] — $\text{NH}_4\text{A}'$ — BaA_2 4aq.

Amide $\text{C}_8\text{H}_{15}\text{CONH}_2$ *Isocamphoroxim* [125°] Glistening plates, sol alcohol, ether, and conc acids. Formed by heating the nitrile with alcoholic KOH, or by heating the ammo-

nium salt of the acid to 250° By distillation with P₂S₅ it yields the nitrile (Nageli, *B* 17, 805, Goldschmidt & Zurrer, *B* 17, 2069)

Nitrile—C₉H₁₃CN (216°) **Formation**—1 By heating camphoroxim with AcCl which removes H₂O—2 By distilling campholenamide (isocamphoroxim) with P₂S₅. **Reactions**—1 By heating with alcoholic KOH it is converted into campholenamide By long boiling with alcoholic KOH it yields campholenic acid—2 By heating with hydroxylamine it gives an amid oxim C₁₀H₁₅N₂O which crystallises in white plates melting at [101°]—3 Reduced in alcoholic solution by Zn and HCl to the amine C₉H₁₅CH₂NH₂ (Goldschmidt & Zurrer, *B* 17, 2069, Goldschmidt & Koreff, *B* 18, 1634)—4 Successive treatment with sodium amalgam and HCl yields C₁₀H₁₅N₂Cl, the hydrochloride of camphyl di phenyl hydrazinamine C₉H₁₁(CHNH₂)₂NHPh [157°] (Balbiano, *G* 17, 155)

Nitro campholenic acid C₁₀H₁₅(NO₂)O₂ **Nitro oxy camphor** [164°] (Z), [170°] (K & S) Formed by nitration of campholenic acid (Zurrer, *B* 18, 2228, Kachler & Spitzer, *M* 4 643, *B* 15, 2396, Swais, *B* 15, 2135) Monoclinic pyramids, *abc* = 76.143, β = 89° 18 Sol hot alcohol and ether Reduced by tin and HCl to amido campholenic acid whose hydrochloride crystallises in lumps [250°]

CAMPHOLIC ACID C₁₀H₁₅O₂ Mol w 170 [95°] (K), [106°] (M) [α]_D = 50° (in alcohol)

Formation—1 By passing camphor vapour over nearly red hot potash lime (Delalande, *A Ch* [3] 1, 120)—2 By adding potassium in small pieces to a solution of camphor (1 pt.) in boiling petroleum (3 pts) at 130° (Malin *A* 145, 201)—3 By boiling camphor with alcoholic KOH (Kachler, *A* 162, 259)—4 By heating camphor with Na at 250° (Montgolfier, *A Ch* [5] 14, 99)

Properties—Monoclinic prisms (from dilute alcohol) or nodular groups of laminae (from ether alcohol) V sl sol water, volatile with steam

Reactions—1 HNO₃ gives first camphoric and then camphoronic acids—2 Moist Br gives at first camphoric acid, then bromo camphoric anhydride, and lastly oxy camphoric anhydride C₁₀H₁₁O₄—3 P₂O₅ gives campholene, red hot soda lime acts similarly

Salts—KA'2aq laminae—CaA',aq—AgA

Chloride (224°) (Kachler, *A* 162, 265)

CAMPHOR C₁₀H₁₆O Mol w 152 [175°] (204°) SG 12.992 S 1 S (alcohol of SG 806) 120 V D 5.32 R_∞ 73.11 (in a 32.3 p.c benzene solution) (Kanonnikoff) [α]_D = 55.4—1372 q (where q = no of grms of alcohol in 100 grms of solution)

Occurs in the wood and bark of *Laurus camphora*, from which it is extracted by distillation with steam followed by sublimation Varieties of camphor occur also in several essential oils (*v infra*) Camphor may be recovered from its bromo derivative by the action of nascent H or of alcoholic KOH (Schiff, *B* 18, 1407, 14, 1377) Camphor is also formed by distilling calcium camphate with calcium formate and by oxidising dextro and laevo rota-

tory borneols (Montgolfier, *C R* 88, 915, *A Ch* [5] 14, 20)

Properties—Hexagonal prisms, terminated by hexagonal pyramids (Desclozeaux, *A Ch* [3] 56, 219, Cazeneuve & Morel, *C R* 101, 438) Tough, with peculiar odour, sublimates at ordinary temperatures Small pieces rotate upon pure water V sl sol water, v sol ordinary solvents Camphor is dextro rotatory, the rotation varying greatly with the nature and strength of the solvent (Arndtsen, *A Ch* [3] 54, 403, Landolt, *A* 189, 334) Its refractive power is that of a saturated compound (Gladstone, *C J* 49, 621)

Reactions—1 Camphor (5 kilos) gives, when oxidised by HNO₃, (1.7 kilos of) pure camphoric acid insol cold water, and (1.8 kilos of) crude camphoronic acid Besides camphoronic acid the soluble portion contains (1 kilo of) dinitroheptonic acid, and (2 kilo of) acids C₉H₁₁O₆ (hydro oxycamphoronic acid), C₉H₁₂O₇, C₇H₁₂O₅ (?) [145°], and another acid A very small quantity (2 g) of mesocamphoric acid, C₁₀H₁₆O₄, is also got This forms woolly needles, soluble in cold water [120°]—2 By oxidation with CrO₃ it gives camphoronic acid C₉H₁₂O₄, and hydro oxy camphoronic C₉H₁₁O₅, but not adipic acid (Kachler, *B* 13, 487, cf Ballo, *B* 12, 1597) Alkaline KMnO₄ gives camphoric acid (Grosser, *B* 14, 2507)—3 The chief products of the dry distillation of camphor with ZnCl₂ (2 pts) are *m* methyl isopropyl benzene (*m* cymene) and (1 2 4) di methyl ethyl benzene (lauene), together with smaller quantities of (1 2 3 5) tetra methyl benzene (isodurene), curvacrol, camphorone, and various other bodies (Armstrong & Miller, *B* 16, 2255) such as CH₃, benzene, toluene, xylene, and *p* cymene (Fittig, *A* 145, 129, Rommier, *Bl* 12, 383, Lippmann & Longuigne, *Z* [2] 5, 413, Montgolfier, *A Ch* [5] 14, 87)—4 By the action of iodine it yields a hydrocarbon C₁₀H₁₆, carvacrol, (1 2 4) di methyl ethyl benzene, (1 2 3 5) tetra methyl benzene, and traces of ordinary cymene (A & M, cf Armstrong & Easkell, *B* 11, 151, Rayman & Preis, *B* 13, 346)—5 By treatment with P₂O₅ ordinary cymene is formed, which is also the chief product of the action of P₂S₅, but accompanied in the latter case by small quantities of *m* methyl isopropyl benzene and tetra methyl benzene (Delalande, *A Ch* [3] 1, 368, Armstrong & Miller, *B* 16, 2255)—6 By distillation over red hot zinc dust a mixture is formed of toluene, *p* xylene, cymene, and a little benzene (Schrotter, *B* 13, 1621)—7 Conc H₂SO₄ forms camphrene or camphorophorone C₁₀H₁₄O (Chautard, *C R* 44, 66, Schwanert, *A* 123, 298)—8 Boiling alcoholic KOH forms campholic acid and borneol (Berthelot, *A Ch* [3] 56, 94, *Bl* [2] 17, 390, Montgolfier, *Bl* [2] 18, 114, 25, 13, Wheeler, *A* 146, 84, Kachler, *A* 162, 268) Campholic acid is also formed by passing camphor vapour over heated soda lime 9 Cl has no action, but in presence of alcohol or PCl₅ chlorination ensues (Claus, *J pr* 25, 257)—10 HClO forms chloro camphor—11 Br forms C₁₀H₁₃OBr₂ which readily splits up into HBr and bromo camphor—12 ICl at 250° forms CCl₄, C₂Cl₆, and C₆Cl₆—13 PCl₅ forms C₁₁H₁₆Cl₂—14 Camphor absorbs HCl (Bineau, *A Ch* [3] 24, 328) Aqueous HCl at 170°

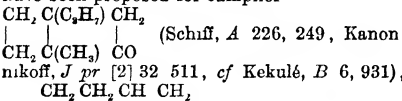

splits it up into H_2O and cymene (Alexeeff, *J R* 12, 187) — 15 Camphor absorbs SO_2 , becoming liquid — 16 It also absorbs NO_2 — 17 Conc $HIAq$ at 200° forms $C_{10}H_{16}$ (163°), $C_{10}H_{18}$ ($135^\circ-140^\circ$), and $C_{10}H_{20}$ ($170^\circ-175^\circ$) (Weyl, *Z* [2] 4, 496, *B* 1, 96) — 18 Sodium amalgam has no action — 19 Na acting at 90° on a solution of camphor in toluene forms sodium camphor and sodium borneol (Baubigny, *Z* [2] 2, 408, 4, 298) (*cf* p 672) — 20 CO_2 gas passed into the product of the action of Na on camphor in toluene forms the carboxylic acids of camphor and of borneol (Baubigny, *Z* [2] 4, 482, 647) Air passed into the same mixture forms camphoric acid (Montgolfier, *A Ch* [5] 14, 75) — 21 Camphor does not combine with $NaHSO_3$ (Fittig a Tollens, *A* 129, 371) — 22 $AcCl$ has no action — 23 Converted in the animal economy (of a dog) into camphoglycronic acid (*q v*) — 24 Melted camphor absorbs BF_3 forming $C_{10}H_{16}OBF_3$ (70°), when this is heated for 24 hours there is formed cymene and its polymerides, $C_{10}H_{16}$, CH_4 , and other hydrocarbons (Landolph, *C R* 86, 539) — 25 Chloral hydrate forms an unstable molecular compound with camphor It is a viscous liquid, sol alcohol and $CHCl_3$, insol water (Cazeuueve, *A Im* ber, *Bl* [2] 34, 209, Zeidler, *J* 1878, 645) — 26 By heating with ammonium formate at $220^\circ-240^\circ$ it yields formyl bornylamine

$C_{10}H_{16} \begin{matrix} \diagup CH_2 \\ \diagdown CH NHCHO \end{matrix}$ (Leuchart a Bach, *B* 20, 104) — 27 It does not react with phenyl cyanate (*L a B*) — 28 Hydroxylamine forms an oxim, *v* CAMPHOROXIM

Phenyl hydrazide $C_{10}H_{16}N HPh$ (233°) at $10mm$ From camphor and phenyl hydrazine Oil Split up by dilute HCl into camphor and phenyl hydrazine, and by dry HCl into aniline and the nitrile of campholenic acid (Balbiano, *G* 16, 132)

Constitution — The action of hydroxylamine on camphor coupled with the fact that camphor does not combine with $NaHSO_3$, indicates that it is a ketone The ready formation of benzene derivatives indicates a six carbon ring Its optical properties are those of a saturated compound, *v* also TERPENES

The two following formulæ amongst others have been proposed for camphor

Chloro-camphor $C_{10}H_{15}ClO$ [95°] From camphor and conc $HClO_4aq$ (Wheeler, *Am S* [2] 45, 48, *A* 146, 81) Crystalline powder (from alcohol), at 200° it gives off HCl Decomposed by alcoholic $AgNO_3$.

(a) **Chloro camphor** $C_{10}H_{15}ClO$ [84°] (*C*), [93°] (*B*) (246°) [α]_D = 90° Formed by passing dry Cl_2 into a solution of camphor (760g) in absolute alcohol (230g) (Cazeuueve, *C R* 94, 1530, *Bl* [2] 38, 9, 44, 161) Formed also by heating chloro camphor carboxylic acid (Schiff a Puliti, *B* 16, 887, Balbiano, *G* 17, 96) Hard, brittle,

monoclinic needles, smelling like camphor; volatile with steam Not decomposed by alcoholic $AgNO_3$ Sodium amalgam reduces it to camphor, the copper zinc couple, and hot soda lime, act similarly Alcoholic KOH at 180° gives borneol Phenyl-hydrazine forms $C_{10}H_{15}(N_2HPh)(N_2HPh)$ [56°] (*B*)

(b) **Chloro camphor** $C_{10}H_{15}ClO$ [100°] (246°) [α]_D = 57° Deposited from the mother liquor after the preceding has separated (Cazeuueve, *C R* 95, 1358, *Bl* [2] 39, 116) Soft, minute, needles, more soluble than the preceding, miscible with boiling alcohol Not decomposed by alcoholic $AgNO_3$, but converted by boiling alcoholic KOH into the preceding body Phenyl hydrazine produces the same compound [56°] as with the preceding (*B*)

(a) **Di chloro camphor** $C_{10}H_{13}Cl_2O$ [90°] *S G* 42 [α]_D = 57.3° (in alcohol or chloroform) Formed by passing dry chlorine for several hours into camphor dissolved in absolute alcohol at $80^\circ-90^\circ$ The product is ppt by water and crystallised from alcohol (Cazeuueve, *C R* 94, 730, 1058, *Bl* [2] 37, 454) Trimetric prisms (from alcohol), $a b c = 1.8358 : 1.14820$, sl sol cold, v sol hot, alcohol, almost insol water but rotates upon it Above 150° it blackens, giving off HCl Insol $HOAc$ (difference from camphor) It forms a liquid combination with aldehyde

(b) **Di chloro camphor** $C_{10}H_{13}Cl_2O$ [77°] [α]_D = 57.4° (in alcohol), 60.6° (in $CHCl_3$) Ppd by adding water to the mother liquor from which the preceding has crystallised (Cazeuueve, *C R* 94, 1360, *Bl* [2] 38, 8) Crystallises from alcohol with difficulty, v e sol alcohol, ether, and chloroform, liquified by chloral hydrate (difference from the preceding)

Tri chloro camphor $C_{10}H_{11}Cl_3O$ [54°] [α]_D = 64° (in alcohol) Formed by saturating chloro camphor with chlorine at 100° (Cazeuueve, *C R* 99, 609) Minute crystals, insol water, sol other menstrua Gives off HCl when heated

Bromo camphor $C_{10}H_{15}BrO$ [76°] (274°) *S G* 144 R_{20} 88.5 (in a 7.37 p.c alcoholic solution) (Kanonnikoff, *J pr* [2] 32 504) [α]_D = 139° Formed by heating camphor dibromide at 100° (Perkin, *C J* 18, 92, Maisch, *C C* 1873, 437) Monoclinic prisms (from alcohol), m sol alcohol, v sol $CHCl_3$ and benzene, may be sublimed (Montgolfier, *Bl* [2] 23, 253)

Reactions — 1 Sodium amalgam reduces it, in alcoholic solution, to camphor, alcoholic KOH also gives camphor Sodium added to its solution in toluene gives sodium camphor (*R Schiff*, *B* 13, 1407) — 2 PCl_5 has no action even at 100° (Schiff, *B* 14, 1378, Kachler a Spitzer, *M* 3, 205) — 3 Heating with $ZnCl_2$ at 160° gives a mixture of *p* xylene hexahydride and a phenol $C_{10}H_{11}O$ apparently identical with the carvacrol obtained by the action of I on camphor (*R Schiff*, *B* 13, 1407) — 4 Nitric acid forms bromo-nitro camphor and camphoric acid (Armstrong, *B* 12, 1358, *R Schiff a Maissen*, *G* 10, 317) — 5 Phenyl-hydrazine forms $C_{10}H_{15}(N_2HPh)(N_2HPh)$, [56°] (Balbiano, *G* 17, 95, 155)

(a) **Di bromo camphor** $C_{10}H_{13}Br_2O$ [115°] Formed, together with the preceding, by heating bromo camphor (1 mol) with Br (2 mols) for 11

hours at 130° (K a S, cf Swarts, *Z* [2] 2, 205, *B* 15, 1622) Formed also by heating (8) di-bromo camphor with gaseous HBr at 130° (Swarts, *B* 15, 2135) Trimetric crystals, $a b c = 95.1 \ 52$, sl sol alcohol, ether, and petroleum Less volatile with steam than the preceding

Reactions —1 Sodium amalgam gives camphor and campholenic acid —2 Conc HNO₃ gives di-bromo nitro camphor [130°]

(8) Di-bromo camphor C₁₀H₁₁Br₂O [61°] Formed, together with its isomeride, by the action of Br (1 mol) on bromo camphor (1 mol) for 7 hours at 120° (Kachler a Spitzer, *M* 3, 208, Zepharovich, *M* 3, 231, cf R Schiff, *G* 11, 178, Montgolier, *Bl* [2] 23, 253) Trimetric crystals, $a b c = 2.0685 \ 1.1 \ 5778$ (Cazeneuve a Morel, *Bl* [2] 44, 161) = 1.944 1.1 558 (K a S) V sol alcohol, ether, and petroleum

Reactions —1 Alcoholic KOH, or sodium amalgam, reduces it to bromo camphor, and finally to camphor —2 Sodium and CO form camphor carboxylic acid —3 Conc HNO₃ gives camphoric and hydro oxy camphoric acids together with bromo di nitro methane (Kachler a Spitzer, *M* 4, 554)

(a) Chloro-bromo-camphor C₁₀H₁₁ClBrO [98°] [α]_D = 78° Formed by heating chloro camphor [84°] with bromine in sealed tubes for 5 hours at 100° White needles Insol water, sol hot alcohol, ether, and CHCl₃ (Cazeneuve, *Bl* [2] 44, 115, *C R* 100, 802)

(8) Chloro-bromo-camphor C₁₀H₁₁ClBrO [51.5°] [α]_D = 51° Prepared by heating chloro camphor (1 mol) with bromine (2 mols) in sealed tubes for one hour at 100° C Hard, trimetric crystals, $a b c = 1.9144 \ 1.1 \ 5395$ Insol water, v sol alcohol, v sol ether, CHCl₃, C₆H₆, and CS₂ (Cazeneuve, *Bl* [2] 44, 115, *C R* 100, 859) Decomposed by boiling AgOAcAq (difference from preceding)

Iodo-camphor C₁₀H₁₁IO [44°] Formed, to gether with NaCy and NaI, by the action of ICy on sodium borneol dissolved in benzene (Haller, *C R* 87, 695) Monoclinic crystals, insol water, sol alcohol Decomposes at about 150°

Nitro-camphor C₁₀H₁₁NO₂ [83°] Prepared by the action of alcoholic KOH on bromo nitro camphor (Schiff, *B* 13, 1402, *G* 10 330, 11, 21) Dissolves in aqueous alkalis Gives a red colouration with FeCl₃ HNO gives a nitro-o compound On oxidation with HNO₃ it gives camphoric acid By reduction it gives amido camphor Bromine forms C₁₀H₁₁N₂BrO₂? [95°] Cl forms similarly C₁₀H₁₁N₂ClO₂? [110°] Steam distillation gives camphoric acid and anhydride and NH₃ This substance is probably a mixture of the two following

(a) Nitro-camphor C₁₀H₁₁(NO)₂O [101°] [α]_D (19.978 p c in benzene) —98° (3.33 p c in alcohol) —7.5° Formed, together with its (s) isomeride, by the action of Zn, Cu, Fe, or alkalis on either chloro nitro camphor dissolved in alcohol Best prepared by using the copper zinc couple The resulting zinc salt of nitro-camphor is decomposed by HCl The (a)-compound is the less soluble in cold alcohol (Cazeneuve, *C R* 103, 275, 104, 1622, *Bl* [2] 47, 920) Trimetric prisms Decomposes at 160° Levorotatory Its rotation varies with concentration of the solution. It forms a com-

pound with benzene It reddens litmus, and decomposes carbonates Fe₂Cl₃ colours its alcoholic solution blood red

(8) Nitro camphor C₁₀H₁₁(NO)₂O [98°] [α]_D (3.33 p c in benzene) —75° (3.33 p c in alcohol) +7.5° Prepared as above Soft, fern-like, crystals (from alcohol) Insol water, sol other menstrua Less stable than the (a) isomeride FeCl₃ colours its solutions red Its salts are more soluble than those of the (a) compound —NaA' —ZnA' sol water

(a) Chloro-nitro-camphor C₁₀H₁₁Cl(NO)₂O [95°] [α]_D = -6.2° From chloro camphor [93°] (1 pt) and fuming HNO₃ (4 pts) Large trimetric prisms (from alcohol), $a b c = 2.022 \ 1.1 \ 475$ (the author does not say whether these numbers belong to this or to the following body) Insol water, in sol cold alcohol Decomposes above 100° Reduced by nascent hydrogen to nitro-camphor (Cazeneuve, *C R* 96, 589, *Bl* [2] 39, 503)

(8) Chloro-nitro-camphor C₁₀H₁₁Cl(NO)₂O [98°] [α]_D = 10.5° (in alcohol) Occurs in the mother liquor from which the preceding has separated Soft crystals, v sol cold alcohol Reduction gives nitro camphor Less stable than the (a) isomeride, for alkalis remove Cl forming nitro camphor even in the cold Not decomposed by alcoholic AgNO₃ (Cazeneuve, *C R* 98, 306, *Bl* [2] 41, 235, 44, 161, 47 926)

(a) Bromo-nitro-camphor C₁₀H₁₁BrNO₂ [105°] [α]_D = -27° Prepared by nitration of bromo camphor Trimetric crystals, $a b c = 2.0854 \ 1.1 \ 5423$ Nearly insol cold alcohol By the action of alcoholic KOH or nascent H it gives nitro camphor (Schiff, *G* 10, 324, *B* 13, 1402, 14, 1377)

Di-bromo-nitro-camphor C₁₀H₁₁Br(NO)₂O [130°] From (a) di-bromo-camphor by nitration (Kachler a Spitzer, *M* 4, 554) Trimetric prisms or needles, $a b c = 1.76 \ 1.1 \ 49$ Reduced by tin and HOAc to amido camphor

Amido camphor C₁₀H₁₁NO (247°) Waxy solid Strong base of alkaline reaction Prepared by reduction of nitro camphor with sodium amalgam in alkaline solution It reduces Fehling's solution, AgNO₃, and HgCl₂ With HNO₃ it produces oxy camphor (Schiff, *B* 13, 1404) On distillation of the hydrochloride of amido camphor with steam 'dicamphyl amine' C₁₀H₁₁NO passes over and 'camphimide' C₁₀H₁₁N remains in the retort Dicamphylamine [160°] crystallises in needles, insol acids, volatile with steam Camphimide forms crystalline flakes, soluble in acids, nitrous acid converts its hydrochloride into 'diaz camphor' C₁₀H₁₁N₂O [74°] which may be reduced by Zn and HOAc to amido-camphor Diazo camphor is converted by heat into 'dehydro camphor' C₁₀H₁₁O [160°] (R Schiff, *G* 10, 362, 11, 171, *B* 14, 1375)

Oxy camphor (?) C₁₀H₁₁O₂ [155°] Prepared by the action of HNO₃ on amido camphor (Schiff, *B* 13, 1404) Colourless crystals Volatile with steam

Wheeler's chloro-camphor (*q v*) gave with alcoholic KOH an 'oxy camphor' [137°]

The acetyl derivative [69°] of an 'oxy-camphor' [249°] is formed by oxidising acetyl-borneol.

An 'oxy camphor' [61°] is formed by oxidising camphene (*v* TERPENES) (Kachler & Spitzer, *A* 200, 358)

V also CAMPHOLENIC ACID

'Nitro oxy camphor,' *v* NITRO CAMPHOLENIC ACID

Cyano camphor *v* Nitrile of CAMPHOR CARBOXYLIC ACID

Ethyl camphor $C_{10}H_{16}EtO$ (228°) SG 22 946 $[a_D] = 161^\circ$ From sodium camphor and EtI (Baubigny, *Z* [2] 4, 481) Oil

Isoamyl camphor $C_{10}H_{16}(C_4H_9)O$ (278° cor) $[a_D] = 59.4^\circ$ From sodium camphor and isoamyl iodide (B)

'Nitrohexoic acid' $C_6H_{11}(NO_2)_2$ *see* Me $CH(NO)CMe_2COH(?)$ [115°] From dinitro heptoic acid and sodium amalgam (Kullhem, *A* 167, 46, Kachler, *A* 191, 157) Rectangular four sided columns (from water) Monoclinic, $b:c = 1.6115$, $\beta = 83^\circ 30'$ After several fusions it melts at 111.5° Quickly heated, it explodes

Reactions—1 Dissolved in a little aqueous KOH, mixed with KNO_3 and dilute H_2SO_4 , a fine blue colour is formed This colour is taken up by ether, hence the body is probably akin to pseudo nitroles—2 Sn and HCl produce methyl isopropyl ketone, hydroxylamine and CO—3 Baryta in sealed tubes at 95° does not decompose it, but forms the basic salt $C_6H_9BaNO_4$

Dinitrohexoic acid $C_6H_9(NO_2)_2O_2$ *see* Me $C(N_2O_4)CMe_2CO_2H(?)$ [215°] Got by Kullhem by treating the residues in the preparation of camphoric acid with strong HNO_3 , (*A* 163, 231, Kachler, *A* 191, 155) Mono c'mic plates, $a:b:c = 57:55:1$ 6024 , $\beta = 70^\circ 42'$ M sol cold water, v sol hot water Explodes when rapidly heated Its ammonium salt gives with cupric acetate a bluish pp sol excess of the acetate (difference from camphoric acid) The free acid does not pp cupric or lead acetate The neutral salts give a flocculent pp with lead acetate

Salt— BaA' , 3aq Needles

Reactions—1 Reduced in alcoholic solution by sodium amalgam to mononitroheptoic acid 2 Reduced by Sn and HCl to methyl iso propyl ketone and hydroxylamine—3 Potash and baryta heated with the aqueous acid in sealed tubes produce both nitro heptoic acid and methyl isopropyl ketone

Hydro-oxy-camphoronic acid $C_9H_{14}O_6$ [164 5°] (Kachler, *A* 191, 148) Needles Sol cold water Tribasic acid Gives no pp with $BaCl_2$ or $CaCl_2$ and NH_3 , even on boiling (difference from camphoronic acid) Cupric acetate gives no pp until boiled when a bluish green cupric salt is pp'd Lead acetate gives a white pp soluble in excess $AgNO_3$ gives a white pp soluble in hot water

Salts— NH_4A''' — $CaHA'''$ 2aq— Ca_2A''' x — Ba_2A''' x — Cu_2A''' x — Ag_2A'''

ISOMERIDES OF CAMPHOR.

Lævorotatory camphor $C_{10}H_{16}O$ [172° cor] (R), [175°] (C) (204°) SG 22 9853 (C) $[a_D] = -47^\circ$ (C), -42° (H) Occurs together with a terpene in the ethereal oil obtained from the leaves of fever few, *Matricaria Parthenium* (Chautard, *C R* 37, 166) Apparently formed also by oxidising the lævorotatory terpene obtained by treating with alcoholic KOH the pro-

duct of the action of HCl on lævorotatory oil of terpentine (Riban, *Bl* 24, 19) Obtained also by oxidising the borneols of madder, valerian, Ngai, and Bang Phien (Haller, *C R* 103, 64, 104, 66) HNO_3 gives lævorotatory camphoric acid $[a_D] = -46^\circ$ The corresponding bromo camphor is also lævorotatory, $[a_D] = -128^\circ$

Inactive camphor $C_{10}H_{16}O$ [173°] Got by oxidising inactive borneol (*q v*) with cold HNO_3 , and then adding water (Armstrong & Tilden, *C J* 35, 752) Also by oxidising inactive camphene with H_2SO_4 and $K_2Cr_2O_7$ Heated with HNO_3 it forms a camphoric acid, [203°] and giving when heated alone an anhydride, [223°]

Inactive camphor From Oil of Sage $C_{10}H_{16}O$ [174°] (205° uncor) When oil of sage is distilled the fraction 205° – 208° deposits this camphor It apparently only differs from ordinary camphor in being inactive, for—1 PCl₅ gives an oil which is converted by water into a wax like solid, [80°] whence Na forms a white solid—2 Boiled with H_2O , (21) it forms inactive camphoric acid [186°]—3 Dissolved in toluene and treated with Na and CO it forms inactive borneol, [200°]—4 Distilled with P_2O_5 it forms cymene (M M P Muir *C J* 37, 685)

'Racemic' camphor $C_{10}H_{16}O_2$ (?) [179°] This name is given to the product of the oxidation of a mixture of equivalent quantities of lævo and dextro rotatory borneol, and is therefore inactive by compensation, as racemic acid is (Haller *C R* 105, 66) It gives a bromo derivative [51°] and a camphoric acid [205°] The 'racemic' camphor, bromo camphor, and camphoric acid were also prepared by mixture and found to be identical with the above They differ in solubility as well as in melting point from the active compounds The borneol of amber, and consequently the camphor derived therefrom appear to be a mixture of dextro and lævo rotatory varieties in unequal proportions

Camphors, or bodies resembling camphor, have been found in many essential oils, *eg* oils of alant (p 94), absinth (p 2), chamomile, eucalyptus, lavender, nutmeg, rosemary, &c When a camphor is converted into borneol, the rotatory power of the resulting borneol varies with each operation, but the camphor regenerated by oxidising the borneol has in each case the rotatory power of the original camphor (Montgomerie) According to Haller (*C R* 105, 228) this may be explained by supposing that the resulting borneol is always a mixture of a stable borneol rotating in the same direction as the original camphor and of an unstable borneol rotating in the opposite direction

CAMP-HOR CARBOXYLIC ACID $C_9H_{14}O_6$, [129°] Formed as a by product in the preparation of borneol from camphor by the action of Na on a solution of camphor in toluene, the product being treated with CO_2 It is produced by the union of CO_2 with sodium-camphor (Baubigny, *Z* [2] 4, 481, 647, *A Ch* [4] 19, 221, Kachler & Spitzer, *B* 18, 1412, *M* 2, 233) Long colourless monoclinic pyramids Sol water Decomposes below 100° into CO_2 and camphor

Reactions—1 Boiling $AcCl$ forms $C_9H_{14}O_4$, [196°], crystallising in needles—2 P_2O_5 , acting

on its solution in CHCl_3 , forms $\text{C}_{22}\text{H}_{36}\text{O}_5$ [265°] 8 PCl_5 forms $\text{C}_{22}\text{H}_{36}\text{OCl}_4$ [45°] which separates from ether alcohol in trichloric crystals *a b c* = 1 804 47

Salts — NaA' — BaA' — PbA' .

Ethyl ether EtA' (276° uncor), SG 12 1 052, colourless fluid (Roser, B 18, 3113)

Nitrile $\text{C}_{10}\text{H}_{14}\text{CyO}$ *Cyano camphor* [128°] (250°) Formed by passing cyanogen into a mixture of camphor and sodium camphor dissolved in hot toluene, extracted by shaking with aqueous NaOH and ppg by HOAc Rect angular prisms (from ether), sol alcohol, ether, and HOAc Contains an atom of hydrogen displaceable by Na or K, forming unstable salts Conc HCl at 100° converts it into camphor carboxylic acid Oxidising agents give HCy and camphoric acid Alcoholic NaOH slowly converts it into the ether of camphor carboxylic acid (Haller, C R 87, 843, 93, 72, 102, 1477)

Chloro-camphor carboxylic acid $\text{C}_{10}\text{H}_{13}\text{ClO}_3$ Formed by passing Cl into a solution of sodium camphor, carboxylate (Schiff, A Pultti, B 16, 887) Flocculent pp, decomposes on fusion into CO_2 and chloro camphor

Bromo camphor carboxylic acid $\text{C}_{10}\text{H}_{13}\text{BrO}_3$ [110°] From camphor carboxylic acid and Br (Silva, B 6, 1092) Both the acid and its salts readily decompose into CO_2 and bromo camphor — BaA'_2 — AgA'

Oxy-camphor carboxylic acid $\text{C}_{10}\text{H}_{16}\text{O}_4$ [160°] $[\alpha]_D = 59^\circ$ Formed by boiling the nitrile of camphor carboxylic acid with aqueous KOH (Haller, C R 87, 929) Nodules (from ether) — CaA'_2 6aq — BaA'_2 6aq

CAMPHOR DICHLORIDE $\text{C}_{10}\text{H}_8\text{Cl}_2$ [155°]

Prepared by the action of PCl_5 on camphor in the cold $\text{C}_{10}\text{H}_{16}\text{O} + \text{PCl}_5 = \text{POCl}_3 + \text{C}_{10}\text{H}_8\text{Cl}_2$ (Spitzer, B 11, 363, 1819, M 1, 319) Formed also by chlorinating bornyl chloride (Kachler a Spitzer, A 200, 361) Feathery trimetric needles, *a b c* = 917 1 1 686 Easily soluble in alcohol and ether Easily splits off HCl

CAMPHORIC ACID $\text{C}_{10}\text{H}_8\text{O}_4$ 16

$\text{C}_6\text{H}_4(\text{CO}_2\text{H})_2$ or $\text{CH}_2 - \text{C}(\text{Me}) - \text{CO}_2\text{H}$ (Schiff)

or $\text{Pr CH}(\text{CO}_2\text{H}) \text{CH}_2 \text{CH} \text{C}(\text{Me}) \text{CO}_2\text{H}$ (W Roser, A 220, 278) Mol w 200 [186°] SG 1 19 S 625 at 12° R ∞ 83 14 (in a 1 p c aqueous solution) (Kanonnikoff, J pr [2] 31, 349) $[\alpha]_D = 46^\circ$ Formed by boiling camphor or camphoric acid with conc HNO_3 (Kosegarten (1785), Laurent, A Ch 63, 207, Malaguti, A Ch 64, 151, A 22, 50, Wreden, A 163, 323, V Meyer, B 3, 116, Kachler, A 162, 262) It is best to use the mixture of camphor and borneol obtained by the action of Na on camphor (Maissen, G 10, 280) Formed also by the oxidation of chloro or bromo camphor with alkaline permanganate (Balbiano, G 17, 240) Monoclinic crystals, the rotation in alkaline solution has been studied by Thomsen (J pr [2] 35, 157) The refractive power indicates a double union, which does not agree with Schiff's formula

Reactions — 1 Heat splits it up into water and an anhydride — 2 Water at 180° changes it into meso-camphoric acid — 3 Fuming HCl at 200° forms C_6H_4 and C_6H_8 (Wreden, A 187, 169). — 4 Conc HIAq at 200° gives xylene tetra-

Vol. I.

hydride and hexahydride (W) — 5. By the action of ZnCl_2 , xylene tetrahydride C_6H_8 , is produced

The same hydrocarbon is produced by the action of ZnCl_2 on ammonium camphoric acid

$2\text{NH}_4\text{Cl} + \text{ZnO} + \text{CO} + \text{CO}_2 + \text{C}_6\text{H}_8$ (Ballo, B 12, 324) — 6 The ammonium salt distilled with P_2O_5 gives a terpene $\text{C}_{10}\text{H}_{16}$ (Ballo, A 197, 322)

7 Conc H_2SO_4 forms CO and 'sulphocamphoric acid' — 8 Conc HNO_3 gives camphoric acid — 9 Potash fusion gives pimelic acid $\text{Pr CH}(\text{CO}_2\text{H}) \text{CH}_2 \text{CO}_2\text{H}$ and an acid $\text{C}_{10}\text{H}_{16}\text{O}_8$ (Hlasiwetz a Grabowsky, A 145, 205) — 10 Distillation with soda lime gives camphoric anhydride and phorone $\text{C}_{10}\text{H}_{16}\text{O}$ (Meyer, B 3, 117) Distillation of camphorates gives similar results

Salts — (Kemper, Ar Ph [2] 110, 106, 117, 23) $\text{NH}_4\text{HA}'$ 7aq — $(\text{NH}_4)_2\text{A}'$ — $\text{Li}_2\text{A}'$ — NaA' — KA' deliquescent — MgA'_2 7aq S 40 at 20° — MgA'_2 12aq — MgA'_2 18aq — CaHA'_2 — CaA'_2 4aq — CaA'_2 7aq — $\text{Ca}_2\text{H}_2\text{A}'_2$ 8aq — $\text{BaH}_2\text{A}'_2$ 2aq — BaA'_2 aq needles and feathers (Kinzett, C J 45, 93) — BaA'_2 4aq — ZnA' — PbA' — CuA' — $\text{Ag}_2\text{A}'$

Ethyl-ammonium salt $(\text{NH}_4\text{Et})_2\text{A}'$ small needles (from alcohol) Converted by PCl_5 into camphoric diethyl imidne

Mono methyl ether MeHA' [68°]

$[\alpha]_D = 51.4^\circ$ Trimetric prisms (from ether), gives camphoric anhydride when distilled. V sl sol water (Loir, A Ch [3] 38, 483)

Mono ethyl ether EtHA' SG 12 1 095

Syrup

Di ethylether EtA' (286°) SG 12 1 029

Formed, together with camphoric anhydride, by the distillation of the mono ethyl ether (Malaguti, A Ch [2] 64, 152, 70, 360, Meyer, B 3, 118) Liquid Chlorine produces a tetrachloro-derivative $(\text{C}_2\text{H}_2\text{Cl}_2)_2\text{A}'$ SG 14 1 386

Chloride $\text{C}_{10}\text{H}_8\text{O}_4\text{Cl}_2$ Heavy oil, decomposing at 200° (Mortessier, A 120, 352)

Anhydride $\text{C}_{10}\text{H}_8\text{O}_3$ [217°] (above 270°)

SG 12 1 194 $[\alpha]_D = -7.7^\circ$ (in benzene)

Formed by heating camphoric acid or its salts (Bouillon Lagrange, A Ch 23, 153, Laurent, A Ch 63, 207, Malaguti, A Ch 64, 151, Blumenau, A 67, 119, Monoyer, J Ph [3] 45, 177) Formed also from camphoric acid by the action of (1 mol of) PCl_5 (Gerhardt a Chiozza, A 87, 294), of conc H_2SO_4 of Ac_2O , or of AcCl (Anschutz, B 10, 1881) Long trimetric prisms (from alcohol) (Montgolfier, A Ch [5] 14, 5) V sl sol water, v sol alcohol, v e sol ether Slowly converted by boiling water into camphoric acid The statement of Brodie (Pr. J, 361, 12, 655) that barium peroxide formed camphoric peroxide has been denied by Kingzett (C J 45, 93)

Amide $\text{C}_6\text{H}_4(\text{CONH}_2)_2$ Amorphous mass (Mortessier, A 120, 253)

Imide $\text{C}_6\text{H}_4\text{C}_2\text{O}_2\text{NH}$ [180°] (in sealed tubes, Ballo, A 197, 332) Formed by heating ammonium camphoramate at 160° (Laurent, Compt chim 1845, 147, A 60, 327) Laminæ May be distilled

Ethylimide $\text{C}_6\text{H}_4\text{C}_2\text{O}_2\text{NEt}$. [50°] (275°) Colourless crystals. Prepared by dis-

X X

tilling ethylamine camphorate (Wallach & Kamenskii, *B* 14, 164, *A* 214, 248)

Allyl imide C_6H_5, C_2O, NC_2H_5 [49°]

Formed by heating camphoric acid with allyl thiocarbimide Insol water, sol alcohol and ether

Phenyl imide C_6H_5, C_2O, NPh [116°] Formed, together with phenyl camphoramidic acid, by warming camphoric anhydride with aniline (Gerhardt & Laurent, *A* 68, 85) Needles (from ether), insol cold water

Diethyl imido imidine C_4H_8, N_2O & e

$C_6H_5, \begin{matrix} C=NC_2H_5 \\ >NC_2H_5 \\ C=O \end{matrix}$ (286°) SG 15 1018

Liquid, v sl sol water Pps salts of Cu and Fe Prepared by the action of PCl_5 on ethylamine camphorate or by the action of ethyl

amine on the chloride $(C_2H_5, \begin{matrix} CCl_2 \\ >N \\ CO \end{matrix})NEt$ obtained

from PCl_5 and camphoric ethyl imide By HCl at 200° it is decomposed into ethylamine and camphoric ethyl imide Salts— $B'HCl$ deliquescent crystals— $B'HI$ sparingly soluble needles— $(B'HI)PtCl$ Its *ethyl iodide* $B'EtI$ [245°], forms long colourless prisms (Wallach & Kamenskii, *B* 14, 162, *A* 214, 242)

Nitrile $C_6H_5, (CN)_2$ Formed, in small quantity, together with hydrocarbons C_6H_5 , and $C_{20}H_{32}$, by distilling ammonium camphoramate with P_2O_5 (Ballo, *A* 197, 334) Crystalline, insol water

Camphoramidic acid $C_6H_5, (CONH_2)(CO_2H)$ So called '*amido camphoric acid*' The ammonium salt is formed by the action of NH_3 on an alcoholic solution of camphoric anhydride (Laurent, *Compt chim* 1845, 147, *A* 60, 326) Trimetric crystals, m sol hot water, v sol alcohol— NH_4A' aq [100°] When heated with dry $ZnCl_2$ it gives xylene tetrahydride and a terpene (Ballo, *B* 12, 324)— PbA'' — AgA'

Phenyl camphoramidic acid

$C_6H_5, (CONPh)(CO_2H)$ Formed by boiling the phenyl imide of camphoric acid with alcoholic NH_3 , or camphoric anhydride with aniline Needles (from alcohol), v sl sol boiling water— AgA' (Laurent & Gerhardt, *A* 68, 36)

Bromo camphoric anhydride

$C_6H_5, Br, \begin{matrix} CO \\ <CO \end{matrix} >O$ From camphoric anhydride (10 g) and Br (15 g) at 130° (Woringer, *A* 227, 3), an additive compound C_6H_5, O, Br_2 appears to be first formed (Wreden, *A* 163, 330) Trimetric crystals (from chloroform) $abc = 8866 \times 5766$ NH_3 gives the imide of oxy-camphoric acid

(a) **Oxy-camphoric acid** C_6H_5, O Formed, together with pimelic acid, by fusing camphor with KOH (Hlasiwetz & Grabowski, *A* 145, 212) Thick liquid, the salts are amorphous.

(b) **Oxy-camphoric acid** C_6H_5, O

Anhydride $C_6H_5, O, 2e$

$C_6H_5, (OH)C_2O, O(?)$ **Camphanic acid** [201°] Formed by boiling bromo-camphoric anhydride with water (Kachler, *A* 162, 264) Monoclinic prisms (containing aq or 2aq) (Grünling, *A* 227, 4) Sublimes at 110° Decomposed on distillation giving CO_2 , lauronic acid $C_{12}H_{21}O_2$, and 'campho lactone' $C_6H_8O_2$ Water at 180°

splits it up into CO_2 and C_6H_5 , (119°)— $Ba(C_6H_5, O)_2, 13aq$ — $Ca(C_6H_5, O)_2, 3aq$

Ethyl ether EtC_6H_5, O , [68°] From bromo camphoric anhydride and alcohol at 150°.

Prisms

Imide $C_6H_5, NO, 2e$ $C_6H_5, (OH)C_2O, NH(?)$ [208°] **Amido-camphoric anhydride** From bromo camphoric anhydride and conc NH_3 aq at 150° (Wreden, *A* 163, 339) Long needles (from alcohol) Sublimes at 150° Converted by nitrous acid into the anhydride

Oxy camphoramidic acid $C_6H_5, NO, 2e$ $C_6H_5, (OH)(CONH_2)(CO_2H)$ '*Amido-camphoric acid*' [160°] Formed by boiling the imide of oxy camphoric acid with dilute KOH (Wreden, *A* 163, 340) Prisms containing aq (from alcohol) On fusion it is converted into the parent imide Converted into oxy camphoric anhydride by HNO_3 , by conc HCl aq, or by H_2SO_4 — CaA' , 2aq

'**Sulpho camphoric acid**' so called C_6H_5, SO_3 [160°–16°] **Sulphocamphyllic acid** Formed, together with CO , by heating camphoric acid or anhydride with conc H_2SO_4 (Walter, *A Ch* [3] 9, 177, Kachler, *A* 169, 179) Triclinic prisms (containing 2aq), $a b c = 8515 \times 17590$, $\alpha = 82^\circ 39'$, $\beta = 121^\circ 10'$, $\gamma = 111^\circ 36'$ (Zepharovich, *Stz* B 73, 7) V e sol water, alcohol, and ether HNO_3 (SG 125) converts it into C_6H_5, SO_3 Potash fusion gives C_6H_5, O_2 [148°], insol cold water, but separating from alcohol in monoclinic crystals

Salts— $(NH_4)A'$ aq— KA' — CaA' — BaA' — PbH_2A'' , 4aq trimetric— PbA'' — $BaCuA''$, 2— AgA''

ISOMERIDES OF CAMPHORIC ACID

Lævo-rotatory camphoric acid $C_{10}H_{16}O_4$, [186°] $[\alpha]_D = -46.3^\circ$ (in alcohol) Formed by the oxidation of lævo rotatory $[\alpha]_D = -38^\circ$ borneol, or the corresponding camphor, by heating for several hours with a large excess of HNO_3 (SG 127) (Chautard, *C R* 37, 166, Haller, *C R* 103, 64) Resembles camphoric acid in all respects except that its rotation though equal is opposite

Inactive camphoric acid $(C_{10}H_{16}O_4)_2$, [204°]. S 1, S (alcohol) 33, S (ether) 28 (C) Formed by heating inactive camphor with HNO_3 at 100°, or by mixing equal weights of dextro and lævo camphoric acids (Chautard, *C R* 56, 698, Armstrong & Tilden, *C J* 85, 757, Haller, *C R* 105, 66) Less soluble than its isomerides

Diethyl ether Et_2A' (270°–275°) SG 15 103 (C)

Anhydride $(C_{10}H_{16}O_3)_2$, [228°] (A & T) S (chloroform) 25, S (ether) 4, S (alcohol) 15 (C) Formed by heating the acid

An inactive camphoric acid [186°] was obtained by Muir (*C J* 87, 685) by oxidising the camphor of oil of sage

Meso-camphoric acid $C_{10}H_{16}O_4$, [118°]

Formation—1 Formed by heating dextro-camphoric acid (5 g) with (20 cc) fuming HCl at 140° for 30 hours (Wreden, *Z* [2] 7, 419, *A* 163, 328, *B* 6, 565)—2 By heating dextro-camphoric acid (5 g) with HI (80 cc of SG. 1.6) at 160°—3 By heating camphoric acid with water at 200° (Jungfleisch, *B* 6, 268, 680) 4 Together with 'sulphocamphoric acid' by the

action of H_2SO_4 on camphor. Occurs also in small quantity in the preparation of camphoric acid from camphor and HNO_3 (Kachler, A 169, 179, 191, 146).

Properties—Crystalline, but separates from alcohol and ether as an oil. More soluble than ordinary camphoric acid. Conc H_2SO_4 converts it on warming into 'sulphocamphoric acid'. When heated it gives the anhydride of ordinary camphoric acid. Boiling dilute HCl changes it into inactive camphoric acid.

CAMPHORIDE $C_{16}H_{14}O_8$ [222°] Occurs together with galangin and alpinin in the galanga root (*Alpinia officinarum*). Flat yellow needles (containing aq), sublimable. Sol hot alcohol, ether, and acetic acid, sl sol chloroform and benzene, insol water. Dissolves in alkalis. On oxidation with dilute HNO_3 it produces amic and oxalic acids.

Salts— $A''Pb$ yellow amorphous pp— $A''Pb_2O$ — $A''Ba_2aq$ orange pp.

Di-acetyl derivative $C_{16}H_{16}O_4(OAc)_2$ [189°] Colourless crystals. Insol water. Sl sol alcohol.

Di benzoyl derivative $C_{16}H_{16}O_4(OBz)_2$ [186°] Fine white needles. Scarcely sol alcohol, insol water.

Di bromo derivative $C_{16}H_{16}Br_2O_4$ [225°] Yellow needles. Sl sol alcohol (Jahns, B 14, 2385).

CAMPHOR-IMIDO-ACETIC ETHER

$C_{16}H_{21}NO_4$, i.e. $C_6H_5 \cdot \begin{smallmatrix} CO \\ \diagup \quad \diagdown \\ CO \end{smallmatrix} \cdot NCH_2CO_2Et$ [86°]

Formed by adding a solution of CH_2ClCO_2Et to a solution of sodio camphorimide in absolute alcohol. Large transparent crystals (from alcohol), sol ether (Haller & Arth, C R 105, 281).

CAMPHOR OIL An oil obtained, together with camphor, by distilling the wood of *Laurus camphora* with water. It consists chiefly of 'camphorogenol' but contains also several terpenes (q v).

Camphorogenol $C_{16}H_{18}O_2$ or $C_{16}H_{16}O_2$ or $C_{16}H_{14}Oaq$ (?) SG 29 9794 $[a_D] = 29.6^\circ$. An oil, v e sol alcohol and ether. HNO_3 acts upon it forming a small quantity of camphor. CrO_3 acts similarly. Excess of conc HNO_3 gives camphoric acid [185°], $[a_D] = 40.3^\circ$. Ac_2O has no action. Sodium reduces it, in alcoholic solution, to borneol, [198°], (212°), $[a_D] = 22.9^\circ$. With $ZnCl_2$ it yields cymene (Yoshida, C J 47, 785, Oishi, C N 50, 275, Wallach, A 227, 296, Lallemant, A Ch 81 57, 404).

CAMPHOR-PHORONE v PHORONE

CAMPHORONIC ACID $C_{16}H_{16}O_6$ Mol w 218 [137°] Formed by oxidising campholol or camphanic acids (Bredt, B 18, 2989).

Preparation—From camphor and HNO_3 . Present in the mother liquor from which camphoric acid has separated. Obtained by means of the barium salt (Kachler) and purified by decomposing this with HCl, extracting with ether, boiling off the ether, dissolving in water, neutralising with lime and boiling. The pure calcium salt then separates (Bredt, A 226, 251, cf Kachler, B 7, 1728, A 159, 286, 162, 262, Kachler & Spitzer, M 6, 178).

Properties—Crystalline aggregates of needles, v e sol water, alcohol, and wet ether, sl sol pure ether. Produces on distillation CO_2 , iso

butyric acid and the anhydride $C_{16}H_{12}O_5$ [135°] which forms trimetric crystals, $a b c = 96.1 \ 82$ sol water, alcohol and ether. This anhydride forms with NH_3 the compound $C_{16}H_{11}(NH_3)O_5$ [c 128°], v sol water.

Reactions—1 $AcCl$ gives $C_{16}H_{12}O_5$, and then the anhydride $C_{16}H_{22}O_5$ [176°], crystals, insol cold alcohol and ether, reconverted into camphoric acid by boiling alkalis—2 Br at 130° gives oxy camphoric acid—3 Potash-fusion gives isobutyric acid—4 Aqua regia forms two acids $C_{16}H_{12}O_5$ —5 $KMnO_4$ gives $HOAc$ and an acid $C_6H_5O_4$ (Kachler, M 5, 415)—6 The Ca salt distilled with lime gives a ketone $C_{16}H_{12}O$.

Salts— NH_4HA'' [128°]— $(NH_4)_2HA''$ [148°]— $K_2HA''aq$ — $Ca_2A''_{12}aq$ — $BaHA''aq$ m sol water— $Ba_2A''_{12}$ insol water— $Ba_4A''_{12}$ — $Ba_6A''_{12}$ — $10aq$ — $ZnHA''$ v e sol water— $CdHA''_{12}$ — $6aq$ — PbA''_{12} — $4aq$ — $Cu_2A''_{12}$ — $2aq$ — $CuHA''_{12}$ — $2aq$ — $Cu_2A''_{12}$ — $Ag_2A''_{12}$ — $Ag_4HA''_{12}$ — aq .

Mono ethyl ether—The anhydride (302°) (or anhydrides liquid and solid (67°), Hjelt, B 13, 797) $C_{16}H_{11}EtO_5$ of this ether is formed together with alcohol by distilling the di-ethyl ether.

Di ethyl ether Et_2HA'' From the acid, alcohol, and HCl.

Tri ethyl ether Et_3A'' (302°) From Ag_2A'' and EtI . Liquid.

Chloride $C_{16}H_{11}OCl$ [131°] Needles, sl sol water, sol alcohol and ether.

Mono amic acid $C_6H_5(CONH_2)(CO_2H)$.

Anhydride $C_{16}H_{11}NO_4$ [212°] From liquid mono ethyl camphoronate and alcoholic NH_3 (Hjelt, B 13, 798). By the same treatment the solid ethyl camphoronate gives a compound $C_{16}H_{12}N_2O_4$ (? di amic acid) crystallising with $HOEt$. It melts at [145°], and is converted by boiling $HClaq$ into camphoric acid.

Di amic acid $C_6H_5N_2O_4$, i.e. $C_6H_5(CONH_2)_2(CO_2H)$ [c 160°] From di-ethyl camphoronate and NH_3 at 120° (H). $HClaq$ converts it into a compound $C_{16}H_{11}NO_4$ [212°].

Constitution—Camphoronic acid appears to contain 3 carboxyls $C_6H_{11}(CO_2H)_3$, as shown by the salts and ethers. $AcCl$ gives no acetyl derivative. The formation of an anhydride by distilling the ether does not prove it to be lactonic. Potash fusion produces iso butyric acid, hence it contains isopropyl. Since it does not split off CO_2 on distillation, the carboxyls must be attached to different carbon atoms. Hence it is iso propyl tri carboxylic acid.

$CH(CO_2H)CPr(CO_2H)CH_2CO_2H$ or $CH_2(CO_2H)CH(CO_2H)CHPrCO_2H$.

Oxy-camphoric acid $C_{16}H_{14}O_7$ [c 210°] Formed by heating camphoric acid $C_{16}H_{16}O_6$ (1 mol) with Br (1 mol) for two hours at 130° (Kachler, A 159, 296). Monoclinic crystals (containing aq), $a b c = 1.4918 \ 1.9808$, $\beta = 86^\circ 50'$. According to Zepharovich (J 1877, 641) they are dimorphous. V sol water, alcohol, and ether, may be distilled.

Salts— $KHA''aq$ crystals— K_2A'' gummy.— $BaA''aq$ pearly plates— $Pb_3(C_6H_5O_4)_2aq$ — Ag_2A'' .

Hydro-oxy-camphoric acid v CAMPHOR. CAMPHOROXIM $C_{16}H_{17}NO_4$ i.e. $C_{16}H_{16}NOH$ [115°] (c 250°) Formed by the action of hydroxylamine on camphor (Nägeli, B 16, 498).

Long needles Smells like camphor and rotates on water Sol alcohol, ether, acids and alkalis

Reactions—1 Hydroxylamine is not split off by heating with aqueous HCl even at 120°—2 By heating with acetyl chloride it loses H₂O yielding the nitrile of campholenic acid C₁₀H₁₃N (Goldschmidt & Zurrer, *B* 17, 2069)—3 Is reduced in alcoholic solution by metallic sodium

to bornylamine C₁₀H₁₇N $\begin{array}{c} \text{CH}_2 \\ \diagup \\ \text{C} \\ \diagdown \\ \text{CH NH}_2 \end{array}$ The oxim

anhydride is reduced to the isomeric camphylamine (Leuchart & Bach, *B* 20, 111)

Hydrochloride C₁₀H₁₃NOH.HCl white powder, sl sol water, v sol alcohol and acids

Sodium salt—C₁₀H₁₃N(ONa) white powder, v sol hot water and hot alcohol

Ethylether C₁₀H₁₃N(OEt) (209°), mobile liquid

Anhydride C₁₀H₁₃N (217°), liquid, formed by heating camphoroxim with acetyl chloride Is the nitrile of CAMPHOLENIC ACID (*q v*) (Nageli, *B* 16, 2981)

Isocamphor-oxim is the amide of CAMPHOLENIC ACID (*q v*)

CAMPHO-TERPENE v TERPENES

CAMPHERE v PHORONF

CAMPHERESIC ACID or **CAMPHERETIC ACID** so called by Schwanert (*A* 128, 77) has been shown by Kachler (*A* 191, 143) to be a mixture of camphoric and camphoronic acids

CAMPHYLAMINE C₁₀H₁₅N possibly C₁₀H₁₃(CH₂NH)CH₂ (195°) Prepared by adding metallic sodium to an alcoholic solution of campholenic nitrile (camphor oxim anhydride) Colourless liquid Volatile with steam Readily absorbs CO₂ from the air and solidifies to a crystalline carbonate Primary base

Salts—B⁺H₃Cl.PtCl₄ glistening golden plates, nearly insol water—B⁺HCl.HgCl₂ colourless orthorhombic plates, sol hot water—B⁺C₂H₃O₄.aq [194°], colourless orthorhombic glistening crystals, v sol hot water—B⁺H₂SO₄ long rhombic prisms, m sol cold water—B⁺H₂CrO₄ orange red plates—The picrate forms fine yellow needles, [190°–194°]

Benzoyl derivative C₁₀H₁₃NBz [77°], colourless prisms (Goldschmidt & Schulhof, *B* 18, 3297, 19, 708, 20, 483)

Isomeride v BORNYLAMINE

CAMPHYL-PHENYL-THIO-UREA

SC(NHC₆H₅)(NHC₁₀H₁₃) [118°] Formed by combination of phenyl thiocarbimide and camphylamine Short colourless prisms V sol alcohol and benzene, sl sol ether, v sol ligroin (Goldschmidt & Schulhof, *B* 19, 712)

CAMPHYL-DI-THIO-CARBAMIC ACID C₁₀H₁₃NHCS₂SH The camphylamine salt, C₁₀H₁₃NHCS₂NH₂(C₁₀H₁₃), is formed by mixing camphylamine with CS₂ White powder, [110°–116°], sol benzene The sodium salt C₁₀H₁₃NHCS₂Na forms white glistening plates, sol cold, decomposed by hot water (Goldschmidt, *B* 19, 712)

CANADA BALSAM Exudes from incisions in the bark of *Abies balsamea* Transparent thick liquid with refractive index (1.532) nearly the same as that of crown glass Dextro-rotatory Steam distillation separates a levorotatory terpene (167°), which forms a crystalline compound with HCl (Donastre, *J. Ph.*

8, 572, Caillot, *J Ph* 16, 436, Wirzen, *Dissertation*, Helsingfors, 1849)

CANADOL A term applied by Vohl (*D P J* 172, 319) to that portion of the volatile hydrocarbons of Canadian and Pennsylvanian petroleum which boils at 60° and has a SG 65 to 70 It is also called petrolum ether or ligroin. It consists chiefly of *n* hexane

CANANGA OIL *Alan gulan* From *Cananga odorata* Neutral oil (170°–190°) It contains benzoyl and acetyl derivatives, a compound that unites with NaHSO₃, and probably a phenol (Fluckiger, *Ph* [8] 11, 934)

CANARIUM The fixed oil of *Canarium commune* contains 51 p.c olein and 49 p.c stearin and myristin (Oudemans, *J pr* 99, 407)

CANAUBA WAX v CARNALBA WAX

CANE SUGAR v SUGAR

CANNABIS INDICA Indian hemp when distilled with steam yields an essential oil C₁₅H₂₄ (257°), VD $\frac{1}{1}$, SG $\frac{2}{3}$ 93, [α]_D = –10.81 at 25.5° (in chloroform) The oil resinifies on exposure (Valenta, *G* 10, 479, 11, 190, cf Martius, *C C* 1856, 225, Personne, *J Ph* [3] 31, 46) HNO₃ (SG 1.32 to 1.42) acting on the resinous extract of Indian hemp forms 'oxy cannabene' C₁₀H₁₀N₂O₂ (Bolas & Francis, *C J* 22, 417, *C N* 24 77) This separates from methylated spirit in flat yellow prisms [176°], insol water, sl sol alcohol Indian hemp, and its alcoholic extract, contain a poisonous resin (T a H Smith, *Ph* 6, 127, 171, Martius) Hay (*Ph* [3] 13, 998) has extracted a crystalline alkaloid 'tetano cannabine' which produces tetanus in frogs The fixed oil from hemp seed (*Cannabis sativa*) is probably a fatty oil, though Lefort (*C R* 85, 734) gives it the formula C₁₁H₂₂O₂ and describes C₁₁H₂₀Cl₂O₂ and C₁₁H₂₀Br₂O₂ as products of substitution

CANNON-METAL v COPPER, ALLOYS OF
CANTHARENE C₁₂H₁₂ i.e. C₆H₄(CH₂)₂ [12, (184°) o Xylene dihydrate

Formation—1 By heating cantharic acid with fused KOH.—2 By heating cantharic acid or cantharidin with water at 300°, CO₂ being split off—3 In a pure state by boiling with conc aqueous KOH, the product C₁₂H₁₀O₂I₂, obtained together with cantharic acid by the action of HI upon cantharidine (Piccard, *B* 12, 577, 19, 1404)

Properties—Liquid, smelling like turpentine and camphor Absorbs oxygen with avidity Dilute HNO₃ oxidises it to o toluic and phthalic acids

CANTHARIC ACID C₁₀H₁₀O₄ i.e. (C₆H₄)₂OCO₂H [278° cor] S 85 at 15°, 85 at 100° Prepared by heating 1 pt of cantharidine with 4 pts of HI (1.96 SG) for 2½ hours at 100° Trimetric crystals (from water), v e sol alcohol, v sl sol ether Distilled with lime it gives cantharene, a little xylene, butyric acid, and di methyl-benzoic acid It is an α-ketonic acid, for on heating with di methyl aniline and ZnCl₂ it evolves CO₂ and yields a condensation product C₂₂H₂₀ON₂, the latter is converted into a green colouring matter by MnO₂, into a violet colouring matter by chloranil or arsenic acid—A'Ag white pp—KA' slender needles—PbA'.2aq

Methyl ether A'Me. (210°–220°) at 50 mm, colourless liquid.

Ethyl ether A^{Et} (c 300°)

Oxim $C_9H_7O_4(NOH)$ [175°–180°], colourless four sided plates (Piccard, *B* 10, 1504, 11, 2121, Homolka, *B* 19, 1086)

CANTHARIDIC ACID $C_{10}H_7O_4$, *re* ($C_9H_5O_4$) CO CO H The alkaline salts are formed by heating cantharidin with aqueous alkalis. When a cold solution of the salts is treated with acids, the free cantharidic acid appears to be formed, but on warming the solution it loses H₂O and cantharidin is precipitated. With hydroxylamine it gives an *oxim*, from the salts of which acids liberate the oxim of cantharidine— $Ag_2A''aq - Ag_2A''2aq$ (NH_4)₂A''aq— $K_2A''aq - CdA''aq - K_2CuA''2aq$

Di methyl ether A''Me₂ [91°], large flat glistening prisms, sol alcohol, ether, and hot water, sl sol cold water (Homolka, *B* 19, 1082, Dragendorff & Masing, *Z* 1867, 464, Masing, *J* 1872, 841)

CANTHARIDIN $C_{10}H_7O_4$, *Lactone of cantharidic acid* [218° cor], *S* 02 at 15°, 29 at 100°, *S* (alcohol) 21 at 78°, 13 at 15°, *S* (benzene) 3.38 at 80°, 51 at 15° (Rennard), *S* (ether) 11 at 18°, *S* (CS₂) 06 at 18°, *S* (CHCl₃) 1.2 at 18° (Bluhm)

Occurrence—In Spanish flies (*Lytta vesicatoria*) and many other insects (Thierry, *A* 15, 315, *J Ph* 21, 44, Robiquet, *A Ch* 76, 302, Gossuann, *A* 86, 317, Pocklington, *Ph* [3] 3, 681, Regnault, *A Ch* [2] 68, 159, Warner, *Am J Ph* 28, 193, Ferrer, *J* 1860, 597, Mortreux, *J Ph* [3] 46, 33, Fumouze, *J Ph* [4] 6, 161, Bluhm, *Z* [2] 1, 675, Dragendorff, *Z* [2] 3, 187, 464, 4, 308, Rennard, *C C* 1872, 568, Wolff, *Ar Ph* [3] 10, 22, Piccard, *B* 10, 1504)

Preparation—1 Powdered cantharides are extracted with chloroform or ether, the solvent is evaporated and the residue freed from fat by washing with CS₂.—2 Cantharides are mixed with water and MgO, dried, treated with dilute H₂SO₄ and then shaken with ether

Properties—Trimetric plates. Blisters the skin. Sublimes readily at 85° (Blyth)

Reactions—1 HI forms cantharic acid.—2 By distillation with P₂S₅ it gives *o* xylene (Piccard, *B* 12, 580).—3 By heating with alkalis it is converted into salts of cantharidic acid $C_{10}H_7O_4$, from whose hot solutions cantharidin is reprecipitated on the addition of acids

Oxim $C_{10}H_7O_4(NOH)$ [166°], splendid long glistening prisms, v e sol alcohol and ether, v sol hot water, sl sol cold. By conc HCl at 150° it is split up into its constituents— $C_{10}H_7O_4(NOAg)$ four sided prisms— $C_{10}H_7O_4(NOMe)$ [134°], large colourless prisms, v e sol alcohol and ether, v sol hot, sl sol cold, water (Homolka, *B* 19, 1082)

Compound $C_{10}H_7O_4I_2$ 'Cantharidin iodide' is formed as a byproduct (5–8 p.c.) in the preparation of cantharic acid by the action of HI (196 S.G.) upon cantharidin at 85°. Crystalline solid. V sol benzene and chloroform, sl sol alcohol, insol water. On boiling with conc KOH it is converted into pure cantharene (*o* xylene dihydride) $C_{10}H_8(CH_2)_2$ (Piccard, *B* 19, 1404)

CAOUTCHOU *India rubber* This substance is obtained from the milky sap of

various trees belonging to several natural orders. The sap, which is obtained by making an incision in the bark of the tree, is a white creamy liquid with a sp gr 1.012

The caoutchouc exists in the sap in the form of minute globules, and is consolidated in various ways, often by heating over a smoky fire which produces the brown colour of the commercial article

Caoutchouc is colourless when pure, it is a bad conductor of heat and a non conductor of electricity S.G. about 925. At ordinary temperatures it is soft, flexible, and very elastic, but at about 10° it begins to lose its elasticity, and at 0° becomes hard and rigid. When heated it loses its elasticity and becomes soft, slowly resuming its original properties when cooled, if heated to 150°–200° it melts, and after this it remains semi liquid and sticky on cooling. It burns readily with a smoky flame, leaving little or no ash

Exposure to air in the absence of light produces little effect on caoutchouc, but light and air together cause it to lose its elasticity and become glutinous, due to the absorption of oxygen (Spiller, *C J* 18, 44, Miller, *ibid* p. 273)

Caoutchouc is insoluble in water, but when immersed in it becomes white and increases in bulk, absorbing about 25 p.c. of its weight of water, which is given up again on exposure to air. Alcohol acts upon it in a similar way

Dilute acids do not affect it, but it is attacked by strong nitric or sulphuric acid. Chlorine renders it hard and brittle. Alkalis produce little effect

Ether, benzene, mineral oil, sulphide of carbon, chloroform, oil of turpentine, oil of caoutchouc, and many essential and fixed oils, act upon caoutchouc, causing it to swell greatly and become gelatinous and soft. The action of these solvents appears to be to dissolve one constituent part of the caoutchouc, leaving the less soluble part in a disintegrated condition

According to Payen, sulphide of carbon with about 5 p.c. of absolute alcohol is the best solvent

Caoutchouc is composed of carbon and hydrogen. The proportions vary in different analyses C 86.1–90.6 p.c., H 10–12.8 p.c. It appears to consist chiefly of two hydrocarbons, which can be partly separated by the prolonged action of a solvent, but the proportion of these constituents obtained varies according to the solvent employed. The more soluble part is soft and ductile, while the less soluble is tenacious and elastic

When caoutchouc is subjected to dry distillation an oil consisting of a mixture of various hydrocarbons is obtained. This is called oil of caoutchouc.

Among the constituents of this oil are isoprene C_5H_8 (37°–38°) S.G. 682, caoutchene $C_{10}H_{16}$ (171°) S.G. 842, and heveene (315°) S.G. 921 (Himly, *A Ch* 27, 41, Gregory, *ibid* 16, 61, G. Williams *Pr* 10, 517, Bouchardat, *J Ph* 1837, 454, *Bl* 24, 108, *C R* 89, 361)

When isoprene is acted on by strong hydrochloric acid a mixture of the mono and dihydrochlorides, together with a solid substance, is obtained. This latter is identical in its proper-

ties with caoutchouc (Bouchardat, *C R* 89, 1117)

Vulcanised caoutchouc—When caoutchouc is heated to about 115° in contact with sulphur, it absorbs some of the latter and becomes vulcanised. The introduction of the sulphur can be attained in many ways, immersion in a mixture of carbon disulphide and chloride of sulphur, or in a solution of polysulphide of calcium, &c.

About 2 p.c. of sulphur appears to enter into combination with the caoutchouc. If more than this quantity is introduced the excess remains mixed with the rubber and can be dissolved out by the ordinary solvents of sulphur, while the combined sulphur cannot be so extracted. An excess of sulphur renders the caoutchouc less durable. Vulcanised caoutchouc does not lose its elasticity at a low temperature and does not soften so easily with heat as ordinary rubber. It is less affected by solvents than pure caoutchouc.

The ordinary vulcanised rubber, besides containing an excess of sulphur, is often adulterated with 40–60 p.c. of mineral matter.

Ebonite—When caoutchouc is heated with half its weight of sulphur, with or without the addition of some mineral matter, a hard dark substance which can be polished is obtained. This is much used for insulating purposes, but according to Wright (*Am S* [3] 4, 29) it becomes hygroscopic when exposed to the action of ozone owing to the formation of H_2SO_4 . Ebonite is little affected by the solvents of caoutchouc.

CAPSAICIN $C_8H_{15}O_2$ [59°]

Preparation—Powdered cayenne pepper (*Capsicum fastigiatum*) is extracted with ether, the extract is evaporated, dissolved in hot alcoholic KOH, diluted with water, ppd by $BaCl_2$, and the dried pp treated with ether. On evaporating the extract, an oily red liquid remains, which is dissolved in dilute potash, and ppd by addition of ammonium chloride.

Properties—Colourless prismatic crystals, insol water, sol alcohol. Begins to volatilise at 100° . Powerful irritant. The pungent taste is removed by heating with potassium bichromate and dilute sulphuric acid. $BaCl_2$ and $CaCl_2$ in alcoholic solution give a pp sol ether, $AgNO_3$, a pp sol ammonia, $FeCl_3$ a red pp when warmed (Thresh, *Ph* [3] 7, 21, 259, 473).

CAPSICINE An alkaloid which may be extracted by benzene from the fruit of *Capsicum fastigiatum*. The benzene is evaporated, and the residue dissolved in ether, from which the alkaloid is obtained by shaking with dilute H_2SO_4 (Thresh, *Ph* [3] 6, 941). Needles, insol water, *v* sol alcohol and ether, may be sublimed. Volatile with steam. It is not pungent. The hydrochloride crystallises in cubes and tetrahedra, the sulphate in prisms.

CAPSULESCIC ACID $C_{12}H_{24}O_8$. An acid obtained from the husks of the horse chestnut (Rochleder, *Z* 1867, 83). Crystals, may be sublimed. $FeCl_3$ turns its solution greenish-blue.

CARAGHEEN MOSS *Irish pearl moss* A gelatinous seaweed (*Chondrus crispus*). Swells up in cold water, almost entirely dissolves in hot water. Ppd by $Pb(OAc)_2$. Appears to be chiefly composed of a carbohydrate, which is insol Schweizer's solution, and not turned blue by H_2SO_4 and I (Schmidt, *A* 51, 56, Flückiger a Obermayer, *N R P* 1868, 350). Caragheen moss gives galactose when boiled with dilute H_2SO_4 (Haedicke, Bauer, a. Tollens, *A* 238, 302).

CARAJURA A red dye, probably identical with china red. Insol water, sol alcohol and dilute alkalis, reppd by acids (Virey, *J Ph* 1844, 151).

CARAMEL A black substance obtained by heating cane sugar at c 200° . It is said to be a mixture of caramelen $C_{12}H_{16}O_8$, caramelen $C_{12}H_{16}O_{12}$, and caramelin $C_{12}H_{16}O_{10}$. They all reduce Fehling's solution. Dilute (84 p.c.) alcohol extracts caramelen, cold water then dissolves caramelen, leaving caramelin. Caramelen is a colourless, brittle, deliquescent resin— $C_{12}H_{16}O_8 \cdot BaO$ — $C_{12}H_{16}O_{10} \cdot PbO$. Caramelin is a mahogany coloured solid— $C_{12}H_{16}O_{12} \cdot BaO$, $C_{12}H_{16}O_{12} \cdot PbO$. Caramelin is a glittering black solid, sol boiling water— $C_{12}H_{16}O_{10} \cdot BaO$, $C_{12}H_{16}O_{10} \cdot PbO$ — $C_{12}H_{16}O_{10} \cdot PbO$ (Géhlis, *A. Ch* [3] 52, 352). Caramelen and caramelin are crystalloids, caramelin is a colloid. The formulas and purity of these bodies are, of course, very doubtful, other

observers have arrived at somewhat different results, indeed the nature of the resulting products depends upon the temperature used in preparing them (Péligot, *A Ch* [2] 67, 172, Völckel, *A* 85, 59, Maumené, *C R* 39, 422, Graham, *C J* 15, 258, Thomson & Sherlock, *C N* 25, 242, 282).

CARAWAY OIL Oil of caraway contains a terpene ($q v$) $C_{10}H_{16}$, identical with citrene, and carvol ($q v$) $C_{10}H_{16}O$.

CARB-ACETO-ACETIC ETHER is *mesitene lactone carboxylic acid*, p 20

CARBACETOXYLIC ACID $C_6H_8O_4$. A syrupy acid, said to be formed by the action of moist Ag_2O on β chloro propionic acid and on α, β di chloro propionic ether. Reduced by sodium amalgam to glyceric acid, and by HI to pyruvic acid (Wichelhaus, *A* 143, 7, 144, 351, Klumken, *B* 3, 468, 5, 477, 7, 1406, cf Beckurts & Otto, *B* 10, 2039).

TRI CARBALLYLIC ACID $C_9H_8O_8$, *ie* $CO_2H \cdot CH(CH_2 \cdot CO_2H)_3$ *s Propane tri carboxylic acid* Mol w 176 [158°] S 40.5 at 14°

Formation—1 In the preparation of sugar from beet root (Lippmann, *B* 11, 707, 12, 1649, Weyer, *C J* 38, 864)—2 By the saponification of its nitrile which is prepared by the action of KCy on β tri bromo propane in alcohol (M Simpson, *Pr* 12, 236, 14, 77, *C J* 18, 331)—3 By reducing α conitic acid or its ether with sodium amalgam (Dessaignes, *C R* 55, 510, Wichelhaus, *A* 132, 61, Hlasiwetz, *Z* 1864, 734)—4 By the action of potash on the product of the action of KCy on β chloro isocrotic ether (obtained from aceto acetic ether and PCl_5) (Claus & Lischke, *B* 14, 1089)—5 In the same way from α chloro crotic ether or from di-chloro propylene (epidichlorhydrin) (Claus, *B* 5, 558, 9, 223, *A* 170, 131, 191, 63)—6 Appears to be formed by the action of HCl and $KClO_4$ on gallic acid (Schreder, *A* 177, 292)—7 Acetyl-succinic ether is converted by Na into acetyl tri-carballylic ether $CH_3CO \cdot C(CH_2 \cdot CO_2Et)_3$, CO_2Et whence alcoholic KOH or baryta water produce tri-carballylic acid (Miehle, *A* 190, 322)—8 By the oxidation of di allyl-acetic acid by dilute HNO_3 (Wolff, *A* 201, 53)—9 By boiling citraconic acid with zinc and HCl (Behrmann & Hofmann, *B* 17, 2692)—10 From propane tetra carboxylic acid ($CO_2H \cdot CH_2 \cdot C(CO_2H)_2$), by heat (Bischoff, *A* 214, 66).

Properties—Hard short trimetric prisms (from water), v sol water and alcohol, sl sol ether. The ammonium salt gives with $BaCl_2$ or $CaCl_2$ no pp, even on adding NH_3 . $Pb(OAc)_2$ gives a white pp. Fe_2Cl_3 gives a red pp.

Salts— Na_2HA''' 2aq(?)— KH_2A''' — Ca_2A''' , 4aq— $BaHA'''$ — Ba_2A''' , 6aq— Pb_2A''' — Cu_2A''' — Ag_2A'''

Tri ethyl ether Et_3A''' (c 300°)

Tri isoamyl ether $(C_4H_9)_3A'''$ (above 360°)

CARBAMIC ACID CH_3NO_2 , *ie* $NH_2 \cdot CO_2H$

Amido formic acid *Amide of carbonic acid*. Not known in the free state. The ammonium salt is formed by the union of dry or moist CO_2 (1 vol) with gaseous NH_3 (2 vols) (J Davy, *N Ed. P J* 16, 345, Rose, *P* 46, 352, *A* 30, 47). Formed also by sublimation of neutral ammonium carbonate, and therefore occurs in commercial ammonium carbonate. Formed also

by oxidising glycocoll, leucine, tyrosine, and albumen, with alkaline $KMnO_4$ (Drechsel, *J pr* [2] 12 417, cf Hofmeister, *J pr* [3] 14, 178). It may be conveniently prepared by digesting commercial ammonium carbonate with saturated aqueous NH_3 for 30 or 40 hours at 20°–25° (Divers, *C J* 23, 215, cf Kolbe & Basaroff, *C J* 21, 194).

Reactions—1 *Acids* decompose carbamates with formation of CO_2 and NH_3 .—2 *Boiling water* converts carbamates into carbonates.—3 *Strongly heating* converts the Na salt into sodium cyanate and H_2O (Drechsel, *J pr* [2] 16, 199).

Salts—The carbamates are soluble in water (difference from most carbonates)— NH_4A' (*supra*) Deliquescent plates. Its aqueous solution quickly changes to carbonate, but it is stable in presence of excess of NH_3 in the cold. At 60° it is completely split up into CO_2 and NH_3 (Nau mann, *A* 160, 1, *B* 18, 1157, Horstmann, *A* 187, 48, Erckmann, *B* 18, 1154). In a sealed tube at 140° it forms urea— NaA' aq formed by adding $NaOEt$ to an alcoholic solution of the ammonium salt, prisms— KA' deliquescent— CaA'_2 aq ppd by adding lime and alcohol to a solution of NH_4A' at 0°, crystalline powder, sol water, the solution quickly deposits $CaCO_3$. When strongly heated it leaves calcium cyanamide— SrA'_2 — BaA' .

Chloride $OC(NH_2)Cl$ [c 50°] (62°). Prepared by passing a stream of dry $COCl_2$ into NH_4Cl heated to about 400°. Long broad needles. Strong odour. On keeping it slowly changes into cyanamide with evolution of HCl . By water it is decomposed into NH_4Cl and CO_2 . On vaporisation it probably dissociates into cyanic acid and HCl , which again recombine on cooling. By CaO it is converted into cyanic acid. With aromatic hydrocarbons in presence of $AlCl_3$ it gives amides of aromatic acids (Gattermann & Schmidt, *B* 20, 858).

Carbamic ethers Urethanes

Preparation—1 From chloro formic ethers and NH_3 .—2 From cyanic acid and alcohols.—3 From cyanogen chloride and alcohols.—4 By heating alcohols with urea nitrate.

Properties—Solid substances, sl sol water, v sol alcohol and ether, may be distilled.

Reactions—1 Heating with NH_3 gives urea. 2 P_2O_5 gives cyanates.—3 Alcoholic KOH acts upon carbamic ethers of the fatty series according to the equation $NH \cdot CO_2 \cdot C_2H_{2n+1} + KOH = KN \cdot CO + C_2H_{2n+1}OH + H_2O$ (Arth, *Bl* [2] 45, 702, *A Ch* [6] 8, 428). Bornyl and menthyl carbamates act similarly.

Methyl ether MeA' [52°] (177°) S 217 at 110°, S (alcohol) 73 at 15° (Echevarria, *A* 79, 110).

Ethyl ether EtA' *Urethane* Mol w 89 [c 50°] (c 182°). Formed by the above methods (Dumas, *A Ch* [2] 54, 233, *A* 10, 284, Liebig & Wöhler, *A* 54, 370, 58, 260, Wurtz, *A* 79, 286, *C R* 22, 503, Bunte, *Z* [2] 6, 96, *A* 151, 181). Also from carbonic ether and NH_3 (Cahours, *C R* 21, 629, *A* 56, 266).

Reactions—Alcoholic potash, at the ordinary temperature, gives large crystals of potassium cyanate. In this case $NH_4 \cdot CO_2K$ is not formed as an intermediate product. A solution of

urethane in absolute ether, treated with K or Na gives the derivatives KNHCO_2Et , and NaNHCO_2Et . Of these, the Na derivative is sufficiently stable for analysis. It is v sol absolute alcohol, insol absolute ether. With alcoholic potash containing water K_2O , is obtained the body HgNCO_2OEt is obtained by mixing alcoholic solutions of urethane, HgCl_2 , and KHO (Mulder, *R T C* 6, 170).

Acetyl derivative NHAcCO_2Et [78°] (Conrad a Salomon, *J pr* [2] 10, 28).

Chloro ethyl ether $\text{H}_2\text{NCO}_2\text{C}_2\text{H}_4\text{Cl}$ [76°] From NH_3 and the chloro ethyl ether of chloroformic acid. Prisms. V sol water, alcohol and ether (Nemirsky, *J pr* [2] 31, 174).

n-Propylether Pr^a [53°] (195°) (Ca hours, *J* 1873, 748, Roemer, *B* 6, 1102) Long prisms.

Isobutyl ether $\text{C}_4\text{H}_9\text{A}'$ [55°] (207°) (Mylus, *B* 5, 973, Humann, *A Ch* [3] 44, 340, *A* 95, 372).

Isoamyl ether $\text{C}_5\text{H}_{11}\text{A}'$ [60°] (220°) (Medlock, *A* 71, 106, Wurtz, *J Ph* [3] 20, 22) Needles.

Octylether $\text{C}_8\text{H}_{17}\text{A}'$ [55°] (155°) at 25 mm, (231°) at 760 mm. On distillation it is partially converted into cyanuric acid (Arth, *C R* 102, 977).

Bornylcarbamate *v p* 523

Menthylcarbamate *v* MENTHOL.

CARBAMIDE *v* UREA

CARBAMIDO- *v* URAMIDO

CARBAMINES *Carbylamines* *Iso nitriles*
Compounds of the formula RNC

Formation—1 By distilling primary monamines with chloroform and alcoholic potash $\text{RNH}_2 + \text{CHCl}_3 + 3\text{KOH} = 3\text{KCl} + \text{RNC} + 3\text{H}_2\text{O}$ (Hofmann, *A* 144, 114, 146, 107) —2 By treating an alkyl iodide (1 mol) with silver cyanide (2 mols) a double salt RNCAgCy is formed, on distilling this compound with conc aqueous KCy there is formed KCyAgCy and the carbamine passes over (Gautier, *A* 146, 119, 149, 29, 155, 151, 239) HgCy , and ZnCy , may also be used in preparing carbamines (Calmels, *Bl* [2] 43, 82) —3 In small quantity in preparing nitriles by distilling potassium alkyl sulphates with potassium cyanide —4 By distilling the compounds of thio carbimides with tri-ethylphosphine (Hofmann, *B* 3, 766, *Z* 7, 29).

Properties —Volatile striking poisonous oils

Reactions—1 Alkalis have no action —2 Mineral acids instantly convert them into alkylamines and formic acid $\text{RNC} + 2\text{H}_2\text{O} = \text{RNH}_2 + \text{HCO}_2\text{H}$ Water at 180° acts similarly 3 Dry HCl forms a compound, quickly decomposed by water as in 2 —4 Organic acids form alkyl formamides —5 EtI forms a compound (difference from nitriles) —6 HgO oxidises them to alkyl cyanates RNCO , alkyl formamides being also formed (Gautier, *A* 149, 311).

CARBAMINE-CYAMIDE or **CARBAMINE-CYANAMIDE** so called is described as AMIDO DI CYANIC ACID. Its derivatives are described as ETHYL-CARBIMIDO-UREA, CARBIMIDO ETHYL UREA, &c

CARBANIL *v* PHENYL CYANATE

CARBANILIC ACID *v* PHENYL-CARBAMIC ACID

CARBANILIDE *v* *s* DI PHENYL UREA.

CARBANILIDO- *v* PHENYL URAMIDO-

CARBAZOLE $\text{C}_{12}\text{H}_9\text{N}$ *is* $\left\langle \begin{smallmatrix} \text{C}_6\text{H}_5 \\ \text{C}_6\text{H}_5 \end{smallmatrix} \right\rangle \text{NH}$.

Mol w 167 [233°] (352° cor) V D 5.86 (calc 585) S (alcohol 92 at 14°, 8.88 at 78°. S (toluene) 55 at 16.5, 5.46 at 100° (Bechi, *B* 12, 1978).

Occurrence —Among the products of the distillation of coal tar, hence it occurs in crude anthracene (Graebe a Glaser, *B* 5, 12, 376, *A* 163, 343, 167, 125, 174, 180, 202, 21, Zeidler, *A* 191, 297).

Formation —1 By passing vapour of aniline or diphenylamine through a red hot tube —2 From imido di phenyl sulphide (thio di phenyl amine) by boiling $\text{HN} \left\langle \begin{smallmatrix} \text{C}_6\text{H}_5 \\ \text{C}_6\text{H}_5 \end{smallmatrix} \right\rangle \text{S}$ with freshly reduced copper for 2 or 3 hours, the yield is about 60 p c (Groske, *B* 20, 233).

Properties —White laminae or tables. Easily sublimates. A solution in conc H_2SO_4 is turned green by HNO_3 . May be distilled over red hot zinc dust without change. Although an imide, it forms a compound with picric acid and its acetyl derivative is obtained with difficulty.

Reactions —1 It is not affected by conc HClAq or alcoholic KOH even at 800°. Cold conc H_2SO_4 dissolves it without change, but at 100° a di sulphonic acid results —2 HNO_3 forms nitro compounds —3 Sodium amalgam does not reduce it in alcoholic solution, but EtI and P at 210° reduce it to carbazoline $\text{C}_{12}\text{H}_{11}\text{N}$ —4 By exhaustive chlorination with SbCl_5 it yields per chloro diphenyl or per chloro benzene according to circumstances as yet undetermined (Merz a Weith, *B* 16, 2875) —5 By heating with oxalic acid the compound $\text{C}_{12}\text{H}_9\text{N}_2\text{O}$ or $\text{HO C}(\text{C}_6\text{H}_5 \left\langle \begin{smallmatrix} \text{NH} \\ \text{C}_6\text{H}_5 \end{smallmatrix} \right\rangle)$, is obtained.

It forms minute crystals which very readily yield blue solutions (carbazole blue) on oxidation (Suida, *B* 12, 1403, Bamberger a Muller, *B* 20, 1903).

Potassium derivative $\text{C}_{12}\text{H}_9\text{NK}$. From carbazole and KOH at 230°. Picric acid compound $\text{C}_{12}\text{H}_9\text{NC}_6\text{H}_3(\text{NO}_2)_3\text{OH}$ [182°]. From carbazole (1 pt) and picric acid ($\frac{1}{4}$ pts) in toluene. Red prisms, v sl sol cold benzene or alcohol. Decomposed by a large quantity of alcohol, by water, and by alkalis.

Nitrosamine $\text{C}_{12}\text{H}_9\text{NNO}$ [82°]. Nitrous acid in an alcoholic solution of carbazole forms mono- and di nitro carbazole. If carbazole (3 g) be mixed with acetic acid (60 g of S G 1.04) and ether (60 g) is poured in, on adding KNO_3 , the nitrosamine is dissolved in the ether as fast as it is formed, and crystallises out on evaporation. Long flat golden needles. Soluble in ether, CS_2 , chloroform, glacial acetic acid and benzene. It is decomposed if heated with alcohol mixed with an acid, carbazole being regenerated. Alcoholic KOH turns it blood red. Reducing agents regenerate carbazole. Conc H_2SO_4 gives a dark green colour (Zeidler, *A* 191, 305).

Acetyl derivative $\text{C}_{12}\text{H}_9\text{NAc}$ [69°] (above 360°). From carbazole and Ac_2O at 250°. Slender needles (from water), v sl sol water, v e sol alcohol. Erdmann's solution does not turn it green. Its picric acid compound is orange.

CARBOHYDRATES A term applied to compounds which may be represented by the formula $C_x(H_xO)_y$ where x is 5, 6, or 12, and y is 5, 6 or 11, and to compounds derived from several such molecules by abstraction of water They are non volatile solids, and the non-saccharine members of the group may be converted by boiling dilute acids into a sugar, usually glucose (dextrose) They contain hydroxyl On oxidation they frequently give rise to oxalic, racemic, saccharic, and mucic acids Most of them are optically active Cellulose is insoluble in water, the gums dissolve, or at least swell up, in water, but are ppd by alcohol Sugars are soluble in water, are not reppd by alcohol, and have a sweet taste Iodine turns starch blue, and affects cellulose in the same way after it has been treated with a dehydrating agent The carbohydrates vary also in their behaviour towards alkaline copper solutions, and as regards

fermentation by yeast They are described in the articles ARABIC ACID, CELLULOSE, DEXTRIN, STARCH, SUGAR, ETC.

CARBOLIC ACID v PHENOL

CARBO MESYL v METHYL OXINDOLE

CARBO DI NAPHTHYL IMIDE v DI NAPHTHYL CYANAMIDE

CARBON GROUP OF ELEMENTS—*Carbon and Silicon* Of these elements, carbon occurs in the freestate in the forms of diamond, graphite, and amorphous carbon, silicon is not known as such in nature, but combined with oxygen it is one of the most widely-distributed elements Diamond was regarded by Newton as a combustible body because of its great refractive power in 1694 the Florentine academicians succeeded in burning small pieces of diamond, and in the early years of this century Davy proved it to be pure carbon In early times graphite was thought to be very similar to lead, hence the

name *plumbago*, for a time it was confused with molybdenum glance, but in 1799 Scheele proved it to be closely related to coal in its composition It is only in somewhat recent times that approximately pure graphite has been obtained Char coal is the commonest form of impure amorphous carbon, this modification of carbon can be obtained approximately pure only with considerable difficulty

After the earths had been proved to be metallic oxides in 1807, it was generally supposed that the common earth like body silica would also be found to contain oxygen and a metal In 1823 Berzelius decomposed silica and obtained the non metal silicon, in the form of a brown amorphous powder A good many years later Deville prepared crystallised silicon in two forms, one more or less resembling diamond, and the other, graphite The leading properties of the two elements are as follows —

	CARBON	SILICON
Atomic weights	11.97	28

Many compounds of each element have been gasified Molecular weights unknown
(?) probably greater than C_2 and Si_2

Melting points	Does not melt at any temperature hitherto attained	1,100°–1,300° (uncertain)
Specific gravities (approximate)	Diamond 3.5, graphite 2.25, amorphous 1.5–1.9	Graphitoidal 2.2–2.5 (doubtful)
Specific heats	0.46 (at about 1000°)	0.203 (at about 250°)

The specific heat of either element increases rapidly as temperature increases from -50° the rate of this increase is however, very small after about 500° for carbon and about 150° for silicon The specific heats of diamond and graphite vary considerably at temperatures below about 600°, but from this point upwards the values are practically identical

Atomic weight		
Spec grav (approximate)	4.5	11.2
Heats of formation of various compounds (Thomsen, Berthelot, &c.). (Generally from amorphous Carbon or Silicon)		
[M, H'] . . .	21,750	24,800
[M, Cl'] . .	21,000	157,600 (product liquid)
[M, O'] . .	96,960	219,200
[M, S'] . .	–26,000	40,000
Change of amorphous M to crystalline M	8,000	8,100

Heats of neutralisation of aqueous solutions of CO_2 and SiO_2 (Thomsen)

Silicic acid shows no constant neutralisation-point The quantity of heat produced is a hyperbolic function of the quantity of soda added, and approaches a probable maximum of 6,800 gram units for one formula weight of SiO_2 (v SILICATES)

Physical properties	<i>Diamond</i> hardest known substance, crystallises in regular forms octahedral predominating, bad conductor of electricity, refractive in dex large ($\mu_D = 2.430$), lustre very marked, usually colourless and transparent, but sometimes green, brown, or yellow,	<i>Adamantine</i> very hard, scratches glass, dark iron grey colour, reddish by reflected light, crystallises in forms derived from a rhombic octahedron <i>Graphitoidal</i> softer than adamantine but scratches glass, may be pulverised, metal like lustre, leaden-
----------------------------	---	---

TABLE—*cont.*

	CARBON	SILICON
	<p><i>Graphite</i> crystallises in hexagonal forms, good conductor of electricity, tough and difficult to pulverise, grey, metal like appearance</p> <p><i>Amorphous</i> black powder, very porous, absorbs large quantities of gases and of many colouring matters from solutions</p>	<p>grey colour, crystallises in leaflets composed of octahedra, good conductor of electricity</p> <p><i>Amorphous</i> brown powder, heated out of contact with air to high temperature it contracts and becomes crystalline, bad conductor of electricity, dissolves in molten Al or Zn and crystallises out on cooling</p>
Occurrence and preparation	<p>The three forms occur in nature, but neither graphite nor amorphous pure, constituent element of all animal and vegetable matter, carbonates very widely distributed, graphite prepared by dissolving amorphous in molten iron, or by decomposing by heat the CN compounds in the mother liquor of soda manufacture, &c approximately pure amorphous, prepared by washing sugar charcoal in acid, alkali, and water, and strongly heating in chlorine, or by decomposing CO_2 by Na, &c</p>	<p>Very widely distributed as silicates of Ca, Mg, Fe, Al, &c, amorphous obtained by action of K on hot SiCl_4, SiF_4, or K_2SiF_6, graphitoid obtained by melting Al with K SiO_2 and cryolite, or by decomposing SiCl_4 at a high temperature by Na, adamantane obtained by melting Zn with K_2SiF_6 and Na</p>
*Chemical properties	<p>Allotropy marked Diamond heated by powerful battery in absence of oxygen gets grey black and coke like but does not volatilise, heated in air combustion begins at 950°–1000° Graphite not affected at any temperature in absence of oxygen, oxidised by repeated treatment with KClO_4 and HNO_3 to <i>graphitic acid</i> $\text{C}_{11}\text{H}_2\text{O}_8$ (or O_8), a yellow solid, sl sol water, acting towards alkaline bases like a feeble acid Amorphous burns easily in air, combines with H at a very high temperature to form C_2H_2, also combines directly with S to form CS_2, with O to form CO and CO_2, and under special conditions with N to form C_2N_2, compounds with halogens formed in directly, combines directly with Ir, Fe, Ni, Pd, Pt, Ag, and perhaps some other metals Carbon a negative element, does not form salts by replacing H of acids, CO_2 an anhydride, an aqueous solution of CO_2 probably contains the dibasic acid H_2CO_3, salts of this acid well marked, H_2CS_3 prepared Atom of C is tetravalent, C atoms tend to combine with each other, vast number of compounds produced by addition of other atoms to groups of C atoms</p>	<p>Allotropy marked Amorphous Si burns easily in air to SiO_2, graphitoid does not oxidise when heated, adamantane not even at a white heat in oxygen, adamantane Si oxidised at red heat in CO_2 (giving $\text{CO} + \text{SiO}_2$), also by strongly heating with K_2CO_3 or Na_2CO_3 (giving $\text{CO} + \text{SiO}_2 + \text{C}$), but not changed by molten KHSO_4, or by heating with KNO_3, if temp at which that salt decomposes is not reached Amorphous Si soluble in HFAq giving $\text{H}_2\text{SiF}_6\text{Aq}$ and hydrogen, also in strong hot potash ley giving $\text{K}_2\text{SiO}_3\text{Aq}$ and hydrogen, adamantane Si insoluble in HFAq and hot alkali solutions Si does not directly combine with H, SiH_4 produced by action of HClAq on compound of Si and Mg, combines with S at high temperature to form SiS_2, with O to form SiO_2, with Cl, Br, or I, to form SiCl_4, SiBr_4, or SiI_4, and with N at white heat to form Si_3N_4, combines directly with Al, Cu, Fe, Mg, Mn, Ni, Pt, and perhaps some other metals SiO_2 an anhydride, probable existence of several silicic acids, $\text{SiO}(\text{OH})_2$ probably present in solution obtained by neutralising $\text{K}_2\text{SiO}_3\text{Aq}$ by HClAq and dialysing, this solution very readily gelatinises Atom of Si is tetravalent, and, to some extent at least, atoms of Si tend to combine together and form groups which combine with other atoms, forming molecules similar to those of the organic compounds.</p>

General formulae and characters of compounds

MO, MO₂, MS_n, (SiO unknown, ?CS and C₂S₂), MO₂H₂ (neither known except (?) in aqueous solution, *v* CARBON and SILICON), CS₂H₄, MH₃, C₂H_{2n+1}, C₂H_{2n}, C₂H_{2n-2}, C₂H_{2n-4}, &c, &c, and a vast number of derivatives, MX_n (X = Cl, Br, I, or in case of Si also = F), M₂X_n (X = Cl, Br, or I where M = Si, X = Cl or Br where M = C), C₂Cl₂, C₂Br₂, &c, SiF₂H₂, CH₂Cl, CH₂Cl₂, CHCl₃, SiHCl₃, SiH₄, &c, C₂N₂, CNH and salts, C₂N₂FeH₄ and salts, C₂N₂FeH₄ and salts, C₂N₂NOFeH₄ and salts, &c, &c, Si₂N₂, &c. The compounds of C and Si exhibit considerable differences in their properties, CO and CO₂ are gases, SiO₂ is a very fixed solid, CS₂ is a liquid, SiS₂ a solid, CCl₄ is not acted on by water, SiCl₄ is at once decomposed into SiO₂ and HCl, Si readily forms a fluoride and also a double fluoride with hydrogen, no corresponding compounds of C are known, CH₄ is a stable gas, SiH₄ is oxidised by mere contact with air and is easily decomposed by heat (at 400°), Si (amorphous) dissolves in potash evolving hydrogen and forming a silicate, carbon is unacted on by alkalis. Both elements form many compounds with H and O (alcohols, ethers, acids &c), the composition of which is similar, in some cases the properties of the Si compounds closely resemble those of C, *eg* C(C₂H₅)₄, H and Si(C₂H₅)₃, H, C(C₂H₅)₂OH and Si(C₂H₅)₂OH, but in other cases the properties of the two classes of compounds differ much, *eg* CH₄, CO₂H and C₂H₂, CO₂H are liquids soluble in water, but CH₄, SiO₂H and C₂H₂, SiO₂H are amorphous solids insoluble in water. Many silicates and carbonates are isomorphous. Silicates, except those of the alkali metals, are insoluble in water, and most of them are with difficulty decomposed by acids, the normal carbonates of the alkali metals are soluble in water, other normal carbonates are insoluble, aqueous solutions of acid carbonates are generally easily decomposed by heat yielding either normal or basic carbonates, the normal carbonates of the alkali metals are not decomposed by heat alone, other normal carbonates are decomposed into metallic oxide and CO₂.

Group IV of the elements, as the elements are classified by the application of the periodic law, contains the following —

	Series					
	2	4	6	8	10	12
Even	C	Ti	Zr	Ce	—	Th
Odd	3	5	7	9	11	
	Si	Ge	Sn	—	Pb	

The metals titanium, zirconium, and germanium show considerable analogies with tin, cerium and thorium are usually classed together among the rarer earth metals, and lead is generally considered apart from other metals nevertheless there are well marked analogies between all the elements which comprise Group IV of the periodic system. Titanium is an amorphous body closely resembling amorphous silicon, it forms the compounds TiO₂, TiCl₄, TiBr₄, TiI₄, Ti₂Cl₆, Ti₂O₃ (probably TiO(OH) and Ti(OH)₂), Ti₂O₃, Ti₂N₃, &c., titanates are known (M₂TiO₃), many of them isomorphous with silicates and carbonates. Ti is more metallic than

C or Si, it forms a sulphate Ti(SO₄)₂, and other salts wherein the hydrogen of acids is replaced by titanium. Zirconium again is more decidedly metallic than titanium, it forms a series of well marked salts Zr(SO₄)₂, Zr₂NO₃, &c, &c. On the other hand Zr resembles C and Si in that it has been obtained both as an amorphous powder, and also in crystals which resemble Si in their behaviour towards acids, zirconates (M₂ZrO₃) are also known. Germanium forms oxides, chlorides, and sulphides, &c (GeX and GeX₂, X = O = S = Cl₂), resembling those of Sn, it is, however, more markedly non metallic in its chemical functions than Sn, physically Ge is decidedly metallic. Cerium forms two oxides Ce₂O₃ and CeO₂, the former dissolves in acids forming a series of salts of which Ce₂SO₄ is a type, CeO₂ is a peroxide, it dissolves in HCl with evolution of Cl and formation of CeCl₃, but a sulphate Ce(SO₄)₂ is known corresponding to the sulphates of Ti and Zr. Ce also forms a fluoride CeF₃, a double fluoride 3KF.2CeF₃, and a chloride CeCl₄. Thorium again approaches more closely than cerium to Zr and Ti, it is a dark coloured amorphous powder resembling Si, but more soluble in acids than Si, Zr, or Ti, it forms the compounds ThCl₄, ThF₄, K₂ThF₆, ThO₂, &c, the sulphate is Th(SO₄)₂, and other analogous salts are known. Tin forms the two oxides and chlorides SnO and SnO₂, SnCl₂ and SnCl₄, the hydrates of SnO₂ are feeble acids, producing stannates (M₂SnO₃) and metastannates (M₂Sn₂O₇), both of which are easily decomposed by dilute acids or by heat. Both the stannous salts *eg* SnSO₃, and the stannic salts *eg* Sn(SO₄)₂ are well marked compounds. Lead is decidedly metallic in its character, it forms four oxides PbO, Pb₂O₃, Pb₃O₄, and PbO₂, the last is a peroxide, and it may also be regarded as an anhydride inasmuch as plumbates (M₂PbO₃) exist, but these salts are very unstable and easily decomposed. The best marked salts of lead are derived from the oxide PbO, *eg* PbCl₂, Pb₂NO₃, PbSO₄, &c, PbCl₄ has not been obtained pure, but this series of salts is represented by the tetramethide P₄(CH₃)₄, which is stable as a gas. The atoms of all the elements of Group IV, so far as evidence has been obtained, are tetravalent. Looking at the properties of these elements as a whole, it may be said that carbon is to a considerable extent set apart from the others, but that it is more closely allied to silicon than to any other member of the group, that titanium and zirconium are closely related, and that tin and lead, while showing distinct analogies with the rest of the group, are yet each characterised by properties which mark them off from the other elements. Not much can yet be said regarding cerium and thorium, they require further study.

For more details and descriptions of the various elements see the articles on these elements, also *v* TITANIUM GROUP OF ELEMENTS; also *v* CARBONATES, NITRATES, SULPHATES, &c. In some of their physical properties carbon and silicon, especially the latter, resemble boron, but boron must be classed with those elements the atoms of which are trivalent *v* BORON.

 411), 93,350 for diamond, and 93,060 for graphite
 (Favre & Silbermann, A Ch [3] 33, 414)
 Emission spectrum observed by passing sparks
 through pure CO or CO is characterised by a
 double line 6583 and 6577.5, three sharp lines
 5150.5, 5144.2, 5133, and a band 4266 (Ångström
 a Thalén, *Nov Act Ups* 9 [1875]) Besides
 these, and many other less marked, lines,
 Juvénat & Dewar describe the arc spectrum
 as showing the following marked lines, 3019.3,
 2837.2, 2836.3, 2511.9, 2509.9, 2296.5 (*Pr* 30,
 152, 494, 33, 403, 34, 123, 418) A very dif-
 ferent spectrum—the band spectrum—is ob-
 served at the base of a candle or gas flame, also
 in cyanogen burnt in O, or by passing sparks
 through CN, CO at increased pressure, CS₂, &c.,
 the most characteristic bands are 5633, 5164,
 and 4736 There has been much discussion as
 to whether this spectrum is that of C or of a
 hydrocarbon (v B A 1880 264) Three allo-
 tropic forms of carbon are known, diamond,
 graphite, and amorphous carbon

The diamond was regarded by Newton as a
 combustible body because of its high refractive
 power, in 1694 diamond was burnt by the
 Florentine Academicians, Lavoisier found that
 CO₂ is produced when diamond is burnt, and
 Davy showed that diamond is pure carbon
 Lavoisier, about 1780 recognised that carbonic
 acid (then called fixed air) was a compound of
 O and the element which is the essential element
 of coal, to this element he gave the name *car-
 bone* Graphite was long considered to be a
 kind of lead, Scheele, in 1799, showed it to be
 closely related to coal, he regarded it as a com-
 pound of iron and carbon, but Kastner proved
 that the iron found in graphite was only an
 impurity, and that pure graphite is a form of
 carbon

Occurrences—Carbon occurs as diamond and
 graphite, the former is pure, the latter some-
 times approximately pure, carbon, many com-
 pounds of C occur in nature, the chief are CO,
 in the air and all waters, mineral carbonates e.g.
 of Ca and Mg, and compounds with H, O, N, and
 sometimes P and S, in all animal and vegetable
 organisms Diamonds are found in India,
 Borneo, Brazil, the Cape, &c., graphite, in
 Cumberland, California, Siberia, &c. Berthelot

(C R 73, 494) found graphite in a meteorite
 which fell near Melbourne (Australia), and
 Fletcher found a cubic form of graphite in a
 meteorite from Western Australia (*Mineralog
 Mag*, Jan 1887) Graphite is found both amor-
 phous and foliated Coal, anthracite, peat, &c.,
 contain from 50 to 95 p.c. of carbon

Formation—Many attempts have been made
 to form diamond, none has been certainly suc-
 cessful (v Liebig, *Agriculturchemie* [1840] 285,
 Wilson, J 1850 697, Favre, J 1856 828 [from
 CCl₄], Despretz, C R 37, 369 [electric current
 for a month from Pt to C pole], Simmler, P
 10b, 466 [crystallisation from liquid CO₂], Lion-
 net, C R 63, 213 [from CS₂], Chancourtois,
 C C 1866 1037 [oxidation of hydrocarbon],
 Rossi, C R 63, 408, Hannay, *Pr* 30, 188 a
 450 [action of Mg, and Li, on gaseous hydrocar-
 bons mixed with N containing compounds at
 very high temperatures and pressures], Mars-
 den, *Pr E* 11, 20 [by dissolving amorphous C
 in molten Ag]) Graphite is formed—1 By
 heating charcoal with molten iron, and dissolv-
 ing out the Fe by HCl and HNO₃Aq—2 By
 the slow decomposition of HCN₂Aq, and boiling
 the product with HNO₃Aq (Wagner, J C T
 1869 230)—3 By evaporating the mother
 liquors obtained in making soda, these con-
 tain CN compounds which are decomposed
 at a certain concentration of the liquid with
 formation of NH₃ and graphite (Paul, D P J
 161, 129, Schaffner, W J 1869 250)—4 By
 leading CO over Fe₂O₃ at 300°–400° (Gün-
 er, C R 73, 28, Stungl, B 6, 392) Amorphous C
 is also formed (Berthelot, C R 73, 494)—5 By
 the decomposition of CS₂ at high temperatures
 6 By leading CCl₄ over molten pig iron (Deville,
 A Ch [3] 49, 72) Amorphous carbon is formed
 in many ways—1 By heating wood, coal, or
 almost any animal or vegetable matter, out of
 contact with air, to a high temperature—2 By
 the incomplete combustion of wax, tallow, oil, or
 other combustible compounds of C and H—3
 By decomposing, at a very high temperature and
 out of contact with air, the gaseous C compounds
 obtained in the production of gas from coal the
 carbon thus obtained is very hard (v *Properties*)

Preparation—Pure graphite is obtained by
 intimately mixing 14 parts of finely powdered
 foliated graphite with 1 part KClO₃ and 2 parts
 conc H₂SO₄, heating on the water bath so long
 as Cl comes off, washing repeatedly with hot
 water, drying and heating to remove H₂SO₄, if
 the graphite contains silica it is treated with
 NaF and H₂SO₄, besides treatment with KClO₃
 and H₂SO₄ (Brodie, T 1860 1, v also Winckler,
 J pr 98, 243, Stungl, B 6, 391)

Amorphous carbon is prepared approximately
 pure by strongly heating cane sugar in a closed
 Pt crucible, boiling the charcoal thus produced
 with (1) conc. HClAq, (2) KOHAq, (3) water,
 drying, heating to full redness in a stream of
 dry Cl and allowing to cool in the same, H is
 removed as HCl, O as CO, also traces of SiO₂,
 Fe₂O₃, &c. as SiCl₄, FeCl₃, AlCl₃, &c. The
 soot from semi burnt turpentine oil, after treat-
 ment with ether, and heating to a high
 temperature in a closed vessel, is approximately
 pure carbon It seems to be impossible to obtain
 finely divided amorphous C quite free from gases

such as H, O, or Cl, even when purified as described it retains traces of Cl, this may be removed by strongly heating in connection with a Sprengel pump, but on exposure to the air considerable quantities of O, CO₂, &c are quickly absorbed. The absorbed gases cannot be removed by heating at ordinary pressures, Erdmann & Marchand (*J pr* 23, 159) found 2 p.c H and 5 p.c O in sugar-charcoal which had been heated nearly to whiteness for 8 hours. According to Porcher (*C N* 44, 203) amorphous C free from H, O, and N is obtained by passing CCl₄ vapour over hot pure Na in a hard glass tube, and then heating the C obtained to a little under the temperature at which burning begins. A very hard kind of amorphous carbon is formed by placing wood (box, ash, elder, lilac, or oak), or flax, hemp, cotton, paper, or silk, in a porcelain tube, driving out all air by CS₂ vapour and then gradually heating to redness for an hour (Sidot, *C R* 70, 605). The harder the wood and the higher the temperature to which it is heated, the harder and denser is the carbon produced. Various materials consisting mainly of carbon are prepared for industrial use, *charcoal*, by partially burning piles of wood covered with turf or earth, or by the dry distillation of wood, *coke*, by heating coal in iron retorts arranged so that the liquid and gaseous products may be separated from the residual carbonaceous matter, *lamp black*, by partially burning tallow, turpentine, &c, and condensing the soot on cold surfaces, *animal char* (which however contains only about 10-20 p.c C) by heating bones in closed vessels.

Properties—Unchanged by action of acids, has not been melted or vaporised.

Diamond is a colourless, transparent, very refractive and dispersive, crystalline, solid, some diamonds are coloured yellow, brown, blue, or black. Diamond is the hardest substance known, but rather brittle. Very bad conductor of electricity and heat. C.E. small, especially at low temperatures, at $-42^{\circ}=0$. Unchanged by heating out of contact with air to 1800° - 1400° , but placed between the carbon poles of a powerful battery it glows brilliantly, swells up, splits, and after cooling the surface resembles coke from bituminous coal (*comp* Rose, *P* 168, 497, v Schrötter, *Sitz W* [2] 63, 462 Morren, *C R* 70, 990, Jacquelin, *A* 64, 256 Gassiot, *Ph. C* 1850 893, Baumhauer, *Ar N* 8, 1). Unchanged when heated to whiteness in water vapour (Baumhauer, *lc*). Strongly heated in a stream of O, diamond is completely burnt to CO₂, it may also be burnt by heating with molten KNO₃, or, very slowly, by powdering finely and heating with K₂Cr₂O₇, H₂SO₄, and a little H₂O (Bogers, *J pr* 50, 411).

Graphite occurs native both crystalline (*foliated*) and amorphous, it forms a grey, metal like, hard, opaque, solid fair conductor of electricity especially after purification by KClO₃, &c (*v supra*), fair conductor of heat, is not changed by heating out of contact with air, burns in O to CO₂ at a high temperature, but more slowly than diamond, burnt to CO₂, more easily than diamond, by molten KNO₃, or by K₂Cr₂O₇ and H₂SO₄, also by heating with various metallic oxides. When graphite is heated with KClO₃ and HNO₃ a compound of

C, H, and O is formed, called by Brodie *graphitic acid* (probably C₁₁H₂O₄), this body is not obtained from diamond or amorphous carbon (*v. Reactions*, No 9).

The **graphite-like form of coke** which is formed in the upper parts of the retorts in which coal is heated for gas making, or is obtained by passing hydrocarbon vapours through red hot porcelain or iron tubes, is an extremely hard, metal like, lustrous, sonorous solid, SG (2356) nearly same as that of graphite, it is a good conductor of electricity and a fair conductor of heat, burns with difficulty, it contains no H, and leaves only from 2 to 3 p.c ash (Marchand & Meyer).

Amorphous carbon (sugar charcoal, lamp-black) is a dense, black, powder, it is extremely slowly acted on by any reagents, even energetic oxidisers, non conductor of electricity. The harder forms of amorphous carbon, obtained by calcining hard woods at high temperatures out of contact with air, somewhat resemble graphite in appearance, they are more or less lustrous, conduct electricity fairly well, and burn slowly when heated in air or O. Ordinary amorphous C, or ordinary wood charcoal, absorbs large volumes of gases. Saussure (*G A* 47, 113) gives the following volumes absorbed by 1 vol box charcoal at 12° and 724 mm. NH₃, 90, HCl 85, SO₂ 65, H₂S 55, N₂O 40, CO₂ 35, CO 9.4, C₂H₄ 35, O 9.2, N 7.5, H 1.75. Hunter (*P M* [4] 29, 116, *C J* [2] 3, 285, 5, 160, 6, 186, 8, 73, 9, 76, 10, 649) gives these numbers for 1 volume cocoa nut charcoal at 0° and 760 mm. NH₃, 171.7, CN 107.5, NO 80.3, CH₄ 76.4, (CH₄) O 76.2, C₂H₄ 74.7, N₂O 70.5, PH₃ 69.1, CO₂ 67.7, CO 21.2, O 17.9. According to Angus Smith (*Pr* 28, 322) absorption of gases by charcoal takes place in definite volumes, thus if the vol of H absorbed under definite conditions is 1, the vol of O = 8, CO = 6, CO₂ = 22, N = 4.66. Chemical reaction sometimes occurs between gases absorbed by charcoal, thus, HCl is produced by leading H over charcoal which has absorbed Cl, and SO₂Cl₂ by leading SO₂ over charcoal under the same conditions. The absorbed gases are removed *in vacuo*. Recently heated porous wood charcoal removes many colouring matters, *eg* indigo, from solutions, it also removes fusel oil from weak alcohol, alkaloids from aqueous solutions, many metallic salts from solutions, &c, in some cases chemical change is produced, *eg* CuSO₄ and AgNO₃ are reduced with pps of Cu and Ag (Monde, *J pr* 67, 255, *v* also Graham & Hofmann, *A* 83, 89, Graham, *P* 19, 139, Weppen, *A* 55, 241, 59, 354, Favre, *A Ch* [5] 1, 209, Guthe & Harms, *Ar Ph* 69, 121, Stenhouse, *A* 90, 186).

Specific heat of carbon—The following numbers summarise the chief determinations exclusive of those of Weber the temperature interval is about 35° - 55° —

Diamond 148 Bettendorff & Wüllner (*P* 133, 293), 147 Regnault (*A Ch* [3] 1, 202), 366 [20° - $1,000^{\circ}$] Dewar (*P M* [4] 44, 461).

Gas carbon 165 Kopp (*A* 126, 862, *Suppld* 3, 1 a. 289), 186 B & W (*lc*), 197 R (*lc*), 82 [20° - $1,000^{\circ}$] D (*lc*).

Graphite 174 Kopp (*lc*), 186 B & W (*lc*); 201 R (*lc*).

Wood charcoal 241 R (Le)

In 1874 Weber made careful determinations of the S H of the different forms of carbon at different temperatures, he used (1) diamond, (2) native graphite, (3) porous wood charcoal in a slender filament strongly heated in dry Cl and sealed at once in a glass tube His chief results were as follows (*v P M* [4] 49, 161 a 276) —

Diamond

Temp	-50°	+10°	85°	250°	606°	985°
S H	0635	1128	1765	3026	4408	4529

Graphite

Temp	-50°	+10°	61°	201°	250°	641°	978°
S H	1138	1604	199	2966	325	4454	467

Wood Charcoal

Temp	0°-23°	0°-99°	0°-223°
S H	1653	1935	2385

These numbers show that the S H increases as temp increases, but that the rate of this increase is much smaller at high than at low temperatures. From 600° onwards the S H of diamond is the same as that of graphite, as the values for wood charcoal are nearly the same as those for graphite for the same temperature intervals, the conclusions may fairly be drawn that at temperatures above 600° the different forms of carbon have all the same S H, and that at lower temperatures there are two values for the S H, one belonging to graphite and amorphous C, the other to diamond.

Allotropy of carbon Carbon exhibits allotropic changes in a marked way, diamond may be superficially at any rate, changed to graphite, amorphous C may also be changed to graphite, each of the three varieties is characterised by special properties. The S G of each is characteristic. The heats of combustion (*v supra*) are different. The S Hs are not the same, but Weber's results tend to show that, as regards S H, there is but one form of C existing at temperatures above 600°. Amorphous C remained unchanged when subjected to a pressure of 6,000-7,000 atmos (Spring, *A Ch* [5] 22, 170). The three forms are clearly distinguished, chemically, by their reactions with KClO_4 and HNO_3 (*v Reactions*, No 9).

Atomic weight — Determined (1) by burning diamond in O and weighing the CO_2 produced (Dumas & Stas, *A Ch* [3] 1, 5, Erdmann & Marchand, *J pr* 23, 159, Roscoe, *A Ch* [5] 26, 136, Friedel, *Bl* [2] 41, 100), (2) by heating silver acetate and weighing the Ag (Marignac, *A* 59, 287), (3) by heating Ag salts (oxalate and acetate) and weighing the Ag and CO_2 formed (Maumené, *A Ch* [3] 18, 41). The mean of all the (closely agreeing) results is 11.97 ($\text{O} = 15.90$).

Chemical properties — The atom of C is tetravalent in gaseous molecules (CH_4 , CCl_4 , CBr_4 , &c). The atomicity of the molecule of C is unknown, as the element has not been gasified, certain considerations, *eg* the increase in S H as temperature increases, and perhaps the character of the spectrum, seem to indicate that the molecule of C is probably composed of several atoms.

Carbon is distinctly a non-metallic element, it does not replace the H of acids to form salts, it forms stable, but easily gasified, compounds

with the halogens; its oxides, and also the sulphide CS_2 , are distinctly acidic in their reactions, it exhibits allotropy in a most decided way, the spectrum of C is very complex, yet in some of the physical properties of graphite and dense amorphous carbon, this element approaches the metals (*v supra*). Carbon stands at the beginning of Group IV in the periodic classification of the elements, the other members of this group, except Si, are more metallic than non-metallic, C shows closer relations to Si, the first odd series member of the group, than to any other element in the group (*v Carbon group of elements*). Both elements are remarkable for the great number of compounds which they form with H, O, and N. Most of the elements of Group IV, except C, form characteristic compounds with F, or double compounds with F and other elements.

Reactions — 1 Unchanged by action of acids. 2 Heat, in absence of air, produces no change (*comp Properties of Diamond*) — 3 When strongly heated in excess of oxygen, CO_2 is formed the combination is much retarded if the C and O are carefully dried (Baker, *C J* 47, 349) — 4 Heated with sulphuric acid and potassium dichromate C is slowly burnt to CO_2 . 5 Oxidised to CO_2 by heating with molten nitrate or chlorate of potassium — 6 Reacts with sulphur vapour at high temperatures to form CS_2 . — 7 Combines with hydrogen to form C_2H_2 , by passing electric sparks between C poles in atmosphere of H — 8 Combines indirectly with nitrogen to form cyanogen — 9 Graphite is oxidised by potassium chlorate and nitric acid to graphitic acid ($\text{?C}_{11}\text{H}_2\text{O}_6$ or $\text{C}_{11}\text{H}_2\text{O}_8$). Brodie (*T* 1859 249) heated an intimate mixture of 1 part purified and very finely divided graphite and 3 parts KClO_4 , with enough very conc HNO_3Aq to bring all into solution, at 60° for 8-4 days, until yellow vapour ceased to come off, the contents of the retort were then poured into much water, the insoluble matter was thoroughly washed by decantation, dried on a water bath, and again oxidised by KClO_4 and HNO_3Aq , as before. These operations were repeated (usually 4 times) until no further change was produced, and the insoluble matter formed a clear yellow solid. Analysis of this yellow solid, dried at 100°, gave the formula $\text{C}_{11}\text{H}_2\text{O}_8$. This body—called *graphitic acid* by Brodie—forms small, transparent, lustrous, yellow plates, it is slightly soluble in water, insoluble in water containing acids or salts, turns blue litmus slightly red, shaken with solutions of alkaline bases it appears to form insoluble salts, but the composition of these is very uncertain, when heated it burns explosively, leaving a fine, black residue, it is easily decomposed by reducing agents such as $(\text{NH}_4)_2\text{S}$, SnCl_4 , HI Aq , &c (*v infra*). Brodie supposed this body to be a compound of a hypothetical element which he called *graphon*, and to which he gave the atomic weight 83, he formulated *graphitic acid* as $\text{Gr}_2\text{H}_2\text{O}_8$, and regarded it as the carbon analogue of a silicic acid $\text{Si}_2\text{H}_2\text{O}_8$, obtained by Wöhler from graphitoidal silicic acid. Gottschalk (*J pr* 95, 821) placed a very intimate mixture of 1 part (50 grms) purified, very finely divided graphite with 8 parts KClO_4 , in a large flask surrounded by ice-cold water, and very

slowly added enough HNO_3 aq. SG 1.525, to completely moisten the whole, he then digested at 50° to 60° , and then at 60° to 70° , for 25–30 hours, he poured off the greater part of the acid and dissolved KNO_3 , washed with hot water by decantation, dried *in vacuo* and then at 100° , he repeated this treatment 5 or 6 times, finally he washed the residue with HNO_3 aq. SG 1.28, removed the acid by pressing between paper and then by washing with alcohol, washed with ether to remove alcohol, pressed again, and dried on the water bath in the dark. Gottschalk's analyses lead to the formula $\text{C}_{11}\text{H}_2\text{O}_2$ for graphitic acid, he describes a salt, $\text{C}_{11}\text{H}_2\text{K}_2\text{O}_2$, obtained by treating with conc. KOH aq. and washing with cold water.

The action of KClO_3 and HNO_3 on graphite has also been investigated by Stungl (B 6, 391), and by Berthelot (A Ch [4] 19, 399). Berthelot calls the compound produced as described *graphitic oxide*, he says it does not react as an acid, he calls the carbon like mass left on heating graphitic oxide *pyrographitic oxide*, the body is completely dissolved by heating with KClO_3 and HNO_3 . The porous, amorphous, insoluble body obtained by heating 1 part graphitic oxide with 20 parts HIAq —SG 2.0 to 280° , Berthelot calls *hydrographitic oxide*, this body is not explosively decomposed by heating, treated with KClO_3 and HNO_3 , it yields graphitic oxide. There appear to be differences from different kinds of graphite. Berthelot distinguishes the three allotropic forms of carbon by their reactions with KClO_3 and conc. HNO_3 , amorphous carbon is oxidised to brown humus like bodies, which dissolve in water, graphite forms graphitic acid, diamond is unchanged—10 Both graphite and amorphous carbon are said to yield mellitic acid $\text{C}_6(\text{CO}_2\text{H})_6$ by the action of $\text{K}_2\text{Mn}_2\text{O}_8$ in KOH aq. (Schulze, B 4, 802)—11 Carbon combines with many metals when strongly heated with them, *eg* with Fe, Ni, Co, &c., none of these carbides has been isolated as a pure compound (*v* CARBIDES).

Carbon, halogen compounds of Carbon does not combine directly with the halogens. These compounds are represented by the formulae CX_n , C_2X_n , and C_xX_n , where $\text{X} = \text{Br}$ or Cl , when $\text{X} = \text{I}$ only CX_n is known, no fluoride of C has been isolated. The chlorides have been gasified and V D of each determined, the formulae are therefore molecular. The bromides decompose, partially or wholly, when heated the formulae are probably molecular. The iodide is easily separated by heat into C and I. The methods of preparation, and reactions, of the chlorides and bromides are very similar [$\text{C}, \text{Cl}^\circ = 21,030$, $[\text{C}, \text{Cl}^\circ] = -1,150$ (at const. press. Thomsen)]. Besides these compounds, several bromochlorides of carbon exist, CBrCl_3 , two isomeric $\text{C}_2\text{Br}_2\text{Cl}_2$, $\text{C}_3\text{Br}_2\text{Cl}_2$, $\text{C}_4\text{Br}_2\text{Cl}_2$, $\text{C}_2\text{Br}_3\text{Cl}$. [For more details of the halogen compounds of carbon *v* the *halogen derivatives of ETHANE, ETHYLENE, and METHANE*].

CARBON BROMIDES *Carbon dibromide* C_2Br_4 (*Tetrabromethylene*) White crystals, M.P. 58° , produced by heating C_2Br_6 , or better, by reducing C_2Br_6 with Zn and H_2SO_4 aq., also by reacting with Br on alcohol or ether, adding KOH aq. to remove HBr , and distilling, or by

treating C_2HBr_3 Br, with alcoholic KOH (Lennox, C J 14, 209). Decomposed by hot Zn, Cu, Fe, ZnO, CuO, &c., giving metallic bromide and C or CO_2 (Löwig, A 3, 292).

Carbon tribromide C_2Br_6 (*Hexabromide* *Tetrabromethylene dibromide*) Hard, rectangular prisms, easily soluble in CS_2 , insoluble in alcohol or ether, decomposed to C_2Br_4 and Br, at 200° . Produced by brominating $\text{C}_2\text{H}_5\text{Br}$, and by heating C_2HBr_3 with Br and H_2O to 170° – 180° (Reboul, A 124, 271).

Carbon tetrabromide CBr_4 (*Tetrabromo methane*) White lustrous tables, SG 3.42, M.P. 91° B.P. 189.5° (at 760 mm.) with partial decomposition. Insol. in water, very sol. in alcohol, ether, or CHCl_3 . Partially decomposed with liberation of Br, at 200° , with alcohol at 100° gives HBr CHBr_3 , and CH_3CHO , with alcoholic NH_3 at 100° gives CHBr_3 , and a little guanidine. Formed by the reaction between (1) Br, in presence of I or SnBr_2 , and CHBr_3 , or CS_2 or $\text{CBr}_4(\text{NO}_2)$, (2) Br, in presence of I, and CHCl_3 . Best prepared by heating 1 part CS_2 with 14 parts I and 7 parts Br to 150° – 160° for 48 hours in a closed tube, shaking contents of tube with NaOH aq., distilling in steam, pressing between paper, and crystallising from alcohol (Bolas & Groves, C J [2] 8, 161, 9, 773).

CARBON CHLORIDES *Carbon dichloride* C_2Cl_4 (*Tetrachlorethylene*) Colourless liquid, ethereal odour, SG at 10° 1.62 (R), 1.612 (G), SG at 0° 1.6595 (B) B.P. 122° (R), 116.7° (G), 121° (B) V.D. 5.82 Easily combines with Cl in sunlight forming C_2Cl_6 . Prepared by reducing C_2Cl_6 , C_2Cl_4 is placed in a flask with water and Zn, H_2SO_4 aq. is added from time to time, the flask being kept cold and frequently shaken, the C_2Cl_4 is distilled over in steam, dried, and fractionated (Faraday, T 1821 47, Regnault, A Ch 71, 377, Geuther, A 107, 212, Bourgoin, Bl 23, 344).

Carbon trichloride C_2Cl_6 (*Tetrachlorethylene dichloride* *Carbon hexachloride*) Hard, colourless, rhombic prisms, SG 2.0 M.P. 187° and B.P. the same (Stadel & Hahn, B 9, 1735) V.D. 8.15 Insol. in H_2O , sol. in alcohol or ether. Easily reduced, *eg* by Zn and H_2SO_4 aq. or by alcoholic KHS , to C_2Cl_4 , with KOH aq. at 200° gives KCl , H_2O , and $\text{K}_2\text{C}_2\text{O}_4$. Prepared by leading Cl into boiling $\text{C}_2\text{H}_5\text{Cl}_2$ till saturated, cooling by ice, pressing between paper, dissolving in alcohol, ppg. by H_2O , pressing, and crystallising from alcohol (Faraday, T 1821 47, Regnault, A Ch 69, 165, 71, 371, Liebig, A 1, 219, Geuther, A 60, 247, Berthelot, A 109, 118).

Carbon tetrachloride CCl_4 (*Tetrachloro methane*) Colourless liquid, with ethereal odour, SG $\frac{16}{100}$ 1.63195, B.P. 76.74° (Thorpe, C J 37, 199) V.D. 5.24 Prepared by leading dry Cl into boiling CHCl_3 containing a little SbCl_3 or ICl , in a large flask with inverted condenser, removing excess of Cl by shaking with Hg, and fractionating. Also by passing CS_2 and Cl through a hot porcelain tube (Kolbe, A 45, 41, 54, 146). Unchanged by KOH aq., with alcoholic KOH slowly gives KCl , K_2CO_3 , and H_2O , passed through a hot tube gives C_2Cl_4 , C_2Cl_6 , and C, heated with SO_2 gives COCl_2 and $\text{S}_2\text{O}_2\text{Cl}_2$; with P_2O_5 gives POCl_3 and COCl_2 .

(Regnault, *A Ch* 71, 377, Dumas, *A Ch* 73, 90)

CARBON IODIDE CI_4 . Dark red octahedra, S G $\frac{20}{2}$ 432, sol in alcohol, ether, or CS. Decomposed by heat to C and I, boiled with H₂O or dilute HIAq gives CHI_3 . Prepared by mixing equal vols CCl_4 and CS with saturated solution of AlI_3 in CS, then diluting with H_2O out of contact with air. The solution of AlI_3 is prepared by placing the proper quantities of Al (in small pieces) and I in a stoppered flask and adding 3 times the quantity of CS, (Gustavson *B* 14, 1705)

CARBON BROMOCHLORIDES *Trichlorobromomethane* CCl_3Br , two *tetrachlorodibromomethanes* $\text{C}_2\text{Cl}_4\text{Br}_2$, *dichlorotetrabromomethane* $\text{C}_2\text{Cl}_2\text{Br}_4$, *chloropentabromomethane* C_2ClBr_5 , *dichlorodibromomethane* $\text{C}_2\text{Cl}_2\text{Br}_2$, *chlorotribromomethane* C_2ClBr_3 , (v these compounds under METHANE, ETHANE, and ETHYLENE)

Carbon, hydrate of (?) By treating pig iron with (1) CuSO_4aq , (2) FeCl_3aq containing HCl, a brownish black substance remains, containing, according to Schutzenberger a Bourgeois (*C R* 80, 911) carbon and water in the ratio $11\text{C } 3\text{H}_2\text{O}$. Besides the C and H₂O, the substance gives about 10 p c ash. It loses $3\text{H}_2\text{O}$ at 250°

Carbon nitride = CYANOGEN (*q v*)

Carbon, oxides of Two oxides certainly exist, CO and CO_2 , these formulæ are molecular, each bears the relation of anhydride to an acid, CO is formic anhydride (the acid is HCO), CO_2 is carbonic anhydride (the acid is HCO_3) (*v infra*). Both oxides can be obtained by direct combination of O with C, either can be produced from the other, by combining with O or with C, respectively. Both are stable gases, CO is an energetic reducer, CO , in a few cases acts as an oxidiser. Brodie (*P* 21, 245) and Berthelot (*Bl* [2] 21, 102) have described bodies, produced by the induced electric discharge on CO , as oxides of C. Brodie noticed a gradual diminution in vol of the CO and the formation of a red brown film on the glass tube, the solid was soluble in water giving a markedly acid solution, its composition appeared to differ in different experiments, Brodie gives the formulæ C_2O_3 and C_2O_4 . Berthelot got brown, amorphous, humus like bodies which dissolved in water with acid reactions, gave brown pps with AgNO_3aq , BaOaq , and $\text{Pb}_2\text{NO}_3\text{aq}$, at 300° – 400° CO and CO_2 (equal vols) were evolved, and another dark body remained, to which B gave the composition C_2O_4 . B also (*A Ch* [5] 17, 142) states that by the action of electric sparks on pure CO_2 a gas was produced which reacted violently with Hg and oxidisable bodies.

CARBON MONOXIDE CO (*Carbonic oxide*, more properly, although rarely, *carbonous oxide*, *formic anhydride*) Mol w 27.93 S G 9673 (air=1) V D 14 (c -186°) (Wroblewski, *C R* 98, 982) S H p 2346 S H v 16844 (E Wiedemann, *P* 157, 1) C E 003667 (Regnault) S (6°) 0287, (9°) 0269, (18.5°) 02315 (Bunsen) S alcohol (2°) 20356, (13°) 20416, (16°) 20566, (24°) 20452 (Bunsen) $\mu_c = 1.000301$, $\mu_n = 1.000350$, $\mu_o = 1.000391$ (Croullebois, *A Ch* [4] 20, 136) $[\text{CO}, \text{O}] = 67,960$ at const press, and 67,670 at const vol, $[\text{C}, \text{O}] = 29,000$, and 29,290, respec-

tively (Thomson). Does not exactly obey Boyle's law, $\frac{PV}{P_1V_1} = 1.00293$ (Regnault, *Acad* 1862 26,

229). Liquefied by cooling to -136° at pressure of 200–300 atmos and then decreasing pressure, not too quickly, to not less than 50 atmos (Wroblewski a Olszewski, *A Ch* [6] 1, 112, v also Natterer, *W A B* 12, 199, and Cailliet, *C R* 85, 1213 a 1217, and *A Ch* [5] 15, 132). First obtained in 1776, by Lasonne, by heating C with ZnO , obtained by Priestly, in 1796, by heating charcoal with iron oxide, but supposed by him to be H, proved by Cruickshank not to be a hydrocarbon, true composition determined by Clement and Desormes.

Occurrence—In the gases from burning coal or charcoal, from the partial combustion or putrefaction of organic matter, or from the reduction of metallic oxides by charcoal, *e g* in the blast furnace (Bareswil, *J Ph* [3] 25, 172, Bunsen, *P* 46, 193, 50, 81). During the oxidation of gallic and tannic acids by exposure to air in alkaline solutions (Boussingault, *A Ch* [3] 66, 295, Calvert, *C R* 57, 873). In pig iron and steel according to Troost a Hautefeuille, also Parry (*J* 1873 997, 1874 1083).

Formation—1 By passing steam over excess of red hot C, the product may contain about 28½ p c CO , 56½ p c H, 14½ p c CO , and traces of CH_4 (v Naumann a Pistor, *B* 18, 164). 2 By passing a slow current of CO over red hot C, and washing the gases through KOHaq and soda lime—3 By heating CO_2 with those metallic oxides which do not readily part with O, *e g* ZnO PbO , FeO , oxides which readily give up O yield but little CO , as it is again oxidised to CO_2 —4 By passing CO over red hot Cu, or over hot Zn dust (Noack, *B* 16, 75)—5 By heating CO_2 to 1300° (Deville *C R* 59, 873)—6 By electric sparks through CO_2 (Buff a Hofmann, *A* 113, 140)—7 By heating powdered CaCO_3 or K_2CO_3 with one sixth its weight of powdered charcoal, Na SO₃ heated with C also yields CO (with Na₂S)—8 In very small quantities (with COS) by passing CO and S vapour through a red hot tube (Berthelot, *A Ch* [5] 30, 547)—9 By heating dry H_2CO_3 , or by reaction between H_2CO_3 or an oxalate and hot conc H_2SO_4 —10 By heating HCO_2H , or a formate, with conc H_2SO_4 .

Preparation—1 One pt dry powdered $\text{K}_2\text{Fe}(\text{CN})_6$ is heated, in a capacious vessel, with 8–10 pts conc H_2SO_4 , as soon as frothing begins the lamp is lowered to a small flame, the gas is passed through milk of lime and KOHaq to remove CO_2 and the SO_2 formed in the process, SO_2 is evolved only in the earlier stages of the reaction (Grimm a Ramdohr, *A* 98, 127) 15 g $\text{K}_2\text{Fe}(\text{CN})_6$ yield about 4 litres CO . $\text{K}_2\text{Fe}(\text{CN})_6 + 6\text{H}_2\text{SO}_4 + 6\text{H}_2\text{O} = 6\text{CO} + 2\text{K}_2\text{SO}_4 + 3(\text{NH}_4)_2\text{SO}_4 + \text{FeSO}_4$ (Fownes). 2 Dry CaC_2O_4 , or BaC_2O_4 , is mixed with about ½ pt dry $\text{CaO.H}_2\text{O}$, and the mixture is strongly heated in a hard glass flask, the gas is passed through milk of lime, and is then dried— CaC_2O_4 gives $\text{CaCO}_3 + \text{CO}$, the CaH_2O absorbs any CO formed—3 According to Cherrier (*C R* 69, 138) pure CO may be prepared by passing the gases produced by heating $\text{H}_2\text{C}_2\text{O}_7$ with H_2SO_4 through a red hot tube filled with

charcoal, and then through a mixture of CaOaq and KOHAq

Properties—A colourless, tasteless, slightly odorous gas, liquefied at low temperature and great pressure (*v supra*) CO is combustible but a non supporter of combustion the temperature of the flame of CO in air is about 1400 (Valerius, *J* 1874 58) Absorbed by C, and by several metals, *e.g.* K, Ag, Au, quickly absorbed by CuCl_2 in a little HClAq (*v infra*), decomposed at very high temperature to C and CO_2 , decomposed when moist by induction sparks, CO is an energetic reducer, it combines with moist KOH (or NaOH) to form K formate, combines directly with Cl and Br in sunlight CO is extremely poisonous, it removes O from the blood and combines with the haemoglobin CO may be detected in the blood by observing the absorption spectrum, this is almost identical with that of oxygenated blood, and is characterised by two bands between D and E, on adding a little ammonium sulphide these bands disappear in the case of oxygenated blood, and the spectrum shows one band midway between D and E, if the blood contains CO the two bands remain unchanged for several days (Vogel, *B* 11, 235, Hoppe Seyler, *Fr* 3, 439)

Reactions—1 *Electric sparks* cause a partial decomposition to CO_2 and C, if the CO_2 is removed the change proceeds (Berthelot, *A Ch* [5] 30, 547) According to Berthelot (*Bl* [2] 21, 102, *A Ch* [5] 17, 142) CO is decomposed by the *induction discharge*, with production of CO_2 and (?) C_2O_2 and C_2O , (*v ante*, beginning of this art) According to Buff a Hofmann (*C J* 12, 282) the induction spark does not decompose dry pure CO Dixon (*C J* 49, 103) found that CO was decomposed (only about $\frac{1}{2}$ p.c. of the total gas) by sparks from a Leyden jar—2 *Heated* to about 1300° CO is partially decomposed to C and CO_2 (Deville, *C R* 59, 873)—3 A mixture of CO with oxygen is burnt to CO_2 by application of a flame or electric sparks Dixon (*T* 1884 617) has proved that if both gases are perfectly dry no chemical change occurs when a spark is passed, that a mere trace of steam renders the mixture explosive; that the oxidation of CO by O takes place very slowly if only a very small quantity of steam is present, and that as the quantity of steam is increased the rapidity of the explosion is increased also The steam acts as a carrier of O to the CO, it is probably reduced, and the H is then again oxidised the reactions which occur are very probably these (*v* Dixon, *C J* 49, 94)

Or (Armstrong, *C J* 49, 112) the changes may be represented by the formulae, *before explosion* $\text{O H}_2\text{O CO}$, *after explosion* $\text{O H}_2\text{OCO}$ Small quantities of gases other than H_2O were tried (H_2S , C_2H_4 , H_2CO , NH_3 , C_2H_2 , HCl , SO_2 , CS_2 , CO_2 , N_2O , C_2N_2 , CCl_4), if the gas contained H, explosion occurred, if the gas did not contain H the mixture did not explode—4 When a mixture of CO and steam is heated to about 600° , a portion of the CO is oxidised to CO_2 , the amount of CO oxidised depends on the conditions (*v* Dixon, *C J* 49, 94 references to other memoirs are given), if the CO_2 is removed as it is formed the whole of the CO can be

oxidised L Meyer's experiments (*B* 19, 1099) however, seem to prove that a mixture of dry CO and O can be exploded if a very strong spark is used, and the temperature is thus made very high The gases must be under considerable pressure, the more dilute the gaseous mixture the more difficult is it to explode it—5 When sparks from an induction coil are passed through a mixture of CO and steam, CO_2 , a little formic acid, and in some cases C, are formed (Dixon, *C J* 49, 94)—6 When to a mixture of dry CO with hydrogen, oxygen in sufficient for complete combustion is added, and the mixture is exploded by the spark, CO_2 and H_2O are formed, the ratio of CO_2 to H_2O depends on the shape of the vessel, and the pressure up to a certain limit, above this pressure—the 'critical pressure'—the ratio $\text{CO}_2/\text{H}_2\text{O}$ is independent of the shape of the vessel The larger the quantity of O used the lower is the critical pressure So long as the volume of H is more than twice that of the O the ratio of $\text{CO} \times \text{H}_2\text{O CO} \times \text{H}_2$ remains constant, provided no H_2O can condense, and the pressure is above the critical pressure when the vol of H is less than twice that of O the value of the ratio diminishes The presence of an inert gas, *e.g.* N increases the formation of CO_2 and diminishes that of H_2O , hence it lowers the value of the ratio $\text{CO} \times \text{H}_2\text{O CO} \times \text{H}_2$ This ratio is called by Dixon the *co efficient of affinity* of the reactor (*v* Dixon, *T* 1884 617, *C J* 49, 94, Horstmann, *B* 12, 64, *v* also CHEMICAL CHANGE)—7 CO is oxidised to CO_2 (1) by *bichrome and sulphuric acid* (Ludvig, *J* 1872 248), (2) by *platinum charged with hydrogen, in presence of oxygen and water*, H_2O being also produced (Traube, *B* 15, 2325, 2854, 16, 123, Remsen a Keiser, *B* 17, 83), (3) by *mixing with oxygen and passing over platinum black*, (4) by *nitrogen dioxide* [NO_2] (Hasenbach, *J pr* [2] 4, 1), (5) by *heating with most metallic oxides*, (6) by *heating with many oxysalts, e.g. alkaline sulphates* (sulphides produced)—8 Many experiments have been made to determine whether CO is oxidised by contact with moist oxygen in presence of slowly oxidising phosphorus, the balance of evidence seems to show that CO_2 is not produced (Remsen (and others) *Am S* [3] 11, 316, *B* 17, 83, *Am* 6, 153, Leeds, *B* 12, 1836, *C N* 48, 25, Baumann, *B* 16, 2146, 17, 283)—9 CO reacts with *most potash or soda* to form alkali formate (Berthelot, *A Ch* [3] 61, 463), the reaction proceeds most quickly at 190° – 200° , and is best accomplished by leading moist CO over soda lime (Fröhlich a Geuther, *A* 202, 317)—10 With *ferrous oxide* at 300° – 400° , CO_2 and a little C are formed (Grüner, *C R* 73, 281)—11 CO appears to react with certain *metallic peroxides* to form carbonates, but, according to Wright a Luff (*C J* 83, 540), CO_2 is formed by partial reduction of the peroxide and reacts with the lower oxide to produce carbonate—12 Many of the preceding reactions exhibit CO as a *reducing agent*, it also reduces PdCl_2Aq to Pd—13 When *sodium or potassium is heated to redness* in CO, alkali carbonate and C are formed

Combinations—1 With *potassium* at about 80° to form the explosive compound KCO (Brodie, *C. J* [2] 12, 269), *v. POTASSIUM*.—

2 With *chlorine* or *bromine* in sunlight, to form COCl_2 , or COBr_2 (v CARBON, OXYCHLORIDE, and OXYBROMIDE, or) — **3** With *sulphur* to form COS (v CARBON, OXYSULPHIDE OF) — **4** With *platinum chloride* to form $\text{C}_2\text{O}_2\text{PtCl}_2$ and $\text{C}_2\text{O PtCl}_2$ (Schützenberger, *A Ch* [4] 21, 350) — **5** CO is absorbed by anhydrous HCN (Böttger, *B* 10, 1122), by several metals, *e.g.* Fe, Ag, Au, by carbon — **6** CO does not combine with cyanogen, nor does it react with $\text{Hg}(\text{CN})_2$

Estimation — CO in a gaseous mixture is absorbed by Cu_2Cl_2 solution Thomas (*C N* 37, 6) prepares the solution by filling a vessel of 120 cc capacity $\frac{1}{2}$ full of Cu turnings, adding 6 g crystallised CuCl_2 and 20 cc conc HClAq , and shaking until solution of the CuCl_2 is effected, he then adds 30 cc water and shakes briskly for some time, and then adds 30 cc water

Carbon dioxide has been known for centuries The identity of the gases produced during fermentation and by the action of acids on chalk was established by Black Bergmann recognised the same gas in the atmosphere Cavendish proved that the same gas was produced by burning charcoal Lavoisier established the composition of the gas Faraday liquefied, and Thilorier solidified, carbon dioxide

Occurrence — In the atmosphere (v ATMOSPHERE), in mineral waters, issues from the earth in different places, sometimes found liquid in cavities in quartz, &c Produced by the breathing of animals, by the decay of organic matter, by the combustion of coal, charcoal, &c In combination as carbonate, of calcium, magnesium, &c , &c

Formation — **1** By burning C in air or O — **2** By oxidation of most C compounds — **3** By burning CO — **4** By reducing many metallic oxides by C — **5** By heating together H_2O and CO — **6** By the reaction between red hot C and steam — **7** By the action of steam on CaCO_3 at red heat — **8** By heating a mixture of $\text{K}_2\text{Cr}_2\text{O}_7$ with Na_2CO_3 — **9** By heating several carbonates **10** During fermentation — **11** By reaction between acids and carbonates

Preparation — CaCO_3 or MgCO_3 in lumps is treated with dilute HClAq at the ordinary temperature, the gas is passed through NaHCO_3Aq (to remove HCl which may have passed over), and is then dried by CaCl_2 Bunsen recommends the use of finely powdered chalk and conc H_2SO_4 and addition of a very little water

Liquid carbon dioxide was obtained by Faraday by decomposing $(\text{NH}_4)_2\text{CO}_3$ by $\text{H}_2\text{SO}_4\text{Aq}$ in one limb of closed glass tube bent at an obtuse angle Thilorier (*A Ch* 60, 247) decomposes NaHCO_3 by dilute $\text{H}_2\text{SO}_4\text{Aq}$ in an iron vessel connected with an iron cylinder in which the CO_2 is liquefied by its own pressure Natterer (*J pr* 35, 169) compresses CO_2 by a specially constructed air pump (v also Gore, *T* 1861 63).

Solid carbon dioxide is obtained by allowing the liquid to escape into a tin vessel, part of the liquid becomes gas and part is solidified Landolt allows the liquid to evaporate freely into conical woollen bags, he then compresses the solid CO_2 in conical moulds of hard wood by wooden pistons (*B* 17, 809)

Properties — A heavy, colourless, gas, incombustible, non superior of ordinary combustion, but strongly heated K or Na, or brightly burning Mg, burns in CO_2 Absorbed by water, solution colours litmus wine red and reacts as

a weak acid (*v* CARBONIC ACID) Absorbed by moist alkalis and alkaline earths forming carbonates, rapidly absorbed by mixture of powdered KOH and hydrated Na₂SO₄. Poisonous, by cutting off supply of O

Liquid carbon dioxide is a limpid, colourless, refractive, liquid, nonconductor of electricity, not changed by strong induction sparks, very expandable by heat, C.E. is greater than that of the gas Insol in water which swims on the surface, mixes with alcohol, ether, &c. Does not dissolve S or P, dissolves I, no reaction with Na or K (Caillietet, *C R* 75, 1271)

Solid carbon dioxide is a white, loose, snow like, solid, when compressed by hammering in wooden moulds it resembles chalk (Landolt, *B* 17, 309) Very bad conductor of heat Evaporates slowly, a specimen prepared by Landolt 53 mm by 71 mm diam took 5 hours to volatilise in the air Burns, if pressed against the skin

Reactions—1 Heated to c 1300° in porcelain tube is partly changed to CO and O (Deville, *C R* 56 729, *v* also Berthelot, *C R* 68, 1035)—2 Partly decomposed by electric sparks, a condition of equilibrium is attained when change of CO, into CO + O equals that of CO and O into CO₂ (Dixon a Lowe, *C J* 47, 671)—3 Mixed with hydrogen, and heated to bright redness or submitted to induction sparks, H₂O and CO are formed, if H₂O is removed the whole of the CO₂ goes to CO (Dixon, *C J* 49, 94) According to Dubrunfaut (*C R* 74, 125) CO₂ and H₂ passed over hot pumice give C and H₂O—4 A mixture of carbon dioxide and sulphur vapour passed through a red hot tube yield a little COS, CO, and SO₂ (Berthelot, *Bl* [2] 40, 362)—5 With sulphuretted hydrogen, passed through red hot tube, forms CO, H₂O and S (Köhler, *B* 11, 205)—6 Decomposed by chlorophyll parts of plants in sunshine—7 Reduced to CO by heating with carbon, iron or zinc, or with copper which has occluded hydrogen (Tissandier, *C R* 74, 531, Schrotter, *W A B* 34, 27)—8 Partly reduced to CO by reaction with ferrous sulphate and a little water, in a closed tube (Horsford, *B* 6, 1390)—9 Reduced to C by heating strongly with sodium, potassium, or magnesium, alkali carbonates strongly heated with phosphorus or boron give CO, which is reduced to C (Tennant, *Crellys A* [1793] 1, 158, Dragen-dorff, *J* 1861 111, Leeds, *B* 12, 1834 a 2131)—10 With moist alkalis, or alkaline earths, forms carbonates—11 With water probably forms a solution of carbonic acid, H₂CO₃ (*v* CARBONIC ACID)—12 With sodium, or potassium amalgam at c 350° gives Na (or K) oxalate (Drechsel, *A* 146, 141)—13 With sodium CO₂Aq reacts to give Na formate (Kolbe a Schmitt, *A* 119, 251) 14 Decomposes moist potassium iodide at high temperature giving HI (Papasogli, *G* 1881 227)

Carbon, oxybromide of The existence of a Br compound of CO analogous to COCl₂ is doubtful A mixture of Br vapour with excess of CO is slowly, but not fully, decolourised in sunlight, in contact with KOHAq this gas produces KBr and K₂CO₃ (Schiel, *A Suppl* 2, 511) Emmerling a Lengyel could not obtain a trace of any compound of C, Br, and O, by the reaction between COS and Br at a high temperature (*B* 2, 547) By the reaction between

H₂SO₄ (50 parts), K₂Cr₂O₇ (20 25 parts), and CHBr₃ (5–10 parts), Emmerling (*B* 13, 874) obtained a small quantity of a liquid, which he slowly distilled through Sb, to remove Br, he thus obtained a colourless heavy liquid, smelling like COCl₂ The B.P. rose from 12° to 30°, analyses seemed to show that the liquid was a mixture of COCl₂ and C oxybromide

Carbon oxychloride of COCl₂ (*Carbonyl chloride Phosgene gas Chloro carbonic acid*) Mol w 98.67 (8.2° at 756 mm) SG ⁴/₄ (liquid)

1432, ¹⁸/₄ 1392 (Emmerling a Lengyel, *A Suppl* 7, 101) V D 50.6 (E a L) [C₂O₂Cl₂]=54.850 at constant volume, 55.140 at constant pressure (Thomsen) First prepared by J Davy in 1811 (*T* 1812 144) by the action of sunlight on Cl + CO (hence the name phosgene)

Formation—1 By leading CO into boiling SbCl₃ (Hofmann, *A* 70, 134, *v* also Butlerow *Z* 1863 484, Kraut, *Gm K I* 2, 386), or over hot PbCl₂ or AgCl (Gobel, *J pr* 6, 388)—2 By heating CCl₄ with ZnO at 200° in a closed tube, or by passing CCl₄ and CO through pumice in a tube heated to about 400°—3 By heating CHCl₃ (1 part), K₂Cr₂O₇ (2½ parts), and H₂SO₄ (10 parts) at 100°, and passing the gas over Sb to absorb Cl (E a L)—4 By passing Cl and CO over Pt black at about 400° (Schutzenberger, *Bl* [2] 10, 188, 12, 198)—5 By passing Cl and CO over hot C (Schiel, *J pr* 6, 388) (For other methods *v* Schutzenberger, *B* 2, 218, Dewar a Cranston, *C N* 22, 174, Armstrong, *B* 3, 730)

Preparation—Dry Cl and dry CO are slowly passed through a succession of large bottles freely exposed to sunlight, then through a U tube loosely filled with pieces of Sb (to remove free Cl), and finally into a tube surrounded by snow and salt Each gas should pass through the drying bottles at as nearly as may be the same rate 100 litres CO give 140–150 g COCl₂ in direct sunlight (Paterno (*G* 5, 233) passes the mixed gases through a tube 400 mm long filled with animal charcoal combination occurs with production of heat, the tube must be cooled by a wet cloth from time to time (*v* also Wilm a Wischin, *A* 147, 150)

Properties—Colourless gas with penetrating odour, at 8° and under it is a colourless limpid liquid, the gas is soluble in acetic acid, benzene, and several liquid hydrocarbons

Reactions—1 Water absorbs COCl₂ with formation of CO₂Aq and HClAq Berthelot (*C R* 87, 591) gives the value [COCl₂:Aq] = 64.600 2 Alcohol forms chlorocarbonic ether CO Cl OEt (*q v*)—3 Several metals decompose COCl₂, when heated with it, to CO and metallic chloride, e.g. Sb, As, Na, Sn, Zn, potassium forms KCl, K₂CO₃, and C—4 With slightly moist potassium carbonate, KCl, H₂O, and CO₂ are formed—5 Zinc oxide produces ZnCl₂ and CO₂—6 Combines with 4 vols ammonia to form urea and NH₄Cl (Natanson, *A* 98, 288, Fenton, *C J* 35, 798)

Carbon, oxysulphide of COS (*Carbonyl sulphide*) Mol w 59.91 V D 30.4 [C₂O₂S]=8.030, [C₂O₂S]=37.080, [COS.O₂]=131.010 (Thomsen)

Occurrence—According to Thom (*A Suppl*

5, 236), in several mineral waters, and in volcanic gases

Formation—1 By passing CO and S vapour through a red hot porcelain tube (Thom)—2 By gently heating SO₂ with CS₂, SO₂ and S also produced (Armstrong, *B* 2, 712)—3 By action of CO₂ on boiling S, or by electric sparks on CO₂ mixed with S vapour (Cossa, *B* 1, 117, Chevrier, *C R* 69, 136)—4 By leading alcohol and CS₂ over red hot Cu (Carnelley, *C J* [2] 13, 523) For other methods v Ladenburg, *B* 1, 273, 2 30, 53, 271, Dewar a Cranston, *C N* 20, 174, Salomon, *J pr* [2] 5, 476

Preparation—By decomposing KCNS by H₂SO₄aq, $\text{KCNS} + \text{H}_2\text{O} + 2\text{H}_2\text{SO}_4\text{aq} = \text{COS} + \text{KHSO}_4\text{aq} + \text{NH}_4\text{HSO}_4\text{aq}$ KCNS is added to a cold mixture of 5 vols H₂SO₄ with 4 vols H₂O as long as the whole remains liquid, if much gas comes off the vessel is cooled, if very little gas is evolved the vessel is warmed gently The gas is passed through three U tubes, containing (1) cotton wool charged with moist HgO (to remove HCN and formic acid), (2) cuttings of unvulcanised caoutchouc (to remove CS₂), (3) CaCl₂, the gas is then collected over Hg (Thom) Bender (*A* 148, 137) recommends passing the gas through a tube surrounded by snow and salt, and Hofmann (*B* 2, 73) through wool moistened with Pet., the object in either method being to remove CS₂.

Properties—Colourless, heavy, gas, with a pleasant somewhat aromatic odour Colours moist blue litmus slightly reddish Absorbed by water, solution sometimes contains CO₂ and H₂S Very sol in alcohol

Reactions—1 Burns in air to CO₂ and SO₂, 2 At full red heat gives CS₂ and CO₂ (Berthelot, *C R* 87, 571)—3 With water gives CO₂aq and H₂SAq—4 With potash solution gives K₂SAq and K₂CO₃aq, similar reactions with NH₄Aq, CaOaq, and BaOaq—5 Ammonia gas, or alcoholic NH₃, gives CO NH₃, SNH₃ (v Berthelot, *A Ch* [5] 30, 539)—6 Solutions of salts of copper, cadmium, lead, or silver give no pps, but on adding NH₄Aq the sulphides of the metals are pptd.—7 The gas is decomposed by hot mercury, copper, silver, and iron, giving sulphides, by hot sodium, giving Na₂S, Na₂CO₃, and C

Carbon selenide Carbon and selenium do not combine directly No definite compounds have been isolated Rathke obtained a liquid which probably contained about 2 pc of a selenide of carbon (along with CCl₄), by heating selenide of phosphorus with moist CCl₄ (v *A* 152, 181)

Carbon, sulphides of Carbon disulphide, CS₂, is a well marked compound A mono sulphide, CS, probably exists According to Löw a sesquisulphide, C₂S₃, can be obtained by the action of Na amalgam on CS₂ (*Z* 9, 178, 10, 20) When sodium and CS₂ react a red brown solid is obtained which according to Raub has the composition C₂S₂ (*C C* 1870 579)

CARBON MONOSULPHIDE CS Mol w unknown SG 166 CS₂ was exposed to sunlight for 2 months in a U tube of special construction, the solid which had formed on the walls of the tube was removed by water, washed with CS₂, and dried in H (Sidot, *C R*

69, 1303, 74, 180, 81, 82) CS is a red powder, insol in water, alcohol, turpentine, and benzene Somewhat soluble in CS₂ or ether Dissolved by HNO₃aq, not by HClAq or H₂SO₄aq At 200° gives C and S Heated with S gives CS CS is not produced by leading CS₂ over hot carbon or pumice, by heating Sb₂S₃ with C, by reaction between CO and H₂S₂, by reaction between CO and H₂S, by reaction between CH₄ and SO₂ or S₂Cl₂, by heating (CN)₂S, by heating Fe spiral in CS₂, by electric sparks through CS₂, or by reaction between CS₂ and hot Cu

CARBON DISULPHIDE CS₂, (Thiocarbonic anhydride Sulphocarbonic acid) Mol w 75.93 [ρ -12°] (Wartha, *B* 3, 80) (46.04° at 760 mm) (Thorpe, *C J* 37, 362, references in this paper to other determinations) SG 20 1.29215 (T) VD 38 SH (liquid, 14°-29°) 2468 (Schuller, *P Ergzbd* 5, 116, v also Harn, *A Ch* [4] 10, 63 and 91) SH p (equal mass of air=1) 1569, (equal vol of air=1) 412 (Regnault) CL v Thorpe (*l c*) [C, S] const press = -26,010, const vol = -25,430, liquid = -19,610, [CS₂, O] = 265.130 (Thomsen) For table of vapour pressures from 0° to 50° v Ramsay a Young, *C J* 47, 653 μ 1.6059, μ 1.6729 (at 13°) (Kundt, *W* 4, 34) For relations between volume as gas and pressure v Herwig, *P* 137, 19, 141, 83, 147, 161

Occurrence—In crude benzole, and in mustard oil First prepared, in 1796, by Lampadius, by heating iron sulphide with charcoal Composition was long uncertain Clement a Desormes (*A Ch* 42, 121) regarded it as a compound of C and S, it was also thought to be a compound of S and H, and at other times of C, S, H, and N Composition established by Vauquelin, Berzelius, and Marcet, in 1812 (v *G A* 28, 427 a 453, 48, 177, S 9, 284, *A Ch* 83, 252)

Formation—1 By heating S with excess of C in a porcelain tube, condensing product in vessel surrounded by cold water, shaking with NaOHAq, drying by CaCl₂, and distilling from water bath—2 By heating C with a metallic sulphide which gives off S at a high temperature, e.g. CuS or Sb₂S₃—3 By heating wax, sugar, resin, &c, with S—4 By heating (CN)₂S—5 By heating CCl₄ with P₂S₅ to 200° in a closed tube

Preparation—Commercial CS₂ is distilled off quickly at 60°-70°, leaving a little undistilled, the distillate is shaken in contact with powdered K₂MnO₄, about 5 grams to 1 litre CS₂, for some time (to remove H₂S), it is then decanted and shaken thoroughly with Hg until fresh Hg is not blackened (various S compounds are thus removed), the liquid is poured off and again shaken with Hg₂SO₄aq (abt 25 g salt per litre) until a few drops leave no trace of badly smelling residue when allowed to evaporate on filter paper, the CS₂ is poured off, allowed to stand in contact with CaCl₂, and then distilled (from a water bath) directly into the bottle in which it is to be preserved. It is kept in perfect dark-

ness (Obach, *J pr* [2] 26, 281, for other methods v Sidot, *C R* 69, 1803, Friedburg, *B* 8, 1616, 9, 127, Millon, *J* 1868 928, Cloëz, *C R* 69, 1856)

Properties—Colourless, limpid, highly refractive, liquid, ethereal odour when quite pure, vapour even when much diluted is poisonous, it stops fermentation (*v* Cloëz, *C R* 63, 185) According to Wartha (*B* 3, 80, 4, 180) CS₂ may be solidified by placing a *small quantity* in the vessel of a Carré freezing machine, exhausting the air, and then opening the stopcock while continuing to exhaust, in large quantities solid CS₂ is obtained by mixing with absolute ether and exhausting the air by a Carré machine Wartha also obtained a snow like solid by blowing dry air through CS₂ at the ordinary temperature, according to Ballo (*B* 4, 118) this body is a hydrate of CS₂, Berthelot (*A Ch* [3] 46, 490) and Duclaux (*C R* 64, 1099) obtained such a hydrate (probably 2CS₂.H₂O) by evaporating CS₂ in moist air (*v* also Venables, *Am* 5, 15) CS₂ vapour is very easily inflammable, ignition temp = 149° (Frankland, *C N* 6, 8), 170° (Braun), with air or O it forms a very explosive mixture, mixed with NO and ignited it burns instantaneously with production of white light rich in actinic rays (*v* Berthelot, *A Ch* [3] 49, 486, Berzelius a Marcet, *S* 9, 284, Frankland, *C N* 6, 3, Sell, *B* 5, 733, Delachanal a Mermet, *D P J* 214, 483) Water dissolves about 1/100 of its weight of CS₂ (Sestini, *G* 1871 473), it is miscible in all proportions with alcohol, ether, essential and fatty oils, and liquid CO₂ (*v* Tuschmidt a Follenius, *B* 4, 583) CS₂ is a solvent for fats, resins, gutta percha, alkaloids, I, S, P, &c (*v* Liebermann, *B* 12, 1294, Gore, *P M* [4] 80, 414) According to Sidot, CS₂ is slowly changed in sunlight to CS and S (*v ante*, CARBON MONOSULPHIDE)

Reactions—1 *Heated* strongly CS₂ gives C and S (Berthelot, *Bl* [2] 11, 450, Buff a Hofmann, *A* 113, 129)—2 *Burns* in air or O to CO₂ and SO₂—3 *Decomposed* by many metals, Fe is said to give CS at ord temp (Kern, *C N* 33, 253, *v* also Merz a Weith, *Z* 11, 513), Cu at 200°–250° forms Cu₂S, S, and C (M a W), K gives a sulphide and C, Na at 140°–150° forms Na₂S and Na₂CS₂, the latter body reacts with dilute HClAq to produce H₂CS₂ (Löw, *Z* 9, 173, 10, 120), Na amalgam according to Low (*lc*) gives C₂S₂, according to Raab (*N R P* 19, 449) CS₂ (*v* also Hermann, *J pr* 79, 448, Reichl, *C C* 1880 420, Guignet, *Bl* 1861 111)—4 *Hydrogen*, when passed with CS₂ over heated Pt black, produces H₂S and C, nascent H (Zn and HClAq) forms H₂S and (?) C₂H₂S (*v* Vernon Harcourt, *C N* 26, 267, Cossa, *B* 1, 117, Girard, *C R* 43, 396, Becquerel, *C R* 56, 237)—5 *Chlorine* reacts with CS₂ differently according to the conditions dry Cl at ord temp, gives S₂Cl₂ and CCl₄, moist Cl, or MnO and HClAq, or other Cl producer, forms H₂SO₄ and CS₂Cl₂ (Kolbe, *A* 46, 41), Cl and CS₂ passed through a hot tube give S₂Cl₂ and CCl₄ (K), Cl passed into boiling CS₂ containing a little I forms S₂Cl₂, CCl₄, and CS₂Cl₂ (Muller, *C J* 15, 41), the same products result by action of ICl, *v* Weber, *W A B* 1866 848, Hannay, *C N* 37, 224)—6 *Chlorides which readily give*

up chlorine react similarly to Cl MoCl₄ and SbCl₅ give CCl₄ and S₂Cl₂, SbCl₅ also producing SbCl₃S which separates into SbCl₃ and S (Aronheim, *B* 9, 1788, Hofmann, *A* 115, 264, Husemann, *A* 117, 229), PCl₅ forms CS₂Cl₂ (Carius, *A* 113, 193), or according to Rathke (*Z* 13, 57) CCl₄ and PSCl₃ (at 100°)—7 *Bromine* reacts in presence of I or SbBr₃, 2 parts CS₂, 14 parts Br, and 3 parts I, heated to 150° in a closed tube form CBr₄ (Bolas a Groves, *B* 3, 508, *v* also Berthelot, *A Ch* [3] 53, 145) Hell a Urech describe a compound C₂S₂Br₂ obtained by slow action of Br and CS₂, and subsequent distillation (*B* 15, 273)—8 *Water*, in presence of air, oxidises CS₂ slowly and partially to CO₂Aq and SO₂Aq (Berzelius), heated to 150° in a closed tube from 3 to 4 hours, CO₂Aq and H₂SAq are formed (Schlagdenhauffen, *J Ph* [3] 29, 401), evaporated in moist air a hydrate (?2CS₂.H₂O) is said to be formed (*v Properties*) 9 Warmed with sulphur anhydride, CO₂, SO₂, and S, are produced (Armstrong, *B* 2, 712) 10 Mixed with carbon dioxide and passed through a hot tube, or over hot Pt black, COS is produced (Winkler)—11 Passed through a hot tube with sulphuric acid, CO, SO₂, H₂S, and S are formed (W)—12 Many metallic oxides when heated with CS₂ react to form sulphides, sometimes also carbonates (Schlagdenhauffen, *J Ph* [3] 29, 401, Muller, *P* 187, 404, Freym, *C R* 35, 27)—13 *Oxidising agents*, e.g. KNO₃, or K₂Mn₂O₈, generally produce CO₂ and H₂SO₄, sometimes CO₂ and H₂S, As₂O₃, As₂O₅, (and salts of these) produce As₂S₃ (*v* Schlagdenhauffen, *lc*, Cloëz a Guignet, *C R* 46, 1110) 14 *Boric acid and borates* react at red heat to form B₂S₃—15 *Sulphuretted hydrogen* mixed with CS₂ and passed over hot Cu produces CH₄ 16 *Alkalis in aqueous solution* form carbonates and thiocarbonates (*v* THIOCARBONATES, under CARBONIC ACID, &c), alcoholic potash forms K xanthate C₂H₅OCS SK—17 *Ammonia* reacts with CS₂ probably to form CS(NH₂), and (NH₄)₂CS₂ (Laurent, *A Ch* [3] 22, 103, Zouteven, *C C* 1870 821), CS₂ and NH₃ passed through a hot tube, or CS₂ heated in a closed tube with alcoholic NH₃, produce H₂S and HCNS, alcoholic NH₃ at ord temp forms (NH₄)₂CS₂, (NH₄)CNS, and CS NH₂ SNH₂ (Debus, *A* 73, 26, *v* also Millon *J Ph* [3] 88, 404, Hofmann, *J* 1858 332), NH₄Aq form (NH₄)₂CS₂Aq and NH₄CNSAq

Combinations—1 With many metallic sulphides to form thiocarbonates (*q v*)—2 With various ammonia derivatives, e.g. NMe₃, CS₂ 3 With zinc ethyl and methyl to form ZnEt₂CS₂, and ZnMe₂CS₂, respectively—4 With triethylphosphine to form PEt₃CS₂

Analysis—Sulphur, by heating in a glass tube with Na₂CO₃ and a little KNO₃, and estimating sulphates produced, as BaSO₄ Carbon, by burning with PbCrO₄ as in organic analyses

Detection and Estimation.—Small quantities of CS₂ may be detected by adding alcoholic solution of potash, whereby K xanthate (C₂H₅OCS SK) is formed, on now adding solution of a copper salt a yellow pp is produced (Vogel, *A* 86, 369) This reaction is applied to liquids, e.g. mustard oil, by distilling a little in a current of air into alcoholic potash, coal gas may be tested by passing through

alcoholic potash A very delicate reaction is to bring the CS_2 into contact with P^{Et} , when a characteristic carmine red compound, $\text{P}^{\text{Et}}\text{CS}_2$, forms, it may be crystallised from ether. This reaction may also be applied for the estimation of CS_2 (Hofmann, *B* 13, 1732). CS_2 is, some times determined, *e.g.* in xanthates, by standardised CuSO_4Aq (Grete, *B* 9, 921), thiocarbonates may be converted into the Pb salt (by addition of Pb acetate), and this may be decomposed by boiling with water, and the CS_2 led into weighed bulbs containing alcoholic potash (Delachanal & Mermet, *B* 8, 1192).

Carbon sulphochlorides of

I THIO CARBONYL CHLORIDE CSCl_2 Mol w 114.69 (70°) VD 57.5

Formation—1 By reaction between Cl and CS_2 , 2 By heating CCl_4 with S —3 By passing CCl_4 and H_2S through a hot tube (Kolbe, *A* 45, 41, Carius, *A* 113, 193, Muller, *C J* 15, 41, Gustavson, *B* 3, 969).

Preparation—To dry CS_2 , about 2 p.c. I is added and dry Cl is passed in (a reversed condenser being attached) until the volume of liquid has increased by about $\frac{1}{4}$. The whole is boiled with water (to remove S CSl_2), separated S is removed, water is separated, the liquid is distilled from the water bath whereby CCl_4 and CS_2 distil over, the residue is then distilled till a thermometer in the liquid reaches 175° , the distillate is fractionated, digested with water to remove S CSl_2 , dried, and fractionated. About 320 g CSCl_2 (*v. infra*) are thus obtained from 1 kilo CS_2 , very finely divided silver (by reducing AgCl) is then added little by little (the liquid being kept cold) until the whole of the liquid is soaked into the silver, it is then distilled, the distillate is shaken with water to remove traces of S CSl_2 , dried, and fractionated (Rathke, *B* 3, 858). The reactions are (1) $2\text{CS}_2 + 5\text{Cl}_2 = 2\text{CSCl}_2 + 3\text{S}$, (2) $\text{CSCl}_2 + 2\text{Ag} = 2\text{AgCl} + \text{CSCl}_2$.

Properties and Reactions—Golden red, limpid, liquid, penetrating odour, resembling that of COCl_2 , fumes in air. Exposed to light and then to a low temperature, large colourless crystals of a polymeride, $n\text{CSCl}_2$, separate, this body is unchanged in air, melts at 112.5° , is volatilised in steam, at 180° in a closed tube it gives CSCl_2 .

II THIONYL PERCHLORIDE CSCl_4 (Rathke, *B* 3, 858). Prepared by action of Cl on CS_2 (*v.* THIONYL CHLORIDE, **Preparation**). A clear, golden yellow liquid, vapour causes free flow of tears, B.P. 146° – 147° , S.G. 1.712 at 12.8° . Decomposed, slowly by moist air, quickly by heating with water to 160° , to CO_2 , HClAq , and S . Heated to 200° is decomposed to CCl_4 , S , CS_2 , and a little CSCl_2 . M M P M

CARBONATES *v.* CARBONIC ACID, CARBONATES, and THIO-CARBONATES

CARBON TETRA BROMIDE *v.* TETRA-BROMO

METHANE

DI CARBON-TETRA-CARBOXYLIC ACID *v.*

ETHYLENE TETRA CARBOXYLIC ACID

CARBONIC ACID, CARBONATES, AND THIO-CARBONATES

CARBONIC ACID A solution of CO_2 in water probably contains carbonic acid, H_2CO_3 . The chief reasons for this statement are as follows. The mass of CO_2 dissolved by water at ordinary temperatures and small pressures (less than

760 mm) varies as the pressure. But at pressures of 2, 3, or more atmospheres, the mass of CO_2 dissolved is less than that calculated by the law of Henry & Dalton. Khanikoff & Longuine (*A Ch* [4] 11, 412) give these numbers— P = pressure in mm, a = vol of CO_2 (measured at 0° and 760 mm) dissolved by 1 vol water at about 15°

P	a	P	a
697.71	0.9441	2188.65	3.1764
809.03	1.1619	2369.02	3.4857
1289.41	1.8647	2554.0	3.7152
1469.95	2.1623	2738.33	4.0031
2002.06	2.9076	3109.51	4.5006

When the pressure is decreased to 760 mm over water saturated with CO_2 at pressures greater than 760 mm most of the CO_2 escapes, at first rapidly, then slowly, the last traces of CO can be removed by placing the water *in vacuo*, or by long continued boiling. Magnesium reacts with a solution in water of CO to form MgCO_3 , and H , the quantity of H evolved is almost exactly that calculated on the hypothesis that the reaction is $\text{H}_2\text{CO}_3\text{Aq} + \text{Mg} = \text{MgCO}_3 + \text{H}_2$ (Ballo, *B* 15, 3003). Water holding in solution Na_2CO_3 or K_2CO_3 dissolves considerably more CO_2 than pure water, NaHCO_3 (or KHCO_3) is produced (Ballo, *lc*). Mg reacts with aqueous solutions of NaHCO_3 or KHCO_3 to form MgCO_3 , K_2 (or Na_2) CO_3 , and H (Ballo, *lc*). Aqueous solution of CO_2 turns blue litmus wine red, the blue colour returns on exposure to air, blue litmus in contact with CO_2 at pressures of $1\frac{1}{2}$ to 2 atmospheres becomes vermilion red (Malaguti, *A Ch* [3] 37, 206). When CO_2 dissolves in water, heat is produced, $[\text{CO}_2\text{Aq}] = 5.880$ (*Th* 1, 260). This solution reacts thermally with alkalis as a dibasic acid, thus (Thomsen)—

n	$[\text{CO}_2\text{Aq}, n\text{NaOHAq}]$
1	11.016
2	20.084

The thermal value of the second formula weight of NaOH (9.068) is considerably less than that of the first (11.016), in this respect carbonic acid behaves like sulphurous, selenious, boric acid, &c (*v.* ACIDS, BASICITY OF). When moist CO_2 reacts with KOH , K_2CO_3 is obtained, from this a great many carbonates may be formed, the composition of which is that of metallic derivatives of a dibasic acid H_2CO_3 . The aqueous solutions of carbonates are decomposed by almost all acids, not by HCNAq or $\text{H}_2\text{BO}_3\text{Aq}$, hence the affinity of carbonic acid is small (*v.* AFFINITY). But soluble silicates are at once decomposed by CO_2Aq , and even insoluble silicates *e.g.* of Ca , Al , &c are slowly decomposed by moist CO_2 . The sulphur analogue of carbonic acid— H_2CS_3 —has been isolated. Finally various derivatives, both of $\text{CO}(\text{OH})$, and $\text{CS}(\text{SH})$, are known, viz COCl_2 , $(\text{COBr})_2$, $\text{CO}(\text{NH}_2)_2$, COS , CSCl_2 , CSNH_2SH , $\text{CS}(\text{NH}_2)_2$.

CARBONATES Normal carbonates have the composition M_2CO_3 or MCO_3 . Certain acid carbonates, MHCO_3 , have also been isolated, very few of these are known as definite solids, the principal are when $\text{M} = \text{Na}$, K , NH_4 (? Ti). Some insoluble normal carbonates, *e.g.* Ba , Mg , Fe , dissolve in water saturated with CO_2 , at a

pressure of 4 or 5 atmos acid carbonates are probably formed. Many 'basic' carbonates exist, these are most simply represented by the general formula $x\text{MO}(\text{or } \text{M}_2\text{O}_3)y\text{CO}_2.z\text{H}_2\text{O}$. A few double carbonates are also known, usually compounds of alkali carbonates with others, e.g. $(\text{NH}_4)_2\text{CO}_3\text{MgCO}_3$, $\text{K}_2\text{CO}_3\text{NiCO}_3.4\text{H}_2\text{O}$. Several ethereal carbonates are known, derived from the hypothetical ortho carbonic acid $\text{C}(\text{OH})_4$, e.g. $\text{C}(\text{OEt})_4$, $\text{C}(\text{OPr})_4$ (v CARBONIC ETHERS).

Formation—1 By reaction between metallic oxides or hydroxides and CO_2 in presence of water, the oxides which act as weak bases, Fe_2O_3 , Al_2O_3 , &c, do not combine with CO_2 when dry—2 By pptn from solutions of salts by alkali carbonate solutions, only the salts of BaO , SrO , CaO , Ag_2O , and HgO , yield normal carbonates, other salts give basic carbonates containing less CO_2 relatively to MO , the weaker is the oxide MO , and the warmer and more dilute is the solution, salts of such weak bases as Fe_2O_3 , Al_2O_3 , and SnO , give pps of hydrates free from CO_2 —3 By strongly heating the alkali or alkaline earth salts of organic acids—4 In some cases by reaction between CO_2Aq and a metal, e.g. Mg , Fe , Zn .

Solubility in water—Carbonates of Na , K , Rb , and Cs , are easily soluble in water, carbonates of Li and Tl are much less soluble, other carbonates are nearly, or quite, insoluble. All carbonates are soluble, to some extent, in water in which CO_2 has been dissolved Al , except those of NH_4 , Rb , and Cs , are insoluble in alcohol.

Reactions—1 All carbonates, except those of the fixed alkalis, are wholly or partially decomposed by heat alone, BaCO_3 begins to decompose only at a full white heat, SrCO_3 at beginning white heat, and CaCO_3 at full red heat, Ag_2CO_3 gives up CO_2 at 200° , and at 250° the Ag_2O gives off O and leaves Ag , MnCO_3 heated to 200° – 300° in air gives MnO , and CO_2 —2 Heated in steam all carbonates are decomposed to hydrates and CO_2 (v Rose, *P* 85, 99 a 279)—3 Carbonates are decomposed by aqueous solutions of most acids at ordinary temperatures with evolution of CO_2 , HCNAq and $\text{H}_3\text{B}_3\text{O}_8\text{Aq}$, however, do not decompose carbonates—4 Solid carbonates are decomposed by heating with solid boric acid, silica, potassium dichromate, and some other salts. Sulphuretted hydrogen reacts with many insoluble carbonates suspended in water, e.g. of Sr , Ba , Ca , Zn , Mg , Li , to form sulphides and CO_2 , the change proceeds the further the more water is present (Nandina Montholon, *C R* 83, 58)—5 The more stable carbonates when heated with carbon give CO —6 Alkali carbonates heated in phosphorus vapour give phosphates and C —7 Aqueous solutions of acid carbonates do not usually affect the colour of litmus, they give an alkaline reaction with rosolic acid.

Detection and Estimation—Usually detected by decomposing by an acid and examining action of gas evolved on CaO Aq . Usually estimated by decomposing weighed quantity by acid and determining CO_2 by loss.

Aluminium carbonate Existence doubtful. Pp produced by alkaline carbonates with Al salts variously formulated as a highly hydrated basic carbonate (Muspratt, *C J* 2, 206, Lang

lois, *A Ch* [3] 48, 502, Wallace, *O Gazette*, 1858 410), as a compound of $\text{Al}_2\text{O}_3\text{H}_2$, and a small quantity of the carbonate employed, e.g. $\text{Al}_2(\text{HO})_4 + 2\text{NH}_4\text{HCO}_3$ (Rose, *P* 41, 462), and as pure $\text{Al}_2\text{O}_3\text{H}_2$ (Barratt, *C J* 18, 190). By Wibain and Renoul the pp in the cold is said to be $2\text{Al}_2\text{O}_3\text{CO}_2.8\text{H}_2\text{O}$ and to decompose about 30° (*C R* 88, 1183) (v also H Rose, *P* 91, 460, Parkmann, *Am S* [2] 84, 824).

Ammonium carbonates Three definite salts seem to exist, the normal, the acid, and the sesqui, carbonate (Divers, *C J* [2] 8, 171). The last is sometimes regarded as a compound of the first and second (Deville, *C R* 34, 880). Divers considers the compositions of the three salts to be

Normal carbonate, $2\text{CO}_2.4\text{NH}_3.4\text{H}_2\text{O}$

Sesquicarbonate, $3\text{CO}_2.4\text{NH}_3.4\text{H}_2\text{O}$

Acid carbonate, $4\text{CC}_2.4\text{NH}_3.4\text{H}_2\text{O}$

Rose's hyperacid carbonate may be the fourth term of this series

I Normal carbonate $(\text{NH}_4)_2\text{CO}_3.\text{H}_2\text{O}$ Prepared (1) by adding excess of NH_4Aq to a warm conc solution of the commercial carbonate, (2) by warming water with the ordinary carbonate, and allowing solution to cool and crystallise, after this has been done repeatedly the cold mother liquor from the last crop of crystals deposits normal carbonate. Large elongated plates, freely soluble in water, insol alcohol, sparingly sol NH_4Aq . Decomposes in air to NH_3HCO_3 , with evolution of NH_3 , and at 85° to NH_3 , CO_2 , and H_2O . Is converted into carbamate by digestion in closed vessel at 20° – 25° .

II Acid carbonate NH_4HCO_3 . Occurs in guano deposits (Ulex, *A* 61, 44). Prepared by saturating NH_4Aq , or solution of NH_3 , sesqui carbonate, with CO_2 , and drying over H_2SO_4 , and KOH S (0°) 11.9, (10°) 15.85, (20°) 21, (30°) 27 (Dibbits, *J pr* [2] 10, 417). This is the stable salt to which the other NH_4 carbonates are converted. Large, transparent, prismatic crystals. Dimorphous, but never isomorphous with KHCO_3 (Deville). Solution at 36° evolves CO_2 , even at ordinary temperature unstable in solution.

III Sesquicarbonate $(\text{NH}_4)_3\text{CO}_3.2\text{NH}_3.\text{HCO}_3$. By slowly heating the commercial salt till melted and then cooling, or crystallises from warm solution of the same salt mixed with NH_4Aq . Large transparent crystals, losing H_2O and NH_3 in air and giving NH_3HCO_3 S (13°) 25, (17°) 30, (32°) 37, (41°) 40, (49°) 50 (Berzelius). Solution easily decomposes with evolution of CO_2 .

Another carbonate— $(\text{NH}_4)_3\text{CO}_3$ —appears to exist in the mother liquor from the preparation of the sesquicarbonate (Divers). The commercial carbonate is probably $3\text{NH}_3.2\text{CO}_2.\text{H}_2\text{O}$. It generally contains 1 p.c. H_2O in excess of this formula, and a little ammonia. Prepared (1) by dry distillation of animal matter and subsequent purification by redistillation with charcoal, (2) by heating to redness NH_4Cl and CuCO_3 in retort with receiver. The first products are H_2O and NH_3 , carbamate, subsequent distillation produces the commercial carbonate. A white, transparent, fibrous mass, with strong ammoniacal smell, volatile, but not without some decomposition. Solution strongly alkaline.

Barium carbonate BaCO_3 . By adding $(\text{NH}_4)_2\text{CO}_3$ aq. to BaCl_2 aq. or $\text{Ba}(\text{NO}_3)_2$ aq., or Na_2CO_3 aq. to BaSAq , or (impure) by strongly heating a mixture of BaSO_4 , charcoal, and K_2CO_3 , and extracting the K_2S formed with water, leaving BaCO_3 . $\text{S} = 0$, in water saturated with CO_2 at 4 to 6 atmos. pressure $\text{S} = 75$. The salt remains in solution at ordinary pressure, but is completely pptd. on boiling (Wagner, *J. pr.* 102, 233, *J.* 1867 135). Found native as *Witherite*. This mineral can be obtained artificially from amorphous BaCO_3 by crystallising from fused KCl and NaCl (Bourgeois, *Bl.* [2] 37, 447). A soft white poisonous powder, easily soluble in solution of NH_4Cl , NH_4NO_3 , or ammonium succinate. Above red heat in presence of C it yields BaO and CO_2 . Decomposed at red heat by aqueous vapour especially in presence of chalk. Yields BaSO_4 when shaken with K_2SO_4 or Na_2SO_4 aq., and is completely decomposed by boiling with NH_4Cl aq.

Barium acid carbonate, $2\text{BaCO}_3 \cdot \text{CO}_2$, described by Boussingault (*A. Ch.* [2] 29, 280) but Rose thinks it cannot exist except in solution.

Beryllium carbonate. A compound of variable composition is obtained by exposing $\text{Be}(\text{HO})_2$ to air, ppg. beryllium salts with alkaline carbonates, or boiling solution of double Be NH_4 carbonate. The composition of pp. by last method is $5\text{BeO} \cdot \text{CO}_2 \cdot 5\text{H}_2\text{O}$ (Schaffgotsch). Decomposed by boiling water, soluble in alkaline carbonates. The salt $\text{BeCO}_3 \cdot 4\text{H}_2\text{O}$ is obtained by passing CO_2 through water containing basic salt in suspension and evaporating over H_2SO_4 in atmosphere of CO_2 .

Beryllium ammonium carbonate $2(\text{BeCO}_3 \cdot (\text{NH}_4)_2\text{CO}_3) \cdot \text{Be}(\text{HO})_2 \cdot 2\text{H}_2\text{O}$. By dissolving BeO in conc. Am_2CO_3 aq. at gentle heat, then boiling till solution becomes cloudy, filtering, and adding conc. alcohol, crystals are drained, washed with alcohol, and dried by pressing between paper (Humpidge, *Pr.* 39, 14). By similar method Deville (*A. Ch.* [3] 44, 5) obtained a salt of formula $3(\text{BeCO}_3 \cdot (\text{NH}_4)_2\text{CO}_3) \cdot \text{Be}(\text{HO})_2$, soluble in cold, and decomposed by hot water.

Bismuth carbonate $\text{Bi}_2\text{O}_3 \cdot \text{CO}$ (Berzelius) a white pp. obtained by dropping a solution of BiONO_3 into an alkaline carbonate. According to Lefort this pp. contains $\frac{1}{2} \text{H}_2\text{O}$ evolved at 100° . Heated strongly yields Bi_2O_3 , $3(\text{BiO})_2\text{CO}_2$, $2\text{BiO} \cdot \text{H}_2$, $3\text{H}_2\text{O}$. Occurs native as *Bismuthite* in South Carolina.

Cadmium carbonate CdCO_3 (?) Occurs native with ZnCO_3 . By ppg. solution of a cadmium salt with $(\text{NH}_4)_2\text{CO}_3$ aq. The white pp. is said to contain water, which is lost at 80° – 120° , and at a higher temp. to lose CO_2 and leave CdO (Lefort, *J. Ph.* [3] 12, 78), Rose (*P.* 85, 304) says pp. is nearly represented by CdCO_3 . Moist $\text{Cd}(\text{HO})_2$ absorbs CO_2 and at 300° loses all its water, leaving $2\text{CdO} \cdot \text{CdCO}_3$.

Cesium carbonate Cs_2CO_3 . S alcohol (19°) = 11.1. Ill. defined hydrated deliquescent crystals separate from a syrupy solution. On melting these leave Cs_2CO_3 as sandy powder. **Acid carbonate**, CsHCO_3 , crystallises from aqueous solutions in large prisms.

Calcium carbonate CaCO_3 . S (cold) = 0094, (100°) = 1.13 (Fresenius, *A.* 59, 117), S (0° in water saturated with CO_2) = 07, (10°) = 088

(Lassaigne, *J. Chem. Med.* 1848 312, Schlessing, *C. J.* [2] 10, 788).

Occurrence—Native, in rhombohedra (hexagonal) as *calcaspar*, S G 2 69–2 75, and in right rhombic prisms (trimetric), S G 2 92–3 23, as *aragonite*, also abundantly as chalk, limestone, &c. Formed when hydrated or anhydrous CaO is exposed to moist air, but not by action of CO_2 on dry CaO .

Preparation. — 1 By ppg. CaCl_2 aq. by $(\text{NH}_4)_2\text{CO}_3$ aq. From not too dilute solutions below 30° , it is pptd. entirely as *calcaspar*, above 30° the pp. contains *aragonite*, in gradually increasing quantity as the temp. rises, until about 90° the pp. is almost entirely *aragonite*. CaCO_3 , which separates as *calcaspar* from a cold, not too dilute, solution of the acid carbonate, is deposited partly in *aragonitic* form on addition of a very little PbCO_3 , CaSO_4 , or SrSO_4 (Credner, *J. f. Mineral.* 1871 288). The *aragonite* tends to change to *calcaspar* form if left under cold solution. Can be obtained in form of calcite from pptd. carbonate by crystallising from fused NaCl and KCl (Bourgeois, *Bl.* [2] 37, 447).

Properties and Reactions—Tasteless, white, slightly alkaline, easily soluble, when recently pptd., and to a certain extent even when it becomes crystalline, in aqueous solutions of $(\text{NH}_4)_2\text{CO}_3$, NH_4Cl , NH_4NO_3 , and ammonium succinate. These salts, therefore, prevent complete ppg. of calcium as carbonate. At full red heat is decomposed into CO_2 and CaO . Temp. of decomposition is lowered by passing air or steam over the CaCO_3 . In closed tube fuses to marble like substance. Boiling ammonium chloride solution decomposes CaCO_3 , forming CaCl_2 and $(\text{NH}_4)_2\text{CO}_3$. Sulphur decomposes CaCO_3 , forming CaSO_4 , without previous formation of H_2S (Podacci, *G.* 1874 177). The sulphur is oxidised at expense of oxygen of water (Brugnattelli a Pelloggio, *G.* 1874 536), and the formation of sulphuric acid is preceded by that of penta and tetra thionic acids (Bellucci, *S.* 1874 179). A salt of the formula $\text{CaCl}_2 \cdot 2\text{CaCO}_3 \cdot 6\text{H}_2\text{O}$ was obtained by Pelouze (*Bl.* [2] 3, 183).

Hydrates—Above 30° CaCO_3 is pptd., below 30° hydrates are formed containing amounts of water (10–27 p.c.) which vary with the temp. and time occupied in ppg. From a solution of lime in sugar water cooled to 0° – 2° , a hydrate $\text{CaCO}_3 \cdot 6\text{H}_2\text{O}$, decomposed at 30° , is obtained, while the same solution at a little higher temp. yields $\text{CaCO}_3 \cdot 5\text{H}_2\text{O}$ crystallising in rhombohedra, S G 1 783, decomposed above 15° even in water (Pelouze, *Bl.* [2] 3, 183). Same hydrate found by Scheerer (*P.* 58, 882) and Rammelsberg (*B.* 4, 469). A gelatinous hydrate formed by action of CO_2 on CaO and water is described by Bondonneau (*Bl.* [2] 23, 100).

Acid carbonate $\text{CaH}_2(\text{CO}_3)_2$ (?) is known only in solution, obtained by passing CO_2 into cold water containing suspended CaCO_3 . Decomposed with separation of CaCO_3 on exposure to air, or more quickly on boiling.

Basic carbonate $2\text{CaO} \cdot \text{CO}_2$. Obtained from CaCO_3 at a moderate red heat. Hardens by action of water, forming $\text{CaCO}_3 \cdot \text{CaOH}_2$, which is also produced by exposing CaO to moist air. This hydrate gives $2\text{CaO} \cdot \text{CO}_2$ at low

red heat, and at strong red heat gives off CO_2 and H_2O (Fuchs, *P* 27, 601)

Cerium carbonate $\text{Ce}_2(\text{CO}_3)_3 \cdot 9\text{H}_2\text{O}$ by exposing Ce_2O_3 to air or by pptn. A white powder, partially converted on heating strongly in air into Ce_2O_3 .

Chromous carbonate CrCO_3 . An amorphous greyish white substance, prepared by heating a chromous salt with $\text{Na}_2\text{CO}_3\text{Aq}$ out of contact with the air (Moissan, *A Ch* [5] 25, 401)

Cobalt carbonate CoCO_3 . By heating CoCl_2 with CaCO_3 to 150° in sealed tube for 18 hrs, or by decomposing CoCl_2 with a solution of NaHCO_3 supersaturated with CO_2 and heated to 140° in a strong vessel allowing slow escape of CO_2 . Light, rose coloured, sandy powder, microscopic rhombohedra, not attacked by acids in the cold (Senarmont, *A Ch* [3] 30, 129)

Hydrated carbonates and double salts are formed on adding cobalt solutions to alkaline carbonates. Hot or cold, not too dilute, solutions yield a rose coloured pp, which dried at 100° is $2\text{CoCO}_3 \cdot 3\text{Co}(\text{HO})_2$ (Setterberg, *P* 19, 55, Winkelblech, *A* 18, 148, Rose, *ibid* 60, 237). Boiling water partially converts it into Co_2O_3 (Field, *C J* 14, 50), digested with NaHCO_3 or $(\text{NH}_4)\text{HCO}_3\text{Aq}$ yields $3\text{CoCO}_3 \cdot \text{H}_2\text{O}$ (Deville, *A Ch* [3] 33, 75). Hot very dilute solutions yield blue $\text{CoCO}_3 \cdot 2\text{Co}(\text{HO})_2\text{aq}$. Heated above 150° both pps give off H_2O and CO_2 , yielding Co_2O_3 (Rose)

Cobalt potassium carbonate

$(\text{CoKH})(\text{CO}_3)_2 \cdot 4\text{H}_2\text{O}$. Rose coloured crystals, prepared by action of excess of KHCO_3Aq on $\text{Co}(\text{NO}_3)_2$ or CoSO_4Aq . Decomposed by water (Rose, Deville). Deville also obtained $\text{CoK}(\text{CO}_3)_2 \cdot 4\text{H}_2\text{O}$

Cobalt sodium carbonate $\text{CoNa}(\text{CO}_3)_2 \cdot 4\text{H}_2\text{O}$. Prismatic, and $\text{CoNa}_2(\text{CO}_3)_2 \cdot 10\text{H}_2\text{O}$ dark red, crystals, obtained together by the action of $\text{Co}_2\text{NO}_3\text{Aq}$ on solution of Na sesquicarbonate (Deville)

Copper carbonate. Unknown except in solution. Obtained by dissolving the ppd basic carbonate in CO_2Aq at 4-6 atmospheres pressure (Wagner, *J pr* 102, 233)

Hydrated basic carbonates

$\text{CuCO}_3 \cdot \text{Cu}_2\text{O} \cdot \text{H}_2\text{O}$ occurs native as *malachite*. Prepared by ppg a cupric salt with an alkaline carbonate. The pp at first is greenish blue, and is said to contain 1 mol H_2O , left in contact with liquid and washed it has above composition and is dark green. Heated to 200° yields *malachite*. Boiled with water it yields CO_2 and CuO (H. Rose, Field, *C J* 14, 71). Digested with $(\text{NH}_4)_2\text{CO}_3\text{Aq}$ at 48° it is converted into $\text{CuCO}_3 \cdot 5\text{CuO}$, a dense black powder, which is also obtained by prolonged boiling CuSO_4Aq with $\text{Am}_2\text{H}_2(\text{CO}_3)_2$, filtering from $\text{CuCO}_3 \cdot \text{Cu}(\text{HO})_2$, and adding more CuSO_4 (Field). Digested with Na_2CO_3 yields $\text{CuCO}_3 \cdot 7\text{CuO} \cdot 5\text{H}_2\text{O}$

The basic salt $2\text{CuCO}_3 \cdot \text{Cu}(\text{HO})_2$ occurs native as *azurite* in blue monoclinic crystals. Boiled with water yields CuO and evolves CO_2 . With hot NaHCO_3 yields a blue solution which after protracted boiling, deposits $\text{CuCO}_3 \cdot \text{Cu}_2\text{O} \cdot \text{H}_2\text{O}$ (Field). Prepared artificially by secret process (Phillips, *A Ch* [2] 7, 44). *Azurite* can be formed from *malachite* at ordinary temps by addition of CO_2 and abstraction of H_2O in presence of a dehydrating agent and CO_2 at high

temp (Weibel, *J für Mineral* 1873 245). Crystallised $\text{Cu}(\text{NO}_3)_2$ heated with CuCO_3 under a pressure of 54 atmospheres yields crystalline warty mass of *azurite* (Debray)

Double salts *Polassic cupric carbonate* $5\text{CuO} \cdot \text{K}_2\text{O} \cdot \text{CO}_3 \cdot 10\text{H}_2\text{O}$. A dark blue silky mass, obtained by adding $\text{Cu}(\text{NO}_3)_2$ to KHCO_3 .

Sodic cupric carbonate $\text{CuNa}_2(\text{CO}_3)_2 \cdot 6\text{H}_2\text{O}$. By action of NaHCO_3 on $\text{CuCO}_3 \cdot \text{CuO} \cdot \text{H}_2\text{O}$ at 40° - 50° . Rhombic prisms

Cuprammonium carbonate $(\text{NL}_3)_2\text{CuCO}_3$. Obtained as dark blue crystals by dissolving basic carbonate of copper in Am CO_3 and pouring solution into alcohol. Water decomposes it into Am CO_3 and $\text{CuCO}_3 \cdot \text{CuO} \cdot \text{Cu}(\text{HO})_2$ (Favre, *Traité de Chem* par Pelouze et Fiémy). Also formed when CuO or Cu is digested in NH_4Aq with access of air

Didymium carbonate $\text{Dy}_2(\text{CO}_3)_3$. A red crystalline powder obtained by passing CO into water containing suspended $\text{Dy}_2\text{O}_3 \cdot \text{H}_2\text{O}$. A hydrated carbonate is obtained, as a very slightly rose coloured pp, by adding an alkaline carbonate to solution of a Dy salt. Loses $\frac{2}{3}\text{H}_2\text{O}$ and a little CO at 100° (Marignac)

Indium carbonate In_2CO_3 . White gelatinous pp, soluble in $(\text{NH}_4)_2\text{CO}_3\text{Aq}$, and ppd on boiling, insoluble in solution of fixed alkali carbonates (Winkler, *J pr* 94, 1)

Iron carbonates *Ferric carbonate* does not appear to exist (Gmelin, Soubeiran, *A Ch* [2] 44, 326). Double salts of ferric and alkaline carbonates appear to exist in solution, as the pp of ferric hydrate obtained by conc alkaline carbonate solutions gradually redissolves, whereas pure well washed $\text{Fe}_2\text{O}_3 \cdot \text{H}_2\text{O}$ does not dissolve in these solutions

Ferrous carbonate FeCO_3 , occurs abundantly as *spathe ore*. Prepared by methods similar to those described for CoCO_3 (*q v*). It is a greyish white crystalline solid, composed of minute rhombohedra, scarcely attacked by dilute acids, nearly unchanged in dry air. It is darker and less alterable the higher the temperature at which it has been formed, and the longer it has been heated (Senarmont, *A Ch* [3] 30, 129). *Spathic ironstone* dissolves under pressure in water saturated with CO_2 ($S = 72$), and is deposited as a black amorphous pp on boiling (Wagner, *J* 1867, 135)

Hydrated ferrous carbonate, $\text{FeCO}_3 \cdot \text{H}_2\text{O}$, occurs native. Amorphous, white, earthy, little altered in air, scarcely decomposed by acids at ordinary temps (Moissan, *C R* 59, 238). The hydrate obtained by ppg solution of a ferrous salt with an alkaline carbonate rapidly decomposes on exposure to air. It can be obtained fairly pure, as a greenish tasteless powder, by ppg ferric free ferrous sulphate with normal or acid alkaline carbonates. The salts are dissolved in de aerated water, the pp washed by decantation out of contact with air, and dried in CO_2 . If dry it is fairly permanent, if moist it gives off H_2O and CO_2 , but if mixed with sugar the change is less rapid

Ferrous hydrogen carbonate. Solution of CO_2 dissolves FeCO_3 and Fe , the latter with evolution of H_2

Lanthanum carbonates $\text{La}_2(\text{CO}_3)_3 \cdot 8\text{H}_2\text{O}$. Found native as *Lanthanite* in four sided plates or minute tables of the trimetric system.

The carbonate obtained by ppn forms a white gelatinous mass which changes to shining crystalline scales $2\text{La}_2(\text{CO}_3)_3 \cdot 15\text{H}_2\text{O}$, ppd by $\text{Na}_2\text{CO}_3\text{Aq}$ from $\text{La}_2\text{SO}_4\text{Aq}$, and dried at ordinary temperature. Micaceous scales with silky lustre (Hermann, *J pr* 82, 385).

Lead carbonate PbCO_3 . Occurs native in trimetric crystals as *white lead ore* or *cerusite*. Has also been found on bronze objects from Pompeii (Luca, *C R* 84, 1457). Prepared by ppg $\text{Pb}(\text{NO}_3)_2\text{Aq}$ with excess of alkaline carbonates in the cold (Berzelius, Lefort, *J Ph* [3] 15, 26). According to Rose (*A* 80, 235) these pps are all hydrocarbonates, the ratio of hydrate to carbonate increasing with the temp and dilution of the solutions. Bodies of the same composition are formed by direct action of CO_2 on $\text{Pb}(\text{HO})_2$, but differ in being amorphous and opaque, instead of consisting of minute transparent crystalline grains.

White lead is a hydrocarbonate presenting varieties of composition represented by (1) $2\text{PbCO}_3 \cdot \text{PbO} \cdot \text{H}_2\text{O}$, (2) $5\text{PbCO}_3 \cdot 3\text{PbO} \cdot \text{H}_2\text{O}$, (3) $3\text{PbCO}_3 \cdot \text{PbO} \cdot \text{H}_2\text{O}$ (Mulder, *A* 33, 242), (4) $5\text{PbCO}_3 \cdot \text{PbO} \cdot \text{H}_2\text{O}$ (Phillips, *C J* 4, 165). Prepared by (1) *Dutch method*. Thin lead sheets are placed over gallipots containing weak acetic acid ($2\frac{1}{2}\%$), the pots are embedded in fermenting tan at a temp of $60^\circ\text{--}65^\circ$. The metal disappears in a few weeks. Oxide of lead is first formed, and dissolved by the acetic acid, forming a basic acetate, and this is decomposed by the CO_2 evolved from the tan. (2) PbO is mixed with water and about 1 p.c. of Pb acetate, and CO_2 is passed over it. $\text{Pb}(\text{NO}_3)_2$ has been used instead of acetate. Nearly insol in sat CO_2Aq even under pressure (Wagner). The ppd carbonate has $S = 0.5$ in sat CO_2Aq .

Lead-sodium carbonate $4\text{PbCO}_3 \cdot \text{Na}_2\text{CO}_3$ (Berzelius, *P* 47, 199).

Lead chloro carbonate. A compound of the chloride and carbonate of lead is obtained as a pp by the action of CO_2 under pressure on PbCl_2 (Miller, *C J* [2] 8, 37).

Lithium carbonate Li_2CO_3 . S (0°) = 1539, (50°) = 1181, (100°) = 728 (Bevade, *Bl* [2] 43, 123). Found in many mineral waters. Prepared by dissolving an excess of $(\text{NH}_4)_2\text{CO}_3$ in conc LiClAq , and washing resulting pp with alcohol, or by strongly heating Li acetate. Not decomposed by heat. Melts at low red heat, and solidifies to a vitreous mass on cooling. The solution is alkaline and decomposes NH_4 salts, but is decomposed by $\text{Ba}(\text{HO})_2$ and $\text{Ca}(\text{HO})_2$. By slow evaporation the solution deposits salt in small prisms. Water saturated with CO_2 dissolves it more readily than pure water.

Magnesium carbonate MgCO_3 . Occurs native as *magnesite*, in rhombohedral crystals isomorphous with calcspar, infusible, dissolves slowly in acids. Prepared (1) By suspending in water the washed pp obtained by adding solution of an alkaline carbonate to solution of a Mg salt (which always contains $\text{MgO} \cdot \text{H}_2\text{O}$), passing CO_2 through the liquid till pp is dissolved, and evaporating by heat (Rose, *P* 42, 366), (2) By heating MgSO_4Aq with $\text{Na}_2\text{CO}_3\text{Aq}$ to 160° in a sealed tube, (3) By inclosing a soluble Mg salt with an alkaline hydrogen carbonate, super-

saturated with CO_2 in a strong vessel closed by a cork through which the CO_2 can slowly escape (Senarmont, *C R* 28, 698), (4) By carefully heating $\text{MgCO}_3 \cdot \text{KHCO}_3$ 4aq to 200° , and extracting with water (Engel, *Bl* [2] 44, 355). A white crystalline powder, isomorphous with arragonite by method (1), obtained in rhombohedra by (3), isomorphous with CaCO_3 . When moist it is alkaline to litmus. CaSO_4Aq partially decomposes it, especially in presence of NaClAq (Fleischer, *J pr* [2] 6, 278). Soluble in cold solutions of alkaline borates, ppd on heating, but redissolved on cooling (Wittstein, *A Ph* [3] 6, 40). *Hydrates* (a) $\text{MgCO}_3 \cdot 9\text{H}_2\text{O}$. Hexagonal prisms obtained by spontaneous evaporation of a solution of MgCO_3 in excess of CO_2Aq . They lose water in dry air but retain their form. (b) $\text{MgCO}_3 \cdot 5\text{H}_2\text{O}$. Transparent oblique prismatic crystals obtained by exposure of above solution at a low temp. Converted into (a) by exposure to air &c. Boiled, they yield $4\text{MgCO}_3 \cdot \text{MgH}_2\text{O}_2 \cdot 4\text{aq}$ (Fritzsche, *v* also Engel, *C R* 101, 814).

Hydrocarbonates. As in the case of lead, the composition of pp formed by adding an alkaline carbonate to solution of a Mg salt depends on proportions, strength, and temp. of solutions. A variable mixture of hydrocarbonates is known as *magnesia alba*, (a) $4\text{MgCO}_3 \cdot \text{MgH}_2\text{O}_2 \cdot 4\text{aq}$, a white granular powder (for preparation *v* Rose, *A* 80, 234). (b) $3\text{MgCO}_3 \cdot \text{Mg}(\text{HO})_2 \cdot 3\text{aq}$, occurs native as *hydromagnesite* in small white monoclinic crystals (Dana). Prepared artificially (Berzelius, Fritzsche) it is a white, slightly soluble powder forming alkaline solutions. Dried at 100° in air it yields a (Rose) (c) $3\text{MgO} \cdot 2\text{CO}_2 \cdot 3\text{aq}$ (?) (Fritzsche, *P* 37, 310). Denied by Rose.

Magnesium hydrogen carbonate $\text{MgH}_2(\text{CO}_3)_2$ (Soubeiran). Obtained by shaking up *magnesia alba* with CO_2Aq . The sol has a bitter taste and alkaline reaction, becomes turbid at 75° but clears on cooling. Heated to 50° , or evaporated *in vacuo*, it yields hydrate a (*v supra*) (Berzelius, Fritzsche).

Magnesium ammonium carbonate $\text{Mg}(\text{NH}_4)_2(\text{CO}_3)_2 \cdot 4\text{H}_2\text{O}$. Translucent rhombohedra, from a mixture of cold MgCl_2Aq , or MgSO_4Aq , and NH_4 sesquicarbonate solution.

Magnesium-potassium carbonates (1) $\text{Mg}(\text{KH})_2(\text{CO}_3)_2 \cdot 4\text{aq}$. In large crystals from cold aqueous mixture of MgCl_2 or $\text{Mg}(\text{NO}_3)_2$ with excess of KHCO_3 . The crystals at 100° become opaque, and lose water. Decomposed by water, leaving a residue $6\text{MgCO}_3 \cdot \text{MgH}_2\text{O}_2 \cdot 6\text{aq}$ (Berzelius), also obtained in oblique rhombic prisms (Deville, *A Ch* 33, 75), (2) $\text{MgK}(\text{CO}_3)_2 \cdot 4\text{aq}$ by digesting *magnesia alba* at $60^\circ\text{--}70^\circ$ for 12 to 15 hours with KHCO_3Aq (Deville, *l c*).

Magnesium sodium carbonate $\text{MgNa}_2(\text{CO}_3)_2$. Prepared in anhydrous microscopic crystals as the corresponding K salt.

On solubility of MgCO_3 in CO_2Aq under pressure *v* Merkel (*J* 1867, 136) and Wagner (*J pr* 102, 233). On solubility of MgCO_3 and CaCO_3 in solutions of calcium and magnesium salts, and the reactions of dolomite or gypsum and magnesite in presence of water containing CO_2 *v* Hunt (*Am S* [2] 42, 49). For reactions of basic MgCO_3 and gypsum with CO_2Aq *v*. Gossmann (*Am S* [2] 42, 217, 366).

Manganese carbonate MnCO_3 , S water = 0.13, aqueous CO_2 = 0.28 (John) Occurs native as *chalcotite*, in rhombohedral crystals, isomorphous with calcite Prepared by heating MnCl_2Aq in sealed tubes to 160° with $\text{Na}_2\text{CO}_3\text{Aq}$, or to 140° – 170° with CaCO_3 for 12 to 48 hours (Senarmont, *C R* 28, 693) $2\text{MnCO}_3 \cdot \text{H}_2\text{O}$ is obtained by drying *in vacuo* the pp formed by alkaline carbonates with manganous salts (*Gm* 4, 214, Prior, *Fr* 1869 428) Dried in air pp contains Mn_2O_3 Equivalent quantities of Na_2CO_3 and MnCl_2 yield $5\text{MnCO}_3 \cdot 2\text{MnH}_2\text{O}$ (Rose, *A* 80, 235) MnCO_3 is a fine amorphous faintly rose coloured powder The hydrate is snow white and tasteless Anhydrous or hydrated the salt is permanent at ordinary temperatures Heated to redness in air it yields Mn_2O_3 Strongly heated in H it yields MnO_2 In chlorine it gives $4\text{MnCO}_3 + \text{Cl} = \text{MnCl}_2 + \text{Mn}_2\text{O}_3 + 4\text{CO}_2$ (Wohler) Chlorine water, or calcium hypochlorite solution, converts it first into Mn_2O_3 , and then into MnO_2 Solutions of ammoniacal salts dissolve it when freshly pptd

Mercury carbonates *Mercuric carbonate* unknown Neutral or acid carbonates of K or Na yield brown red pps $2\text{HgO} \cdot \text{HgCO}_3$ (Setterberg, *P* 19, 60) Mercuric chloride yields an oxychloride

Mercurous carbonate Hg_2CO_3 A black or yellow powder $\text{Hg}_2\text{NO}_3\text{Aq}$ is mixed with slight excess of $\text{Na}(\text{or K})\text{HCO}_3\text{Aq}$, the mixture is set aside for a few days and frequently stirred, and the pp then washed quickly, and dried over H_2SO_4 *in vacuo* (Setterberg, *lc*) Easily loses CO_2 , is converted into HgO by exposure to air, blackened by alkalis with separation of Hg (*Gm* 6, 15)

Nickel carbonate NiCO_3 For preparation, v COBALT CARBONATE It is a greenish white powder in minute rhombohedra scarcely attacked by strong acids at ordinary temperatures

Hydrocarbonates

(1) $\text{NiCO}_3 \cdot 2\text{NiH}_2\text{O} \cdot 4\text{H}_2\text{O}$ Occurs native as *emerald nickel* (Silliman, *Am S* [2] 6, 248, Shepard, *ibid* 250) (2) $2\text{NiCO}_3 \cdot 3\text{NiH}_2\text{O} \cdot 4\text{H}_2\text{O}$ is the pp obtained from cold NiSO_4Aq and $\text{Na}_2\text{CO}_3\text{Aq}$, when dried at 100° Boiled with water takes up water and loses CO_2 Heated above 100° in air gives off water and CO_2 , and is partly converted into Ni_2O_3 (Rose, *A* 80, 237) Not altered by digestion at 60° – 70° with NaHCO_3Aq (Deville) The pps produced by alkaline carbonates in solutions of nickel salts vary with temperature, strength, and proportions, of solutions employed

Nickel-potassium carbonates

(1) $\text{Ni}_2\text{K}_2(\text{CO}_3)_4 \cdot 4\text{H}_2\text{O}$, shining apple green microscopic needles (2) $\text{NiKH}(\text{CO}_3)_2 \cdot 4\text{H}_2\text{O}$ light green, apparently oblique rhombic prisms Obtained similarly to corresponding cobalt salts (Deville)

Nickel-sodium carbonate,

$\text{NiNa}_2(\text{CO}_3)_2 \cdot 10\text{H}_2\text{O}$ is obtained like the cobalt salt, in small prisms (Seville)

Palladium carbonate A light yellow pp is formed by adding solution of an alkaline carbonate to a solution of a Pd salt No CO_2 is evolved at first, but on continuing ppn effervescence ensues and pp turns brown A small quantity of CO_2 retained when dry (Berzelius)

Potassium carbonates Two salts have been obtained

I *Normal carbonate* K_2CO_3 , S 95.2 at 3° , 111 at 12° , 204 at 70° The commercial salt is prepared by treating the ash of plants, especially of beetroot, with water, and evaporating The residue, containing 60–80 p c K_2CO_3 , is sold as '*crude potash*' The impurities— KCl , K SO_4 , and a little K silicate—are partially removed by digesting for several days with its own weight of cold water, decanting, and evaporating quickly with constant stirring The small crystals obtained are washed with pure $\text{K}_2\text{CO}_3\text{Aq}$, dried, and heated to redness in metal vessels, the product is '*pearl ash*,' which usually contains from 2 to 3 p c impurities

Pure K_2CO_3 is prepared (1) by heating pure K oxalate, (2) by digesting powdered cream of tartar with water containing a little HCl , washing, drying to render silica insoluble, crystallising from water to remove Na salts, heating in a closed silver dish, digesting residue with hot water, filtering, evaporating to dryness, dissolving in cold water, evaporating, and repeating treatment with cold water and evaporation two or three times (Stas, *Chem Proport* 340) (v also Smith, *C N* 30, 234)

Properties and Reactions — White solid, melting at red heat (83°) (Carnelley, *C J* 33, 280), volatilised without change at white heat, very deliquescent, $[\text{K}'\text{CO}'\text{Aq}] = 6490$ (*Th* 3, 198) Solution strongly alkaline, hot solution deposits rhombic octahedra $\text{K}_2\text{CO}_3 \cdot 2\text{H}_2\text{O}$, conc solution deposits monoclinic crystals $2\text{K}_2\text{CO}_3 \cdot 3\text{H}_2\text{O}$, which at 100° give $\text{K}_2\text{CO}_3 \cdot \text{H}_2\text{O}$ (Stadeler, *A* 133, 371, Pohl, *W A B* 41, 630) Heated with aqueous vapour is partly decomposed, giving KOH , heated with charcoal gives K and CO (v POTASSIUM) heated with sulphur forms K sulphide and sulphate, and CO_2 (Berthelot, *Bl* [2] 40, 362), heated in sulphur dioxide gives K SO, and traces of K S (Berthelot, *A Ch* [5] 30, 547) Solutions, about 1 in 10 H O partly decomposed by $\text{CaO} \cdot \text{H}_2$ giving KOH Aq , amount of change much increased by boiling, reverse reaction occurs with more conc solutions

II *Potassium hydrogen carbonate* KHCO_3 , S 22.4 at 0° , 33.2 at 20° , 45.2 at 40° , 16.4 at 60° (Dibbitts, *J pr* [2] 10, 417) Prepared (1) by passing CO_2 into solution of commercial normal carbonate, (2) by passing CO_2 into solution obtained by lixiviating residue from heating K H tartrate in closed vessels, and crystallising *Properties and Reactions* — Large transparent monoclinic crystals, $\text{KHCO}_3 \cdot \text{H}_2\text{O}$, solution has slightly alkaline reaction, and gives off CO_2 on gently warming (v Dibbitts, *J pr* [2] 10, 417) At 200° gives K_2CO_3 and CO_2

Rubidium carbonate Rb_2CO_3 By ppn of $\text{Rb}_2\text{SO}_4\text{Aq}$ with BaO Aq adding $(\text{NH}_4)_2\text{CO}_3$ to filtrate evaporating to dryness, exhausting with water, and evaporating this solution, indistinct crystals of $\text{Rb}_2\text{CO}_3 \cdot \text{H}_2\text{O}$ are obtained Soluble in alcohol, strongly alkaline Heated, lose water and leave Rb_2CO_3 , as a sandy powder, which melts at a higher temperature In air it deliquesces, and yields RbHCO_3 , in glassy prismatic crystals, permanent in air, having very faint alkaline reaction, easily converted by heat

into Rb_2CO_3 (Bunsen & Kirchhoff) (melting point, 837°, Carnelley & Williams, *C J* 37, 125)

Samarium carbonate $\text{Sm}_2(\text{CO}_3)_3 \cdot 3\text{H}_2\text{O}$
Needles insoluble in water. The following double salts have also been prepared: *Samarium ammonium carbonate*, $\text{SmNH}_4(\text{CO}_3)_2 \cdot 2\text{H}_2\text{O}$; *Samarium potassium carbonate*, $\text{SmK}(\text{CO}_3)_2 \cdot 6\text{H}_2\text{O}$, brilliant needles; *Samarium sodium carbonate*, $\text{SmNa}(\text{CO}_3)_2 \cdot 8\text{H}_2\text{O}$, a crystalline pp (Clève, *Bl* [2] 43, 168)

Silver carbonate Ag_2CO_3 . Prepared in crystals by adding ammonia by drops to mixed solutions of AgNO_3 and Na_2CO_3 of definite strength (Vögel, *J pr* 87, 288). As a white pp, becoming yellow on washing, by adding Na_2CO_3 aq to AgNO_3 aq. Blackens on exposure to light. Is readily soluble in strong NH_4aq . Solution treated with absolute alcohol yields a pp containing Ag_2CO_3 and ammonia (Berzelius). At 200° loses CO_2 and leaves Ag_2O . By ppg AgNO_3 aq with large excess of alkaline carbonate and boiling, a substance, possibly a mixture, is obtained which dried at 100° has formula $\text{Ag}_2\text{CO}_3 \cdot 2\text{Ag}_2\text{O}$ (Rose, *A* 84, 202). *Ammonio silver carbonate* $\text{Ag}_2\text{CO}_3 \cdot 4\text{NH}_3$. A grey pp on adding absolute alcohol to Ag_2CO_3 dissolved in NH_4aq (Keen, *C N* 31, 231)

Sodium carbonates. Three salts have been isolated, besides various hydrates, and several double salts

I Normal carbonate Na_2CO_3 . Occurs in waters of several lakes and mineral waters, is a constant constituent of ash of sea plants

Formation—1 From Na_2SO_4 , by heating with C and CaCO_3 , and lixiviating with H_2O (Leblanc's process)—2 From cryolite, by heating with CaO and decomposing the Na aluminate formed by CO_2 —3 By reaction between NaCl and $(\text{NH}_4)_2\text{CO}_3$ in solution

Preparation—1 Soda crystals are repeatedly washed with cold water until all sulphates, chlorides, &c are removed, the last traces of SiO_2 are removed by dissolving the washed salt in water evaporating nearly to dryness, adding a little $(\text{NH}_4)_2\text{CO}_3$, heating till quite dry, dissolving in water, filtering, evaporating, and heating (Wurtz, *J* 1852 357)—2 Soda crystals are repeatedly recrystallised, the crystals being obtained as small as possible (Gay Lussac, *A* 12, 15), most of the chlorides and sulphates and iron salts are thus removed. The washed salt is dried, heated in a silver dish, and the residue is repeatedly washed with small quantities of cold water, the salt is now free from iron, but may contain traces of silica (*v supra*) (Stas)

Properties and Reactions—White solid, melts at c 818° (Carnelley, *C J* 33, 280), giving off a little CO_2 (Jacquelin, *A Ch* [3] 32, 205, Mallard, *A Ch* [4] 28, 86, Scheerer, *A* 116, 134). Heated in steam gives NaOH . Decomposed at high temperature by carbon, to Na and CO , by phosphorus, to C , CO , and Na orthophosphate (Dragendorff, *C C* 1861 865), by silicon to C , CO , and Na silicate, by sulphur, at 275° to Na_2S and $\text{Na}_2\text{S}_2\text{O}_3$, at melting point, to Na_2S and Na_2SO_4 , by ferric oxide, or ferrous oxide with evolution of CO_2 (Stromeyer, *A* 107, 366), by ferrous sulphide to Na and Na Fe sulphide (E Kopp, *Bl* [2] 5, 207). **Solubility**

in water increases from 0° to 84°, from 34° to 79° S is constant $S = 46.2$ at 34° (Löwel, *A Ch* [3] 83, 353, Poggiale, *A Ch* [3] 8, 468, Tomlinson, *C N* 18, 2, Gerlach, *Fr* 8, 279). Solution is accompanied with production of heat, $[\text{Na}^+\text{CO}_3^-\text{Aq}] = 5,640$ (*Th* 3, 198)

Hydrates of Na_2CO_3 —(1) $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$, separates from moderately conc solutions at ordinary temperatures, in clear, monoclinic crystals, these melt at c 34°, leaving $\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$ (Schindler, *Mag Pharm* 33, 14), according to Thomsen (*B* 11, 2042) the residue is $\text{Na}_2\text{CO}_3 \cdot 2\text{H}_2\text{O}$ but this gives up another H_2O in the air. Crystals of $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ effloresce in air, at 12.5° they give the hydrate with $5\text{H}_2\text{O}$, and at 38° *in vacuo*, or over CaCl_2 , the hydrate $\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$ (Watson, *P M* 12, 130). Dissolve in water with disappearance of heat $[\text{Na}^+\text{CO}_3^-\text{10H}_2\text{O}, \text{Aq}] = -16,160$ (*Th* 3, 198)

(2) $\text{Na}_2\text{CO}_3 \cdot 15\text{H}_2\text{O}$ (Jacquelin, *A Ch* [3] 32, 205). Crystallises from conc solutions of Na_2CO_3 at -20°

(3) $\text{Na}_2\text{CO}_3 \cdot 7\text{H}_2\text{O}$ (Löwel, *A Ch* [3] 33, 353, Rammelsberg, Margnac, *Ann M* [5] 12, 55). Crystallises from hot saturated solutions by cooling in closed vessels, if air has entrance the $10\text{H}_2\text{O}$ hydrate forms. Said to crystallise in two modifications, rhombohedra and rhombic tables, with different solubilities

(4) $\text{Na}_2\text{CO}_3 \cdot 6\text{H}_2\text{O}$, crystallises from Na_2SAq standing in air also from NaClAq mixed with K_2CO_3 aq (Mitscherlich, *P* 8, 441)

(5) $\text{Na}_2\text{CO}_3 \cdot 5\text{H}_2\text{O}$, crystallises at temperatures over 33° from molten $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ (Berzelius, *P* 32, 303), also by the efflorescence of $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ at 12.5°

(6) $\text{Na}_2\text{CO}_3 \cdot 2\text{H}_2\text{O}$, melting $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ at 34° (Thomsen), $[\text{Na}^+\text{CO}_3^-\text{2H}_2\text{O}, \text{Aq}] = 20$

(7) $\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$, from hot saturated solutions of Na_2CO_3 , or from hot solutions of $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$, separates from boiling solutions, also produced by efflorescence of some of the hydrates with more H_2O (Marnagac, *Ann M* [5] 12 55, Haidinger, *P* 5, 369)
 $[\text{Na}^+\text{CO}_3^-\text{H}_2\text{O}, \text{Aq}] = 2,250$ (*Th*)

II Sodium hydrogen carbonate, NaHCO_3 , (Bicarbonate of soda) **Formation**—1 By passing NH_3 into NaClAq , and then decomposing by CO_2 under pressure

$\text{NH}_3 + \text{NaClAq} + \text{CO}_2 + \text{H}_2\text{O} = \text{NaHCO}_3 + \text{NH}_4\text{ClAq}$ (Ammonia soda process)—2 By reaction between soda crystals in solution and commercial NH_3 carbonate—3 By reaction between CO_2 and effloresced soda crystals, or a mixture of 1 part crystallised and 3 parts dry Na_2CO_3 —4 By passing CO_2 into Na_2CO_3 aq as long as it is absorbed (1 part Na_2CO_3 in 2 parts H_2O) (L Meyer, *A Suppltd* 2, 170, Berzelius, *P* 16, 434, Mohr *A* 19, 15, 29, 268). **Properties and Reactions**—White monoclinic tables, alkaline taste, changes moist red litmus to blue, but has no action on colour of turmeric paper. In moist air readily goes to Na_2CO_3 aq. When heated gives off CO_2 and H_2O , solution decomposed on boiling (Rose, *P* 34, 158). S 8.8 at 10°, 14.64 at 70° (Poggiale, *A Ch* [3] 8, 468, also Dibbitts, *J pr* [2] 10, 417)

III Sesquicarbonate $\text{Na}_2\text{H}_2(\text{CO}_3)_3 \cdot 8\text{H}_2\text{O}$ ($= \text{Na}_2\text{CO}_3 \cdot 2\text{NaHCO}_3 \cdot 3\text{H}_2\text{O}$) Occurs native, *S G* 2112. Prepared (1) by heating NaHCO_3 to 200° (Hermann, *J pr* 26, 312), (2) by evapo-

rating solutions of NaHCO_3 , *in vacuo* over H_2SO_4 , (8) by melting together the two carbonates, in the ratio $\text{Na}_2\text{CO}_3, 10\text{H}_2\text{O} : 2\text{NaHCO}_3$, and standing in air till mass becomes crystalline, when it contains crystals of the sesquicarbonate, (4) by pouring alcohol on to a mixture of $\text{Na}_2\text{CO}_3\text{Aq}$ and NaHCO_3 , the salt separates in fine needles (Winkler, *R* P 48, 215). Monoclinic crystals, non efflorescent in air, goes to Na_2CO_3 at red heat, aqueous solution *in vacuo* over H_2SO_4 gives Na_2CO_3 and NaHCO_3 (Rose, *P* 84, 160) S 12.63 at 0° , 41.59 at 100° (Poggiale).

IV Double Salts Sodium potassium carbonates

(1) $\text{Na}_2\text{KCO}_3, 6\text{H}_2\text{O}$, monoclinic crystals, unchanged in dry air, effloresces in moist air, by evaporating solution of equal equivalents of the constituent salts, and crystallising from $\text{K}_2\text{CO}_3\text{Aq}$. At 100° loses $6\text{H}_2\text{O}$. S 185 at 15° (Margnac, *C* R 45, 650, Marguerite, *A* 56, 220, Stolba, *Bl* [2] 4, 192, 7, 241).

(2) $2\text{Na}_2\text{CO}_3, \text{K}_2\text{CO}_3, 18\text{H}_2\text{O}$, from mother liquor from which $\text{K}_2\text{Fe}(\text{CN})_6$ has crystallised out. May be crystallised from $\text{K}_2\text{CO}_3\text{Aq}$ (Marguerite).

SODIUM CALCIUM CARBONATE

$\text{Na}_2\text{CO}_3, \text{CaCO}_3, 5\text{H}_2\text{O}$, occurs native as *Gay Lussite*, obtained, in microscopic monoclinic crystals, by reaction between freshly ppd CaCO_3 and conc $\text{Na}_2\text{CO}_3\text{Aq}$ at ordinary temperature. When dry this compound is decomposed by water (Fritzsche, *J* pr 93, 339, Boussingault, *P* 7, 97, H Rose, *P* 93, 606).

Strontium carbonate SrCO_3 , S G (pp) = 3.62 S (cold or hot) = 0003 (Bineau, *C* R 41, 509). S (cold) = 005 (Fresenius) solubility diminished by NH_4Aq or $(\text{NH}_4)_2\text{CO}_3\text{Aq}$. S (10° in satd CO_2Aq) = 12 (Lassaigne). Occurs native as *strontianite*. Crystals of trimetric system, isomorphous with aragonite and witherite. Prepared by ppn with alkaline carbonate as a smooth white substance, in form of strontianite, by crystallising amorphous carbonate from fused KCl and NaCl (Bourgeois, *Bl* [2] 37, 447). Heated in closed vessel CO_2 given off only at about white heat, but in aqueous vapour SrH_2O_2 is formed at a much lower temp. Alkaline sulphates in solution do not decompose it at any temperature (Rose, *P* 95, 284). Ammonium chloride solution boiled with it converts it into SrCl_2 .

Thallium carbonate Tl_2CO_3 , S G (fused) 7.06 (Lamy). S (15.5°) = 4.02, (60°) = 11.7, (100°) = 27.21. M.P. c 272° (Carnelley, *C* J 33, 275). Formed by exposure of Tl in a saturated solution of Tl_2O to air. Prepared by allowing granulated metal to oxidise in warm air, boiling with water containing excess $(\text{NH}_4)_2\text{CO}_3$, and filtering. Tl_2CO_3 is deposited in groups of prisms (Miller, *Pr* 14, 555), which are brilliant, highly refractive, very heavy, anhydrous, colourless, melting, undecomposed, much below redness to clear liquid which solidifies to dark grey mass, and at red heat decomposes evolving CO_2 . Taste mildly caustic and metallic. Solution has alkaline reaction not completely removed by supersaturation with CO_2 (Crookes, Werther, *J* 1864 249).

Thorium carbonate $\text{Th}(\text{CO}_3)_2, 3\text{ThH}_2\text{O}, 2\text{H}_2\text{O}$. Alkaline carbonates throw down a basic salt with evolution of CO_2 . Moist ThH_2O absorbs CO_2 from air. ThO_2 is not sol in water containing CO_2 (Berzelius). Salt of above formula obtained

as an amorphous pp by treating hydrate suspended in water with CO_2 , or by ppg solution of ThCl_4 with an alkaline carbonate.

Tin carbonates $\text{SnCO}_3, \text{SnO}$, by adding solid SnCl_2 to conc $\text{Na}_2\text{CO}_3\text{Aq}$ in absence of air very unstable. If $(\text{NH}_4)_2\text{CO}_3\text{Aq}$ is used hexagonal prisms of $(\text{NH}_4)_2\text{O} 2\text{SnO} 8\text{CO}_2, 8\text{H}_2\text{O}$ are said to be formed (Deville, *A* Ch [3] 85, 448).

Uranium carbonates have not been isolated. Alkaline carbonates ppt uranous hydrate from UCl_4 , a basic sulphate from $\text{U}(\text{SO}_4)_2$, and double carbonates from uranic salts.

Uranyl ammonium carbonate

$(\text{UO}_2)_2\text{CO}_3, 2(\text{NH}_4)_2\text{CO}_3$, S = 5 at 15° , increased by $(\text{NH}_4)_2\text{CO}_3$. Prepared in small yellow transparent crystals, by digesting in $(\text{NH}_4)_2\text{CO}_3\text{Aq}$ at 60° – 80° the pp produced by NH_4Aq or $(\text{NH}_4)_2\text{CO}_3\text{Aq}$ from uranic salts, filtering, and allowing to cool. Decomposed slowly at ordinary, more quickly at higher, temps leaving UO_2 , solution boiled evolves NH_3 and CO_2 , and deposits yellow pp, containing uranium, of doubtful composition (Aifedson, Peligot, Ebelmen, *A* Ch [3] 5, 189, Delffs, *P* 55, 229).

Uranyl potassium carbonate

$(\text{UO}_2)_2\text{CO}_3, 2\text{K}_2\text{CO}_3$, S = 7.4 at 15° , insol in alcohol. Prepared, as a bright yellow crystalline crust, by dissolving in KHCO_3Aq the pp formed from uranic salts by $\text{K}_2\text{CO}_3\text{Aq}$, and evaporating. At 300° evolves CO_2 , at red heat leaves mixture of K uranate and carbonate. KOHAq pps all the U as K uranate, even in presence of excess of K_2CO_3 .

Uranyl sodium carbonate

$(\text{UO}_2)_2\text{CO}_3, 2\text{Na}_2\text{CO}_3$. Preparation and properties similar to K salt. Two Ca salts,

(1) $(\text{UO}_2)_2\text{CO}_3, \text{CaCO}_3, 10\text{H}_2\text{O}$,

(2) $(\text{UO}_2)_2\text{CO}_3, \text{CaCO}_3, 5\text{H}_2\text{O}$,

occur native (Smith, *A* 66, 253).

Yttrium carbonate $\text{Y}_2(\text{CO}_3)_3, \text{Na}_2\text{CO}_3\text{Aq}$ pps it from yttrium salts with $12\text{H}_2\text{O}$ in the cold, and $2\text{H}_2\text{O}$ at 100° . Not easily decomposed by heat, sparingly soluble in water containing CO_2 . Solution in $(\text{NH}_4)_2\text{CO}_3\text{Aq}$, if concentrated, deposits a white crystalline double salt which does not redissolve in $(\text{NH}_4)_2\text{CO}_3\text{Aq}$, also soluble in K_2CO_3 and $\text{Na}_2\text{CO}_3\text{Aq}$ (Berzelius).

Zinc carbonate ZnCO_3 . Occurs as *calamine*. Not obtained by precipitation. Pp formed by KHCO_3Aq in ZnSO_4Aq is $2\text{ZnCO}_3, 3\text{ZnO}, \text{H}_2$ (Berzelius). ZnCO_3 unaltered at 200° , slowly evolves CO_2 at 300° (Rose).

Hydrocarbonates. Native hydrocarbonates are (1) *zinc bloom* $\text{ZnO}, \text{ZnCO}_3, 3\text{ZnH}_2\text{O}_2$ (Berzelius), or $\text{ZnCO}_3, 2\text{ZnH}_2\text{O}_2, \text{Aq}$ (Smithson, a Borndorff, *Gm* 6, 15). (2) *Auriscalcine* or *green calamine* $2\text{ZnCO}_3, 3\text{ZnH}_2\text{O}_2$, in which Zn is partly replaced by Cu. (3) *Buraita*, a hydrocarbonate containing Cu and Ca.

The pps formed by alkaline carbonates in solutions of zinc salts all appear to contain water, and to vary in composition with strength, temperature, and proportions, of solutions. For results obtained under varying conditions, v Rose (*P* 85, 107), Schindler a Boussingault (*Gm* 1, 15). They all evolve CO_2 and H_2O at 200° , yielding ZnO (Rose).

Ammonio carbonate of zinc $(\text{NH}_4)_2\text{Zn}(\text{CO}_3)_2$. Deposited in crystals from a solution of ppd zinc carbonate in conc $(\text{NH}_4)_2\text{CO}_3\text{Aq}$ (Favre, *Traité de Chimie*, Pelouze et Frémy, 2nd ed. 3, 47).

Zinc-potassium carbonate

$8\text{ZnCO}_3, 8\text{K}_2\text{CO}_3, 7\text{H}_2\text{O}$ (?) Crystallises from a solution of ZnCl_2 mixed with K sesquicarbonate (Deville, *A Ch* [3] 82, 75)

Zinc and sodium carbonate

$8\text{ZnCO}_3, 3\text{Na}_2\text{CO}_3$ (?) Small crystals, obtained as potassium salt (Deville)

Zirconium carbonate Excess of alkaline carbonate solution produces a pp in solutions of Zr salt, soluble in $\text{Na}_2(\text{or K})_2\text{CO}_3\text{Aq}$. Composition seems to be variable (Hermann, Klaproth, Vauquelin)

THIO CARBONIC ACID H_2CS_2 . Mol w un known. A dark yellow very strongly smelling oil, obtained by adding cold dilute HClAq to K_2CS_3 or Na_2CS_3 , very easily decomposed, by heating, to CS_2 and H_2S (Zeise, *S* 41, 105, Berzelius, *P* 6, 450)

THIO CARBONATES These salts have the composition M_2CS_3 or MCS_3 , when $\text{M}_2 = \text{Na}_2 \&c$, and $\text{M} = \text{Ca} \&c$. A few basic salts are also known. The composition of the salts of the alkali and alkaline earth metals has been determined, several other thio carbonates seem to be produced in the reactions between solutions of metallic salts and $\text{K}_2\text{CS}_3\text{Aq}$ or $\text{Na}_2\text{CS}_3\text{Aq}$, but the composition of very few of these thio carbonates of the heavy metals has been determined. Thio carbonates are formed by reactions between CS_2 and aqueous solutions of the monosulphides of the alkali and alkaline earth metals, M_2S and MS . By using MOHAq and CS_2 , thio carbonates and carbonates are formed simultaneously, with MOH.Aq and CS_2 ($\text{M} = \text{Ca, Ba, Sr}$) basic thio carbonates are formed, e.g. $\text{CaCS}_2, 2\text{CaO.H}_2\text{O}, 6\text{H}_2\text{O}$. NH_3Aq reacts with CS_2 to form $(\text{NH}_4)_2\text{CS}_3$ and $(\text{NH}_4)_2\text{CNS}$ (Gélis, *J* 1861, 340). The thio carbonates are yellow, red yellow, brown, or black, solids, the hydrated salts are yellow. The salts of the alkali and alkaline earth metals are soluble in water, those of the heavy metals are more or less soluble in excess of $\text{M}_2\text{CS}_3\text{Aq}$ ($\text{M} = \text{Na} \&c$). The thio carbonates are not very stable, those of the heavy metals easily decompose to metallic sulphide and CS_2 , conc solutions of the alkali salts change to H_2S and alkali carbonates when boiled, dilute solutions decompose by standing in air to carbonates and S . Heated alone, most of them give metallic sulphide and CS_2 . K_2CS_3 gives K_2S and C . The thio carbonates have been chiefly investigated by Zeise (*S* 41, 105), Berzelius (*P* 6, 450), Walker (*C N* 30, 28), Sestini (*G* 1871, 473, *B* 5, 327), Gchls (*J Ph* [3] 89, 95, *C R* 81, 282), P Thénard (*C R* 79, 673), Husemann (*A* 123, 67), Mermet (*C R* 81, 344).

Ammonium thiocarbonate $(\text{NH}_4)_2\text{CS}_3$. Prepared by mixing a saturated alcoholic solution of NH_3 with its vol CS_2 , cooling after the liquid has become brown, pouring off liquid, and washing the crystals several times with alcohol, then with ether, and pressing between paper (Zeise). Yellow crystals, v sol in water, insol in alcohol or ether, may be sublimed in dry air by gentle warming, very hygroscopic. Aqueous solution heated to $90^\circ\text{--}100^\circ$ evolves H_2S and NH_4CNSAq remains (Gélis).

Barium thiocarbonate BaCS_3 . By shaking BaSAq with CS_2 , washing with alcohol, and drying *in vacuo*.

Calcium thiocarbonate CaCS_3 . By digesting CaS with excess of CS_2 , and evaporating *in vacuo*. Citron yellow, sol in alcohol or water, milk of lime shaken with CS_2 gives an orange red pp of $\text{CaCS}_2, 2\text{CaO.H}_2\text{O}, 6\text{H}_2\text{O}$, and this at 30° gives red liquid from which red crystals of $\text{CaCS}_2, 3\text{CaO.H}_2\text{O}, 7\text{H}_2\text{O}$ separate (Walker, Sestini).

Potassium thiocarbonate K_2CS_3 . When K SAq is digested with CS_2 at 30° in a closed vessel, or CS_2 is dissolved in a conc alcoholic solution of K_2S , yellow deliquescent crystals separate, dried at $60^\circ\text{--}80^\circ$ these give K_2CS_3 , a red brown solid, v sol in water, sl sol in alcohol.

The other thiocarbonates which have been fairly well examined and analysed are those of Lithium, Magnesium, Sodium, and Strontium. Thiocarbonates of Bi, Cd, Cr, Co, Au, Fe, Pb, Mn, Hg, Ni, Pt, Ag, Sn, Zn, seem also to be formed by adding the solution of an alkali thio carbonate to a solution of a salt of each of these metals. M M P M

CARBONIC ANHYDRIDE CO_2 v CARBON, OXIDES OF

CARBON TETRA-CHLORIDE v *supra* and TETRA CHLORO METHANE

CARBONIC ETHERS There are three classes of carbonic ethers viz acid ethers $\text{CO}(\text{OR})(\text{OH})$, normal ethers $\text{CO}(\text{OR})_2$, and ethers of ortho carbonic acid $\text{C}(\text{OR})_2$. In these formulae R may be any alkyl. They are described as salts of the alkyl e.g. ETHYL CARBONATE, METHYL CARBONATE, PHENYL CARBONATE, &c.

Orthocarbonic ethers are formed by the action of sodium alcoholates on chloropicrin (Williamson a Basset, *A* 132, 54). They are converted by ammonia into guanidine.

Normal carbonic ethers

Formation — 1 From alkyl iodides and silver carbonate (de Clermont, *A* 91, 375) — 2 By the action of Na , K , solid NaOEt ($\frac{1}{2}$ mol) or KOEt ($\frac{1}{2}$ mol), upon alkyl oxalates (1 mol) (Etting, *A* 19, 17, Ludwig a Weidmann, *A* 36, 301, Geuther, *Z* 1868, 656, Cranston a Dittmar, *Z* 1870, 4) — 3 By the action of alkyl chloroformates upon sodium alcoholates, e.g.

$\text{Cl CO OEt} + \text{NaOMe} = \text{NaCl} + \text{MeO CO OEt}$ (Roese, *A* 205, 240). The mixed ether prepared from ethyl chloroformate and sodium methylate is identical with that from methyl chloroformate and sodium ethylate — 4 From COCl_2 and sodium alcoholates.

Properties — The boiling points and specific gravities of the fatty carbonic ethers are as follows (Roese, *A* 205, 244) —

Ether	Boiling point	S.G.
Me_2CO	90.6°	1.065 at 17°
MeEtCO	109.2°	1.00 at 27°
Et_2CO	125°	97
MePrCO	130.8°	98 at 27°
Pr_2CO	168.2°	95 at 17°
$\text{Me}(\text{PrCH}_2)\text{CO}$	143.6°	95 at 27°
$\text{Et}(\text{PrCH}_2)\text{CO}$	160.1°	93 at 27°
$(\text{PrCH}_2)_2\text{CO}$	190.3°	92 at 15°
$\text{Et}(\text{C}_2\text{H}_{11})\text{CO}$	182.3°	92 at 27°
$(\text{C}_2\text{H}_{11})_2\text{CO}$	228.7°	91 at 15°

Reactions—1 *Ammonia* converts the ethers R_2CO_2 into carbamic ethers, and finally into urea—2 PCl_5 forms chloroformic ethers. In mixed ethers $RR'CO$, the alkyl which is converted into chloride is the smaller of the two $Et(C_2H_5)_2CO_2 + PCl_5 = EtCl + ClCO_2C_2H_5 + POCl_3$. The amides of the chloroformates, which may be regarded as half chloride half amide of carbonic acid (carbamic chlorides), are obtained by the action of $COCl_2$ upon the hydrochlorides of amines, e.g. $COCl_2 + NEt_3 = COCl(NEtH) + HCl$ (Gattermann a Schmidt, *B* 20, 118) *cf.* CHLOROFORMIC ACID—3 When an alkyl carbonate is heated with an alcohol containing a heavier alkyl, the heavy alkyl displaces the light one (*R*)

Chloro imido-carbonic ethers $CIN(COR)_2$. These are formed by leading chlorine into a cooled solution of $NaOH$ and KCN in an alcohol (Sandmeyer, *B* 19, 862). They are crystalline, and converted by dilute acids or by aqueous H_2S into the corresponding carbonic ethers. Aqueous potassium arsenite reduces them to imido carbonic ethers (*cf.* CHLORO IMIDO-CARBONIC ETHERS)

Imido carbonic ethers $HN(COR)$. Prepared as above, are alkaline liquids, readily decomposed by aqueous acids into NH_3 and carbonic ethers (*cf.* IMIDO-CARBONIC ETHERS)

CARBO-DI-NICOTINIC ACID *v.* PYRIDINE TRI-CARBOXYLIC ACID

CARBONIC OXIDE Name usually given to CO , *v.* CARBON, OXIDES OF

CARBONIC - OXIDE - POTASSIUM *v.* potassium salt of HEXA OXY BENZENE

CARBONOUS OXIDE CO , *v.* CARBON, OXIDES OF

CARBON TETRA IODIDE *v.* TETRA IODOMETHANE

CARBONPIMELIC ACID *v.* 130 PENTANE TRI-CARBOXYLIC ACID

CARBONYL The divalent radicle CO . When attached to two carbon atoms the product is a ketone, when attached to one carbon atom and to hydroxyl the compound is a carboxylic acid, when attached to one carbon atom and to one hydrogen atom the product is an aldehyde. Two or three carbonyls attached to CH render the hydrogen displaceable by metals. Many carbonyl derivatives of amido compounds are described under the amido compounds from which they are formed by the action of $COCl_2$.

CARBONYL - DI-*m*-AMIDO-DI BENZOIC ACID *v.* DI PHENYL UREA DI *m*-CARBOXYLIC ACID

CARBONYL AMIDO PHENOL *v.* Anhydride of OXY PHENYL CARBAMIC ACID

CARBONYL BROMIDE *v.* CARBON, OXY BROMIDE OF

CARBONYL DI BIURET *v.* BIURET

CARBONYL CARBAMIC ETHER $C_2H_5NO_2$, *i.e.* $CONCOEt$ or $(C_2H_5NO_2)_2$, Carbonyl cyanate or cyanurate [119²]. Formed by the action of chloroformic ether on potassium cyanate. If dry ether be present a second compound $C_4H_9N_3O_4$ [107²] is also formed. Rhombic plates, sl. sol. cold alcohol, *v.* sol. $CHCl_3$. When heated with water to 100° it loses CO_2 , forming cyanuric ether. Its formula should therefore possibly be trebled. The compound $C_4H_9N_3O_4$, when distilled with water behaves similarly (Wurtz a. Henniger, *C R* 100, 1419, *d Ch.* [6] 7, 132).

Compounds with cyanic ether

(a) $C_6H_5N_2O_2$ or $(CONCO_2Et)(CONEt)_2$ [107²]. Formed as above, or together with carbonyl carbamic (imido diformic) ether [50²], (226²) when the ether is wet. Needles, which lose CO_2 on heating, yielding cyanuric ether (*W a H*)

(b) $C_6H_5N_2O_2$, *i.e.* $(CONCO_2Et)_2(CONEt)_2$ [123²]. Formed together with imido diformic ether when KCN acts on an aqueous ethereal solution of chloroformic ether for a long time. On distilling it forms cyanuric ether (*W a H*)

CARBONYL CHLORIDE *v.* CARBON, OXYCHLORIDE OF

CARBONYL GUANIDINE *v.* AMIDO DICYANIC ACID

CARBONYL DI-PHENYLENE *v.* DIPHENYLENE KETONE

CARBONYL-DI-PHENYL OXIDE *v.* DI-PHENYLENE KETONE OXIDE

CARBONYL-PYRROLE $C_4H_5N_2O_2$ *i.e.* $OC \begin{smallmatrix} \diagup NC_2H_4 \\ \diagdown NC_2H_4 \end{smallmatrix}$, Di-tetrol urea [63²] (*c* 238°)

Formed, together with di-pyrrol ketone, by the action of carbonyl chloride upon pyrrol-potassium (Ciamician a. Magnaghi, *B* 18, 414, 1829). Large monoclinic crystals, *abc* = 1.1688 1.7189 *v.* sol. alcohol and ether, insol. water. By heating to 250° it is transformed into a mixture of pyrrolyl pyrrol $C_4H_5N CO C_4H_5NH$ and di-pyrrolyl-ketone $CO(C_4H_5NH)_2$.

CARBONYL SULPHIDE *v.* CARBON, OXY-SULPHIDE OF

CARBONYL-UREA *v.* UREA

CARBOPETROCENE *v.* PETROCENE

CARBO - DIPHENYLENE *v.* DI-PHENYLENE KETONE

CARBO-DIPHENYLIMIDE *v.* DI-PHENYL-CYANAMIDE

CARBO TRI PHENYL TRIAMINE *v.* DI-PHENYL AMIDO BENZAMIDINE

CARBO PHENYL TOLYL-IMIDE *v.* PHENYL TOLYL CYANAMIDE

CARBO DI PROPYL DI PHENYL IMIDE *v.* DI PROPYL DI PHENYL CYANAMIDE

CARBO PYRIDENIC ACIDS *v.* PYRIDINE-CARBOXYLIC ACIDS

CARBO-PYROTETRAIC ACID *v.* DI-METHYLFURFURANE CARBOXYLIC ACID

CARBO PYRROLIC ACID *v.* PYRROL-CARBOXYLIC ACID

CARBO PYRROLYL FORMIC ACID *v.* PYRROLYL GLYOXYLIC ACID

CARBOSTYRIL C_8H_7NO *i.e.* $C_6H_5 \begin{smallmatrix} \diagup CH & CH \\ | & | \\ NH & CO \end{smallmatrix}$ or

$C_6H_5 \begin{smallmatrix} \diagup CH & CH \\ | & | \\ N & C(OH) \end{smallmatrix}$ Lactam or lactim of *o*-amido cinnamic acid (*Py* 3) Oxy-quinoline [199²]

Formation—1 By boiling *o*-amido cinnamic acid with $HClAq$ (Chiozza, *C R* 34, 598, *A* 83, 117, Tiemann a. Oppermann, *B* 13, 2070)—2 Obtained by reducing tri-chloro oxy quinoline with HI (Rotheit, *J pr* [2] 29, 300)

Preparation—*o*-Nitro cinnamic ether is heated with alcoholic $(NH_4)_2S$ to 100° under pressure, the solution is evaporated to dryness, taken up with $NaOH$ and the carbostyryl pptd.

by CO_2 (Friedlander & Ostermeyer, *B* 14, 1918)

Properties—Prisms (from alcohol), or long thin threads (containing aq) from dilute aqueous solution. May be sublimed. V sl sol cold, v sol hot, water. Sol alcohol and ether. Alkaline KMnO_4 oxidises it to isatin and oxal oxyl amido benzoic acid (carbostyrylic acid) $\text{CO}_2\text{H C}_6\text{H}_4\text{NH C(OH)CO}_2\text{H}$ [200°]

Salts—The K and Na salts form easily soluble plates. The barium salt A^+Ba sparingly soluble plates.

Methylether (247° uncor) Colourless liquid. Smells of oranges.

Ethylether [below 0°] (256°) Prepared by the action of ethyl iodide on sodium carbostyryl, or of alcoholic KOH on chloro quinoline. Volatile with steam. Colourless liquid. Sweet smell—B'HCl hygroscopic crystals.

Phenylether [69°] Sublimable. Glistening plates. Sol. ordinary solvents (Friedlander & Ostermeyer, *B* 15, 335).

Reference—AMIDO-CARBOSTYRYL, BROMO-CARBOSTYRYL, &c. Hydrocarbostyryl is described under AMIDO-PHENYL-PROPIONIC ACID. Ethyl pseudo carbostyryl is described as (Py 3, 4) OXY-ETHYL QUINOLINE.

CARBOSTYRYL-CARBOXYLIC ACID v OXY-QUINOLINE CARBOXYLIC ACID.

CARBOTHIALDINE $\text{C}_8\text{H}_8\text{N}_2\text{S}_2$ Crystals which separate on adding CS_2 to an alcoholic solution of aldehyde ammonia (Redtenbacher & Liebig, *A* 65, 43). Also from aldehyde and ammoniac thio carbamate (Mulder, *A* 168, 235). Insol water. Sol acids.

Reactions—1. HCl splits it up into aldehyde, NH_3 , and CS_2 —2. KMnO_4 forms H_2SO_4 , CO_2 , $\text{K}_2\text{C}_2\text{O}_4$, and acetic acid—3. HCl and Fe_2Cl_6 forms NH_4Cl , aldehyde, and $\text{NH}_4\text{CS}_2\text{S CS}_2\text{NH}_2$ (Guareschi, *G* 8, 246, *B* 11, 1383).

CARBO-TRI-THIO-HEXABROMIDE v HEXA-BROMO DI METHYL TRI SULPHIDE.

CARBO-TOLYLENE DI-PHENYL-TETRAMINE v DI-PHENYL TOLYLENE TETRA AMIDO-MPTHANE.

CARBO-DI-TOLYL-IMIDE v DI-TOLYL CYAN-AMIDE.

DICARBOTHIONIC ETHER $\text{S}(\text{CO}_2\text{Et})_2$ (180°) From ClCO_2Et and alcoholic Na_2S Oil, decomposed by baryta water or alcoholic KOH into Et_2S and CO_2 (V Meyer, *B* 2, 298).

CARBO-VALERTHIALDINE $\text{C}_{11}\text{H}_{12}\text{N}_2\text{S}_2$ [109°] (*G*), [117°] (*S*) V D 60. From isovaleric aldehyde (5g), CS_2 (3g) and aqueous NH_3 (Schröder, *B* 4, 469). From isovaleric aldehyde and ammonium thio carbamate (Mulder, *A* 168, 237). Colourless needles (from alcohol). Fe_2Cl_6 on warming gives the sulphocyanide reaction. KMnO_4 forms HCN , H_2SO_4 , and valeric acid. Fe_2Cl_6 and HCl form in the cold a yellow powder (S CSNH_2). Carbovaleridine may therefore be dithiocarbamate of di valeryludene ammonium $\text{H}_2\text{N CS SN}(\text{CH}_2\text{CH}_2\text{CHMe})_2$ (Guareschi, *A* 222, 810, *G* 13, 500).

CARBOVINIC ACID is Hydrogen ETHYL CARBONATE (*q* v).

CARBOXAMIDO-BENZOIC ACID v DI-PHENYL UREA DI-CARBOXYLIC ACID.

CARBOXAMIDO-CARBIMIDAMIDO-BENZOIC ACID v p 157.

VOL. I

CARBOXAMIDO-CYANAMIDO-BENZOYL v p 155.

CARBOXAMIDO-HIPPURIC ACID v p 164.

CARBOXAMIDO-O-OXY-BENZOIC ACID

$\text{C}_{11}\text{H}_9\text{N}_3\text{O}_4$. A product of the action of urea on amido salicylic acid at 200° (Griess, *J* pr [2] 1, 235). Minute needles, v sl sol most sol vents.

CARBOXETHYL CYANATE or **CYANURATE**

v CARBONYL CARBAMIC ETHER.

CARBOXY-ACETO-GLUTARIC ACID v

METHYL PROPYL KETONE TRI-CARBOXYLIC ACID

v **CARBOXY O-AMIDO-BENZOIC ACID** v ISATOIC ACID.

v **Carboxy m amido benzoic ether** v p 157.

CARBOXY BENZENE PHOSPHONIC ACID

$\text{CO}_2\text{H C}_6\text{H}_4\text{PO}(\text{OH})_2$ [above 300°] Prepared by the oxidation of *p* toluene phosphonic acid $\text{C}_6\text{H}_4(\text{CH}_3)\text{PO}(\text{OH})_2$ with KMnO_4 . Needles or tables. V sol water, m sol aqueous HCl or alcohol. On heating to 300° it decomposes, giving metaphosphoric and benzoic acids.

Salts— A^+Ag , slightly soluble pp— $\text{A}^+\text{H}_2\text{Kaq}$ fine needles sol water, sl sol alcohol— $\text{A}^+\text{H}_2\text{K}$ long prisms sl sol water.

Chloride $\text{C}_6\text{H}_4(\text{COCl})(\text{POCl}_2)$ (83°) (315°). Colourless crystals. Heated with PCl_5 , it gives *p* chlorobenzoyl chloride PCl_5 and POCl_3 .

Trimethyl ether A^+Me_3 , thick liquid (Michaels & Panek, *B* 14, 405).

CARBOXY BENZOYL ACETIC ACID v ACETOPHENONE DI-CARBOXYLIC ACID, p 37.

CARBOXY BENZOYL-AMIDO-BENZOIC ACID v PHTHALOXYL AMIDO-BENZOIC ACID.

CARBOXY BENZOYL ETHERYL TRI-CARBOXYLIC ACID v PHENYL ETHYL KETONE TETRA-CARBOXYLIC ACID.

CARBOXY BENZOYL PROPIONIC ACID

$\text{C}_{11}\text{H}_{10}\text{O}_5$ \approx $\text{CO}_2\text{H C}_6\text{H}_4\text{CO C}_2\text{H}_5\text{CO}_2\text{H}$. The free acid is unstable, but its Na salt is formed by dissolving phthalyl propionic acid in NaOHaq (Gabriel & Michael, *B* 11, 1680).

CARBOXY-BENZYL-ACETO-ACETIC ETHER

$\text{C}_{11}\text{H}_{10}\text{O}_5$ \approx $\text{CO}_2\text{H C}_6\text{H}_4\text{CH}_2\text{CHAc CO}_2\text{Et}$ [92°]. Formed by reducing phthalyl acetoacetic ether with zinc dust in glacial acetic acid (Bulow, *A* 236, 190). Needles, v sol hot water, alcohol, ether, and HOAc . The ammonium salt melts at [121°]. Boiling baryta-water converts it into benzyl acetone o-carboxylic acid.

Phenyl hydraside $\text{C}_{20}\text{H}_{12}\text{N}_4\text{O}_4$ [235°]. Decomposes slowly, forming alcohol and $\text{C}_{18}\text{H}_{12}\text{N}_4\text{O}_3$ [229°].

CARBOXY BENZYL MALONIC ACID

$\text{HO}_2\text{C C}_6\text{H}_4\text{CH}_2\text{CH}(\text{CO}_2\text{H})_2$. Formed by saponifying o-carboxy benzyl malonic ether (Wislicenus, *A* 242, 37). Prisms. V sol hot, sl sol cold, water. Heated to 190° gives off CO_2 and forms o-carboxy phenyl propionic acid [166°].

Salt— A^+Ag , V sl sol hot water.

Di ethyl ether

$\text{CO}_2\text{H C}_6\text{H}_4\text{CH}_2\text{CH}(\text{CO}_2\text{Et})_2$ [86°] S 045 at 17°. Formed by reducing phthalyl malonic ether with acetic acid and zinc (Wislicenus, *A* 242, 32). Fine needles. V sol ether and hot alcohol, sl sol hot water.

Salts— A^+Ag white needles— A^+Na deliquescent needles. V sol alcohol, insol ether.

Tri ethyl-ether A^+Et_3 (250°) at 45 mm.

Z Z

CARBOXY CARBAMIC ETHER $C_6H_{11}NO_4$, i.e. $NH(CO.Et)_2$ [50°] (226°)

Formation—1 By the action of chloroformic ether on potassium cyanate in the presence of wet ether. A second compound $C_6H_{11}N_2O_4$ [107°], insoluble in water, is also formed, while a small quantity of yellow oil [170°] is found in the aqueous extract. If absolute alcohol be used instead of ether, the second compound is not formed.—2 Chloroformic ether (14 gr) and carbamic ether (24 gr) are heated together at 120°

Properties—Long prisms. It forms buret and alcohol when made with aqueous NH_3 . The salt $C_6H_{11}NO_4.Ag$ crystallises in cubes (Wurtz & Henniger *A Ch* [6] 7, 135)

CARBOXY CINNAMIC ACID *v* CINNAMIC ACID

CARBOXY-CORNICULARIC ACID $C_{15}H_{16}O_8$, i.e. $C_6H_5.C(CO_2H).CH.CO.CH(CO_2H).C_6H_5$, formed as a by product in the reduction of pulvic acid to dihydrocornicularic acid. It was not isolated, but was converted into the lactone by means of acetic anhydride

Carboxy-cornicularic lactone

$C_{15}H_{12}O_8$ or $C_6H_5 \begin{array}{c} | \\ OC-O \\ | \end{array} CO_2H$ [215°]

Long felted needles or short prisms. In cold aqueous NH_3 or alkaline carbonates it dissolves forming salts of the formula $C_{15}H_{11}O_8M$, but on heating it gives salts of carboxy cornicularic acid $C_{15}H_{11}O_8M_2$ (Spiegel, B 15, 1546)

CARBOXY-CYANAMIDO-BENZOYL *v* p 155

DI-CARBOXY-GLUTARIC ACID $C_6H_8O_8$

Propylene tetracarboxylic acid

Ethyl ether $(CO_2Et).CH.CH.C(CO_2Et)_2$ (270°-280°) SG 1.131 at 15°. From its sodium salt by HCl. Oil, soluble in alcohol or ether. Boiled with HCl it gives off CO_2 and forms glutaric acid (*q v*) and iso aconitic ether. NaOH acts similarly. Sodium derivative $(CO_2Et)_2.CNa.CH.C(CO_2Et)_2$ [260°]. From malonic ether, NaOEt and chloroform (Conrad & Guthzeit, A 222, 251) $2(CO_2Et)CNa_2 + CHCl_3 = (CO_2Et)_2.CNa.CH.C(CO_2Et)_2 + 3NaCl$. Bright yellow prisms. Insol ether, sl sol cold water or cold alcohol, v sol hot water or hot alcohol. Gives a violet colour with ferric chloride, and pps with metallic salts. Sodium amalgam reduces it to *dicarboxy glutaric acid*, $(CO_2H).CH.CH_2.CH(CO_2H)_2$ [167°]. When this acid is heated it gives off CO_2 , becoming glutaric acid

Methyl di-carboxy-glutaric ether—Sodium di-carboxy glutaric ether heated with alcoholic MeI at 150° forms methyl di-carboxy-glutaric ether, $(CO_2Et)_2.CMe.CH.C(CO_2Et)_2$, an oil, which on saponification gives rise to $(CO_2H)_2.CMe.CH.C(CO_2H)_2$, and this readily splits off CO_2 , forming *methyl glutaric acid*, $CO_2H.CHMe.CH.CO_2H$ [137°]. Methyl glutaric acid forms white crystals, v sol water, alcohol, or ether

Benzyl-di carboxy glutaric ether $(CO_2Et)_2.C(C_6H_5).CH.C(CO_2Et)_2$, [78°], is formed in a similar way, using benzyl chloride. Insol. water, v sol hot alcohol, ether, or conc H_2SO_4 . When saponified by caustic soda it gives off CO_2 , carbonic acid and forms *benzyl glutaric acid* $CO_2H.CH(C_6H_5).CH.CO_2H$, [145°]

DI-CARBOXY-GLUTARIC ACID *v* DI-CARBOXY-GLUTARIC ACID

CARBOXYL *Oxalyl* The monovalent acid radicle $CO.H$ i.e. $CO.OH$. Its hydrogen is always displaceable by metals, cf Acids

CARBOXYLIC ACID, so called, *v* DI-OXY-BENZENE DI-QUINONE

Di-hydro-carboxylic acid *v* TETRA OXY-QUINONE

Tri-hydro carboxylic acid *v* HEXA OXY BENZENE

Oxy-carboxylic acid *v* BENZENE TRI-QUINONE
CARBOXY-OXAMIC ACID *Di-ethyl ether* $C_6H_{11}NO_4$, i.e. $CO_2Et.NH.CO.CO_2Et$ [45°]. From $ClCO.CO_2Et$ and oxamic ether (Saloman, J pr [2] 9, 292). Needles (from ether), sol water and alcohol

CARBOXY-PHENOXY-ACETIC ACID

$C_6H_4(CO_2H).O.CH.CO_2H$ *Carboxy phenyl glycolic acid* [187°]. Formed by oxidation of *o* aldehyde phenoxy acetic acid with $KMnO_4$. White needles. Sol alcohol, ether, and hot water—A'Ag₂ white, sparingly soluble pp

Di-ethyl ether A'Et, liquid

Di-amide $C_6H_4(O.CO.NH)_2$ [158°]. Long yellow needles, sparingly soluble in ether, benzene, and hot water, v sol chloroform and hot alcohol (Rossing, B 17, 2995)

m Carboxy phenoxy acetic acid

$C_6H_4(CO_2H).O.CH_2.CO_2H$ [1.3] [206°]. Prepared by oxidation of *m* aldehyde phenoxy acetic acid with $KMnO_4$. Needles, v sol alcohol, ether, and acetic acid, sl sol cold water—A'Ag₂ crystalline (Elkan, B 19, 3044)

p Carboxy phenoxy acetic acid

$C_6H_4(CO_2H).O.CH_2.CO_2H$ [1.4] [278°]. Prepared by oxidation of *p* aldehyde phenoxy acetic acid with $KMnO_4$. White needles, v sol alcohol, ether, and acetic acid, more sparingly in benzene, chloroform, and ligroin, sl sol cold water

Salts—A'Ag₂ white sparingly soluble pp. The Pb, Cu, and Fe salts are sparingly soluble pps, the Cu and Ba salts are soluble (Elkan, B 19, 3044)

***o*-CARBOXY PHENYL-ACETIC ACID**

$C_6H_4(CO_2H).CH_2.CO_2H$ [1.2] *Homophthalic acid*, *Phenyl acetic carboxylic acid* *Isovitric acid* [174°]. Formed by saponification of benzyl cyanide *o* carboxylic acid by boiling with dilute KOH. Colourless crystals. V sol alcohol and hot water, insol benzene

Salts—A'Ag₂ insoluble amorphous pp—A'Ca 2aq sparingly soluble crystalline powder—A'Ba easily soluble crystals (Wishnecus, B 18, 173).

Anhydride $C_6H_4 \begin{array}{c} \diagup CH_2 CO \\ \diagdown CO-O \end{array}$ [141°], long

prisms, v sol ether and chloroform. Formed by the action of acetyl chloride on the acid

Ethyl ether A'Et₂ (292°), thick aromatic oil (Gabriel, B 20, 2499)

Imide $C_6H_4 \begin{array}{c} \diagup CH_2 CO \\ \diagdown CO NH \end{array}$ di oxy isoquinoline)

[c 233°]. Formed by dry distillation of the ammonium salt. Short colourless needles (from alcohol or acetic acid). Sublimes in long crystals. Sl sol alcohol. Dissolves in aqueous caustic alkalis. Heated with $POCl_3$ at 150°.

170° it is converted into di chloro iso quinoline

(314°-318°), long colourless needles, ∇ sol ordinary solvents. Dissolves in aqueous alkalis. Obtained by dry distillation of the methylamine salt of the acid. By MeI and methyl alcoholic KOH at 100° it is converted into a tri methyl

also obtained by methylation of the imide (Gabriel, *B* 19, 1654, 2354, 2363). The imide and methylimide combine with diazo benzene in alkaline solution

Amic acid $C_6H_4(CO_2H)CH_2CONH_2$ (homo phthalamic acid) [187°], colourless needles. Formed by slowly warming benzyl cyanide *o* carboxylic acid $C_6H_4(CO_2H)CH_2CN$ with conc H_2SO_4 to 70°, and pouring into water

Amic methyl ether $C_6H_4(CO_2Me)CH_2CONH_2$ [112°], crystalline solid (Gabriel, *B* 20, 1203)

Benzen- α -azo-carboxy-phenyl-acetic-imide

action of diazo benzene chloride upon an alkaline solution of the imide of carboxy phenyl acetic acid. Orange yellow needles (Gabriel, *B* 20, 1205)

CARBOXY-PHENYL-BENZ-GLYCOCYAMINE *v* BENZGLYCOCYAMINE

CARBOXY-PHENYL-GLYCOLLIC ACID *v*

CARBOXY PHENOXY ACETIC ACID

CARBOXY-PHENYL-MALONAMIC ACID

Ethyl ether $CO_2EtCH_2CO-NH-C_6H_4-CO_2H$ [173°] \bullet A product of the action of malonic ether on *m* amido benzoic acid (Schiff, *A* 232, 144, *B* 17, 403). Silvery needles. When heated it breaks up into malonic ether and malonyl di amido di benzoic acid

o **CARBOXY PHENYL METHYL ACETIC ACID** $C_6H_4(CO_2H)CHMeCO_2H$ *a* *Methyl homo*

o-phthalic acid. *Hydratropic o* carboxylic acid [147°] Formed by heating the imide with fuming HCl at 200°. Colourless crystalline powder —

Δ Ag₂ crystalline pp

Di oxy methyl isoquinoline [145°] Formed by heating *o* cyano phenyl methyl aceto nitrile $C_6H_4(CN)CHMeCN$ with conc H_2SO_4 at c 130° and pouring into water. Glistening prisms. Can be distilled undecomposed. Dissolves in aqueous alkalis. By digestion with alcoholic KOH and MeI it is converted into the methylimide of carboxy phenyl di methyl acetic acid

into (*Py* 2 4 1)-di chloro methyl isoquinoline, whilst (*Py* 4 2 1) chloro oxy methyl isoquinoline is formed as a by product (Gabriel, *B* 20, 2503)

o **Carboxy phenyl di methyl acetic acid** $C_6H_4(CO_2H)CMe_2CO_2H$ *Di methyl homo* *o*-

phthalic acid [c 123°] Obtained by dissolving the anhydride in boiling aqueous NaOH and ppg with HCl. On heating it is reconverted into the anhydride. By distillation with soda lime it gives isopropyl benzene — Δ Ag₂ crystalline pp — Δ K₂aq plates

(312°) at 760 mm. Prepared by heating the imide or methylimide with fuming HCl (4 pts) at 210° for 4 or 5 hrs. Flat crystals, slowly dissolved by aqueous alkalis, forming salts of the acid

phthalimide) [120°], (318°) at 770 mm. Prepared by the action of methyl iodide on a solution of the imide of carboxy phenyl acetic acid in methyl alcoholic KOH at 100°. Flat needles.

methyl homo phthalimide) [103°] (295°) at 770 mm. Formed by further methylation of the preceding imide or of the methylimide of *o*-

Long needles. Slowly sublimes at 100°. ∇ sol ordinary solvents, insol alkalis (Gabriel, *B* 19, 2363, 20, 1198)

CARBOXY PHENYL METHYL *v* m PYRERYL-BENZOIC ACID $C_6H_4H_2NO_2$ *e*

by saponification of its mono ethyl ether which is obtained by several days' standing of an acetic acid solution of acetophenone aceto acetic ether (1 mol) and *m* amido benzoic acid (1 mol). Aggregates of colourless needles. Sol ordinary solvents except water

[160°], slender yellow needles (from dilute acetic acid), sol alcohol, ether, &c. Its Ca, Ba, Sr, and Mg salts are white granular pps (Paal & Schneider, *B* 19, 3162)

o **CARBOXY PHENYL OXAMIC ACID**

Formation — 1 By heating oxalic acid with *o* amido benzoic acid at 120° — 2 From carbostyryl and alkaline $KMnO_4$ (Friedlander & Ostermaier, *B* 14, 1916, 15, 334) — 3 From acetylquinoline tetrahydride and cold dilute $KMnO_4$ (Hofmann & Königs, *B* 16, 734) — 4 From cynurin or cynurenic acid and alkaline $KMnO_4$ (Kretschy, *M* 4, 156, 5, 16) — 5 Formed by oxidation of (*Py*) bromo quinoline with $KMnO_4$ (Claus & Collischonn, *B* 19, 2767)

Properties — Silvery needles (containing aq) (from water), or geodes (from ether). Decomposed by dilute acids, or by long boiling, into oxalic and amido benzoic acids

Salts — (NH_4)₂A" minute felted needles — KHA'' 1 aq — BaA'' aq — BaH_2A'' aq — CaA'' 2 1/2 aq. $CuA''CuO$ 4 aq — AgA'' .

Mono-ethyl ether

$C_6H_4(CO_2H)NHCOCO_2Et$ *Ethyl oxalyl anthranilic acid* [181°] Felted needles Formed by oxidation of indoxyle ether or indoxanthine ether with CrO_3 (Baeyer, *B* 15, 777)

m-Carboxy phenyl oxamic acid

$CO_2HCO_2NHCO_2C_6H_4CO_2H$ *Oxaloyl amido benzoic acid*

Formation—1 By boiling an aqueous solution of the barium salt of cyano-carbimido amido benzoic acid—2 By heating (equal mols of) *m* amido benzoic acid and anhydrous oxalic acid for an hour at 180° (Griess, *B* 16, 336, 18, 2412)

Properties—Small white plates ν sol hot water, *m* sol alcohol, insol ether—BaA° 2aq

Mono ethyl ether

$CO_2EtCO_2NHCO_2C_6H_4CO_2H$ (ethoxal benzamic acid) [225°] Formed by boiling *m* amido benzoic acid with oxalic ether (Schiff, *A* 232, 132, *B* 17, 402, *G* 15, 534) Silky needles (from water or alcohol) When heated above 225° it splits up into oxalic ether and carboxy phenyl oxamide

Amide ether $CO_2EtCO_2NHCO_2C_6H_4CONH_2$ [1915°] Got by heating *m* amido benzamide with oxalic ether Gives with aniline the amide anilide $CO(NHPh)CO_2NHCO_2C_6H_4CO_2NH_2$ [c 310°] **Anilide ether** $CO_2EtCO_2NHCO_2C_6H_4CONHPh$ [180°] From *m* amido benzanilide and oxalic ether Satiny needles

Amic acid $CO(NH_2)CO_2NHCO_2C_6H_4CO_2H$ *v* PHENYL OXAMIDE CARBOXYLIC ACID

CARBOXY PHENYL OXAMIDE v PHENYL OXAMIDE CARBOXYLIC ACID

CARBOXY PHENYL OXY ACETIC ACID v CARBOXY PHENOXY ACETIC ACID

o CARBOXY PHENYL PHENYL-CARBA-MATE $C_6H_4(CO_2H)OCO_2NHC_6H_5$

Methyl ether $C_6H_4(CO_2Me)OCO_2NHC_6H_5$ [238°], long needles, sublimable Formed by heating methyl salicylate with phenylcyanate (Snape, *B* 18, 2431)

m CARBOXY PHENYL PHOSPHORIC ACID $C_6H_4(CO_2H)OP(O)(OH)_2$ [201°] From its chloride and water Scales, ν sol water, alcohol, and ether Water at 160° decomposes it into phosphoric and *m* oxy benzoic acid (Anschutz a Moore, *A* 239, 333)

Chloride $C_6H_4Cl_2Cl_2PO_2$, *ie* $C_6H_4(COCl)OP(O)Cl_2$ (170°) at 12mm SG 2° 1548 From *m* oxy benzoic acid (1 mol) and PCl_5 (1½ mols) Further treatment with PCl_5 (1 mol) produces $C_6H_4Cl_2PO_2$ (178°) at 11 mm. This is probably $C_6H_4(COCl)OPCl_2$ and is converted by water into $C_6H_4(CO_2H)OP(O)(OH)_2$. A further quantity of PCl_5 converts $C_6H_4Cl_2PO_2$ into $C_6H_4Cl_2CCl_2$

o CARBOXY β PHENYL-PROPIONIC ACID $HO_2C C_6H_4CH_2CH_2CO_2H$ [168°] Formed by heating *o*-carboxy benzyl malonic acid to 190° (Wishlizenus, *A* 242, 39, cf Gabriel & Michael, *B* 10, 2204) Prisms, ν sol hot, sl sol. cold, water

CARBOXY-PHENYL-SEBACAMIC ACID $CO_2H C_6H_4CO_2NH C_8H_{17}CO_2H$ [193°] From its ether by saponification. Prisms

Mono-ethyl ether

$CO_2Et C_8H_{17}CO_2NH CO_2C_6H_4CO_2H$ [146°] From sebamic ether and *m* amido benzoic acid (Pellizzari, *A* 232, 146, *B* 18, 215, *G* 15, 550)

m CARBOXY-PHENYL-SUCCINAMIC ACID

$C_6H_4(CO_2H)CO_2NH C_6H_4CO_2H$ *Benzamsuccinic acid* [223°] Colourless prisms Its ethyl-ether is formed, together with *di* phenyl succinamide *di* carboxylic acid, by boiling amido-benzoic acid with an alcoholic solution of succinimide On heating to its melting point it loses H_2O and is converted into succinyl amido benzoic acid $C_6H_4\langle\begin{smallmatrix} CO \\ CO \end{smallmatrix}\rangle N C_6H_4CO_2H$ [235°]

Ethyl ether

$C_6H_4(CO_2Et)CO_2NH C_6H_4CO_2H$ [174°], glistering plates from water

Amide $C_6H_4(CONH_2)CO_2NH C_6H_4CO_2H$ [229°]

Anilide $C_6H_4(CONHPh)CO_2NH C_6H_4CO_2H$ [252°] (Pellizzari, *A* 232, 146, *B* 18, 214, *G* 15, 550, Muretoff, *J R* 4, 298)

p Carboxy-phenyl-succinamic acid

[4 I] $C_6H_4(CO_2H)NHCOCH_2CH_2CO_2H$ [226°] From *p* tolyl succinimide and dilute aqueous $KMnO_4$ (Michael, *B* 10, 877) Needles, sl sol cold water and cold alcohol Boiling conc $HClAq$ gives succinic and *p* amido benzoic acids— $AgHA$

o CARBOXY-PHENYL-SULPHURIC ACID

$CO_2H C_6H_4OSO_3OH$ *Salicyl sulphuric acid* Prepared by the action of $K_2S_2O_8$ on a solution of salicylic acid in strong KOH By heating the *K* salt to 190° it gives K_2SO_4 and salicylide— $A^{\circ}K$ Colourless spikes Readily decomposed by dilute acids into salicylic acid and $KHSO_4$ (Baumann, *B* 11, 1914)

m Carboxy-phenyl sulphuric acid

[3 I] $CO_2H C_6H_4OSO_3OH$ Prepared by the action of $K_2S_2O_8$ on a solution of *m* oxybenzoic acid in strong KOH — $A^{\circ}K_2$ [220°–225° with decomposition], needles, more stable towards dilute acids than the *ortho* compound, is decomposed however at 100°

p Carboxy-phenyl-sulphuric acid

[4 I] $CO_2H C_6H_4OSO_3OH$ Prepared by the action of $K_2S_2O_8$ on a solution of *p* oxybenzoic acid in strong KOH — $A^{\circ}K$, leaflets or tables Does not decompose till heated to 250°

CARBOXY-PROPYL-ACETIC ACID v ETHYL-SUCCINIC ACID

CARBOXY-PYRRYL-GLYOXYLIC ACID

$C_6NH_3(CO_2H)CO_2CO_2H$ Formed by the oxidation of pyrrole - *di* - methyl *di* - ketone ($CH_3CO_2C_6H_3NH_2$), or of pyrrol methyl ketone carboxylic acid, with alkaline $KMnO_4$ Crystal line, sol ether, alcohol, and boiling water, insol benzene— $A^{\circ}Ag_2$ yellow pp

Di-methyl ether $A^{\circ}Me_2$ [145°], long colourless needles, *m* sol hot alcohol, sl sol ether and benzene Potash fusion gives pyrrol *di* carboxylic acid (Ciamician & Silber, *B* 19, 1412, 1957, *G* 16, 373, 379)

CARBOXY-TARTARIC ACID v DI-OXY-TARTARIC ACID

CARBYLO-DIACETONAMINE v p 27**CARBYLAMINES v** CARBAMINES

CARDAMOMS, OIL OF Employed in medicine as a carminative

1 From Ceylon The seeds of *Elettaria major* contain 85 p.c. of an essential oil which consists of a terpene (170°–178°), terpinene, a solid substance [61°], and terpineol $C_{10}H_{18}O$ (205°–220°) The latter is converted by HCl into *di* pentene hydrochloride, $C_{10}H_{17}2HCl$ [52°]

and by HI into $C_{10}H_{16}2HI$ [76°]. The terpene also gives a hydrochloride $C_{10}H_{17}2HCl$ [52°]. A solid tetrabromide could not be got (Weber, *A* 238, 98).

2 From Malabar The oil from *Elettaria Cardamomum* slowly deposits crystals of $C_{10}H_{16}3H_2O$ (Dumas & Péligot, *A Ch* [2] 57, 334).

CARDOL $C_{21}H_{36}O_2$ (?) An oil, occurring with anacardic acid (*q v*), in the pericarp of the cashew nut (*Anacardium occidentale*). It is sol alcohol and ether. It is not volatile, it blisters the skin. It gives with basic lead acetate a pp of $C_{21}H_{36}(PbAc)O_2PbO$ (Stadeler, *A* 63, 137). Anacardic acid $C_{21}H_{36}(OH)CO_2H$ in alcoholic solution gives with metallic solutions pps of the salts $AgA' - CaA'2aq - BaA'aq - MgA'aq - Itsmethyl ether$ is an oil (Ruhemann & Skinner, *C J* 51, 663, *B* 20, 1861).

CARICIN An oily substance present in the seeds of the Papaw tree (*Carica papaya*) (Peckolt, *Ph* [3] 10, 343).

CARMINAPHE *v* *NAIHTHOQUINONE*

CARMINIC ACID $C_{11}H_{18}O_{10}$ The colouring matter of cochineal which is obtained from insects of the genus *Coccus*, chiefly *Coccus cacti*. Cochineal contains only 10 p.c. colouring matter (Pelletier & Caventou, *A Ch* [2] 7, 90, 255, Warren de la Rue, *A* 64, 1, 23, Schutzenberger, *A Ch* [3] 54, 52, Schaller, *Bl* [2] 2, 414, Mène, *C R* 68, 666, Dieterich, *C C* 1867, 287, Liebermann, *B* 18, 1969). The lead salt is ppd on adding lead acetate to an aqueous infusion of cochineal, by this means the quantity of colouring matter in cochineal may be estimated. Carmine, a red pigment prepared from cochineal, appears to be a compound of carminic acid with alumina, lime, and some organic acid. Cochineal also contains a fat (in which are ethers of myristic acid, of $C_{17}H_{32}O_2$ and of $C_{17}H_{32}O_2$ and a waxy substance, coccerin (Raimann, *M* 6, 891, Liebermann, *B* 19, 328).

Properties — Purple mass, sol water and alcohol, sl sol ether. Its solution forms red pps with the alkaline earths and with acetates of Pb, Zn, Cu, and Ag. Alum and Na_2CO_3 give the aluminium lake.

Reactions — 1 Boiling dilute H_2SO_4 forms 'carmine red' and a sugar $C_6H_{12}O_6$ (Hlasiwetz & Grabowski, *A* 141, 329). According to Liebermann the formation of sugar is questionable. — 2 Potash fusion gives coccin, oxalic acid, and succinic acid (*H a G*). — 3 Conc H_2SO_4 at 130° forms a compound $C_{11}H_{18}O_{11}$ and rufococcin $C_{11}H_{18}O_8$ (Liebermann & Dörp, *A* 163, 105). — 4 HNO_3 forms *nitro-coccic acid* $C_6H_5(NO_2)_3O_8$. — 5 By distillation with zinc dust a small quantity of a solid hydrocarbon $C_{11}H_{12}$ is produced, this forms plates melting at [187°] (Furth, *B* 16, 2169).

Salts — $Na_2A'' - K_2A''$ zaq — BaA'' zaq

Coccin $C_{11}H_{12}O_8$ Prepared as above. Yellow laminae (from alcohol), insol water, v sol alcohol, sl sol ether. Sol alkalis. The alkaline solutions are yellow and absorb oxygen, becoming green and, finally, purple. The solution in conc H_2SO_4 turns indigo blue on warming. On distillation with zinc dust it yields a

small quantity of a hydrocarbon $C_{11}H_{12}$, which forms plates melting at [187°] — $C_{11}H_{12}(NH_4)O_8$.

Acetyl derivatives Yellow crystals, sol alcohol and acetic acid, insol water (Furth, *B* 16, 2169).

Rufococcin $C_{11}H_{18}O_8$ Formed as above. Brick red powder, sl sol warm water and ether, m sol alcohol. The ethereal solutions fluoresce green. The alkaline solutions are brown. Conc H_2SO_4 forms a violet solution — $CaC_{11}H_{18}O_8$.

Compound $C_{22}H_{30}O_{13}$ Black insoluble powder. Forms violet solutions in KOH and conc H_2SO_4 . Both this compound and rufococcin give $C_{11}H_{12}$ [187°] when distilled over zinc dust.

Carmine red $C_{11}H_{12}O_7$ Formed by boiling carminic acid with dilute H_2SO_4 (*v supra*). Dark purple mass with green lustre, scarlet when powdered. Alcohol and water form red solutions. Insol ether. Potash fusion forms coccin. Water at 200° forms ruficarmine $C_{11}H_{12}O_8$. — Salts $K_2C_{11}H_{12}O_7 - CaC_{11}H_{12}O_7$ zaq — $BaC_{11}H_{12}O_7$ zaq — $ZnC_{11}H_{12}O_7$ zaq — $Zn(C_{11}H_{12}O_7)_2$ zaq.

If carmine red be dissolved in acetic acid, and treated with bromine two products are obtained, named provisionally (a) and (b) *bromo carmine*. The (a) bromo carmine is sparingly soluble in acetic acid and separates in crystals (yield 10 p.c.), whilst the amorphous (b) bromo-carmine remains in solution and is ppd on adding water (the yield is 20 p.c.).

'(a) Bromo-carmine' $C_{11}H_7BrO_8$ crystallises in colourless needles, [248°], v sol alkalis. By boiling with strong aqueous KOH it gives

'(a) Bromo dioxycarmine,' so called, $C_{11}H_7BrO_8$, which forms colourless crystals, [208°]. By its behaviour on etherification it is shown to contain one CO_2H and one phenolic OH group. On oxidation with $KMnO_4$ it yields two bodies — (a) An acid $C_6H_4Br_2O_8$, which forms colourless crystals [244°]. By its reactions on methylation it is proved to contain one OH and CO_2H group, whence it probably has the constitution $C_6(CH_2)Br_2(OH)(CHO)CO_2H$ or $C_6H(CH_2)Br_2(OH)CO_2H$. — (b) A neutral body $C_6H_4Br_2O_8$, [195°], which by its reactions is shown to be a di-bromo oxy methyl phthalic anhydride $C_6MeBr_2(OH)C_2O_2O$ [1 2 4 3 5 6].

'(b) Bromo carmine,' so called, is the second product of the bromination of carmine red, and separates in yellow amorphous flocks on adding water to the acetic acid solution. It is v sol alcohol, acetic acid, &c., but could not be obtained in a pure state. By boiling with strong aqueous KOH it is converted into

'(b) Bromo oxy carmine' $C_{11}H_7Br_2O_8$, which forms glistening yellow needles, [232°]. It is a di-basic acid and forms red salts. On oxidation with $KMnO_4$ it yields two bodies — (a) An acid $C_{11}H_7Br_2O_8$, which forms colourless prisms (containing aq), and melts at [230°] with evolution of CO_2 . From its reactions it probably has the constitution $C_6MeBr_2(OH)(CO_2H)CO_2H$. (b) A neutral body $C_6H_4Br_2O_8$ identical with that obtained from the '(a)-bromo oxy carmine' (Will & Leymann, *B* 18, 3180).

CARMUFELLIC ACID $C_{17}H_{26}O_{11}$ An acid said to be formed by the action of HNO_3 on the aqueous extract of cloves. Micaceous scales,

insol alcohol, ether, and cold water (Muspratt & Danson, *P M* [4] 2, 293)

CARNAUBA WAX Obtained from the leaves of *Copernicia cerifera* in Brazil, and largely used there for making candles. It contains myricylic alcohol, $C_{26}H_{52}CH_2OH$ [85.5°], a hydrocarbon, [59°] and compound ethers derived from the following alcohols and acids myricylic alcohol, an alcohol $C_{26}H_{52}CH_2OH$ [76°], a dihydric alcohol $C_{26}H_{46}(CH_2OH)_2$ [104°], an isomeride of lignoceric acid, $C_{26}H_{52}CO_2H$ [72.5°], an acid isomeric or identical with cerotic acid $C_{26}H_{52}CO_2H$ [79°], and an oxy acid of the formula $C_{26}H_{50}(CH_2OH)(CO_2H)$ or its lactone [103.5°]. The alcohol $C_{26}H_{52}CH_2OH$ gives on oxidation an acid $C_{26}H_{50}(CO_2H)_2$ [102.5°], and the oxy acid $C_{26}H_{50}(CH_2OH)(CO_2H)$ gives the acid $C_{26}H_{50}(CO_2H)_2$ [90°] (Stürcke, A 223, 283, cf Lewy, *A Ch* [3] 13, 438, Brandes, *T* 1811, 415, Maskelyne, *C J* 22, 87, Bérard, *Z* [2] 4, 261). The greater part of the wax is myricylic cerotate and myricylic alcohol

CARNINE $C_8H_{11}N_3O_3$ A substance occurring in extract of meat, and in the product of boiling yeast with water (Weidel, A 158, 353, Schutz enberger, *C R* 78, 493). Obtained by boiling with water the pp thrown down from meat extract by lead acetate, the carmine crystallises from the evaporated filtrate (Kruckenberg & Wagner, *C C* 1884, 107). Crystallises with aq, v sl sol cold water, insol alcohol and ether. Bromine water converts it into hypoxanthine $C_8H_9N_3O - B^+HCl$ needles - $B^+H_2PtCl_6$.

CARPENE C_8H_{14} (156°) Obtained, together with p cresol, by distilling calcium podocarpate. Oil, smelling of turpentine, resinous in the air. Forms an oily compound with bromine (Oudemans, *B* 6, 1125, A 170, 252).

CAROTIN $C_{40}H_{56}$ (?) *Carotene* The colouring matter of the carrot (*Daucus Carota*) (Wackenroder, *Geiger's Mag* 33, 144, Zeise, *J pr* 40, 297, Husemann, A 117, 200). Occurs also as a normal constituent in the leaves of plants, and in the tomato (Arnaud, *C R* 102, 1119, 104, 1293, *Bl* [2] 40, 487, 48, 64). Inasmuch as no other coloured hydrocarbon is known, carotin probably contains oxygen.

Preparation—The roots are cut up and pressed, dried at 80° and extracted with CS_2 . The juice is ppd with lead acetate and the pp also extracted with CS_2 . Carotin, hydrocarotin, and fat are obtained from the CS_2 solutions. The fat is saponified with alcoholic potash. Water and $BaCl_2$ are added. The pp is dried and extracted with acetone. On recrystallising from methyl alcohol hydrocarotin separates out first (Reimtzter, *M* 7, 597).

Properties—Small red plates, v sol CS_2 , benzene, v sl sol absolute alcohol, and less sol 90 p.c alcohol. Insol aq. Rapidly absorbs oxygen from the air. Dissolves in conc H_2SO_4 , giving a deep blue colour. Yields a derivative $C_{40}H_{54}I_2$ with iodine, this has a deep green colour, and metallic lustre. Chlorine forms a chloro-derivative [120°].

Hydrocarotin $C_{40}H_{54}O$ (?) [138°] $[\alpha]_D = -87.4^\circ$ in $CHCl_3$ at -3.4° . Prepared as above. Greatly resembles cholesterol. Colourless, insol. water, v sol alcohol, acetone ether, $CHCl_3$, and CS_2 . Crystallises from acetone in long

needles, and from methyl alcohol in plates containing water. Resembles Liebermann's cholesterol and Hesse's cupreol but differs from phytoosterin (Reimtzter, *M* 7, 597).

Acetyl derivative [128°], coloured green by H_2SO_4 , and rose by addition of chloroform.

Benzoyl derivative [145°]

CARTHAMIN $C_{15}H_{16}O_2$ The colouring matter of safflower (*Carthamus tinctorius*) (Chevreul, Schlieper, A 58 362). Washed safflower is treated with aqueous Na_2CO_3 , acetic acid is added and pieces of cotton are put in. The carthamine that has been taken up by the cotton is subsequently dissolved off it by aqueous Na_2CO_3 , and ppd by citric acid. Powder with red lustre (from alcohol), sl sol water, insol ether, v sol alcohol. Its alcoholic solution is purple. Decomposed by boiling with water or alkalis. Potash fusion gives oxalic and p oxy benzoic acids (Malin, A 136, 117).

CARVACROL $C_{10}H_{16}O$ & $C_8H_{14}MePr(OH)$ [142°] *Cymenol* Mol w 150 [c 0°] (237° i V) SG $\frac{1}{4}$ 986 μ , 15252 HF p 68, 181 ((C,O) = 94,000, (H,O) = 69,000) (Stohmann, *J pr* [2] 34, 310). Occurs in the essential oil of *Origanum hirtum* and, together with cymene and a terpene, in oil of *Satureja hortensis* and *S. montana*, in oil of mint and of *Thymus Serpyllum* (Jahns, *Ar Ph* [3] 16, 277, *B* 15, 816, Haller, *Bl* [2] 37, 411, *C R* 94, 132, Beyer, *Ar Ph* [3] 21, 283).

Formation—1 By boiling carvol (50 pts) diluted with oil of caraway (50 pts) with glacial phosphoric acid (12 pts) for 3 or 4 hours (Lustig, *B* 19, 11, cf Volckel, A 35, 303, 85, 246, Kekule & Fleischer, *B* 6, 1088, Kreyser, *B* 13, 1704)—2 From camphor (5 pts) by boiling with iodine (1 pt) (Kekule & Fleischer, *B* 6, 934, cf Claus, *J pr* 25, 264, Schweizer, *J pr* 26, 118, A 40, 320)—3 From bromo camphor and $ZnCl_2$ (Schiff, *B* 13, 1408)—4 Pure camphor cymene is converted into its monosulphonic acid and the latter carefully fused with 3 pts of KOH (Jacobsen, *B* 11, 1060, cf Pott, *B* 2, 121, H Muller, *B* 2, 130).

Properties—Oil $FeCl_3$ colours its alcoholic solution green.

Reactions—1 On fusing with KOH isooxycummic acid $C_8H_8(CO_2H)(OH)C_2H_5$ [124°] is first formed and finally oxy terephthalic acid is produced (*B* 11, 1060)—2 P_2S_5 gives cymene and thio carvacrol $C_{10}H_8S$ —3 P_2O_5 forms cresol and propylene—4 $FeCl_3$ gives di-carvacrol—5 PCl_5 forms chloro cymene—6 *Diazo benzene* forms $C_8H_8MePr(OH)N_2$, C_8H_8 [80°–85°] and $C_8H_8MePr(OH)(N_2C_2H_5)_2$ [126°] (Mazzara, *G* 15, 214)—7 *Chloro acetic acid* in presence of an alkali forms carvacryl glycollic acid $C_{10}H_8OCH_2CO_2H$ —8 H_2SO_4 forms one or two sulphonic acids of the form $C_8H_8MePr(OH)SO_2H$. According to Jahns one only is formed, its salts being $KA^+aq - AgA^+2aq - BaA^+5aq$ S 125 at 15°— MgA^+12aq .

Sodium salt— C_8H_8ONa white crystalline powder.

Methyl ether $C_{10}H_{16}OMe$ (217°) SG $\frac{1}{4}$ 954 (Paterno & Pisati, *B* 8, 71, *G* 5, 13). Forms with H_2SO_4 two acids $C_{10}H_{14}(SO_3H)(OMe)$ whose Ba salts are BaA^+3aq v sl sol water, and BaA^+5aq , v sol water.

Ethyl ether $C_{10}H_{16}OEt$ (235°), oil having

an odour of carrots (Lustig, B 19, 11, C C 1881, 787)

Acetyl derivative $C_{10}H_{13}OAc$ (246°)
SG ² 1011, colourless liquid heavier than
water

Benzoyl derivative $C_{10}H_{13}OBz$ (above 260°), thick odourless oil

Dicarvacrol $C_{20}H_{22}O_2$ [154⁷] Formed by the action of neutral $FeCl_3$ on carvacrol (Dianin, *J. R* 14, 141) Thin silky needles (from dilute alcohol), insol water, v sol alcohol and ether

o CARVACROIC ACID $C_{10}H_{12}(OH)CO_2H$
Ortho cymene carboxylic acid [136°] Prepared
 by passing CO_2 over heated sodium carvacrol
 White silky needles Sublimable V sol hot
 water, alcohol, and ether, nearly insol cold
 water* Alcoholic $FeCl_3$ gives a violet coloura
 tion (Lustig, *B* 19, 18)

p Carvacroic acid $C_{10}H_8(OH)CO_2H$ *Oxy-*
cymene carboxylic acid [80] Obtained by
oxidation of carvacrol aldehyde (from carvacrol,
 $CHCl_3$, and $NaOH$) with $KMnO_4$. Long white
silky needles. Can be sublimed and distilled
with steam. V sol hot water, alcohol, and
ether, nearly insol cold water. Green coloura-
tion with alcoholic $FeCl_3$ (Lustig, B 19, 16)

***p* CARVACROTIC ALDEHYDE**
 $C_9H_{12}(CH_3)(C_3H_7)(OH)(CHO)$ [1425] (?) *Oxy*
aldehydo cymene (c 236°) Formed by heating
 carvacrol with aqueous NaOH and chloroform
 Oil Volatile with steam (Lustig, *B* 19, 14)

An isomeride [96*] has also been described as *p* carvacrotic aldehyde. It is left as a residue after distilling off the volatile aldehyde with steam. White silky flat plates. Easily soluble in alcohol, ether, and benzene, sparingly in hot water, insoluble in cold water (Nordmann, *B* 17, 2632).

CARVACRYL-AMINE $C_{10}H_{15}NH_2$ *Methylpropyl phenyl-amine* (242°) Formed, together with di carvacryl amine, by heating carvacrol with ammoniacal $ZnBr_2$ or $ZnCl_2$ and NH_4Br or NH_4Cl at 350°-360°, yield, 25 to 30 p c Colourless oil, which solidifies at -16° $B^{\circ}H^{\circ}Cl.PtCl_2$ yellow prisms, sl sol hot water

Acetyl derivative $C_{10}H_{13}NHAc$ [115°], white glistening tables, sl sol hot water, v sol warm alcohol

Benzoyl derivative $C_{10}H_{11}NHBz$
[102°], flat glistening crystals, nearly insol
water, sl sol cold alcohol, v sol hot alcohol,
and benzene (Lloyd, *B* 20, 1261)

Di-carvacryl-amine ($C_{10}H_8$)₂NH (344°-348°) Formed as above, the yield is 27 to 40 p.c. Colourless oil V sol alcohol, ether, and benzene. Its solution in conc H_2SO_4 is coloured blue by nitrites and nitrates— $B'HCl$ — $B'H_2Cl$. $PtCl_4$.

Acetyl derivative $(C_{10}H_{13})_2NAc$ [78°], white glistening scales, v sol hot alcohol and ligroin, sl sol in the cold (Lloyd, *B* 20, 1261)

CARVACRYL GLYCOLLIC ACID $C_{12}H_{16}O_4$, *rac*
 $C_{10}H_{14}OCH_2CO_2H$ [140°] From carvacrol,
 chloro acetic acid and potash (Spica, *G* 10, 345)
 Flat needles — PbA' — AgA'

Ethyl ether EtA' [c 100°] (289°)

Amide $C_{12}H_{15}O_2NH_2$ $[68^\circ]$

CARVACRYL-LACTIC ACID $C_{18}H_{18}O_3$ 26
 $C_{16}H_{14}O$ CM_eH CO_2H [74°] From carvacrol,
 α -chloro propionic acid, and potash (Scichilone).

G 12, 49) Prisms, v e sol alcohol, ether, and chloroform.

CARVACRYL MERCAPTAN $C_{10}H_{16}S$ *ts*
 $C_6H_5MePr(SH)$ [1 4 2] (236°) SG $\frac{175}{100}$ 998
 From camphor or carvacrol and P_2S_5 (Flesch, *B*
 6, 478, Roderburg, *B* 6, 669, Kekulé & Fleischer,
B 6, 934) Liquid HNO_3 oxidises it to sulpho-
 lonic acid (Bechler, *J pr* [2] 8, 168)

Salts — $\text{Hg}(\text{C}_{10}\text{H}_{13}\text{S})_2$ [109°] (Fittica, A. 172, 327) — $\text{C}_{10}\text{H}_{13}\text{S HgCl}$ — $\text{C}_{10}\text{H}_{13}\text{S Ag}$ — $\text{C}_{10}\text{H}_{13}\text{S AgAgNO}_3$

Methyl ether $C_{10}H_{18}SMe$ (244°) S G 93
TRI CARVACRYL PHOSPHATE

PO(OC₁₀H₁₉)₃ [75°] Colourless prisms or tables
Easily soluble in alcohol, ether, and benzene, more
sparingly in petroleum ether. Formed by heating
carvacrol with POCl₃, yield, 55–60 p.c. of the
theoretical (Kreysler, *B* 18, 1704)

CARVACRYL PHOSPHORIC ACID
 $C_8H_8MePr OPO_3H_2$ [4 2] Formed by the action of POCl₃ upon carvacrol, and treatment with aqueous K₂CO₃. The potassium salt A'K₅aq forms large silvery plates. By alkaline KMnO₄ it is oxidised to oxyisopropyl salicylic acid $C_8H_8(CMe_2OH)(OH)CO_2H$ [4 2] (Heymann & Königs, *B* 19. 3309).

TETRA CARVACRYL SILICATE $\text{Si}(\text{OC}_{10}\text{H}_{19})_4$
(380°–390°) at 118 mm Colourless oil Formed
by heating carvacrol with SiCl_4 , the yield is
85 p c of the theoretical (Hertkorn, *B* 18, 1694)

CUMYL CARBACRYL SULPHURIC ACID (Königs, B. 19, 3309)
 $C_6H_5MePr O SO_3H [4 \ 2]$ *Cumyl sulphuric acid*
 The potassium salt is formed by adding potassium pyrosulphate to a warm solution of carvacrol in aqueous KOH. Silvery plates. V sol. in water and alcohol. By alkaline permanganate it is oxidised to oxyisopropyl salicylic acid $C_6H_4(CMe, OH)(OH)CO_2H [4 \ 2 \ 1]$ (Heymann & Königs, B. 19, 3309).

CARVENE A terpene present in oil of caraway. **2 TERPENES**

Nitroso carvene *v* **CARVOXIM**
CARVEOL $C_{10}H_{13}OH$ (219°) Thick fluid
Formed by reduction of carvol with sodium and
alcohol With phenyl cyanate it reacts to form
carveyl phenyl carbamate [84°] (Leuchart, *B*
20, 114)

CARVEYL PHENYL CARBAMATE
 $C_{10}H_{11}O CO NPhH$ [84°] Formed by the action of phenyl cyanate upon carveol $C_{10}H_{15}OH$. Slender needles. V sol hot alcohol, sl sol ether and ligroin (Leuchart. B 20. 114).

CARVOL C₁₀H₁₄O (228°) (R Schiff, *B* 19, 562) SG 11 9667 (Gladstone, *C J* 49, 621), 25 9574 (Fluckiger, *Ar Ph* [3] 22, 861) μ_D 1.5020 (G) R_A 76.68 (G) S V 190.26 HFp 48,250 ((C, O₂) = 94,000, (H₂, O) = 69,000) (Stohmann, *J pr* [2] 34, 322)

Occurrence—In oil of caraway (*Oleum carvi*) together with carvene (173°) (Völckel, *A* 85, 246) In oil of dill (*Anethum graveolens*) and of mint (*Mentha crispata*) The carvol in the oils of caraway and of dill is dextro rotatory, but that from oil of mint is laevo rotatory $[\alpha]_D^{20} = -62$ at 2° (Beyer, *Ar Ph* [3] 21, 283) According to Flückiger (*Ar Ph* [3] 22, 261) the rotatory power of carvol is $[\alpha]_D = 58$ 2°

Properties—Liquid Carvol from all three sources forms the same crystalline compound $(C_{10}H_8O)_2H_2S$ [187°] when H_2S is passed into its alcoholic solution. When prepared from oils

of caraway or of dill this compound is dextro rotatory, $[\alpha]_D = +5.5^\circ$ at 20° , but when obtained from oil of mint it is laevo rotatory, $[\alpha]_D = -5.5^\circ$ at 20° . Dilute alcoholic KOH in the cold liberates carvol from this compound. Protracted treatment with H_2S converts carvol in alcoholic solution into the amorphous $(C_{10}H_{11}S)_2H_2S$.

Reactions —1 Distillation over solid KOH or P_2O_5 changes carvol into the isomeric carvacrol (Kekulé a Fleischer, *B* 6, 1088) —2 P_2S_5 forms cymene —3 P_2S_5 gives thio carvacrol $C_{10}H_{11}SH$ —4 Distillation over heated zinc dust gives $C_{10}H_{11}$ (173°) and cymene (Arndt, *Z* [2] 4, 730, *B* 1, 204) —5 Sodium in alcohol forms carveol (*q v*) —6 Dry HCl gas passed into a mixture of carvol (1 mol) and aceto acetic ether (1 mol) forms the compound $C_{10}H_{15}ClO$, possibly $C_5H_9Cl \cdot C(OH)CH(COCH_3)CO_2Et$ [146°] Glistening white prisms (Goldschmidt a Kisser, *B* 20, 489) —7 Hydroxylamine forms the oxim, *v* CARVOXIM

Carvol-phenyl hydrazide $C_{10}H_{11}N_2HC_6H_5$ [106°] Formed by the action of phenyl hydrazine on carvol (Goldschmidt, *B* 17, 1578) Slender white needles. Sol hot water

Carvol chloro hydride $C_{10}H_{11}ClO$ *Hydrochlorocarvol* Oil Formed by leading dry HCl into carvol

Oxim $C_{10}H_{11}Cl(NOH)$ [182°], tables Formed by the action of hydroxylamine upon carvol-chloro hydride or of HCl upon carvoxim

Benzoyl oxim $C_{10}H_{11}Cl(NO_2Bz)$ [115°], needles (from petroleum spirit) (Goldschmidt a Zurrer, *B* 18, 2220)

Phenyl-hydrazide $C_{10}H_{11}Cl(N_2HPh)$ [137°], small white prisms

Carvol bromo-hydride $C_{10}H_{11}BrO$ Oil De composing at about 50°

Oxim $C_{10}H_{11}Br(NOH)$ [116°], prisms (from ligroin)

Phenyl hydrazide $C_{10}H_{11}Br(N_2HPh)$ [119°], slender yellow needles (Goldschmidt a Kisser, *B* 20, 488, 2071)

Constitution of carvol

is probably the pseudo form of

Carvacrol

(Goldschmidt, *B* 20, 490) According to Gladstone (*C J* 49, 621) the presence of two pairs of doubly linked atoms of carbon in the molecule of carvol is indicated by its molecular refraction

CARVOXIM $C_{10}H_{11}N(OH)$ Nitroso hesperidene or nitroso cariene [71°] Large colourless transparent plates. Sol acids and alkalis

Formation —1 By the action of hydroxylamine upon carvol —2 By passing nitrosyl chloride into a methyl-alcoholic solution of carvene, and heating to its melting point the crystalline hydrochloride $C_{10}H_{11}ONCl$ which precipitates

Reactions —1 By heating with dilute H_2SO_4 , carvol is regenerated —2 By passing HCl gas into its methyl-alcoholic solution the oxim of carvol chloro hydride (*v supra*) is formed

Hydrochloride $BHCl$, white crystalline

solid, decomposed by water, formed by passing HCl into the ethereal solution

Methyl ether $C_{10}H_{11}N(OMe)$ colourless fluid

Benzoyl derivative $C_{10}H_{11}N(OBz)$ [95°], white glistening needles, *v* sol alcohol and benzene (Goldschmidt a Zurrer, *B* 17, 1577, 18, 1729)

Iso-carvoxim $C_{10}H_{11}(NOH)$ [143°], possibly $\text{CPr} \begin{array}{c} \text{CH} \text{ C(NOH)} \\ \diagdown \quad \diagup \\ \text{CH}_2 \quad \text{CH} \end{array} \text{CMe}$ Obtained, together with a small quantity of carvoxim, by the action of excess of hydroxylamine on a solution of carvol chlorohydride or bromo hydride in alcohol (Goldschmidt a Kisser, *B* 20, 2071) Needles *sl* sol alcohol, *sol* acids and alkalis Unlike carvoxim, it does not combine with HCl or HBr Dilute H_2SO_4 forms carvacrol and a compound $C_{10}H_{11}NO$ [94°]

Benzoyl derivative $C_{10}H_{11}(NOBz)$ [112°], scales, *v* sol alcohol

CARVYLAMINE $C_{10}H_9NH_2$ Formed by reduction of carvoxim $C_{10}H_{11}NOH$ in alcoholic solution, by sodium amalgam and acetic acid Colourless liquid, of strongly aromatic basic odour. Readily absorbs CO , from the air — $BHCl$ [c 180°], slender silky needles (from alcohol)

Benzoyl derivative $C_{10}H_{11}NHBz$ [169°], white needles (Goldschmidt a Kisser, *B* 20, 486)

CARYOPHYLLIN $C_{10}H_{14}O_4$ (?) A substance that may be extracted by alcohol from cloves, the dried flower buds of *Caryophyllus aromaticus* (Mylus, *B J* 22, 452, Muspratt, *Ph* 10, 343) Silky needles in stellate groups, sublimes at about 285° *sl* sol cold alcohol, *sol* boiling alkalis PCl_5 forms $C_{10}H_{13}O_4Cl$ and $C_{10}H_{13}O_4Cl_2$

Acetyl derivative [184°] Monochloric crystals (Hjelt, *B* 13, 800)

Caryophyllinic acid $C_{10}H_{14}O_{12}$ From caryophyllin and fuming HNO_3 (Mylus, *B* 6, 1053) Amorphous, *sl* sol water, *v* sol alcohol, ether, and $HOAc$ May be crystallised from fuming HNO_3

Salts — Na_2A''' — Ag_2A''' — Ba_2A''' $1\frac{1}{2}aq$

CASCARILLIN $C_{10}H_{14}O_4$ [205°] *S* 127 at 100° , *S* (alcohol) 3.33 at 8° Extracted from cascarilla bark (from *Croton Eleutheria* and *Cascarilla*) by boiling water (Mylus, *B* 6, 1051, cf Tuson, *C J* 17, 195, Duval, *J Ph* [3] 8, 91) Minute prisms (from alcohol), tastes bitter Not affected by boiling dilute HCl Cascarilla bark also contains a volatile oil (173°–180°)

CASEIN *v* PROTEIDS

CASEOSE *v* PROTEIDS

CASEINIC ACID $C_8H_8O_4$ Formed, together with saccharic and oxalic acids, in the oxidation of cane sugar by HNO_3 (Siewert, *Institut* 21, 78), Also from glyconic acid and HNO_3 (Honig, *J* 1879, 667) Syrup Reduces ammoniacal $AgNO_3$, to a mirror — BA''' $2aq$

CASTORIN Castoreum is a hard black substance (soft when fresh) found in a pair of small sacs situated in the genital organs of the beaver (*Castor fiber* and *americanus*) An alcoholic extract deposits first fat, and then castorin. Castoreum also contains a volatile pungent oil,

cholesterin, a resin, proteïns, CaCO_3 , and inorganic salts (Valenciennes, J 1861, 803)

CASTOR OIL. A fatty oil obtained by pressure from the seeds of *Ricinus communis*. It solidifies at about -18° , has S G about 969 at 12° , and is dextro rotatory, $[\alpha] = 12^\circ$ (Popp, *Ar Ph* [2] 145, 233). Castor oil consists chiefly of glycerides of stearic and ricinoleic acids. It is completely dissolved by 5 vols of 90 p.c. alcohol (Hager, *C C* 1876, 389). Dry distillation gives acrolein, cenanthol (heptico aldehyde) and an acid $(\text{C}_{11}\text{H}_{20}\text{O}_2)_x$ (Bussy a Lecanu, *J Ph* 13, 57, Stanek, *J pr* 63, 138, Leeds, *B* 16, 290, Krafft a Brunner, *B* 17, 2985). HNO_3 oxidises it to heptico, oxalic, azelaic, suberic, and (8) pimelic acids (Arppe, *A* 120, 288). The products obtained by saponifying castor oil and distilling the resulting alkaline ricinoleate alone or with NaOH are methyl hexyl ketone, sec-octyl alcohol, and sebacic acid (Neison, *C J* 27, 507, 837). Conc H_2SO_4 converts castor oil into ricinyl sulphuric acid $\text{C}_{18}\text{H}_{34}\text{O}_2\text{OSO}_3\text{H}$, which by the addition of water breaks up into ricinoleic acid and H_2SO_4 . From the fatty acids derived from the Turkey red oil prepared from castor oil, crystals of a di oxy stearic acid separate after some time (Benedikt a Ulzer, *M* 8, 217).

CATALPIC ACID $\text{C}_{11}\text{H}_{18}\text{O}_8$ [206°] Extracted by ether from decoctions of the siliqueous capsule of the *Bignonia Catalpa*. It may be isomeric with hydrocardenic acid (Sardo, *G* 14, 134). Large white crystals, v. sl sol water, sol alcohol and ether— $\text{BaC}_{11}\text{H}_{18}\text{O}_8$ 6aq white glistening laminae— $\text{Ag}_2\text{A}''$ a white pp

CATALYSIS v CHEMICAL CHANGE

CATECHINS $\text{C}_{15}\text{H}_{10}\text{O}_8$ 3aq (Hlasiwetz, Cross a Bevan, *C J* 41, 92), $\text{C}_{15}\text{H}_{10}\text{O}_8$ (Etti, *M* 2, 547), $\text{C}_{15}\text{H}_{10}\text{O}_8$ (Liebermann a Tauchert, *B* 13, 694), $\text{C}_{15}\text{H}_{10}\text{O}_8$ and $\text{C}_{15}\text{H}_{10}\text{O}_8$ (Gautier, *C R* 86, 668). This name has been given to various compounds contained in catechu or Terra japonica which is extracted by boiling water from the fruits or twigs of a variety of plants. Bombay catechu from the fruit of *Areca Catechu*, Bengal catechu from twigs and unripe pods of *Acacia* (or *Mimosa*) *Catechu*, Gambir catechu from *Nuclea* (*Uncaria*) *Gambir*, and Nubian catechu from some *Acacia*. Catechu is used in dyeing.

Catechin $\text{C}_{15}\text{H}_{10}\text{O}_8$ (Gautier, *C R* 85, 752), $\text{C}_{15}\text{H}_{10}\text{O}_8$ 3aq (C a B), $\text{C}_{15}\text{H}_{10}\text{O}_8$ 5aq (L a T) [217°] S (alcohol) 20 at 15° , S (ether) 8 at 15° (Wackenroder, *A* 37, 311). Obtained from Bombay catechu by washing with water and crystallising from acetic ether (L a T, Löwe, *Fr* 13, 118, Zwenger, *A* 37, 320, Neubauer, *A* 96, 337, Kraut a Van Delden, *A* 128, 285, Hlasiwetz a Malin, *A* 134, 118, Etti, *A* 186, 837, Schutzenberger, *Bl* [2] 4, 5, Sacc, *C R* 63, 1102).

Properties—Small needles (from water) V. sl sol cold water, v. sol hot water and acetic ether. The aqueous solution is coloured green by FeCl_3 . The solution in KOH aq. absorbs oxygen, turning brown. Lead acetate gives in aqueous solution a pp of $(\text{C}_{15}\text{H}_{10}\text{O}_8)_2\text{PbO}$ (?) Catechin solutions are ppd by albumen, but not by gelatin.

Reactions—1 Boiling dilute H_2SO_4 forms catechuratin—2 With HCl and KClO_3 it gives

$\text{C}_{20}\text{H}_{12}\text{Cl}_2\text{O}_{12}$? (Cross a Bevan, *C J.* 41, 92) which is turned crimson by Na_2SO_3 . Catechutannic acid does the same—8 Br gives bromocatechuratin $\text{C}_{15}\text{H}_8\text{Br}_2\text{O}_7$, a red insoluble powder 4 Water and PI_2 give $\text{C}_{15}\text{H}_{10}\text{O}_8$, an elastic insoluble mass—5 HOAc and BaO give $\text{C}_{15}\text{H}_{10}\text{O}_8$, a colourless powder which melts below 100° (Schutzenberger a Rack, *Bl* 4, 8)—6 Aqueous $\text{K}_2\text{Cr}_2\text{O}_7$ forms $\text{C}_{15}\text{H}_8\text{O}_{10}$, a brown insoluble powder—7 Potash fusion gives phloroglucin and protocatechuic acid (Hlasiwetz, *A* 134, 118)—8 Dry distillation gives pyrocatechin—9 Boiling dilute H_2SO_4 forms insoluble $\text{C}_{15}\text{H}_8\text{O}_8$ (Neubauer, *A* 96, 356), or $\text{C}_{15}\text{H}_{10}\text{O}_8$ (Etti)—10 Boiling dilute KOH forms $\text{C}_{15}\text{H}_{10}\text{O}_8$ (?) a brown powder, sol alcohol and alkalis—11 HI gives iodoform and other products (G)

Di acetyl derivative $\text{C}_{15}\text{H}_{10}\text{O}_8(\text{OAc})_2$ [181°], needles or prisms. Soluble in ordinary solvents except water and ligroin (L a T)

Di benzoyl derivative $\text{C}_{15}\text{H}_{10}\text{O}_8(\text{OBz})_2$. Flocculent brown substance (S a R)

Diacetyl dichloro catechin $\text{C}_{15}\text{H}_8\text{Cl}_2(\text{OAc})_2$ [169°], needles. Sol. alcohol, sl sol ether

Diacetyl bromo catechin $\text{C}_{15}\text{H}_7\text{Br}(\text{OAc})_2$, [120°] White needles. Sol. alcohol, sl sol ether

Catechuratin $\text{C}_{15}\text{H}_{10}\text{O}_8$ 6aq (?) or $\text{C}_{15}\text{H}_{10}\text{O}_8$. Formed by passing HCl into a boiling alcoholic solution of catechin (Kraut a Delden, *A* 128, 291). Formed also by heating catechin with conc HCl at 170° . Dark reddish brown insoluble powder. Not changed at 190°

Di-benzoyl derivative $\text{C}_{15}\text{H}_{10}\text{Bz}_2\text{O}_8$ (?) Formed, together with di benzoyl catechin by heating catechin with BzCl at 190° . Brown mass

Catechin $\text{C}_{15}\text{H}_{10}\text{O}_8$ 2aq [205°] S 99 at 50° . Occurs according to Gautier (*C R* 86, 668) in Gambir catechu together with the two following catechins, they are extracted by alcohol and crystallise after evaporation with exclusion of air. Monoclinic prisms

Catechin $\text{C}_{15}\text{H}_{10}\text{O}_8$ aq [177°] Minute needles (v. supra)

Catechin $\text{C}_{15}\text{H}_{10}\text{O}_8$ aq [163°] S 53 at 50° . Minute needles (v. supra)

Catechin $\text{C}_{15}\text{H}_{10}\text{O}_8$ aq. According to Etti (*M* 2, 547) this is the formula of the catechin in Gambir and Pegu catechins. At 100° it becomes $\text{C}_{15}\text{H}_{10}\text{O}_8$, at 160° catechutannic acid $\text{C}_{15}\text{H}_{10}\text{O}_8$, and at 180° $\text{C}_{15}\text{H}_{10}\text{O}_8$. The latter is also got by heating catechin for some time with dilute H_2SO_4 .

Reactions—1 **Diazobenzene chloride** gives $(\text{C}_6\text{H}_5\text{N}_2)_2\text{O}_{15}\text{H}_{10}\text{O}_8$, a red crystalline pp. sol alcohol and ether, it dyes wool golden brown—2 Dilute H_2SO_4 (1/8) at 140° gives phloroglucin and pyrocatechin

Catechin $\text{C}_{15}\text{H}_{10}\text{O}_8$ [165°] In mahogany (*Acajou*) (Gautier, *Bl* [2] 30, 568). Latour a Cazeneuve (*Bl* [2] 24, 119) give this catechin the formula $\text{C}_{15}\text{H}_{10}\text{O}_8$. **Catechin** $\text{C}_{15}\text{H}_{10}\text{O}_8$ [140°] In brown catechu (G)

CATECHOL v PYROCATECHIN

CATECHUIC ACID v CATECHIN and PROTOCATECHUIC ACID

CATECHUTANNIC ACID $\text{C}_{15}\text{H}_{10}\text{O}_8$ (?) or $\text{C}_{15}\text{H}_{10}\text{O}_{12}$ (?) Extracted by water from catechu.

Formed also by heating catechin alone at 130° , with water at 110° , or by boiling it with alkalis, lime, or $\text{Pb}(\text{OH})_2$ (Etti, *A* 186, 832, Löwe, *J pr* 105, 82, 75, *Z* [2] 5 538, *Fv* 12, 285) Dark reddish brown powder. *V* sol acetic ether, *v* e sol alcohol, insol ether, *m* sol. water It oxidises in the air It gives a greyish green pp with Fe_2Cl_6 . It does not pp tartar emetic Its aqueous solution is ppd by gelatin, albumen, and by dilute H_2SO_4 . At 162° it changes to $\text{C}_{14}\text{H}_{10}\text{O}_5$ (?) which resembles catechutannic acid in all respects—($\text{C}_{14}\text{H}_{10}\text{O}_5$) $\cdot 3\text{PbO}$

CATHARTIC ACID The active principle in senna leaves It is a glucoside It contains only C, H, and O Its Ba and Pb salts are amorphous (Kubly, *Bl* [2] 7, 356, Stockman, *Ph* [3] 15, 749, cf Lassaigue a Feneuille, *A Ch* [2] 16, 18, Bourgoin, *C R* 73, 1449)

CAULOSTERIN *v* CHOLESTERIN

CEDAR OIL Obtained by distilling with water the wood of *Juniperus virginiana* Contains cedrene and cedar camphor According to Bertagnini (*C R* 85, 800) it contains a compound which combines with NaHSO_3

Cedar-camphor $\text{C}_{15}\text{H}_{20}\text{O}$ (74°) (282°) *VD* 84 (calc 77) Crystalline mass smelling like cedar wood *V* sol sol water, *v* sol alcohol Distillation with P_2O_5 splits it up into water and cedrene (Walter, *A Ch* [3] 1, 498)

CEDRENE $\text{C}_{15}\text{H}_{24}$ (287°) *SV* 76 *SG* 12 984 Obtained as above (Walter, *lc*)

Cedrene From oil of sage (English) $\text{C}_{15}\text{H}_{24}$ (260°) *SG* 12 915 Yellow or green oil In active Resinified by H_2SO_4 (41) even at 0° Gaseous HCl turns an ethereal solution purple The refractive index seems to indicate four C C groups (M M P Muir, *C J* 37, 686)

The name Cedrene has been used as a generic name for the hydrocarbons $\text{C}_{15}\text{H}_{24}$, which occur in the oils of cedar, cloves, patchouli, cubeba, calamus, cascarrilla, rosewood, &c (*v* TERPENES) Cedrenes closely resemble the terpenes in their optical properties, which point to the existence of $1\frac{1}{2}$ pairs of doubly linked carbon atoms (Gladstone, *C J* 49, 617)

CEDEIRET *v* CERULIGNON

CELLULOSE $\{\text{C}_6\text{H}_{10}\text{O}_5\}$ **SG* 1 25-145

Occurrence—Cellulose is the basal substance of the skeleton of plants, and indeed may be said to constitute the framework of the vegetable world The problem of its origin is as much physiological as chemical It does not appear to be formed as the immediate product of the synthetical action of the cell upon carbonic anhydride and water, but mediately from starch, sugar, and other carbohydrates, through the intervention of the cell protoplasm The mechanism of this transformation, as well as the inverse conversion of cellulose into the simpler carbohydrates, has not been elucidated, but is assumed on physiological grounds to be of the simplest character There is nothing in this assumption which contravenes the evidence afforded by the chemical relationships of the carbohydrate group, which are likewise simple

Adapting itself to the infinite variety of structure and function presented by plant tissues cellulose occurs in multitudinous forms and in any given structure is subject to differentiation modification, or variation of elaboration within very wide limits The scope of this

article, however, precludes such a treatment of the subject as would deal with lesser variations, and we shall therefore confine our attention to those celluloses which constitute the fully elaborated plant fibres Plant tissues seldom if ever consist of pure cellulose but contain besides other products of growth, either mechanically bound up with the tissue, and therefore frequently removable by mechanical means and by the action of simple solvents, or chemically united to the cellulose, combinations of this latter kind constitute the compound celluloses, and are only resolved by a chemical process

Preparation—The isolation of pure cellulose depends upon its relative insusceptibility of chemical change The general method of preparation from raw fibrous materials consists in exposing the moist fibre to the action of chlorine gas or bromine water in the cold and subsequently boiling in a dilute alkaline solution, repeating this treatment until the alkaline solution no longer dissolves anything from the tissue or fibre The cellulose is then washed with a dilute acid, water, alcohol, and ether, and dried

Properties—Obtained in this way, or by the ordinary process of bleaching from cotton or linen (flax), or in the form of Swedish filter paper, the typical cellulose is a white substance more or less transparent, retaining the microscopic features of the raw fibre

The elementary composition is expressed by the percentage numbers (F Schulze)

C	44.0	44.2
H	6.4	6.3
O	49.6	49.5

or by the corresponding empirical formula $\text{C}_6\text{H}_{10}\text{O}_5$ These numbers represent the composition of the dry and ash free cellulose Nearly all celluloses contain a certain proportion, however small, of mineral constituents¹ and the union of these with the organic portion of the fibre or tissue is of such a nature that the ash left on ignition preserves the form of the original It is only in the grating point of certain young shoots that the cellulose tissue is sometimes found free from mineral constituents (Hofmeister) The proportion of hygroscopic moisture, which is an essential constituent of cellulose under ordinary atmospheric conditions, varies from 7 to 9 p.c., the mean variation due to variations in the hygroscopic state of the air is about 1 p.c

Cellulose is insoluble in all simple solvents, it is dissolved by certain reagents but only by virtue of a preceding constitutional modification The most remarkable solvent of cellulose is cuprammonia (Schweitzer's reagent) in which it dissolves without essential modification, being recovered by precipitation in a form which is chemically identical with the original (Erdmann, *J pr* 76, 385), though differing in being amor

¹ Cellulose in its earlier stage of elaboration has no action upon light, but with age it acquires the property of double refraction This action is independent of the state of aggregation of the cellulose and is therefore an essential property of the substance itself (Sachs, *Lpz Phys d Pflanzen* p 398)

² The inorganic constituents of bleached cotton amount to 0.102 p.c of its weight In the manufacture of the so-called Swedish paper, the proportion is reduced by special treatment of the cellulose with acids.

phous This reagent has been employed in a variety of forms, a fact which explains the discrepancies in the statements as to the solubilities of the various celluloses in cuprammonia. The following methods of applying the reagent are to be recommended

The substance to be operated upon is intimately mixed with copper turnings in a tube which is narrowed below and provided with a stopcock. Strong ammonia is poured upon the contents of the tube and after standing for some minutes is drawn off and returned to the tube, the operation is several times repeated until the solution of the substance is effected

Perhaps the most convenient solution, though not so effective in all cases as the former, is that prepared by dissolving ppd cupric hydrate in ammonia. In preparing the reagent in this way it is important that the hydrate should be thoroughly washed, preferably out of contact with the air, before dissolving in the strong aqueous ammonia. Cotton is rapidly dissolved by this solution. The soluble compound formed is represented by Mulder as $(\text{C}_6\text{H}_7\text{O}_5)_2\text{Cu}(\text{NH}_3)_4\text{O}$. It has been doubted whether this compound exists actually dissolved in the viscous solution, an investigation of the osmotic properties of the liquid, however, shows it to be a true solution (Cramer). From an extended investigation of the optical properties of the solution Béchamp concludes that the solution of the cellulose is not simple but is accompanied by progressive molecular transformations, the optical activity (dextrorotatory) of the products increasing to a maximum corresponding to a condition of equilibrium ultimately attained (*C R* 100, 117, 279, 368)

The soluble bases (NaOH , KOH) added to the solution give blue gelatinous pps having the composition $(\text{C}_6\text{H}_7\text{O}_5)_2\text{CuM}'\text{O}$. Digested with finely divided lead oxide the solution yields the compound $\text{C}_6\text{H}_7\text{O}_5\text{PbO}$. Cellulose is reprecipitated as a gelatinous hydrate, on the addition of acids, as well as of many neutral bodies such as alcohol, sugar, and common salt, or even on largely diluting with water and allowing to stand. The pp dried *in vacuo* is obtained as a transparent mass resembling gum arabic. On digesting the ammonia cupric solution upon metallic zinc, this metal pps the copper, replacing it in the solution and producing the corresponding ammonia zincate solution of cellulose, which is colourless. The property of cellulose of being dissolved by cuprammonia receives an important technical application. A sheet of paper left for a short time in contact with the cuprammonia, so that the constituent fibres are superficially attacked, and then passed between rollers and dried, becomes impervious to water and its cohesion is not affected at the boiling heat. Two sheets thus treated adhere firmly together, and with a sufficient number, artificial boards are produced. A variety of materials are now produced in this way, on the manufacturing scale, useful for roofing and other purposes (*C R A Wright, Journ. Soc. Chem. Ind.* 1884, p. 121)

Reactions—Cellulose has already been spoken of as a comparatively inert substance, and its characteristic reactions are consequently few. One of these is available for its identification and is chiefly used in the microscopical exami-

nations of tissues: this is its reaction with iodine. The reaction, although similar to that of starch, differs in requiring for its determination the presence of an auxiliary (dehydrating) reagent such as sulphuric or phosphoric acid or zinc chloride. The most effective solution is prepared in the following way: zinc is dissolved to saturation in hydrochloric acid and the solution evaporated to the sp. gr. 2.0, to 90 pts of this solution are added 6 pts potassium iodide dissolved in 10 pts water, and in this solution iodine is dissolved to saturation. By this reagent cellulose is coloured instantly a deep blue or violet.

COMPOUNDS OF CELLULOSE—Cellulose is generally inactive towards compounds contained in dilute aqueous solution, hence its extensive employment in the filtration of solids from solutions. Nevertheless it exhibits a tendency to incipient combination even with acids and alkalis (Mills, *C J* 43, 153), with metallic salts it forms compounds of sufficient stability to cause their removal from solution, but the combination is of an indefinite and unstable order (Erdmann, *J pr* 76, 385) (*Cf Gladstone, J pr* 56, 247, Müller, *Fr* 1, 84, O'Shea, *C J Proc* 1, 206). Certain carbon compounds, such as the organic astringents, and many of the colouring matters natural and artificial, unite with cellulose to form compounds of various orders of stability, of these we would more particularly instance amongst others many of the derivatives of diphenyl which possess a specific power of direct combination with cellulose. Although such combinations are of great technical importance, being the foundation of the arts of dyeing and printing they are not sufficiently systematised to deserve more than this passing notice. On the other hand some of the substitution compounds of cellulose with acid radicles are both definite and stable.

Acetyl cellulose—The tri substituted compound $\text{C}_6\text{H}_3(\text{C}_2\text{H}_3\text{O}_2)_3$ is formed by heating cellulose with 6–8 times its weight of acetic anhydride at 180° , and separates as a white flocculent pp on diluting the syrupy product. Tri acetyl cellulose is insoluble in alcohol and in ether, and is soluble in glacial acetic acid. It is saponified by boiling with alkaline solutions, the cellulose being regenerated. No derivative containing more than three acetyl groups has been obtained, but a mixture of the mono and di acetyl cellulose is formed by treating cellulose with only twice its weight of acetic anhydride, the formation of these bodies being unattended by their solution.

Cellulose nitrates (*Pyroxyline*—*Nitrocellulose*)—Whenever cellulose in any form is brought into contact with strong nitric acid at a low temperature, a nitro product or nitrate is formed. The extent of the nitration depends upon the concentration of the acid, upon the duration of its contact with the cellulose, and on the state of the physical division of the cellulose itself. The first investigation of these substances dates from 1838, when Pelouze showed the identity of several of these products obtained from paper, linen &c and starch. Knop and also Kamarsch and Heeren found that a mixture of sulphuric and nitric acids also formed nitrate of cellulose, and still later (1847) Millon and Gaudin employed a mixture of sulphuric

acid and nitrate of potash and soda, which they found to have the same effect. Although gun-cottons or pyroxylines are generally spoken of as nitro celluloses, they are more correctly described as cellulose nitrates, since they have not been found to yield amido bodies on reduction with nascent hydrogen. The following are the general properties of these compounds (Eder):

- (1) When warmed with alkaline solutions, nitric acid is removed in varying quantities, dependent upon the strength of the solution employed.
- (2) Treatment with cold concentrated sulphuric acid expels almost the whole of the nitric acid.
- (3) On boiling with ferrous sulphate and hydrochloric acid, the nitrogen is expelled as nitric oxide, this reaction is used as a method of nitrogen estimation in these bodies.
- (4) Potassium sulphhydrate, ferrous acetate, and many other substances, reconvert the nitrates into cellulose.

Several well-characterised nitrates have been obtained, but it is a matter of difficulty to prepare any one in a state of purity and without admixture of a higher or lower nitrated body. The following have been described under a nomenclature having reference to a C_{12} formula.

Hexa nitrate $-C_{12}H_{14}(NO_3)_6O_4$ (gun cotton). Prepared by treating cotton with a mixture of HNO_3 (SG 15) 3 parts, and H_2SO_4 (SG 184) 1 part, for 24 hours, at a temperature not exceeding 10° , 100 parts of cellulose yield about 175 of the compound (calc 183). Insoluble in alcohol, ether, or mixtures of both, and glacial acetic acid, with acetone it forms a jelly and is slowly dissolved. It is the most explosive of the series igniting at $160^\circ-170^\circ$. Mixtures of sulphuric acid and nitre do not give this nitrate (Eder). Ordinary gun cotton may contain as much as 12 p.c. of nitrates soluble in ether alcohol, the hexa nitrate seems to be the only one quite insoluble in this menstruum.

Penta nitrate $-C_{12}H_{14}(NO_3)_5O_4$. This composition has been very commonly ascribed to gun cotton. It is impossible to prepare it in a state of purity by the direct action of the acid on cellulose. It is prepared by dissolving the hexa nitrate in nitric acid at $80^\circ-90^\circ$, cooling to 0° , and adding concentrated sulphuric acid, by which the penta nitrate is precipitated, after mixing with a large volume of water and washing the precipitate with water and alcohol, it is dissolved in ether alcohol and finally reprecipitated by water. This nitrate is slightly soluble in acetic acid, nearly insoluble in alcohol containing only a small proportion of ether. Strong potash solution converts it into the dinitrate.

Tetra- and tri-nitrates (collodion pyroxyline) are generally formed together when cellulose is treated with a more dilute acid at a higher temperature and for a shorter time than in the case of the hexa nitrate, e.g. 4 vols HNO_3 (138), 5 vols H_2SO_4 (184) at $65^\circ-70^\circ$ for 5-10 minutes. They are freely and equally soluble in ether alcohol, acetic ether, and mixtures of acetic acid and wood spirit, or alcohol, and are therefore inseparable. They are insoluble in pure alcohol, ether, or acetic acid. On treatment with concentrated nitric and sulphuric acids they are converted into the higher nitrates. Potash and ammonia convert them into the dinitrates.

Din nitrate $C_{12}H_{14}(NO_3)_2O_4$ is formed as already indicated, and also by the action of hot dilute nitric acid on cellulose. Freely soluble in ether alcohol, acetic ether, acetic acid, wood spirit, acetone, and absolute alcohol. The further action of alkalis on the dinitrate results in a complete resolution of the molecule.

The cellulose nitrates have generally much stronger absorption affinities for colouring matters than the celluloses. They are much less susceptible of attack by acid oxidants than cellulose itself, and are therefore used in the filtration of solutions containing e.g. chromic acid, permanganates, and, of course, nitric acid of any degree of concentration. Nitric acid of SG 1.42 has a remarkable toughening action upon filter paper, the modification is effected by simple immersion, and the paper so treated is increased in strength tenfold, under going at the same time a contraction amounting, in circles, to about $\frac{1}{10}$ diameter. The cellulose so treated contains no nitrogen (Francis, *C J* 47, 183).

Cellulose and sulphuric acid—Cellulose is disintegrated and dissolved by the concentrated acid to a colourless solution. The products are sulphates of a series of compounds of which the celluloses and the dextrans may be regarded as the extreme terms. They are easily isolated in the form of Ba salts. The composition of the sulphates may be expressed by the general formula $C_{10}H_{10}O_{10-x}(SO_3)_{x-2}$. The variations in composition and in physical properties are functions of the temperature ($5^\circ-33^\circ$) and duration of the action. The limits of specific rotation of these sulphates are $[\alpha]_D = -3.65$ and $+72.94$. These ethereal salts are entirely decomposed by boiling with alcohol, the resulting carbohydrates may be regarded as the corresponding alcohols. In composition and properties (e.g. their reactions with iodine) they constitute an extended series, beginning with soluble celluloses and terminating in achrodextrin (Hong & Schubert, *M* 7, 455). While it is impossible to determine the mechanism of these successive resolutions of the cellulose molecule with the precision attainable where such changes may be reversed, and therefore completely studied, they certainly establish the typical connection of the celluloses with the simpler carbohydrates, and in a much more complete way than the coincidence of empirical formulae.

Prior to the researches above detailed the initial terms of the transition series had been similarly obtained and described under the term *Amyloid*, a term selected to indicate their resemblance to starch.

A practical application of the reaction of cellulose with sulphuric acid is found in the manufacture of *parchment paper*. The process consists in the rapid passage of the paper through the strong acid (SG 1.5-1.6) followed by copious washing. The result may be described as a superficial conversion of the cellulose into amyloid, whereby it acquires the properties which have obtained for it the designation in question (cf. Hofmann, *A* 112, 243).

Cellulose and chlorine—Dry chlorine has no action upon cellulose, the presence of water determines an indirect oxidising action, but there is no direct combination of cellulose with

chlorine By heating cellulose nitrates with phosphoric pentachloride and oxychloride at 200° and evaporating the excess of the reagents at 170° , a viscous liquid is left, miscible with alcohol and ether, which appears to be composed of, or to contain, a chloride of cellulose or a cellulose derivative (Baeyer, *B* 2, 54) *Bromine* is without action upon cellulose specimens left for several months in contact with strong bromine water were not sensibly attacked (H Muller, *Pflanzenfaser*, p 27, cf Franchimont, *R T C* 2, 91)

Cellulose and Oxygen *Oxycelluloses*—Two of these compounds or series of compounds have been described

(a) *Oxycellulose* (Witz, *Bull Rouen*, 10, 416, 11, 189) is formed by the action of solutions of the hypochlorites upon cellulose Exposed to the action of a solution of bleaching powder (5 p c) for 24 hours, the fibre is converted into a friable modification having the composition C 43.0, H 6.2, O 50.8 Other oxidising agents produce similar results, even by exposure to air and light cellulose is slowly converted into these oxidised derivatives Their formation is accompanied by molecular resolution, as is shown by their reducing action upon alkaline copper solution the product giving this reaction is dissolved by alkalis to a yellow solution These oxycelluloses have a strong attraction for basic colouring matters also for vanadium compounds, attracting these from a solution containing so minute a quantity as 1 pt in 1,000,000,000 Upon this property a method has been founded for the quantitative estimation of minute traces of vanadium in aqueous solution (Witz & Osmond, *Bull Rouen*, 14, 30) The study of these oxycelluloses is of great importance to the manufacturer of textile materials

(b) *Oxycellulose* $C_{18}H_{20}O_{18}$ (Cross & Bevan, *C J* 43, 22) is the residual product (insoluble) of the prolonged digestion of cellulose with nitric acid (20–30 p c) at $90^{\circ}C$ On washing with water to remove the acid the substance gelatinises It dries to a horny colourless mass It is characterised by its reaction with sulphuric acid on gently warming it dissolves with development of a bright pink colour, the reaction resembling that of mucic acid, to which, on other grounds, it is probably related A fresh preparation, treated with a mixture of nitric and sulphuric acids, dissolves, and on pouring into water the nitrate $C_{18}H_{20}(NO_3)_2O_{18}$ separates as a white flocculent pp

Chromic acid—Cellulose treated with potassium dichromate in presence of acetic acid is converted into glucose, dextrin, and formic acid Permanganates under the same condition effect a similar decomposition

Chromic anhydride in presence of sulphuric acid decomposes cellulose rapidly and completely, the carbon being entirely converted into the gaseous compounds CO and CO_2 It has been proposed to apply this to the quantitative estimation of carbon in celluloses and cellulose mixtures (Cross & Bevan, *C N* 52, 207)

Alkaline oxidations—The permanganates and hypochlorites in presence of alkalis oxidise cellulose to a syrupy mixture of acids of the pectic series (H Muller, *Pflanzenfaser*, v also *S C I* 8, 206, 291) Fused with potassium

hydrate the cellulose is oxidised to oxalic acid, malic acid being obtained as an intermediate product

Electrolytic oxidants—The nascent oxygen and other electronegative ions liberated in the electrolysis of various saline solutions have a very powerful action upon cellulose These actions have been made the subject of interesting researches by F Goppelsroeder (*D P J* 254, 42)

Cellulose and Hydrolytic Agents

(1) *Dilute acids* A large number of acids, organic as well as mineral, attack cellulose, producing hydration changes, attended by disintegration of the fibre The action is gradual at ordinary temperatures, and is of course accelerated by applying heat The study of these actions is of the first importance to the cellulose technologist (Girard, *C R* 81, 1105, Cross & Bevan, *S C I* 1885, Crookes, *Handbook of Dyeing and Calico printing*, p 19)

It is worthy of note here that the cellulose isolated from grass and hay, and many others less highly elaborated than the celluloses which we are at present considering (cotton and linen), are decomposed on boiling with dilute mineral acids with formation of furfural

(2) *Alkalis*—Dilute solutions of the alkalis are without sensible action upon cellulose, even at temperatures considerably above the boiling point when, however, oxidising conditions are superadded, molecular resolution sets in The joint action of calcium hydrate and air at the boiling temperature is especially powerful, oxy cellulose being produced (Witz, *loc cit*) Con concentrated solutions of the alkalis (NaOH, KOH) at ordinary temperatures act in a very remarkable way upon cellulose There appears to be a 'molecular' combination of the reagents in the proportion $C_{18}H_{20}O_{18}Na_2O$ (Mercer) which however is easily resolved by washing with water But the characteristics of the fibre and the fibre substance are found to have undergone a permanent modification There is a considerable shrinkage in linear dimensions in cotton fabrics treated with caustic soda solution of SG 1.225 this amounts to 25 p c The corresponding modifications in microscopic features have been investigated by Crum (*C J* 1863), the changes being found similar to those which take place in the ripening of the fibre in the plant, viz from a flattened tube with large central cavity, to a thick walled cylinder with small lumen The chemical change produced is, so far as has been ascertained, entirely one of hydration, and it is remarkable that the only evidence of the change is the increased capacity for hygroscopic moisture This amounts to 5 p c of the weight of the cotton, the proportion calculated for the formula $C_{18}H_{20}O_{18}H_2O$ being 5.5 p c From this fact we may also infer that the normal attraction of cellulose for atmospheric moisture is a residual manifestation of the molecular combinations which are seen in the multitudinous hydrates of cellulose found in, or constituting, growing tissues Mercer, who appears to have first investigated these phenomena, further found that the addition of hydrated oxide of zinc very much increased the action of the caustic solution thus a solution of sodium hydrate of SG 1.100, which is without marked action, is rendered very active by

acid and nitrate of potash and soda, which they found to have the same effect. Although gun cottons or pyroxylines are generally spoken of as nitro celluloses, they are more correctly described as cellulose nitrates, since they have not been found to yield amido bodies on reduction with nascent hydrogen. The following are the general properties of these compounds (Eder):

- (1) When warmed with alkaline solutions, nitric acid is removed in varying quantities, dependent upon the strength of the solution employed.
- (2) Treatment with cold concentrated sulphuric acid expels almost the whole of the nitric acid.
- (3) On boiling with ferrous sulphate and hydrochloric acid, the nitrogen is expelled as nitric oxide, this reaction is used as a method of nitrogen estimation in these bodies.
- (4) Potassium sulphhydrate, ferrous acetate, and many other substances, reconvert the nitrates into cellulose.

Several well-characterised nitrates have been obtained, but it is a matter of difficulty to prepare any one in a state of purity and without admixture of a higher or lower nitrated body. The following have been described under a nomenclature having reference to a C_{12} formula.

Hexa nitrate $-C_{12}H_{10}(NO_3)_6O_8$ (gun cotton). Prepared by treating cotton with a mixture of HNO_3 (SG 1.5) 3 parts, and H_2SO_4 (SG 1.84) 1 part, for 24 hours, at a temperature not exceeding 10° , 100 parts of cellulose yield about 175 of the compound (calc 183). Insoluble in alcohol, ether, or mixtures of both, and glacial acetic acid, with acetone it forms a jelly and is slowly dissolved. It is the most explosive of the series igniting at 160° – 170° . Mixtures of sulphuric acid and nitre do not give this nitrate (Eder). Ordinary gun cotton may contain as much as 12 p.c. of nitrates soluble in ether alcohol, the hexa nitrate seems to be the only one quite insoluble in this menstruum.

Penta nitrate $-C_{12}H_{12}(NO_3)_5O_8$. This composition has been very commonly ascribed to gun cotton. It is impossible to prepare it in a state of purity by the direct action of the acid on cellulose. It is prepared by dissolving the hexa nitrate in nitric acid at 80° – 90° , cooling to 0° , and adding concentrated sulphuric acid, by which the penta nitrate is precipitated, after mixing with a large volume of water and washing the precipitate with water and alcohol, it is dissolved in ether alcohol and finally reprecipitated by water. This nitrate is slightly soluble in acetic acid, nearly insoluble in alcohol containing only a small proportion of ether. Strong potash solution converts it into the dintrate.

Tetra- and tri-nitrates (collodion pyroxyline) are generally formed together when cellulose is treated with a more dilute acid at a higher temperature and for a shorter time than in the case of the hexa nitrate, e.g. 4 vols HNO_3 (1.38), 5 vols H_2SO_4 (1.84) at 65° – 70° for 5–10 minutes. They are freely and equally soluble in ether alcohol, acetic ether, and mixtures of acetic acid and wood spirit, or alcohol, and are therefore inseparable. They are insoluble in pure alcohol, ether, or acetic acid. On treatment with concentrated nitric and sulphuric acids they are converted into the higher nitrates. Potash and ammonia convert them into the dintrate.

Dintrate $C_{12}H_{18}(NO_3)_2O_8$ is formed as already indicated, and also by the action of hot dilute nitric acid on cellulose. Freely soluble in ether alcohol, acetic ether, acetic acid, wood spirit, acetone, and absolute alcohol. The further action of alkalis on the dintrate results in a complete resolution of the molecule.

The cellulose nitrates have generally much stronger absorption affinities for colouring matters than the celluloses. They are much less susceptible of attack by acid oxidants than cellulose itself, and are therefore used in the filtration of solutions containing e.g. chromic acid, permanganates, and, of course, nitric acid of any degree of concentration. Nitric acid of SG 1.42 has a remarkable toughening action upon filter paper, the modification is effected by simple immersion, and the paper so treated is increased in strength tenfold, under going at the same time a contraction amounting, in circles, to about $\frac{1}{10}$ diameter. The cellulose so treated contains no nitrogen (Francis, *C J* 47, 183).

Cellulose and sulphuric acid—Cellulose is disintegrated and dissolved by the concentrated acid to a colourless solution. The products are sulphates of a series of compounds of which the celluloses and the dextrans may be regarded as the extreme terms. They are easily isolated in the form of Ba salts. The composition of the sulphates may be expressed by the general formula $C_{12}H_{10}O_{3n-2}(SO_4)_x$. The variations in composition and in physical properties are functions of the temperature (5° – 35°) and duration of the action. The limits of specific rotation of these sulphates are $[\alpha]_D = -3.65$ and $+72.99$. These ethereal salts are entirely decomposed by boiling with alcohol, the resulting carbohydrates may be regarded as the corresponding alcohols. In composition and properties (e.g. their reactions with iodine) they constitute an extended series, beginning with soluble celluloses and terminating in achroedextrin (Hönig & Schubert, *M* 7, 455). While it is impossible to determine the mechanism of these successive resolutions of the cellulose molecule with the precision attainable where such changes may be reversed, and therefore completely studied, they certainly establish the typical connection of the celluloses with the simpler carbohydrates and in a much more complete way than the coincidence of empirical formulae.

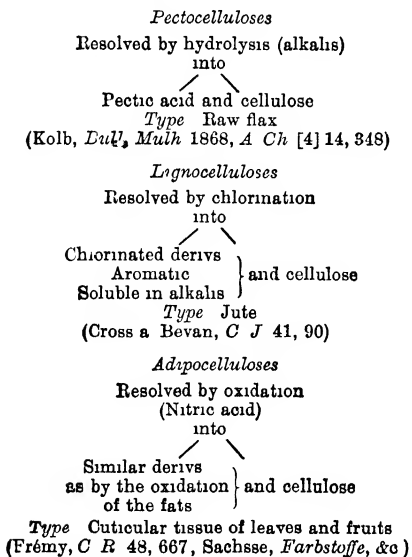

Prior to the researches above detailed the initial terms of the transition series had been similarly obtained and described under the term *Amyloid*, a term selected to indicate their resemblance to starch.

A practical application of the reaction of cellulose with sulphuric acid is found in the manufacture of *parchment paper*. The process consists in the rapid passage of the paper through the strong acid (SG 1.5–1.6) followed by copious washing. The result may be described as a superficial conversion of the cellulose into amyloid, whereby it acquires the properties which have obtained for it the designation in question (cf. Hofmann, *A* 112, 243).

Cellulose and chlorine—Dry chlorine has no action upon cellulose, the presence of water determines an indirect oxidising action, but there is no direct combination of cellulose with

the cellulose as to mask its reactions. From the circumstances of their occurrence and formation it is not to be expected that the line can be sharply drawn between *mixtures* and *combinations* of cellulose with non cellulose constituents of either fibres or tissues. Frémy (*Ann Agro nomiques*, 9, 529) recognises the existence of the following compounds distinguished from cellulose chiefly by their different behaviour to hydrolytic reagents and cuprammonia, (1) *Fibrose*, constituting the membranes of wood cells, (2) *Paracellulose*, constituting the membrane of the pith and medullary rays, and (3) *Vasculose* constituting the membranes of the vessels. The value of this somewhat arbitrary classification is questionable (Sachsse, *Farbstoffe, Kohlehydrate*, &c., p 150), and the distinctions which it seeks to establish have not been generally recognised. On the other hand, there are certain groups of substances widely distributed throughout the plant world, which, while they have certain features in common with the celluloses, are sufficiently distinct to admit of chemical classification apart from them. Generally speaking, these substances are made up of a *cellulose* and a *non cellulose* portion, the latter conferring the special features of distinction. The compound cellulose thus constituted is resolved, by treatment with reagents according to the methods to be described, into cellulose or a cellulose residue on the one hand, and soluble derivatives of the *non cellulose* on the other. Of these groups we shall consider typical members.

The following are the compound celluloses sufficiently characterised to warrant special description under class names: the nomenclature of these compounds is explained by their characteristic resolutions.

Pectocelluloses—The purified bast of a Russian flax investigated by Kolb was found to have the aggregate composition.

C 43.7
H 5.9
O 50.4

The non cellulose constituent is therefore a substance of lower carbon percentage than cellulose. From its yielding pectic acid on boiling with alkalis, it is obviously a substance allied to pectin. Since the fibre yields about 20 p.c. of its weight of the acid derivative we infer independently that it is a substance containing approximately 41 p.c. carbon, which confirms the view of its constitution above expressed. Many other plant fibres are made up of or contain pectocelluloses (Webster, *C J* 43, 223), pectic derivatives were identified by Schunck in the products of the action of boiling alkaline solutions upon raw cotton (*Proc Manchester Lit Phil* [3] vol iv).

The cellular tissue of a large number of fruits, e.g., the apple and pear, and roots, e.g., turnips and carrots, is composed of pectocelluloses.

Lignocelluloses—The course of lignification in plants is marked by profound alterations in the physical properties of the tissues undergoing this modification, the tissues lose their elasticity, become coloured from grey to brown, and the substance of the tissues manifests the chemical properties about to be described.

Jute—Aggregate percentage composition C 47.0-48.0, H 5.9-5.7, O 47.1-46.3 ($C_{12}H_{10}O_6$)_n. It may be regarded as composed of Non cellulose (Lignin) $C_{10}H_8O_4$ (55.5 p.c. C) 25 p.c. and Cellulose $C_{12}H_{10}O_6$ (44.4 p.c. C) 75 p.c., though the cellulose isolated from the fibre by chemical resolution differs in composition as already stated from normal cellulose, appearing rather as an oxycellulose. The mineral constituents of the raw fibre (purified) vary from 0.5 to 2 p.c. of its weight, the hygroscopic moisture from 10-12. Attacked by concentrated solutions of the alkalis similarly to cotton, freely soluble in cuprammonia, but is incompletely precipitated on acidifying, the body remaining in solution gives the reactions of the original substance, and may, therefore, be regarded as a hydrated modification. Jute combines freely with the organic astringents (tanins) and the majority of aromatic colouring matters. It is coloured a bright yellow by solutions of salts of aniline and other aromatic bases. This reaction is probably due to a product of oxidation, since it does not take place with jute which has been boiled for some time in solutions of sulphites. It is coloured brown by iodine solutions. Moistened with a solution of phloroglucin and treated afterwards with hydrochloric acid it gives a deep red colouration, with pyrrol also in presence of hydrochloric acid it gives a deep carmine colour. A mixture of sulphuric and nitric acids nitrates the fibre, the gain in weight being approximately equal to that of cellulose under the same conditions. The products are orange-coloured and are soluble in acetone. Like the cellulose nitrates, they give no amido derivatives on reduction. Iodine is absorbed by the fibre, the quantity taken up being constant under constant conditions, the resulting compound is not more stable than the iodide of starch. This

reaction may be made use of for the quantitative estimation of the lignocelluloses in cellulosic mixtures. Bromine attacks the fibre in presence of water, forming all defined compounds which are dissolved by alkaline solutions. The operation once or twice repeated eliminates the whole of the non cellulose, the resulting cellulose amounts to 72-75 p.c. of the weight of the fibre. Chlorine does not act upon the dry fibre, even when the temperature is raised to 100°, but in presence of water combines rapidly at ordinary temperatures with evolution of heat. The chlorinated derivative is yellow coloured, it is soluble in alcohol, and from the solution water precipitates the compound $C_{10}H_8Cl_2O_6$, as a yellow flocculent mass. This compound gives a characteristic magenta colouration with sodium sulphite solution similar to that of malroogallol¹ (Webster, *C J* 45, 205). It dissolves in solutions of the caustic alkalis with a brown colour, evolving the characteristic odour of the chloroquinones. It yields chloropierin on distillation with nitric acid. Fused with potassium hydrate it yields protocatechuic acid. It is therefore an aromatic derivative, and appears to be allied to the trihydric phenols. The chlorinated fibre when boiled with sodium sulphite solution is entirely resolved into cellulose, and soluble derivatives of the non cellulose or lignin constituent. This constitutes the simplest and most rapid method of cellulose estimation in the fibre. The proportion of cellulose obtained is somewhat higher than by the bromine method (75-78 p.c.) and is further increased by preventing rise of temperature in the chlorination.

Digested with dilute nitric acid at 80° jute is resolved directly into cellulose (oxycellulose) oxalic and carbonic acids and a peculiar acid derivative of the lignin constituent. This body has the formula $C_{25}H_{40}(NO_2)_{23}$, it is of an intense yellow colour, and dyes the animal fibres to a similar shade. It forms salts with the earthy bases ($C_{25}H_{40}(NO_2)_{23}M''$) which are precipitated by alcohol from aqueous solutions in the form of bright yellow flocks.²

Hydrolytic agents.—Jute and the lignocelluloses generally are much more susceptible of hydrolysis than the simple celluloses. The dilute acids effect a simple hydrolysis at 80°, i.e. the portion dissolved has the same composition and properties as the original, on raising the temperature to boiling, fufural is obtained in considerable quantity. Boiling dilute alkalis effect a simple hydrolysis. When the hydrolysis is complicated by the introduction of either reducing or oxidising conditions, resolution into cellulose and non cellulose (soluble derivatives) is determined. Thus sulphurous acid, the bisulphites, and the normal sulphites (alkaline) attack and resolve the lignocelluloses when heated with their solutions under pressure. The temperatures necessary for efficient resolution,

i.e. for the isolation of cellulose are with sulphurous acid (75 p.c. SO_2) 90°-100°, with bisulphites (4 p.c. SO_2) 150°, with normal sulphites (4 p.c. SO_2) 170°-180°, the increase of temperature corresponding with the diminution of hydrolytic power by progressive neutralisation of the acid. The hydrolysis is aided by combination of the reagents with the soluble derivatives, which prevents the reversal of the action at the high temperature, which would otherwise occur. In heating with solutions of the caustic alkalis under pressure, a high temperature is necessary for complete resolution, a considerable proportion of the reagent is necessary for combining with the products, which under the oxidising conditions are of an acid nature. These facts are of importance in the preparation of cellulose from lignocelluloses, which is now a widely extended industry (*Forestry Exhibition Reports*, Edinburgh, 1885).

Animal Digestion.—It has long been known that the urine of the herbivora contains hippuric acid as a normal constituent, and it has been shown that the benzoyl radicle necessary to form this body is a product of the digestion of lignocellulose (Meissner). Since the lignocellulose molecule contains no aromatic compounds in the strict sense of the term (Stutzer, *B* 8, 570) the process of digestion must effect the conversion.

Decomposition by Heat.—**Cumulative Resolution.** The celluloses burn in the air with a quiet luminous flame. When heated out of contact with the air they are completely resolved into gaseous and volatile products on the one hand, and a residual black mass, containing a high percentage of carbon. Regarding these carbonaceous substances as the products of condensation of cellulose molecules with elimination of water, the process may be viewed as, in the main, one of cumulative resolution by dehydration (Mills, *P M*, June, 1877), the cumulate containing hydrogen and oxygen in chemical union with carbon is still in every sense a compound, taking into consideration, at the same time, its approximation in appearance and properties to the element itself it may be termed a *pseudo carbon*.³ Dehydrating reagents effect similar resolutions, the lignocelluloses undergoing condensation more readily than the celluloses. The tendency to carbon accumulation which is the main feature of these resolutions is well marked in the vast series of natural products of the decay of cellulosic tissues, from humus to the coals. Though not of pyrogenic origin they nevertheless deserve mention in this connection from considerations of general resemblance.

It is noteworthy that the products of chlorinating ulmic substances (Sestini, *Gaz. It.*, 1882, 292) are closely similar to those obtained from the lignocelluloses. Similar products are also yielded by the cannell coals.

Other forms of Lignocellulose. Two other varieties of lignocellulose deserve mention, viz. *glycolignose*, $C_{20}H_{34}O_{21}$, the substance of fir woods '*glycodrupsos*', $C_{20}H_{34}O_{20}$, the substance of the stony concretions of pears (Erdmann, *A* 188, 1, *Suppl.* 5, 223, Bente, *B* 8, 476, Sachsse, *Farbstoffe*, 151). On boiling with dilute

¹ According to Hantzsch & Schnitter (*B* 20, 2033), malroogallol is a species of condensed quinone chloride—the characteristic molecule being derived from quinone by replacement of one of its typical O atoms by Cl, the aromatic linking being at the same time partially resolved. Such a view accords equally well with the properties of the derivative in question.

² It is worthy of note that the addition of urea to the dilute acid considerably modifies its action, which becomes one of simple hydrolysis as in the case of sulphuric and hydrochloric acids (*ibid.*).

³ *Phil. Mag.*, 1882, 325.

hydrochloric acid these compounds are said to be resolved into a sugar and an insoluble residue, lignose = $C_{16}H_{22}O_{11}$, and drupose = $C_{18}H_{26}O_{12}$, respectively. On comparing these formulæ with those of the original substances, the differences are so slight as to be negligible. The action of the acid is probably therefore one of simple hydrolysis. The reactions of these substances are also in other respects identical with those of the jute substance. Although therefore differing from the ligno cellulose, above described, in ultimate composition, they are essentially of the same order of compounds.

Crude fibre. This term is applied by agricultural chemists to the residual product of the treatment of fodder plants with boiling solutions of certain acids and alkalis, applied successively. The process is a crude imitation of the process of digestion in the animal, and the results which it yields are of purely empirical value. Crude fibre will be found on examination, in most cases, to be a ligno cellulose and to be further resolved by chlorine in the manner indicated.

ADIPOCELLULOSES. *Cork and Cuticular Tissue.* From the mode of formation of these tissues it has been concluded, on physiological grounds, as in the case of the lignocelluloses, that they are modified celluloses (Sachse, *Farbstoffe*, &c p 153). The ultimate composition of cork is represented by, the following percentage numbers C 65.7, H 8.3, N 1.5, O 24.5. Unlike the lignocelluloses, however, it is by no means a simple or homogeneous substance, but is resolved by the action of mere solvents into a number of proximate constituents, some of which are crystalline. The residue from the action of these solvents may be regarded as the true cork substance. It is resolved by the action of boiling nitric acid (20–30 p.c.) into cellulose on the one hand—only a small proportion (3–5 p.c.), however, surviving so severe a treatment—and a series of fatty acids (or products of their decomposition) such as suberic and adipic acids, on the other, the latter amount to about 40 p.c. of the weight of substance treated. If cork be resolved by treatment with sodium sulphite solution, at 166° a soft mass is obtained preserving the structural features of the original, but which on slight pressure breaks down into a cellular mass. On slight purification this yields a pure cellulose, the proportion obtained being from 9 to 12 p.c. of the original cork. From these resolutions into cellulose, and products of decomposition similar to those obtained from the fats and waxes under similar treatment, the substance of cork has come to be regarded as a compound of such molecules, and this view of its constitution, as well as that of the entire group of substances similar in composition and function, is summed up in the group term Adipocellulose, by which it is proposed to designate them. The cuticular tissues, such as constitute the covering of fleshy fruits and leaves, while similar in many respects, are simpler in composition. When purified they are non nitrogenous and appear to be homogeneous.

Frémy and Urbain have developed (C. R. 100, 19) a somewhat different view of the constitution of these tissues. Taking the protective tissues of the leaf of the agave as the type, in

addition to an interior epidermal layer, which is cellulosic, and is soluble in cuprammonia after treatment with boiling hydrochloric acid, they distinguish the external or true epidermis, which they term Cutose. The substance composing this tissue has the following properties: it is resolved by alkaline saponification into two fatty acids, *oleocutic* $C_{25}H_{40}O_8$, a liquid oily body, and *stearocutic* $C_{27}H_{44}O_8$, a solid body melting at 76°, soluble in benzene and glacial acetic acid, and slightly soluble in boiling alcohol, the solution gelatinising on cooling. The following numbers give the percentage composition of the original cutose and of the two derivatives.

	<i>Cutose</i>	<i>Oleocutic acid</i>	<i>Stearocutic acid</i>
C	68.4	66.6	75.5
H	8.7	8.2	10.3
O	22.9	25.2	14.2

Whence it is concluded that the molecule of cutose is composed proximately of oleo and stearo cutic acids in the molecular proportion of 5:1.

The two derived acids above described are marked by a curious instability or tendency to reversion, passing under certain conditions, notably by exposure of their solutions to light, into modifications closely resembling the original cutose.

With regard to the distribution of cutose in the plant world, while it is the main constituent of the external protective tissues of leaves, fleshy fruits and the stems of annuals, it is found also in the interior tissues, e.g. the bast and fibro vascular bundles.

These researches are an important contribution to the subject, and while there is no reason to doubt the authors' conclusions in the main, it is probable that they have overlooked the presence of cellulose as a constituent of cutose which occurs as an organised i.e. cellular tissue. We need scarcely observe that the chemistry of these adipocelluloses has been but little investigated.

CONSTITUTION OF CELLULOSE

The physical properties of cellulose throw but little light on the problem of its molecular constitution. We have seen, moreover, that cellulose is chemically inert, its derivative compounds are few, and of these indeed the nitrates alone appear to merit such a description, their formation being unattended by molecular resolution. From their composition and properties we infer the presence of alcoholic OH groups in the cellulose molecule. The gradual resolution by the action of sulphuric acid, through a series of compounds terminating with achroodextrin, indicates a certain constitutional relationship to the simpler carbohydrates of which the latter is a typical representative. The exact mechanism of the resolution not having been elucidated, it is impossible to draw any but the general inference from the products to the original cellulose molecule, viz., that the latter is a complex of molecules resembling these simpler and better known carbohydrates. We also infer that the bond which unites them is one of dehydration, but the exact nature of this bond is for the present entirely conjectural. (For a discussion of the probabilities involved in this problem the reader is referred to a paper by Baeyer entitled

'Wasserentziehung u ihre Bedeutung fur das Pflanzenleben und die Gahrung,' B 3, 63) That such molecules are to be regarded physiologically as well as chemically, as the proximate constituents of the cellulose molecule, is a conclusion which has perhaps been somewhat prematurely drawn Its ultimate origin is of course to be traced to the carbonic anhydride and water of the air and soil, the synthesising agencies being the protoplasm and chlorophyll of the plant, aided by the supplies of energy from without It has been supposed that the mediate source of the vegetable carbohydrates is formic aldehyde, and the recent researches of Loew (B 20, 141) upon the condensations of this aldehyde have at least confirmed the probability of this supposition The products of resolution of cellulose, moreover, clearly indicate the presence of aldehydic groups in the molecules Apart from conjecture, we may, to sum up this brief review, regard the cellulose molecule as a complex of simpler carbohydrate groups, containing alcoholic and aldehydic oxygen (v also Bowman, B A 1897)

The most striking features of the empirical formula of cellulose $C_6H_{10}O_5$ are those characteristic of the entire group of carbohydrates, the molecule containing some multiple of C_6 and the hydrogen and oxygen having the ratio 2:1 At present these relationships are merely suggestive of conditions of molecular equilibrium to be elucidated by future investigation

The prevalence of the C_6 group is remarkable and suggests a relationship to the aromatic group, which is confirmed by the undoubtedly cellulosic origin of the benzene compounds On the other hand we have no evidence of the existence of closed chains of C atoms in the cellulose molecule nor have any simple transitions from the one group to the other been as yet discovered If we turn, however, from the typical cotton cellulose to other forms of cellulose, such as those isolated from growing tissues, we find in the ease with which many of them yield furfural as a product of acid hydrolysis, some evidence of a more complex union of the C atoms, than the normal type usually assumes Passing on further to the lignocelluloses we find a molecule in the constitution of which a furfural group undoubtedly plays a part, and in which the linking of the C atoms is such as permits a simple transition, in part at least, to products of undoubtedly 'aromatic' composition

We have, in this brief statement of the evidence which we have upon which to found our views of the constitution of cellulose, endeavoured rather to indicate the main lines upon which the investigation of the problems involved is proceeding, than to draw premature conclusions The subject will be enormously developed in the future, and will constitute an important foundation of the natural history of the carbon compounds, a department or view of the science which can scarcely as yet be said to be within reach

NOMENCLATURE

Considerable confusion has been imported into this subject by the indiscriminate employment of the terms, cellulose, lignin, woody fibre, lignose, 'crude fibre,' in describing the

various products, natural and artificial, of which this article treats The want of uniformity arises from the division of the subject amongst physiologists, agriculturists and chemists That which we have adopted appears to bring about a certain simplification

The application of the term cellulose we have already defined and limited To denominate the compound celluloses, which correspond with the chief modifications of cellulose recognised by physiologists, we use a compound term consisting of cellulose as the substantive portion with a qualifying prefix To specially distinguish the characteristic constituent of these compounds, that to which we have applied the neutral term non cellulose, we employ the root of the prefix with the termination *in*, thus *pectin, lignin*

In conformity with this plan it may be expedient to introduce such terms as suberocellulose, cutocellulose, suberin, cutin, and many others but this should be left to be determined by the progress of investigation The special classification and nomenclature proposed by Frémy has been already discussed C F C

CERASIN, the meta acid (v ARABIC ACID) existing in cherry tree and plum tree gums, and in the gums of other trees of the same family, Gum arabic yields cerasin when heated to 150° (Gchls, C R 44, 144) Cherry tree gum is said to contain 52 p.c arabin, 34.9 cerasin, 12 water and 1 ash Treated with nitric acid cerasin yield 15.5 p.c mucic acid C O'S

CERATIN v PROTEINIS

CERATOPHYLLIN [147°] Extracted by lime water from the lichen *Parmelia ceratophylla* (Hesse A 119, 365) Thin prisms, sol cold, v sol hot, water, v sol alcohol, ether, and aqueous alkalis Fe Cl₃ colours its alcoholic solution purple Bleaching powder gives a red colour

CERBERIN A poisonous, crystalline glucoside occurring in *Cerbera Odollam* (Oudemans, J pr 99, 407, de Vrij, R T C 3, 167)

CEREBRIN C 69.08, H 11.47, N 2.13, O 17.32 (Parcus From these numbers the formulae $C_{12}H_{18}N_2O_{11}$, $C_{18}H_{27}N_3O_{11}$, or $C_{24}H_{36}N_4O_{11}$ may be calculated) The body called *Phrenosin* by Thudichum (J pr [2] 25, 19) is probably the same body in an impure state The name cerebrin was used first by Kuhn (1828) and applied to a mixture of cholesterin and leucithin It was used by Lassaigne (1830) to denote the entire substance that can be extracted from brain by alcohol It was employed by Gobley (1850) to denote so called 'protagon,' and by Muller to denote the nitrogenous substance free from phosphorus that can be extracted from the brain by alcohol, to which he gave the formula $C_{17}H_{25}NO$

References—Foureroy, A Ch 16, 282, Frémy, J Ph 27, 453, Liebreich, A 134, 29, Gobley, J Ph [4] 19, 346, W Muller, A 103, 131, 105, 361

Preparation—Ox brain is freed from membranes, washed with water, squeezed and heated with baryta to boiling The clear liquid is poured off and the coagulated residue washed with nearly boiling water, dried and extracted with alcohol The first extract deposits very

little on cooling, but cerebrin mixed with cholesterol separates from the subsequent extracts. The cholesterol is removed by solution in ether. So prepared, cerebrin is free from phosphorus but contains inorganic matter. 250 grms were got from 90 brains. It is redissolved in alcohol at 60° which leaves a barium salt undissolved. The barium that goes into solution is removed by a current of CO_2 . The cerebrin is purified by frequent recrystallisations from alcohol. The earlier mother liquors deposit on standing a gelatinous pp. By recrystallisation from alcohol this pp may be separated into cerebrin (spherical crystals), homocerebrin (needles), and encephalin (E. Parcus, *J pr* 132, 310).

Properties—Separates as a white crystalline powder composed of transparent globules from a boiling alcoholic solution. Soluble in acetone, chloroform, benzene, and glacial acetic acid. Insoluble in ether. Separates from acetone partly as globules, partly as matted threads. Cerebrin dissolves in conc H_2SO_4 . On standing exposed to the air, the liquid becomes covered with a purple skin, which afterwards turns green. Cerebrin does not combine with acids, bases, or salts. It is not affected by boiling for a short time with baryta. It is but slightly decomposed by boiling alcoholic potash. Cerebrin swells up but slightly in boiling water. It is very slightly hygroscopic, absorbing 2 p.c. of water from the air. It is decomposed by boiling for a long time with baryta. Boiled for some hours with dilute HCl it forms a solution that can reduce Fehling's solution.

Homocerebrin C 70.1 p.c., H 11.6, N 2.2, O 16.1. The yield is $\frac{1}{4}$ that of the cerebrin. Soluble in the same liquids as cerebrin, soluble also in boiling ether. Swells up in hot water, but does not form a paste. Is not decomposed by boiling water. Treated with hot HCl , it forms a solution that reduces Fehling's solution. Boiled for a long time with baryta, it is decomposed. It is not hygroscopic. Its solutions are neutral. It does not combine with acids, bases, or salts. It separates from alcoholic solutions in very fine needles. After separation from alcohol and drying, it is not a white powder (like cerebrin) but a waxy mass. It is more soluble in absolute alcohol than cerebrin.

Encephalin C 68.4, H 11.6, N 3.1, O 16.9. Resembles homocerebrin rather than cerebrin. It separates from solutions in flexible plates. From acetone it separates in granular masses. It swells up with hot water forming a complete paste. Boiled with HCl , it forms a solution that can reduce Fehling's solution.

CERIC ACID C 64.2 p.c., H 8.8 p.c., O 27.0 p.c. Obtained by the action of HNO_3 on cerin, or according to Kugler on phellonic acid $\text{C}_{20}\text{H}_{20}\text{O}_8$, [96°]. Phellonic acid is obtained, together with glycerin and stearic acid, by the action of alcoholic KHO on cork that has previously been exhausted by chloroform and alcohol (Döpping, *A* 45, 289).

CERIN $\text{C}_{20}\text{H}_{20}\text{O}_8$ (?) [250°]. A substance that may be extracted by chloroform from cork, the bark of *Quercus Suber*, in which it occurs to the extent of 2 p.c. (Kugler, *Ar Ph* [3] 22, 217, cf. Chevreul, *A Ch* 96, 170, Döpping, *A* 45, 289). Needles, insol water, sol other solvents. According to Siewert (*P* 1248, 388) an alcoholic

extract of cork contains phellyl alcohol $\text{C}_{17}\text{H}_{34}\text{O}$ [100°], a neutral, crystalline substance, sol alcohol.

CERIUM Ce. At w 139.9. Mol w un. known as element has not been gasified. S.G. (abt 18°) 6.63 to 6.73 (Hillebrand & Norton, *P* 156, 471). M.P. considerably above that of Sb (450°) but below that of Ag (950°) (H & N) S.H. (0°–100°) 0.4479 (H, *P* 158, 7). S.V.S. 21.1. Chief lines in emission spectrum, 5352.2, 5273.2, 4628.2, 4572.6, 4562.1, 4296, 4289 (Thalén). In 1803 Klaproth, and independently Berzelius and Hisinger, separated a new earth from a Swedish mineral and called it *Cerita* (from the then recently discovered planet *Ceres*), in 1839–41 Mosander (*P* 11, 406) proved that ceria was a mixture of at least three metallic oxides, oxides viz. of Ce, La, and Di. The metal cerium was first obtained by Mosander in 1836, it was more fully examined by Wohler, Bunsen, and other chemists.

Occurrence—In many Swedish minerals, more especially in *cerite* a silicate of Ce (abt 56 p.c. Ce_2O_3), occurs as silicate, phosphate, carbonate, fluoride, &c, also in many *apatites*, generally accompanied by La, Di, Fe, Al, &c. It has been recently found that clay used for brickmaking at Hanstadt (near Seeligenstadt in the neighbourhood of Frankfurt) contains from 8 to 12 p.c. of Ce_2O_3 (Strohecker, *J pr* [2] 33, 133 a 260).

Preparation—Certe is heated to redness, powdered, mixed with considerable excess of conc H_2SO_4 , and the mixture is gradually heated to incipient redness in a Hessian crucible, after cooling, the mass is powdered and then added, little by little, to ice cold water, whereby sulphates of Ce, La, and Di are dissolved, the treatment with H_2SO_4 &c is repeated with the portion insoluble in cold water, the aqueous solution is heated to boiling, whereby basic sulphates are ppd., solution in ice cold water and ppn by heating to boiling are repeated several times (Marnagat, Bunsen, Wohler). The solution in cold water is ppd by addition of oxalic acid solution, the oxalates are washed with water, dried, and heated in a Pt dish until completely converted into oxides. The mixed oxides (of Ce, La, and Di) may now be treated in many different ways. The following method was used by Brauner (*C J* 47, 884) in order to prepare pure Ce_2SO_4 for atomic weight determinations, it is based upon the formation of basic Ce nitrate insoluble in water. The mixed oxides were dissolved in moderately conc HNO_3 , excess of acid was removed by evaporation, and the syrup like liquid was poured into much pure boiling water, the ppd. basic ceric nitrate was washed (on a funnel connected with a pump) with boiling water containing a little nitric acid. The nitrate was dissolved in HNO_3 , excess of acid was removed by evaporation, the liquid was poured into boiling water, &c, as already described. This treatment was repeated 10 or 11 times. From the pure basic ceric nitrate thus obtained other Ce compounds may be prepared. Brauner prepared Ce_2SO_4 by dissolving the basic nitrate in dilute H_2SO_4 , and H_2SO_4 , evaporating to dryness in a Pt dish, and heating with due precaution, dissolving in a little ice cold water, ppn by absolute alcohol, washing

with abs alcohol, dissolving in ice cold water, ppg by alcohol, dissolving again, heating to 100° and stirring with a glass rod, $\text{Ce}_2\text{S}_3 \cdot 6\text{H}_2\text{O}$ was thus obtained, it was dehydrated by heating for some weeks at 440° in molten sulphur, at full redness the sulphate gives off SO_2 and SO_3 and leaves pure CeO_2 .

Robinson (*Pr* 37, 150) prepared pure Ce_2Cl_6 . The mixed oxides from cerite were dissolved in HNO_3Aq (*v supra*), and the liquid, after concentration to a syrup, was poured into boiling dilute $\text{H}_2\text{SO}_4\text{Aq}$, the basic sulphates were dissolved in HNO_3Aq , the Ce salt oxidised by boiling with PbO_2 (Gibbs, *Am S* [2] 37, 352), the liquid evaporated, and La and Di salts removed by treatment with HNO_3Aq , the pure basic ceric nitrate remaining was converted into chloride by treatment with HClAq , from this Ce oxalate was obtained by pptn with oxalic acid, the oxalate was heated in dry HCl , and pure Ce_2Cl_6 was thus obtained (for details *v original*). Robinson (*l c*) also recommends evaporating the nitric acid solution of the mixed nitrates to complete dryness, heating the brown mass to full redness until the residue is pale yellow, and treating this with boiling dilute HNO_3Aq , Ce basic nitrate remains while nitrates of Di and La dissolve.

Other methods for preparing more or less pure Ce salts are described by Bunsen, *P* 155, 375, Ozdnowicz, *J pr* 80, 16, Watts, *C J* 2, 147, Holtzmann, *J* 1862 136, Jolin, *Bl* [2] 21, 583, Erk, *Z* [2] 7, 100, Popp, *A* 131, 361, Pattison & Clark, *C N* 16, 259. Wöhler (*A* 144, 251) prepared Ce by adding pieces of Na to a molten mixture of Ce_2Cl_6 , KCl , and NH_4Cl , the product, however, was impure. Hillebrand & Norton (*P* 155, 633, 156, 466) by electrolysis Ce_2Cl_6 , covered with NH_4Cl , using a thick iron wire as negative electrode (4 Bunsen's cells) obtained approximately pure cerium (For details *v original papers*).

Properties and Reactions—Steel grey, very lustrous, very ductile, metal, malleable, unchanged in dry air, but in moist air is superficially oxidised, heated in air burns to oxide with production of heat and much light, burns in Cl_2 , Br , I vapour, S vapour, P vapour, forming compounds with these elements, easily dissolved by HClAq , dilute HNO_3 , or $\text{H}_2\text{SO}_4\text{Aq}$, no reaction with cold conc HNO_3 or $\text{H}_2\text{SO}_4\text{Aq}$. Ce slowly decomposes cold water, quickly decomposes hot water. As the VD of no Ce compound has yet been determined, the At w of the metal must be fixed by chemical considerations and by S.H. The value given to the At w for many years was abt 92, and the formulæ of the oxides, and chloride, &c, were CeO , Ce_2O_3 , CeCl , &c, Ce was thus placed, along with La and Di, in the same class as Al and the earth metals. Considering the relations between the properties of compounds of Ce, La, Di, and of other elements, Mendelejeff (*A Suppld* 8, 186) thought that Ce ought to be classed with those elements which form well marked oxides MO_2 , i.e. with Ti, Zr, Sn, &c. If this were done the At w of Ce would become 92.4. Further investigation has completely justified Mendelejeff's proposal, Ce is now classed with O, Si, Ti, Zr, Sn, Pb, and Th, La is placed with Al and the earth metals, and Di is classed with the elements

of Group V whose characteristic highest oxide is MO_2 .

The At w of cerium has been determined (1) by estimating SO_2 in cerous sulphate (Beringer, *A* 42, 134, Rammelsberg, *P* 55, 65; Hermann, *J pr* 30, 184, Margnac, *A Ch* [3] 27, 209, 38, 148) (2) by estimating Cl in cerous chloride (Beringer, *l c*, Robinson, *Pr* 37, 150) (3) from combustions of cerous oxalate (Jogel, *A* 105, 45, Rammelsberg, *P* 108, 44) (4) by conversion of $\text{Ce}_2\text{S}_3\text{O}$ into CeO_2 by heat (Brauner, *C J* 47, 879) (5) by determining S.H. of approximately pure Ce (Hillebrand & Norton, *P* 156, 471). The most accurate determinations are those made by Robinson and Brauner, respectively both lead to the number 139.90 (0 = 15.96).

Cerium is distinctly metallic in its phys cal and chemical properties, it forms the oxides Ce_2O_3 and CeO_2 (and probably also CeO), both of these are salt forming in their reactions with acids, but the well marked salts (cerous salts) are those corresponding to Ce_2O_3 , e.g. $\text{Ce}_2\text{S}_3\text{O}$, &c, in this respect Ce differs from Ti, Zr, Th, Sn, and Pb, the salts of which metals belong to the forms MX and MX_2 ($\text{X} = \text{SO}_4, \text{CO}_3, 2\text{NO}_3$, &c), and shows analogies with the elements of Group III (Al &c). Ce does, however, form a ceric sulphate Ce_2SO_4 , besides the oxide CeO_2 , a fluoride CeF_3 , analogous to TiF_3 , ZrF_3 , &c, is known (*v CARBON GROUP OF ELEMENTS*, also TITANIUM GROUP OF ELEMENTS).

Detection and Estimation—Ce salts are generally soluble in water alkalis ppt white hydrated Ce_2O_3 , NaClO_4Aq pps yellow hydrated CeO_2 which dissolves in HClAq in presence of alcohol to form a colourless liquid, solutions of Ce salts are pptd by oxalic acid, the pptd oxalate is white and insoluble in NH_4 salts, saturated $\text{K}_2\text{SO}_4\text{Aq}$ pps a white crystalline double sulphate, scarcely soluble in cold water, decomposed and dissolved by hot water containing a little HCl , Ce salts boiled with PbO_2 and a little HNO_3Aq give a yellow solution. When a slightly acid solution of a Ce salt is mixed with ammonium acetate, a little $\text{H}_2\text{O}_2\text{Aq}$ is added, and the whole is warmed, a yellowish ppt is formed (Hartley, *C J* 41, 202), if this ppt is moistened with NH_4Aq , again treated with $\text{H}_2\text{O}_2\text{Aq}$, and warmed, an orange solid (? CeO_3) is produced (de Boisbaudran, *C R* 100, 605). Ce can be separated from La and Di only by very prolonged treatment, *v Preparation*. Ce is usually estimated as CeO_2 , but it is very difficult to obtain this oxide pure. For methods of separation and estimation a manual of analysis must be consulted.

Cerium, carbide of Said to be obtained as a dense black powder, insoluble in hot conc acids, by heating cerous formate or oxalate in a stream of H, and treating with HClAq to dissolve out any oxide formed. Analyses agree approximately with composition CeC , (Dela fontaine, *J* 1865 177).

Cerium, haloid and oxyhaloid compounds of Cerium forms cerous haloid compounds, Ce_2X_3 , or CeX_3 , corresponding to the oxide Ce_2O_3 , and also a ceric fluoride CeF_4 , the molecular weight of none of these compounds has been determined.

CEROUS BROMIDE Ce_2Br_6 or CeBr_3 . Known as the hydrate $\text{CeBr}_3 \cdot x\text{H}_2\text{O}$. Obtained by dissolving cerous oxide, Ce_2O_3 , in HBrAq and evaporating. Deliquescent needles, unchanged by heating out of contact with air, heated in air, partially decomposed with loss of Br. Forms double salt $\text{CeBr}_3 \cdot \text{AuBr}_3 \cdot 8\text{H}_2\text{O}$ (John, *Bl* [2] 21, 323).

CEROUS CHLORIDE Ce_2Cl_6 or CeCl_3 . Obtained by heating Ce in Cl_2 or by dissolving Ce_2O_3 in HClAq , adding NH_4Cl , evaporating to dryness, and driving off NH_4Cl by heating, or by passing a mixture of dry CO and Cl over hot Ce_2O_3 (Didier, *C R* 101, 882). Pure CeCl_3 was prepared by Robinson (*Pr* 37, 150) by heating pure $\text{Ce}_2(\text{C}_2\text{O}_4)_3$ in pure dry HCl gas to $120^\circ\text{--}130^\circ$ for some time, then to 200° , and then to low redness, the small quantity of C separated was removed by heating at low redness in mixed CO_2 and HCl, finally the temperature was raised to a full red heat and the CO_2 stream was stopped. The chloride was allowed to cool in HCl gas, transferred to a small flask, and kept *in vacuo*, over H_2SO_4 and surrounded by CaO, until all HCl was removed. SG $\frac{16.50}{15.50}$ 3.88 (Robinson, *lc*). A white, deliquescent solid, easily soluble in water with production of heat, decomposed by O, or by steam, to Ce_2O_3 (Didier). A hydrate, $\text{CeCl}_3 \cdot 7\text{H}_2\text{O}$, is said to be formed by digesting Ce_2O_3 in HClAq and evaporating. Various double salts are described, *eg* $\text{CeCl}_3 \cdot 4\text{HgCl}_2 \cdot 10\text{H}_2\text{O}$, $\text{CeCl}_3 \cdot \text{PtCl}_4 \cdot 13\text{H}_2\text{O}$, $\text{CeCl}_3 \cdot \text{AuCl}_3 \cdot 13\text{H}_2\text{O}$ (John, *lc*).

CEROUS CYANIDE (and double cyanides) v **CYANIDES**

CEROUS FLUORIDE CeF_3 . Obtained as a gelatinous pp ($2\text{CeF}_3 \cdot \text{H}_2\text{O}$) by adding NaFAq to CeCl_3 in HClAq (John).

CERIC FLUORIDE $\text{CeF}_4 \cdot \text{H}_2\text{O}$. An amorphous brown powder, insoluble in water, obtained by treating $\text{CeO}_2 \cdot 6\text{H}_2\text{O}$ with HFAq , washing, and drying at 100° . Decomposed by heat with loss of H_2O and HF and formation of CeF_3 , heated strongly in contact with moist air Ce_2O_3 and HF are formed. Combines with KF (by treatment with KF HF to form 2CeF_6 , $3\text{KF} \cdot 2\text{H}_2\text{O}$ (Brauner, *C J* 41, 69).

CEROUS IODIDE Ce_2I_6 or CeI_3 . Obtained as the hydrate $\text{CeI}_3 \cdot 9\text{H}_2\text{O}$, in colourless crystals, by dissolving Ce_2O_3 in HIAq , evaporating in a current of H_2S , and placing *in vacuo* over H_2SO_4 , soluble in water and alcohol, very quickly decomposes in air (Lange, *J pr* 82, 184).

CERIUM OXYCHLORIDES. The compound $\text{Ce}_2\text{O}_3\text{Cl}_2$ ($= \text{Ce}_2\text{O}_3 \cdot 2\text{CeCl}_3$) is said to be formed when CeCl_3 is heated with Na (in preparation of Ce) and the mass is treated with water. Dark purple, lustrous, powder, insoluble in water (Wöhler, *A* 144, 254). The same oxychloride is said to be obtained, as iridescent scales, by passing a mixture of steam and N over a fused mixture of CeCl_3 and NaCl, easily soluble in dilute acids, heated in air gives Ce_2O_3 and HCl (Didier, *C R* 101, 882).

Cerium, hydroxides of, v CERIUM, OXIDES OF.

Cerium, oxides and hydrated oxides of. The best studied oxides are cerous oxide Ce_2O_3 , and ceric oxide CeO_2 , a peroxide CeO , also probably exists. Other oxides, *eg* Ce_2O_4 and Ce_2O_5 ,

have been described, but their existence is very doubtful.

CEROUS OXIDE Ce_2O_3 . (*Cerium sesquioxide*) Mol w unknown. The white, bulky pp obtained by adding KOHaq to a solution of a cerous salt is hydrated cerous oxide, as the pp. at once begins to take up O and CO_2 from the air the hydrate has not yet been obtained pure. The oxide Ce_2O_3 is prepared by heating cerous oxalate in a stream of pure H. The oxalate is prepared from the basic nitrate (*v* CERIUM, Preparation) by dissolving in a little HNO_3aq and ppg by oxalic acid (Popp, *A* 181, 361, Rammelsberg, *B* 6, 86).

Properties and Reactions—A grey solid, unchanged by heating in H. Dissolves in many acids to form cerous salts of the form Ce_2X_3 , X = SO₄, CO₃, 2NO₃, 2ClO₄, &c.

CERIC OXIDE CeO_2 . (*Cerium dioxide*) The pale yellow pp obtained by suspending $\text{Ce}_2\text{O}_3 \cdot x\text{H}_2\text{O}$ in KOHaq and passing in Cl is hydrated ceric oxide ($2\text{CeO}_2 \cdot 8\text{H}_2\text{O}$, Rammelsberg, *P* 108, 40).

Formation—1 By washing the hydrate with water containing a little acetic acid until KOH is removed, drying and heating—2 By heating cerous sulphate Ce_2SO_4 to full redness in air 3 By heating CeF_3 in air (Brauner).

Preparation—Cerous oxalate is prepared from the basic nitrate from *cerite* (*v* CERIUM, Preparation), it is heated to redness in a Pt dish with free access of air. Nordenskiöld (*P* 114, 616) obtained colourless, transparent, tesseral crystals of CeO_2 by heating Ce_2O_3 for 24 hours with a little borax in a porcelain oven, and treating the mass with HClAq SG at $15^\circ = 6.94$.

Properties and Reactions—Very pale yellow solid (Wolf, Brauner, Robinson [*C N* 54], Crookes, *Pr* 38, 414) SG 6.74 (Nilson a Pettersson, *B* 13, 1459) SVS 25.45 SH 0.877 (N a P, *Pr* 31, 46). Dissolves in conc $\text{H}_2\text{SO}_4\text{aq}$ with production of much heat, and evolution of some O, on crystallising, the salt $\text{Ce}_2\text{SO}_4 \cdot \text{Ce}(\text{SO}_4)_2 \cdot 24\text{H}_2\text{O}$ separates (Mendelejeff, *A* 168, 45), from the mother liquor of this salt ceric sulphate $\text{Ce}_2\text{SO}_4 \cdot 4\text{H}_2\text{O}$ is obtained. This reaction shows that part of the CeO_2 is reduced by the H_2SO_4 to Ce_2O_3 , and part reacts with the acid to form Ce_2SO_4 . Dissolves in HNO_3aq , on adding NH_4NO_3 and crystallising *in vacuo* the double salt $2\text{Ce}(\text{NO}_3)_3 \cdot 4\text{NH}_4\text{NO}_3 \cdot 8\text{H}_2\text{O}$ is obtained. Scarcely soluble in HClAq , but dissolves in this acid, and also in other dilute acids, in presence of reducing bodies, *eg* filter paper, alcohol, SO_2aq , &c.

CERIUM TRIOXIDE Ce_2O_3 . (*Cerium peroxide*) Said to be obtained as a reddish pp by adding a slight excess of NH_4aq to $\text{Ce}_2\text{SO}_4\text{aq}$, and digesting with hydrogen peroxide (de Boisbandran, *C R* 100, 605, Cleve, *Bl* [2] 43, 53).

OTHER OXIDES OF CERIUM are described by Popp (*A* 181, 361), Hermann (*J pr* 30, 184, 82, 385, 92, 113), the formulae Ce_2O_4 and Ce_2O_5 are assigned to these oxides, respectively, but experiments made by Rammelsberg (*P* 108, 40) and others tend to show that the only oxides which have been isolated are Ce_2O_3 , CeO_2 , and CeO .

Cerium, oxychlorides of, v. under CERIUM, HALOID AND OXYHALOID COMPOUNDS OF.

Cerium, salts of—Salts obtained by replacing H of acids by Ce. Two series of salts are known, cerous salts represented by Ce_2SO_4 , and ceric salts represented by Ce_2SO_4 . The cerous salts correspond to the oxide Ce_2O_3 , the general form of these salts is Ce_2X_3 , where $\text{X} = \text{SO}_4, \text{CO}_3, 2\text{NO}_3, 2\text{ClO}_4$, &c., the ceric salts correspond to the oxide CeO_2 , their general form is Ce_2X_4 , where $\text{X} = \text{SO}_4$, &c. The cerous salts are considerably more stable than the ceric salts, the latter are readily reduced to the former, but few ceric salts have been obtained, the principal salt is Ce_2SO_4 , several double salts are known of the form $\text{Ce}_2\text{SO}_4, x\text{M SO}_4$, and $\text{Ce}_4\text{NO}_3, x\text{MNO}_3$, when M is an alkali metal. Many double cerous salts are known. A few basic salts are also known. Some salts have been isolated which appear to belong to the mixed form $x\text{Ce}_2\text{X}_3, y\text{CeX}_2$, and one of the so called basic nitrates is probably $x\text{Ce}_2\text{NO}_3, y\text{CeO}_2$. For descriptions of the individual salts see the articles on the various groups of salts, CARBONATES, SULPHATES, &c., the chief salts are the *bromate, carbonates, iodate, nitrates, oxalate, perchlorate, phosphates, selenate, sulphates, tungstate*.

Cerium silicide Described by Ullik (Z [2] 2, 60) as a brown powder, obtained by passing an electric current from 8 Bunsen cells through a fused mixture of KF and Ce_2F_6 in a porcelain crucible, and treating with water the brownish mass formed at the negative pole. The Si was derived from the crucible which was strongly attacked. Analysis gave numbers nearly agreeing with the formula Ce_2Si_3 .

Cerium, sulphides of Only one sulphide is known, cerous sulphide, Ce_2S_3 . It is best obtained by passing dry H_2S over CeO_2 heated to faint redness in a porcelain tube SG 51. Vermilion to black according to the temperature at which prepared. May also be obtained in red translucent crystals by passing dry H_2S over a fused mixture of dry NaCl and dry Ce_2Cl_6 , and then washing with water. Unchanged in ordinary air, but burnt to SO and CeO_2 below a red heat in air. Dissolves easily in dilute acids with production of H_2S , very slowly decomposed by warm water (Didier, C R 100, 1461, v also Lange, J pr 82, 128, and Mosander, P 11, 406).

Cerium, sulphocyanide of, v SULPHOCYANIDES, under CYANIDES M M P M

CEROPIC ACID $\text{C}_{26}\text{H}_{48}\text{O}_5$ (?) In the leaves of the Scotch fir (*Pinus sylvestris*), from which it may be extracted by dilute alcohol. Minute needles— BaA'' aq (Kawaler, A 88, 360).

CEROSIN $\text{C}_{24}\text{H}_{48}\text{O}$ [82°] A waxy substance found on the stem of the sugar cane. Nacreous laminae (from alcohol). Heating with potash lime oxidises it to cerosic acid $\text{C}_{24}\text{H}_{44}\text{O}_2$ (?) [93°], which may be crystallised from petroleum (Avequin, A Ch 75, 218, Dumas, A Ch 75, 222, Lewy, A Ch [3] 13, 438).

CEROTENE $\text{C}_{27}\text{H}_{54}$ [58°] A product of the distillation of Chinese wax (Brodie, P M [3] 83, 878, A 67, 210). Resembles paraffin. Chlorine forms $\text{C}_{27}\text{H}_{36}\text{Cl}_{18}$, $\text{C}_{27}\text{H}_{32}\text{Cl}_{22}$, and $\text{C}_{27}\text{H}_{28}\text{Cl}_{22}$. A similar body [66°] occurs in hay, it is perhaps $\text{C}_{26}\text{H}_{52}$ (König & Kiesoff, B 6, 590).

CEROTIC ACID $\text{C}_{27}\text{H}_{54}\text{O}_2$ or $\text{C}_{26}\text{H}_{52}\text{O}_2$ [78°]

Occurrence.—1 As ceryl cerotate in Chinese

wax, whence it is obtained by distillation, or, better, by treatment with alcoholic KOH—2 In the free state in bee's wax (John, *Chemische Schriften*, 4, 38, Boudet & Boissenot, J Ph 13, 38, Etling, A 2, 267, Hess, A 27, 8, Gerhardt, *Rev scient* 19, 6, Lewy, A Ch [3] 13, 438, Brodie, A 67, 180, Zatzek, M 3, 677).

Formation—By oxidation of paraffin with dilute HNO_3 or with chromic mixture (Gill & Meusel, C J 21, 466). Also by heating ceryl alcohol with soda lime (Schwalm, A 235, 141).

Preparation—The alcoholic extract from bee's wax is recrystallised till it melts at 70°. This is dissolved in alcohol and the lead salt thrown down by alcoholic lead or cupric acetate.

Salts — $\text{NaA}' - \text{CuA}'_2$ at 100° — PbA' .

[113°] — $\text{KA}' - \text{MgA}'_2$? [140°-145°] — AgA' .

Methyl ether MeA' [60°] (Nafzger, A 224, 233).

Ethyl ether EtA' [60°]. Fatty plates (from alcohol). Soluble in ether. May be distilled *in vacuo*. On distillation it gives off C_2H_4 and CO , and the distillate contains cerotic acid and a paraffin [44°] ($\text{C}_{26}\text{H}_{54}$, or $\text{C}_{27}\text{H}_{56}$) while in the retort there remains a ketone [92°] which is $(\text{C}_2\text{H}_5)_2\text{CO}$ or $(\text{C}_{26}\text{H}_{52})_2\text{CO}$.

Ceryl ether $\text{C}_{27}\text{H}_{56}\text{O}$ $\text{C}_2\text{H}_5\text{O}$ [82°] Occurs almost pure as Chinese wax (Brodie). Occurs also in opium wax (Hesse B 3, 638), and in yolk, the sweat of sheep (Buisine, Bl [2] 42, 201).

An acid [79°] isomeric or identical with cerotic acid is the chief acid present in the product of saponification of carnauba wax. From alcohol it separates as a jelly, but from other solvents (ether, benzene, light petroleum) as a crystalline powder (Sturcke, A 223, 283, cf. Bérard, Z [2] 6, 465).

Salt — PbA'_2 [116°] Sol boiling glacial acetic acid and toluene. Insol boiling alcohol or ether.

CEROTONE $\text{C}_{25}\text{H}_{50}\text{O}$ *ie* $(\text{C}_{26}\text{H}_{52})\text{CO}$ (?) [62°] Formed by distilling lead cerotate (Bruckner, J pr 57, 17). Plates (from ether).

Cerotone $(\text{C}_{26}\text{H}_{52})\text{CO}$ (?) [92°] Formed by distilling cerotic acid or its ethyl ether (Nafzger, A 224, 237). Plates (from acetone).

CERYL ALCOHOL $\text{C}_{27}\text{H}_{56}\text{O}$ or $\text{C}_{26}\text{H}_{54}\text{O}_2$ [79°]

Occurrence—Chinese wax consists almost entirely of ceryl cerotate (Brodie, A 67, 180, Schwalm, A 235, 141). Ceryl cerotate also occurs in the sweat on the wool of sheep. The wax outside ripe heads of the opium poppy contains ceryl cerotate and ceryl palmitate, [79°] (Hesse, B 3, 637).

Preparation—Chinese wax is saponified with alcoholic potash, the product mixed with barium chloride solution and the ceryl alcohol separated from baric cerotate by solution in alcohol.

Reactions—Is oxidised to cerotic acid $\text{C}_{27}\text{H}_{54}\text{O}_2$ by heating with soda lime.

Iso ceryl alcohol $\text{C}_{27}\text{H}_{56}\text{O}$ [62°] The portion of the wax of *Ficus gummiiflua* which is insoluble in cold ether (Kessel, B 11, 2113).

Acetyl derivative $\text{C}_{27}\text{H}_{52}\text{OAc}$ [57°]

CESPITINE $\text{C}_{27}\text{H}_{52}\text{N}$ (?) [95°] Occurs in coal tar, and in the product of the distillation of peat (Church & Owen, P M [4] 20, 110, Fritzsche, J 1868, 402). Liquid, miscible with water. Combines with EtI . Its platinumchloride is de-

composed by boiling water (De Coninck, *Bl* [2] 45, 131) Goldschmidt a Constam (*B* 16, 2978) suggest that it is wet pyridine

CETANE v HEXADECANE

CETENE $C_{16}H_{32}$ *re* $CH_2(CH_2)_{14}CH_2$, *Cetylene Hexadecylene* [42°] (275°), (155°) at 15 mm SG $\frac{1}{4}$ 7917, $\frac{15}{16}$ 7842 VD 80 Formed by distilling cetyl alcohol with PO_3 (Dumas a Pélégot, *A Ch* [2] 62, 4, Smith, *A Ch* [3] 6, 40) Also by distilling cetyl palmitate or commercial spermaceti (*cf* Krafft, *B* 16, 3018) Oil, sol alcohol and ether According to Berthelot (*A Ch* [3] 51, 81) it forms unstable compounds with HBr and HCl It forms a dibromide $C_{16}H_{32}Br_2$ [14°] whence alcoholic KOH forms only bromo cetene (Chydenius, *A* 143 267) HClO forms chloro cetyl alcohol $C_{16}H_{31}Cl(OH)$ (c 300°) (Carius, *A* 126, 195) SO₂ forms $C_{16}H_{31}SO_3H$ [8°], insol water —KA' [106°] S 1 (Lasarenko, *B* 7, 125)

An isomeride of cetene, [42°], (284°) is got by distilling azelaic acid with baryta (Schorlemmer, *A* 136 265)

CETENE GLYCOL The *di acetyl derivative* $C_{16}H_{32}(OAc)_2$ is formed by the action of $AgOAc$ on cetene dibromide It cannot be distilled (Chydenius, *A* 143, 270)

ETENE OXIDE $C_{16}H_{30}O$ [below 30°] (below 300°) From chloro cetyl alcohol (*v* CETENE) and aqueous KOH (Carius, *A* 126, 202) Minute needles

CETIC ACID $C_{15}H_{30}O$ [55°] The glyceryl derivative occurs in the oil expressed from the seeds of *Jatropha Curcas* (Bouis, *J* 1854, 462) According to Heintz (*P* 90, 137) a very small quantity of this acid is found in the products of saponification of spermaceti

Ethyl ether EtA' [21°] (B)

CETINENE $C_{16}H_{30}$ *Cetylene Hexadecimene Hexadecylidene* [20°] (284°) (160°) at 15 mm SG $\frac{4}{5}$ = 804, $\frac{3}{5}$ = 797 HF 118 000 (Berthelot) Large colourless tables Formed by heating cetene (hexadecylene) bromide (natural or synthetical) with alcoholic KOH (Krafft, *B* 17, 1373, *cf* Chydenius, *C* 64, 180)

CETRAPIC ACID $C_{16}H_{30}O_6$ Contained, together with lichenostearic acid, in Iceland moss (*Cetraria islandica*) (Berzelius, *Schw* J 7, 317, *A Ch* 90, 277, Herberger, *A* 21, 137, Knop a Schnedermann, *A* 55, 144) Hair like needles (from alcohol), v sl sol water, sl sol ether, v sol boiling alcohol Tastes bitter Decomposed before melting Its solutions turn brown on boiling, especially in presence of alkali $FeCl_3$ gives a red pp in neutral solutions —(NH₄)A'' —PbA''

DICETYL $C_{32}H_{64}$ *Dotriacontane* [70°] (above 360°) VD 158 Formed by treating an ethereal solution of cetyl iodide with sodium (Sorabji, *C J* 47, 37, *cf* Lebedeff, *J R* 1884, [2] 299) Scales, v sl sol ether, v sol boiling glacial HOAc

CETYL ACETATE $C_{16}H_{32}OAc$ *n Prim hexadecyl acetate* [19°] (Becker, *A* 102, 220), [23°] (Krafft, *B* 16, 1721) (278°) at 190 mm, (200°) at 15 mm (K) SG $\frac{1}{4}$ 8640, $\frac{3}{4}$ 8612 MM 18 772 at 207° (Perkin, *C J* 45, 421) Needles, sl sol cold alcohol

CETYL - ACETIC ACID is identical with **STEARIC ACID** (*q v*)

Di-cetyl-acetic acid $C_{32}H_{64}O_4$ *re* ($C_{16}H_{32}$)₂CH CO₂H [70°] Formed by heating di cetyl malonic acid at 150° (Guthzeit, *A* 906, 365) Crystalline scales, sl sol alcohol —AgA' amorphous pp

CETYL ALCOHOL $C_{16}H_{33}O$ *Æthyl n-Prim-hexadecyl alcohol* Mol w 242 [50°] (844°), (190°) at 15 mm SG (liquid) $\frac{50}{100}$ = 8176, $\frac{90}{100}$ = 8105, $\frac{95}{100}$ = 7837 HF 112,000 (Berthelot)

Occurrence —Spermaceti is cetyl palmitate ($C_{16}H_{33}$) $C_{16}H_{31}O_2$ (Chevreul, *Recherches sur les corps gras*, p 171, Dumas a Pélégot, *A Ch* [2] 32, 4, Dumas a Stas, *A Ch* [2] 73, 124, Smith, *A Ch* [3] 6, 40, *A* 42, 247, Heintz, *P* 84, 232, 87, 553) In the sebaceous glands of geese and ducks (De Jonge, *H* 3, 225)

Formation —By the distillation of bario sebacate (Schorlemmer, *Pr* 19, 22)

Preparation —1 Spermaceti (10 pts) is boiled with alcohol (5 pts) and potash (2 pts) until saponified The product is poured into water and the cetyl alcohol crystallised from ether The crude commercial cetyl alcohol contains in addition to hexadecyl alcohol also *n p* octadecyl alcohol and probably small quantities of other homologues (Krafft, *B* 17, 1627) —2 The acetate is formed by reducing palmitic aldehyde (obtained by distilling barium palmitate with barium formate) with zinc dust and acetic acid (Krafft, *B* 16, 1721)

Properties —Small crystalline plates (from alcohol) Gives palmitic acid on oxidation

Sodium Cetylolate $C_{16}H_{33}NaO$ [110°] (Fri Jau, *A* 83, 1)

Ethyl ether $C_{16}H_{33}OEt$ [20°] (Becker, *A* 102, 220)

TRI-CETYL-AMINE $C_{48}H_{96}N$ *re* ($C_{16}H_{33}$)₃N [39°] From cetyl iodide and gaseous NH₃ at 150° (Fridau, *A* 83, 25) Needles Its salts are insol water, sol alcohol and ether —B'HCl —(B'HCl).PtCl₃ yellow pp

CETYL-ANILINE $C_{32}H_{50}N$ *re* $N(C_2H_5)(C_{16}H_{33})H$ *Phenyl cetyl amine* [42°] From cetyl iodide and aniline at 100° (Fridau, *A* 83, 29) Silvery scales (from alcohol) Has no action on litmus, and does not pp metallic salts —B'H PtCl₃

Di-cetylaniline $N(C_2H_5)(C_{16}H_{33})_2$ From cetyl aniline and cetyl iodide at 110° (F) Crystalline —B'H PtCl₃

CETYL-BENZENE $C_{32}H_{50}$ ($C_{16}H_{33}$) *Hexadecylbenzene* [27°] (230° at 15 mm) Formed by the action of sodium upon a mixture of iodo benzene and cetyliodide (Krafft, *B* 19, 2983)

CETYL BENZENE-SULPHONIC ACID $C_{32}H_{50}(C_{16}H_{33})SO_3H$ *Hexadecyl benzene sulphonic acid* Formed by sulphonating cetyl benzene The sodium salt A'Na is sparingly soluble (Krafft, *B* 19, 2983)

CETYL BENZOATE $C_{32}H_{50}OBz$ [30°] (Becker, *A* 102, 219) Crystalline scales

CETYL BORATE $C_{16}H_{33}BO$ [58°] (Schiff, *A* Suppl 5, 198)

CETYL BROMIDE $C_{16}H_{33}Br$ [15°] From cetyl alcohol, Br, and P (Fridau, *A* 83, 15) Insol water, v sol alcohol and ether

CETYL CHLORIDE $C_{16}H_{33}Cl$ SG 12 841 From cetyl alcohol and PCl₅ Oil, insol alcohol, sol ether Boils above 280° with decomposition (Dumas a Pélégot, *A Ch* 54, 4, Tütschkeff, *Rep Chm pure*, 2, 463)

CETYL CYANIDE $C_{15}H_{31}ON$ *Margaronitrile*. [58°] (?) Formed by heating potassium cetyl sulphate with KCN and extracting with ether. Crystalline solid (Köhler, *Z d gesammte Naturw* 7, 252). According to Heintz (P 102, 257) it is a liquid, but is accompanied by a solid mixture [55°].

CETYL ETHER *v.* **CETYL OXIDE**

CETYLIDE $C_{16}H_{33}O_2$ [α 65°]. A substance said to be formed by dissolving cerebrin in conc H_2SO_4 and pouring the solution into water (Geoghegan, *H* 3, 332). Insol water, v sol hot alcohol, v e sol ether. Potash fusion gives palmitic acid, hydrogen, and CH_4 .

CETYL IODIDE $C_{16}H_{33}I$ [22°]. From cetyl alcohol, phosphorus, and iodine. Laminæ (from alcohol) [22°] (Fridau, *A* 83, 23).

CETYL MALONIC ACID $C_{16}H_{33}CH(CO_2H)_2$. *Hexadecyl malonic acid* [117°] (G), [121°] (Krafft, *B* 17, 1630). Formed by heating alcohol (40 g), in which Na (2 g) has been dissolved, with malonic ether (20 g) and cetyl iodide (44 g), the resulting solid ether being saponified by aqueous KOH (Guthzeit, *A* 206, 357). Granules, m sol cold alcohol. Decomposed by heat into CO_2 and cetyl acetic acid—Salts— Ag_2A'' — BaA'' .

Di cetyl malonic acid $(C_{16}H_{33})_2C(CO_2H)_2$ [87°]. Prepared in the same manner as cetyl malonic acid, using half the quantity of malonic ether (Guthzeit, *A* 206, 362). Aggregate of minute crystals (from alcohol), sl sol cold alcohol. Split up at 150° into CO_2 and di cetyl acetic acid— Ag_2A'' voluminous white pp.

CETYL MERCAPTAN $C_{16}H_{33}SH$ [51°]. From cetyl chloride and alcoholic KSH. Silvery scales (from ether), does not attack HgO but gives white pps with alcoholic $AgNO_3$ and $HgCl_2$ (Fridau, *A* 83, 18).

CETYL NITRATE $C_{16}H_{33}NO_3$ [12°] SG 91. From cetyl alcohol, H_2SO_4 , and HNO_3 . Long flattened needles, sl sol cold alcohol (Champion, *Z* 1871, 469).

DI-CETYL OXIDE $(C_{16}H_{33})_2O$ [55°] (300°). From sodium cetylate and cetyl iodide at 110° (Fridau, *A* 83, 22).

CETYL PALMITATE *v.* **PALMITIC ACID**

CETYL PHENOL $C_{16}H_{33}(C_{15}H_{31})^H$ *Hexadecyl phenol* [77½°] (260°) at 15 mm. Formed by fusing cetyl benzene sulphonic acid with KOH. Colourless, tasteless and odourless crystals (Krafft, *B* 19, 2984).

CETYLPHENYL AMINE $C_{16}H_{33}(C_{15}H_{31})NH_2$. *Amido cetyl-benzene*. *Amido hexadecyl benzene* [α 53°] (254°) at 15 mm. Colourless crystals (from benzene). Formed by reduction of nitro cetyl benzene (Krafft, *B* 19, 2984).

CETYL STEARATE *v.* **STEARIC ACID**

CETYL SULPHIDE $(C_{16}H_{33})_2S$ [58°]. From cetyl chloride and K_2S . Scales (from ether alcohol) (Fridau, *A* 83, 16).

CETYL SULPHURIC ACID $C_{16}H_{33}OSO_3H$. From cetyl alcohol and H_2SO_4 (Dumas & Péligot, *A* 19, 293, Köhler, *J* 1856, 579, Heintz, *P* 102, 257)— KA'' soft nacreous laminæ composed of interlaced needles (from alcohol).

CETYL DI THIO CARBONATE OF POTAS-SIUM $(C_{16}H_{33})_2OS_2K$. From cetyl alcohol, KOH , and CS_2 at 70°. Unstable, hygroscopic scales. Gives a yellow pp with alcoholic $AgNO_3$,

quickly turning black (Desains & De la Provostaye, *A Ch* [5] 6, 494).

CEVADILLINE *v.* **VERATRUM ALKALOIDS**

CEVADINE *v.* **VERATRUM ALKALOIDS**

CEVINE *v.* **VERATRUM ALKALOIDS**

CHAMOMILE OIL. An essential oil distilled from chamomile flowers. Both the English or Roman oil of chamomile (from *Anthemis nobilis*) and the oil from *Matricaria Chamomilla* are blue, or greenish blue, and boil between 105°–300°. In the oil from *Matricaria Chamomilla* Kachler (*B* 4, 36) found a liquid $C_{15}H_{31}O$ (150°–170°), a terpene (165°–185°) (*cf* Bizio, *Sitz B* 43 [2] 292), and a blue liquid $(C_{15}H_{31}O)_2$ (270°–300°), whence K forms a terpene $(C_{15}H_{31})_2$ and PO_3 , forms cymene (*cf* Borntrager, *A* 49, 243). English (or Roman) oil of chamomile consists of isobutyl isobutyrate (149°), isobutyl angelate (177°), amyl angelate (200°), amyl tiglate (205°), hexyl angelate, hexyl tiglate, and anethol (*q v*) (Fittig & Kobay, *A* 195, 106, van Romburgh, *R T C* 5, 220, *cf* Demarcay, *C R* 77, 360). Petroleum ether extracts from chamomile flowers (*Anthemis nobilis*), in addition to the above liquids, very small quantities of two solids [64°] and [189°], the former is possibly $C_{15}H_{31}$ (Naudin, *Bl* [2] 41, 483).

CHARACIN. A white unctuous substance, soluble in ether, occurring in *Palmella cruenta*, *Vaucheria terrestris*, and other *Oscillariæ* present in fresh water (Phipson, *C N* 40, 86).

CHERCOAL *v.* **CARBON**

CHEBULIC ACID $C_{15}H_{25}O_3$ (?). Occurs in the fruit of *Terminalia Chebula* (Fridolin, *C C* 1884, 641). Trimeric prisms, sol alcohol and hot water, has a sweet taste. Reduces Fehling's solution. $FeCl_3$ gives a blue black pp. Differs from gallic acid in giving no colour with aqueous KCy .

CHELEERYTHRINE $C_{15}H_{25}NO$, [160°]. S (alcohol) 33 at 17°. Occurs in very small quantity in the root and unripe fruits of the common celandine (*Chelidonium majus*), and in the root of the yellow sea poppy (*Glaucium luteum*) (Probst, *A* 29, 120, 31, 250). *Sanguinaria canadensis* contains an alkaloid, sanguinarine, which is possibly identical with cheleerythrine (Schiel, *Am S* [2] 20, 220, but *cf* Naschold, *Z* 1870, 119, Henschke, *C C* 1887, 243). NH_3 throws it down from solution in dilute acids as a flocculent pp, v sol ether, CS_2 , chloroform, and benzene. Its solutions fluoresce violet. Acids turn it red— $B'HCl$ aq red, v sol water and alcohol— $B'H_2PtCl_6$ aq— $(B'HI)_4HgI_2$ — $(B'HCy)_4PtCy$.

CHELIDONIC ACID $C_{15}H_{25}O_6$:

$\begin{array}{c} \text{O} \\ \diagup \quad \diagdown \\ \text{O C C (CO}_2\text{H) CH C CH CO}_2\text{H} \end{array}$ (Lerch) [220°] S 6 at 8°, 3.9 at 100°. Occurs as calcium salt in the sap of the celandine *Chelidonium majus* (Probst, *A* 29, 116, Lerch, *A* 57, 273, *M* 5, 367, Lietzenmayer, *Dissertation*, 1884).

Reactions—1 By warming with water and bromine it is split up into oxalic acid, bromoform, and penta bromo acetone (Wilde, *A* 127, 165)—2 *Aqueous alkalis* in the cold turn it yellow, forming xanthochelidonic acid $C_{15}H_{25}O_7$;

on boiling it is split up into oxalic acid and acetone $C_4H_4O_6 + 3H_2O = 2H_2C_2O_4 + C_2H_4O$ — 8 *Ammonia* forms chelidamic (oxypyridine di carboxylic) acid (Lieben & Hartinger, *B* 16, 1259) — 4 *Zinc* and *acetic* acid reduce it to hydrochelidonic acid $C_8H_{10}O_6$ — 5 *HI* forms pimelic acid $C_6H_8(CO_2H)_2$ — 6 *Sodium amalgam* gives hydro xanthochelidonic acid — 7 At 220°–230° it gives off CO_2 forming comanic acid $C_8H_6O_4$.

Salts — Chelidonic acid is dibasic. It dissolves zinc and iron and decomposes carbonates. The normal salts are mostly soluble in water and crystallisable, those of the alkalis and alkaline earths are readily transformed into salts of xanthochelidonic acid (this led formerly to the belief that the acid was tribasic). The acid salts crystallise in needles, are soluble in water, and reddens litmus. $\frac{1}{2}KA''$ — $(NH_4)A''$ 2aq — NaA'' 3½aq — $NaHA''$ 2aq (at 100°) — NaH_2A'' 2½aq — CaA'' 3aq — CaH_2A'' 4aq — BaA'' 4aq — BaH_2A'' 5aq — PbA'' 4aq — Ag_2A'' — $AgHA''$ 4aq.

Mono ethyl ether $EtHA''$ [224°] (H & L), [184°] (Lerch). White needles, gives with $AgNO_3$ the salt $EtAgA''$ trimetric prisms.

Di ethyl ether Et_2A'' [63° cor]. Golden triclinic prisms, sol water, alcohol, and ether.

Xanthochelidonic acid $C_8H_6O_7$. *Chelhydryronic acid*.

Preparation — When chelidonic acid is dissolved, at ordinary temperatures, in excess of aqueous alkalis or alkaline earths it assimilates water and the resulting yellow solution contains a salt of xanthochelidonic acid (Hartinger & Lieben, *M* 5, 347, Lerch, *M* 5, 377). On adding aqueous KOH to an aqueous solution of calcium chelidonate $CaC_8H_4O_6$, a yellow jelly $CaKC_8H_4O_6$ separates, and ultimately coagulates. This salt is acidified with H_2SO_4 and the xanthochelidonic acid extracted by ether that contains alcohol.

Properties — Amorphous, transparent, hygroscopic mass. Its aqueous solutions give lemon yellow pps with bases. Fe_2Cl_6 gives a dark red colouration. $AgNO_3$ gives in neutral solutions a yellow pp, turned chocolate brown by boiling. Xanthochelidonic acid gives the iodoform reaction. Sodium amalgam reduces it to hydro xanthochelidonic acid ($C_8H_8O_7$?). Its salts readily change into those of chelidonic acid.

Salts — Ca_2A'' yellow powder — Ag_2HA'' 4aq yellow pp — Ag_2A'' chocolate brown powder — Ag_2CaHA'' 4aq yellow — Ag_2CaA'' chocolate — Pb_2Ca_2A'' — $BaCaA''$ — Ca_2K_2A'' 4aq.

Hydro-chelidonic acid $C_8H_{10}O_6$ [142°]. Prepared by reducing chelidonic acid with zinc and acetic acid, and purified by means of its zinc salt (Hartinger & Lieben, *M* 5, 353). Groups of colourless leaflets (from water), sol alcohol, sl sol ether. It does not give the iodoform reaction. $KMnO_4$ oxidises it to oxalic and succinic acids. *HI* reduces it to pimelic acid.

Salts — ZnA'' 2aq monoclinic six-sided tables, $abc = 1.029$ 1.737 , $\beta = 80^\circ 8'$ (Zepharovich, *M* 5, 355) — CaA'' 4aq — Ag_2A'' .

Chelidamic acid $C_8H_8NO_6$ 1:2
 $C_8H_8N(OH)(CO_2H)_2$ or

Ammonochelidonic acid (Py 1) *Oxy pyridine* (Py 3, 5) *di carboxylic acid*. Prepared by evaporating chelidonic acid with excess of ammonia and ptd by HCl (Hartinger & Lieben, *M* 6, 283, Lerch, *M* 5, 383). Six sided trimetric prisms (containing aq), sl sol cold water and alcohol, insol ether. Its solutions give a red colouration with Fe_2Cl_6 and a gelatinous pp with $AgNO_3$.

Reactions — 1 Split up by heat at 230°, or by water at 196° into CO_2 and oxy pyridine — 2 Distillation with zinc dust gives pyridine.

Salts — $H_2A''HCl$ aq — PbA'' minute prisms — $Pb_2(C_8H_8NO_6)_2$ silky needles — $Pb(NH_4)(C_8H_8NO_6)$ needles — $PbAgC_8H_8NO_6$ — $BaPb_2(C_8H_8NO_6)_2$ 3aq — $PbK_2C_8H_8NO_6$ — Ag_2A'' — CaA'' 2aq — $Ca_2(C_8H_8NO_6)_2$ 8aq — $Ca(NH_4)C_8H_8NO_6$ 2aq.

Di ethyl ether Et_2A'' aq [81°]. Needles.

Di-bromo-chelidamic acid $C_8H_4Br_2NO_6$ 2aq. *Di bromo oxy pyridine di carboxylic acid*. From chelidamic acid, water, and Br. Deliquescent needles or prisms, sl sol alcohol. Gives a purple colouration with Fe_2Cl_6 — Ag_2A'' .

Di-chloro-chelidamic acid $C_8H_4Cl_2NO_6$ aq. From chelidamic acid, KOH aq, and Cl. Trimetric prisms — Ag_2A'' — $Pb_2(C_8H_4Cl_2NO_6)_2$.

Di-iodo-chelidamic acid $C_8H_4I_2NO_6$. From chelidamic acid, KOH, and I. Slender needles.

Methyl chelidamic acid $C_8H_8NO_6$ 1:2 $C_8H_8MeN(OH)(CO_2H)_2$. *Oxy methyl-pyridine di carboxylic acid*. From chelidonic acid and methylamine. Gives a yellow colour with Fe_2Cl_6 . $AgNO_3$ pps neutral solutions, but not solutions of the free acid (difference from chelidamic acid). Heating with HCl aq does not split off MeCl showing absence of methoxyl. Heat splits it up into CO_2 and oxy methyl pyridine. Bromine gives a di bromo derivative $C_8H_4Br_2NO_6$, which is split up by heat into CO_2 and di bromo-oxy methyl pyridine [196°].

Phenyl-chelidamic acid $C_{11}H_8NO_6$ aq 1:2 $C_6H_5(C_2H_4)N(OH)(CO_2H)_2$. From chelidonic acid and aniline. Silky needles. Gives a golden colouration with Fe_2Cl_6 . When heated it yields oxy phenyl pyridine.

Chelamine v Oxy PYRIDINE

CHELIDONINE $C_{20}H_{16}N_2O_6$ aq [186°]. Occurs in the root of *Chelidonium majus* and separated from chelerythrine by ether in which it is less soluble (Probst, *A* 29, 123, Realing, *A* 29, 131, Will, *A* 35, 113, Henschke, *C* 1887, 243). Tables (from acetic ether). Insol water, sol alcohol and ether. Gives a green colour with Erdmann's solution (Eijkman, *R* T C 8, 190) — $B'H_2PtCl_6$.

Preparation — The expressed juice (1 kilo), clarified by albumen, is acidulated with HNO_3 (7 g of S G 1.8) and ptd by lead nitrate. The pp is decomposed by calcium hydrosulphide, the filtrate is acidified by HCl, decolourised by animal charcoal, and evaporated. The Ca salt that crystallises out is purified by conversion into the Ag salt, whence the acid is liberated by HCl (Luetzenmayer, *M* 5, 341).

Properties — Needles containing 2aq (from water), m sol hot water, v sl sol alcohol. It gives the iodoform reaction.

CHEMICAL AND PHYSICAL PROPERTIES OF BODIES, CONNEXIONS BETWEEN

Certain properties are common to all kinds of matter, others are characteristic of this or that kind only. Thus, every material substance is acted on by the force of gravity in exactly the same manner, but only a few liquids rotate the plane of polarisation of a ray of light. Properties belonging to the second of these classes are subdivided into two groups, physical and chemical properties. Chemistry deals with those changes in the properties of material bodies which are accompanied by changes in the composition of the bodies. Physics deals with changes in the properties of bodies the composition of which remains the same. When the totality of properties by which a body is known remains unaltered throughout any process, that process is called physical, when the result of any process is a body or bodies with properties so different from the totality of those of the original that the original can no longer be said to exist, that process is called chemical. Physical and chemical processes are always closely connected in their occurrence, no chemical change takes place without some accompanying physical change, and it is probable that every physical change is to some extent accompanied by chemical change. Many physical properties are quantities which may be accurately measured, *e.g.* melting and boiling points, specific gravity, &c., &c. Change of composition of a body or system of bodies is very frequently accompanied by change in the value of one or more of these measurable quantities, in other words, the physical constants of a body are conditioned, among other circumstances, by changes in the variable, chemical composition. By the chemical composition of any homogeneous kind of matter is meant, in the first place, a statement of the elements, and of the mass of each element, in a given mass of that body in this meaning of the term the chemical composition of a body or system can be accurately stated, and definite relations can be determined between changes in the composition and changes in the values of such physical properties as melting and boiling points, specific rotatory power, specific refractive energy, and so forth. When the relations between the two groups of changes have been studied and generalised, it may be come possible to infer the amount and character of a change of composition from measurements of the changes in the values of a few physical properties. It would be impossible to study the relations between every chemical change and the accompanying variations in the physical properties of the bodies forming the changing system, it is necessary to select typical cases, and to study these as accurately and minutely as possible. As a rule, one physical property is chosen for measurement, the composition of the system is defined to begin with, the system is allowed, or caused, to pass into another definite state, and the variation in the value of the chosen property is determined.

But when it is found that several distinct kinds of matter exist, each homogeneous, each distinguished by definite properties, and each containing in a given mass the same masses of

the same elements, it becomes necessary to widen the meaning of the expression chemical composition. It becomes necessary to frame an hypothesis to account for the observed facts. The hypothesis generally adopted asserts that matter has a grained structure, that a mass of any kind of homogeneous matter is composed of a vast but not indefinite number of minute parts, and that the properties of the mass are conditioned by the properties of these parts. These minute portions of matter are called molecules. But the molecule is not necessarily itself without parts. The chemist asserts that every molecule is built up of a definite number of smaller parts either of one or of several kinds of matter. These parts of molecules are called atoms. The atoms of elements are the ultimate forms of matter with which chemistry at present concerns itself. The hypothesis goes on to assert that the properties of a molecule, and hence the properties of any portion of homogeneous matter composed of molecules of this kind are conditioned by the nature, the number, and the relative arrangement, of the atoms which together form the molecule. In other words the hypothesis declares that the molecule is itself a structure. On this hypothesis, by the chemical composition of a body is meant a statement of the nature, number, and relative arrangement, of the atoms which form a molecule of the body. We know as yet almost nothing about the configuration of atoms in molecules, but chemistry has formed certain more or less clear hypotheses, and attempts are constantly being made to connect changes in the values of various physical properties with variations in the relative arrangement of atoms in molecules, as this arrangement is conceived by the hypotheses in question.

But the physical conception of the molecule is derived from the study of various gaseous phenomena. The physicist deals with the molecule as a whole, he pictures the molecules as performing certain vibrations, on the form, amplitude, and rate, of which the physical properties of bodies depend. The two conceptions, the chemical and the physical conception, of the molecule are therefore to a great extent mutually independent. In how far then, one may ask, can a development of the chemical conception be looked for by using physical methods of inquiry? Looking at recent researches, it seems probable that the chemical conception of the molecule must be very considerably modified, and must be brought more into harmony with the physical conception. The latter is itself to some extent being changed by the development of the theory of vortex atoms. But it must not be forgotten that the physical conception, in so far as it is a clear conception, has been developed almost wholly from the study of gaseous laws, more especially of the laws which express the relations of the volumes of gases to temperature and pressure, these relations are dependent on the states of combination of the parts of molecules, and are in no way affected by the nature or number of these parts. The chemical conception, on the other hand, must be made sufficiently elastic to cover the phenomena presented by gaseous,

liquid, and solid, compounds, and most of the chemical processes which occur among compounds belonging to these classes are conditioned both by the nature and number, and by the states of combination, of the atoms which form the chemical molecules of the reacting bodies. The chemical conception of the molecule will probably be modified when we know more of those properties which, like the relation between the volumes of gases and the temperature and pressure of these gases, are to a great extent, if not altogether, independent of the nature and numbers of the constituent parts of molecules. The physical conception will probably be modified as we learn more of those properties which, like specific heat, are for the most part dependent on the nature and numbers of the constituent parts of molecules (*v* MOLECULAR STRUCTURE OF MATTER, THEORIES REGARDING).

Chemistry regards not only changes in the composition, but also changes in the properties, of bodies, she attempts to generalise not only the laws of composition, but also those of the mutual actions, of bodies. The study of the connexions between changes of composition and variations in physical properties of chemically reacting bodies will throw light on the nature of chemical change. When accurate measurements have been made of the quantities of heat which disappear or are produced in a series of typical chemical processes we shall be able to apply to these processes the knowledge of heat energy which is generalised in the thermodynamical laws. Chemical change may then perhaps be shown to be a special instance of the working of these laws. The conditions of chemical change on the one hand, and of physical change on the other, must be studied, in order that the laws which express these conditions may be gained, the relations between these two groups of laws must then be ascertained, thus it may become possible to attain to clear mental images of natural phenomena as wholes which now present one aspect to the physicist and another to the chemist.

For accounts of the various physical methods employed in chemistry, and résumés of the more important results, *v* PHYSICAL METHODS.

M M P M

CHEMICAL CHANGE Chemical science is based upon the hypothesis that matter is constituted of extremely small particles or atoms, and that these atoms are capable of aggregating together by virtue of certain inherent properties or forces, their affinities, to form complex atomic structures or groupings.

The recognition of this distinctive force by the older chemists led them to propound various theories to account for its existence and explain the phenomena of chemical action (*v* AFFINITY).

With the nature of this force we are not concerned here, but only with the phenomena that accompany its exhibition and the circumstances that modify its action.

By a chemical change, therefore, is meant any alteration either (1) of the character of a permutation in an atomic group, such for instance as is exhibited in the change of ammonium cyanate, NH_4CNO , into urea (NH_2), CO , or (2) a permutation between two or more such groups,

as $\text{AB} + \text{CD} = \text{AD} + \text{BC}$, which groups may be of various degrees of complexity, or (3) the change may arise from a combination such as $\text{AB} + \text{CD} = \text{ABCD}$, or the converse of this, as is seen in the phenomena of dissociation.

The majority of chemical changes may be formulated as permutations between two sets of atomic groups, such as the action of bases on acids, the decomposition of one salt by another, or the combination between gaseous elements as $\text{H}_2 + \text{Cl}_2 = 2\text{HCl}$. Examples of chemical change according to case (3) are of less frequent occurrence than the last, such are the formation of double salts like the alums, the combination of certain gaseous molecules with oxides, &c., as $\text{CaO} + \text{CO}_2 = \text{CaCO}_3$, and $\text{CO} + \text{Cl}_2 = \text{COCl}$. The number of strikingly marked instances that could come under the head of permutations in an atomic group is very small, but such changes may be of frequent occurrence, producing alterations in physical and chemical properties too slight to be recognisable.

There are several bodies which are known to undergo remarkable and highly interesting physical, and consequently no doubt chemical, changes, when heated, but whether such changes come under class (1) or class (3) is undecided. Among such substances are phosphorus, paracyanogen, and cyanuric acid. In the case of phosphorus, the change from the yellow to the red modification, caused by heat or light, is probably due to an alteration in the state of aggregation of the atoms, that is to say, if the molecule of yellow phosphorus be P_8 , that of the red modification is probably P_m , for solid paracyanogen, which is converted by heat into gaseous cyanogen, and for cyanuric acid, the same may be true, with or without a rearrangement among the constituent atoms of the molecules (*v* ALLOTROPY and ISOMERISM).

The study of the phenomena attending a chemical change shows that in many instances there is an accompanying evolution of energy, from the changing system, in one form or other, either as heat, or light, or as electrical currents. In other cases to produce a chemical change expenditure of energy is necessary.

What may be the nature of the chemical force or affinity that acts between atoms is not known, but it is characterised from gravitative force by this difference, that whereas gravitation acts upon all kinds of matter alike, depending merely on the masses of the bodies, chemical attraction or affinity depends upon the kinds of matter that are presented to each other, as well as upon the conditions under which the bodies are brought together, in other words, it is an elective attraction modifiable by circumstances. For instance, at a red heat metallic iron is oxidised by water vapour and hydrogen is set at liberty, but at a lower temperature oxide of iron is reduced by hydrogen with the formation of metallic iron and water vapour, a mixture of hydrogen and chlorine will remain unchanged for any length of time in darkness, but exposure to sunlight will cause almost instantaneous combination, and the resulting compound (hydrochloric acid) may be again converted into its original constituents by heat. If to a solution of silver nitrate a piece of metallic copper be added, metallic silver is precipitated, and copper nitrate formed, and if now to the

copper nitrate a piece of zinc or iron be added, metallic copper is *ppd*, and zinc or iron nitrate is formed

These illustrations are sufficient to show the relativity of chemical affinity as depending both upon the conditions to which the system is subjected as well as upon the qualities of the materials

Under whatever conditions a chemical system may exist in which a change is happening, the atomic forces at work will continue to act until a state of more or less stable equilibrium is reached, after which no further action will take place, and the ultimate limit reached will depend upon (1) the relative quantities of the reacting bodies, and (2) the conditions to which the system is subjected. As the system passes from the initial to the final configuration there will be a loss or gain of energy equal in amount to the difference between the total energy of the system in the two states. The rate at which the change takes place will depend also upon the same two circumstances. These two statements amount to this, that, representing a chemical change by the equation $A + B = A' + B'$, all the atomic forces at work producing the transformation have not invariably the same ratios, but that the ratios vary with variations in the conditions as regards heat, light, &c., and, consequently, any determinations of the relative affinities of the members of the system can only be looked upon as expressing certain ratios that hold good under special conditions. The final state reached by the system, and the rate at which the change progresses towards that state, vary with the relative masses of the reacting bodies, other things being equal, although the atomic forces or the affinities remain the same. In other words the final configuration, and the speed of attaining it, are each a function of the reacting masses and of the atomic forces, the latter being a function of the physical conditions to which the system is subjected.

The phenomena of dissociation furnish many examples of these facts, as do also those systems which are limited by inverse actions and do not properly come under the term dissociation, wherein both the masses of the constituents as well as the conditions, especially as regards heat, influence the change in its amount and rate. The great field offered for investigation by fractional *pptn* will, no doubt, afford many striking instances of the variations of the affinity values under diverse circumstances when the subject is worked out.

From the foregoing considerations it is clear that a chemical system may or may not undergo change by virtue of any intrinsic forces acting among the constituents, but that such will happen only according to the conditions to which it is subjected. Reactions which at moderate temperatures take place with evolution of much energy may be completely suspended by lowering or increasing the temperature, excluding light, or altering the pressure, in other words, the forces or affinities resisting change, if greater than those tending to produce an alteration under some circumstances, may be reversed when these circumstances are altered.

There are, however, a number of interesting examples in which the stability of a system seems to be overturned by the mere presence

of an extraneous body which itself undergoes no apparent change. For instance, oxygen and SO_2 do not combine when moderately heated, but if passed over spongy platinum combination readily occurs. Sometimes again the intermediate body does undergo change, as when chlorine is passed over a strongly heated mixture of carbon and silica, whereas without the addition of carbon the silica is not acted upon by the chlorine, or, platinum, which itself is insoluble in nitric acid, may be rendered soluble in the same acid by alloying it with silver (*v post*, Catalytic changes, p 750).

Some equally remarkable instances of the apparent necessity of the presence of a third body in order to bring about chemical action between two others have been noticed. Wanklyn (*C N* 20, 271) found that perfectly dry chlorine gas has no action upon metallic sodium. Couper (*C J* 43, 153), starting from Wanklyn's observation, has examined the action of dry chlorine on several metals that are acted upon vigorously by the moist gas. He found that dry chlorine has no perceptible action on Dutch metal, whereas with the moist gas combination takes place, with production of heat and light, or on touching the metallic surface when in an atmosphere of dry chlorine with a drop of water, instant combination occurs. Couper examined a number of metals in the same way with the following results: the chlorine gas used was allowed to stand over CaCl_2 for several days to thoroughly dry it. Zinc, and magnesium, showed no action, silver, slight action, bismuth, combination slow, arsenic, antimony, and tin, rapidly acted upon. It is worthy of note that these last three metals form volatile chlorides liquid at ordinary temperatures. With mercury, combination equally rapid, with dry or moist chlorine. Potassium showed slight action, probably due to adhering KHO , with proper precautions against moisture, action was slow. Dixon (*T* 1884, 617) has observed a somewhat analogous fact relating to the combination of gases under the influence of the electric spark. He has shown that if a mixture of CO and O be perfectly dried by P_2O_5 , and be then subjected to the spark from a large Leyden jar or a Ruhmkorff's coil, union does not take place, if, however, the slightest trace of moisture be admitted to the mixture, and the spark again made to pass, combination occurs. The hypothesis Dixon advances to account for these facts is that the intervention of water molecules is necessary to bring about combination, a molecule of water being decomposed under the influence of the spark by one of carbonic oxide to form carbonic acid and free hydrogen, the latter in its turn combining with the oxygen to form water. This cycle of operations being represented by the equations $\text{H}_2\text{O} + \text{CO} = \text{H}_2 + \text{CO}_2$, $\text{H}_2 + \text{O} = \text{H}_2\text{O}$, consequently a comparatively small number of water molecules are necessary to effect complete combustion. (See also *C J* 49, 94.) Phosphorus and carbon have been shown by Baker (*C J* 47, 349) to combine with oxygen less energetically in the absence of moisture than when moisture is present, and Ramsay and Young (*C J* 45, 93) observed that if a mixture of dry H and N is passed through a tube containing iron filings at a red heat no

ammonia is formed, with the moist gases, however, a trace of NH_3 is obtained

ALLOTROPIC CHANGE

Several of the elementary bodies are known to exist in two or more different modifications, such for instance as sulphur, selenium, carbon, phosphorus, and oxygen the several forms of each element exhibit more or less strongly marked differences in chemical as well as physical properties. It is probable that such different modifications of one elementary body consist, as in the case of oxygen and ozone, of different atomic groupings or aggregates of atoms. The means by which the change from one modification of an element to another is brought about are various. Oxygen is converted into ozone by the electric spark or 'silent discharge,' and ozone is changed again into oxygen by heat, yellow phosphorus is converted into the red modification either by light or by heat, and the red modification is again reconverted into yellow phosphorus at a higher temperature, sulphur and selenium undergo several changes under the influence of heat, in the case of carbon, the conditions necessary to bring about metamorphoses are not fully known.

The study of certain isomeric compound bodies (*v* ISMERISM) has shown that the transformation of one isomeride into another is, in some cases, somewhat analogous to the phenomena of dissociation. If solid paracyanogen (CN), is heated in a closed vessel to 860° it is entirely converted into cyanogen gas $(\text{CN})_2$, the pressure increases until the gas condenses and is liquefied on the cooler parts of the apparatus. At temperatures below 500° little or no decomposition occurs. As the paracyanogen is heated above this temperature a slow transformation takes place into gaseous cyanogen, and the transformation continues until the pressure of the cyanogen gas attains a certain definite limit beyond which it does not rise, and there is no further evolution of gas. Exhausting the apparatus and maintaining the temperature, the pressure again rises to its previous limit and remains stationary however long the heating is continued. For every such temperature there is a maximum pressure reached which limits the further decomposition of the paracyanogen into gaseous cyanogen. If now when the pressure has attained its limit, at a given temperature, a quantity of cyanogen gas is forced into the apparatus, the pressure slowly falls to the initial limit with the transformation of gaseous cyanogen into solid paracyanogen. Troost & Hautefeuille (*C R* 66, 735, 795) have found the following values for these pressures of transformation at different temperatures—

Temp.	Pressure of transformation.
502°	54° mm
506	56 "
559	123 "
575	129 "
587	157 "
599	275 "
601	318 "
629	868 "
640	1810 "

The transformation of solid paracyanogen into gaseous cyanogen is seen to be analogous to the volatilisation of a liquid in presence of its own vapour, but the formation of red phosphorus from the yellow material or *vice versa* is a more complex process. If a quantity of yellow phosphorus is heated in a closed vessel (say to 500°), the mass of phosphorus being more than sufficient to volatilise in the space, a maximum pressure is quickly attained. After a time the pressure gradually falls, more or less quickly according to the temperature, till it reaches a minimum at which it remains constant. Provided there is no change of temperature, the vapour of the phosphorus is gradually converted into the red modification which condenses on the sides of the apparatus. If the quantity of phosphorus introduced into the apparatus is just sufficient to volatilise and fill the vessel with vapour at the first pressure (the heating being continued), red phosphorus begins to form after a time, and the pressure continues to fall until the minimum limit is reached as before. If, however, only sufficient ordinary phosphorus is used to fill the apparatus with vapour at the lower limit of pressure, no red phosphorus is formed, however long the heating may be continued. These two pressures—the maximum is first attained, and the final minimum limiting the transformation of yellow into red phosphorus—depend solely upon the temperature. Troost & Hautefeuille (*A Ch* [5] 2, 153) found the following numbers relating to these phenomena

Temp	Pressure of vapour of P limiting the transformation	Maximum pressure of P vapour first produced
360°	12 atms	3.2 atms
440	1.75 "	7.5 "
487	6.80 "	—
494	—	18 "
503	—	21.9 "
510	10.8 "	—
511	—	26.2 "
531	16 "	—
550	31 "	—
577	56 "	—

The rates at which the transformation takes place as well as other phenomena exhibited during the change have been studied by Lemoine (*A Ch* [4] 24, 194). He gives the following numbers illustrative of the progress of the change in time

Ordinary P per litre Grams	Quantities of ordinary P remaining at 440° , after							
	5 mins	1 h	2 h	8 h	17 h	24 h	32 h	41 h
2.9	—	—	—	2.9	—	—	—	—
5.9	—	—	—	5.3	—	—	4.9	4.7
16.0	—	—	—	5.0	—	—	—	—
24.0 (Hittorf)	15.5	11.1	7.0	4.4	—	—	—	—
30.5	—	—	5.4	4.0	3.7	3.6	—	—

Lemoine (*C R* 73, 990) has given a mathematical theory of the changes that red or yellow phosphorus undergoes when heated in a closed vessel, and has compared his formulæ with the results of experiment. Let x be the total mass

of material introduced into a space v , and let y be the mass of yellow phosphorus formed or existing at time t , if the red phosphorus be supposed to remain in the same state of division throughout, its free surface will be sensibly proportional to its mass $p-y$. The quantity of yellow phosphorus evolved, δy , in time δt is equal to $a(p-y)\delta t$, and the quantity of the ordinary phosphorus, δy_2 , transformed into the red modification in the same time is $b(p-y)\frac{y}{v}\delta t$, the total effect is therefore the difference between these two quantities, or

$$\delta y = \delta y_1 - \delta y_2 = a(p-y) - b(p-y)\frac{y}{v}$$

which may be written $\frac{dy}{dt} = f(g-y)(h-y)$, representing the rate of change in terms of the ordinary phosphorus existing.

For further account of Allotropic Changes **v** ALLOTROPY

INFLUENCE OF PRESSURE ON GASEOUS CHANGES

Many bodies when subjected to the influence of heat in the gaseous state, undergo marked changes either in their physical or chemical properties, or in both, such changes result more particularly in a diminution of molecular density or a disruption of molecular structure. Among such bodies may be cited, mercurous chloride, chloral hydrate, phosphoric chloride, hydriodic acid, nitric peroxide, hydric selenide, amyl bromide, and acetic acid. In the case of some of these bodies the changes in question have been proved to be the accompaniment of disruption or dissociation of their molecules (*v* DISSOCIATION), in other cases, such as nitric peroxide and acetic acid, there is no complete proof that the changes in density which these bodies suffer when heated in the gaseous state are really occasioned by a dissociation of their molecules, or are due to the fact of their vapours not obeying the dilatation law even when sufficiently far removed from the liquid state as to place them under the category of gases. Considered from these two points of view, it is evident that the dilatation of a gas under the influence of heat may be of a twofold character, arising from two distinctly separate causes, firstly, the expansion may be purely physical, varying or not according to the dilatation law, and secondly, there may be expansion as the accompaniment of a chemical change, viz., separation of the gaseous molecules into simpler groups of atoms. An observed variation of density at different temperatures may be produced by either of these two causes, or by both combined, and it becomes therefore a matter of great importance to be able if possible to discriminate these two actions, and to say to which of them the observed results are to be ascribed. If it could be shown that a diminution of pressure produced the same variation in the densities of certain gases as has been observed under the influence of heat, a great point would be gained in favour of the dissociation theory in settling the cases under dispute. It would seem possible that a discrimination between the two possible phenomena, accounting for abnormal densities might be made by introducing the element of time into such

investigations. To make this clear, take the gas *nitrogen tetroxide*, whose vapour density at low temperatures has been found to be approximately represented by the formula N_2O_4 , while at high temperatures it corresponds to NO_2 (the vapour densities being 3.18 and 1.59 respectively). Now Troost (*C R* 86, 1394) found the vapour density of nitrogen tetroxide at 27° and at low pressures to be as follows

Pressure	Density	ρ
35 mm	16	
16 „	1.59 ($NO_2=1.59$)	

These results show that the same change takes place under diminished pressure as occurs under the influence of heat at ordinary atmospheric pressures, that is to say, these numbers indicate that, if the observed changes in density are due to dissociation of the molecules N_2O_4 into the molecules NO_2 , then under a pressure p the ratio of the number of molecules of N_2O_4 to NO_2 is different from the ratio when the pressure is altered to p' , temperature being the same in each case. The proof of this assertion is of considerable importance in the theory of dissociation, whether the change in density is or is not to be attributed to the supposed fact, that the gas N_2O_4 forms an exception to the dilatation law, would seem to be capable of indisputable proof by introducing the element of time into the experiments. If the gas N_2O_4 is really dissociated into NO under diminished pressure, 2 vols N_2O_4 would give 4 vols NO , now, by the kinetic theory of gases it is conceivable that this dissociation would take place practically instantaneously when the temperature was increased or the pressure was diminished, whereas on reversing the process the molecules of NO would require some time before meeting with the requisite number of partners to re-form the molecules of N_2O_4 . Such an experiment might form a crucial test of the truth of the dissociation hypothesis for a particular gas, and it might also be applied to other cases, for it is scarcely conceivable that the coefficient of dilatation of a gas should alter in time. Natanson (*W* 24, 454) has determined the ratio between the specific heats of nitrogen tetroxide by means of Kundt's dust figure method, his results seem to show that as the pressure decreases this gas passes from a more to a less complex molecular structure.

In the determination of the vapour densities of several bodies whose abnormal dilatations are almost undoubtedly to be ascribed to the disruption or dissociation of their molecular structures, the influence of time on the phenomenon has been several times observed, and has been made the subject of investigation by Naumann for the particular case of ammonium carbamate (*v* next page).

Wurtz (*C R* 60, 728), when determining the vapour density of amyl bromide (b.p. 113°) between 153° and 360°, noticed that when the vapour was suddenly heated to 225° the density was 4.69, whereas in another experiment when the vapour had been maintained at this temperature for ten minutes the density was 3.68. These results show undoubtedly that the diminution in density, or the dissociation produced by heating, required time to be effected, and hence was

due to a chemical change and not to a variation in the coefficient of dilatation of the gas

Naumann (*A* 160, 1) studied the influence of time on the dissociation and reformation of ammonium carbamate, the following tables illustrate the general bearing of his experiments —

Speed of dissociation of NH_4CO_2 at 46°

Pressure under the dissociation pressure which = 354 mm *	Increase of pressure	Time of increase
124 mm	—	—
37	87 mm	5 min
17	20	5
10	7	5
6	4*	5
4	2	5
3	1	5
2.5	5	5
2	5	5
1.5	4	5
0	1.5	17

Speed of formation a combination of $2\text{NH}_3 + \text{CO}_2$ at 20°

Excess of pressure over dissociating pressure (= 62.4 mm) at 20°	Decrease of pressure	Time of decrease
185 mm	—	—
140 "	45 mm	2.5 mins
90 "	50 "	5 "
63 "	27 "	5 "
45 "	18 "	5 "
30 "	15 "	5 "
21 "	9 "	5 "
15 "	6 "	5 "
10 "	5 "	5 "
6 "	2 "	5 "
4 "	2 "	5 "
1 "	3 "	10 "
0 "	1 "	5 "
0 "	0 "	5 "

In these two examples it is seen that, starting with a mass of solid ammonium carbamate (N u mann showed by his experiments that at all temperatures the gas evolved consists of $2\text{NH}_3 + \text{CO}$) and suddenly increasing the temperature, a considerable time is required before the normal pressure of dissociation corresponding to that temperature is reached. In like manner, by suddenly diminishing the temperature, the recombination of the ammonia with the carbon dioxide to form the solid $(\text{NH}_4)_2\text{CO}_2$ does not take place instantaneously, but a considerable time elapses before the pressure corresponding to the lower temperature is arrived at. Although analogous in some respects to the volatilisation and condensation of a liquid, the phenomena exhibited by $(\text{NH}_4)_2\text{CO}_2$ when heated are characterised by their greater slowness.

In experiments relating to vapours of varying densities—such as those of Troost on acetic acid and nitric tetroxide at low pressures—it is important to determine whether diminution of pressure acts in a manner similar to that of heat

in bringing about dissociation, or disruption, of the molecules of the gas. By introducing the element of time into the experiments, and by suddenly varying the pressure, dissociation might be shown to occur in the case of nitric tetroxide as already remarked, the process in this case being doubtless reversible, whereas with say, ozone, or a mixture of ozone and oxygen, the amount of change produced by increasing the volume, say, twenty fold, could be determined by the usual methods of analysis (*cf* also DISSOCIATION, and EQUILIBRIUM, CHEMICAL)

CHEMICAL SYSTEMS

Considering the three physical states in which bodies are capable of undergoing chemical change, either as gases, liquids, or solids, it is evident that there are two distinct kinds or classes of chemical systems possible, according to the states in which the active substances exist, and which may be termed heterogeneous and homogeneous systems. The former name is applied to all reactions in which the active members of the system are in different physical states, a solid and a liquid, or a solid and a gas, or a liquid and a gas, as examples of each of these may be mentioned the action of acids on metals or on carbonates, the dissociation of calcic carbonate or ammonic carbamate by heat, and the oxidising action of free oxygen on solutions of stannous or ferrous salts. By homogeneous systems are to be understood those in which all the active members exist in the same physical state, either as liquids or gases, it is inconceivable that two solid bodies, however finely powdered and well mixed, could come under this category. Examples of homogeneous systems are shown in the numerous etherification processes, the oxidising action of potassic chlorate on ferrous salts, the action of oxalic acid on potassic permanganate, among liquids, and for gaseous systems, the action of iodine or selenium on hydrogen, and the influence of light on a mixture of chlorine and hydrogen or on gaseous hydriodic acid. Many valuable facts have been brought out by the study of heterogeneous chemical systems, especially as regards dissociation phenomena, but the great field in which the most fundamental facts concerning chemical action will be gathered is naturally that embracing homogeneous systems, for here the most intimate contact exists among the acting substances, affording free play to the various chemical forces at work, and the secondary physical changes which interfere with the primary chemical change are reduced to a minimum.

Heterogeneous Systems — Gladstone and Tribe (*Pr* 19, 498) have investigated the rate at which a more positive metal immersed in a solution of a salt of a less positive one displaces the latter, and the relation which exists between the rate of action and the mass of salt in the solution. Employing a solution of argentic nitrate, the displacing metal being copper, and allowing the action to continue for ten minutes under varying conditions of concentration, they found that by doubling the amount of silver salt in solution the amount of action that took place during this interval of time was trebled. Zinc and cupric chloride, zinc and cupric sulphate, zinc and lead nitrate, iron and cupric sulphate,

and other combinations, showed in every case, when the solutions were sufficiently diluted, that this 2-3 law holds good. Expressed algebraically, if y be the mass of metal dissolved, and x the concentration of the solution, then the above

2-3 law is $y = ax^{\frac{\log 3}{\log 2}}$ where a is a constant

These experiments have been repeated and extended by Langley (*C J* 45, 668), who confirms the truth of Gladstone's law, but when the method of experimenting is modified, as by continually moving the metal about in the solution or by brushing its surface so as to keep the solution uniform throughout, Langley considers that the rate of action is proportional solely to the amount of salt in solution. Moreover, Langley's experiments indicate that the law observed by Gladstone and Tribe arises from two causes, viz, chemical action, and gravitative action, the latter producing slow currents through the solution because of the changing densities of the original salts and of those which are produced in the change.

In studying the rate of evolution of carbon dioxide from marble by the action of acids, Bojuskı and Kajander (*B* 10, 34) found that the rate of action is proportional to the concentration of the acid, but varies according to the nature of the acid employed, moreover, they concluded that, for the three acids HCl, HBr, and HNO_3 , the speed of the action is inversely proportional to the molecular weights of the acids when the solutions are of equal degrees of concentration. Pawlewski (*B* 13, 334) has continued these experiments, employing different carbonates (BaCO_3 , CaCO_3 , SrCO_3) with the same acid, although his results are not very regular, yet he considers them sufficient to show that the speed of the reaction is inversely proportional, not to the molecular weights of the carbonates, but to the atomic weights of the metals whose carbonates were employed.

Of a somewhat similar nature to the experiments of Gladstone and Tribe is the work of Thorpe (*C J* 41, 287) on the behaviour of zinc, magnesium, and iron, as reducing agents, with acidulated solutions of ferric sulphate. Known weights of these three metals in the form of thin foil were introduced into acidified solutions of ferric sulphate, and the amount of reduction effected—part of the liberated hydrogen coming off as gas—under varying conditions of temperature, amount of free acid, and strength of the ferric solution, was determined. The results obtained showed that the reduction effected when a given mass of zinc dissolves in an acidified solution of ferric sulphate increases with increase of temperature, other conditions being the same. Provided a sufficiency of acid to dissolve the zinc be present, the maximum reducing action is obtained by concentrating the ferric sulphate solution, and diminishing the amount of free acid.

When magnesium is employed, the reduction effected is scarcely one fourth of that for zinc, while the time required for solution is comparatively very short, by diminishing the quantity of free acid the amount of reduction effected is increased. The diminution in the rate of solution with a decrease in the quantity of free acid

was found to be much greater in the case of magnesium than in that of zinc, with zinc the rates were approximately in the ratios 1 15 2, and, under like conditions with magnesium, the rates were as 1 6 86. When the ferric sulphate is reduced by iron, the rate of solution becomes extremely slow, and the reducing action appears to decrease with increase of temperature. These reduction experiments, considered as a whole, seem to be in harmony with the view that the reducing action of so-called nascent hydrogen is connected with the existence of atoms, as distinguished from molecules of this gas, and that any conditions which tend to prevent the mutual combination of these atoms tend also to increase the amount of reduction effected by the hydrogen.

When phosphorus oxychloride acts upon certain nitrates, it has been found that the ratio between the chlorine and phosphoric pentoxide in the residue obtained after all action has ceased has a certain definite value. Mills (*P M* [4] 40, 134, and 44, 506), who has studied this reaction for several nitrates, has designated these ratios by the symbol α , or

weight of chlorine

rather he has taken α as = $\frac{\text{Cl}}{\text{weight of P}_2\text{O}_5}$

— $\frac{\text{weight of Cl}}{\text{weight of P}_2\text{O}_5}$ 4 06. When one nitrate fixes more chlorine, per unit of P_2O_5 , than another nitrate, Mill says that the affinity of the former is greater than that of the latter nitrate, inasmuch as this chlorine fixing action can be measured for several nitrates, the values of α , on Mill's view, represent the 'elective attractions' of the nitrates.

If α be divided by the formula weights, Σ , of the several nitrates, calculated to a uniform mass of NO_3 , the following numbers (under q) are obtained —

	α	Σ	q
Thallous nitrate	8 78	265 30	30 29
Silver "	5 48	169 94	31 01
Lead "	5 17	165 56	32 02
Rubidium "	2 38	147 40	61 93
Cæsium "	2 21	195 01	88 24
Potassium "	1 99	101 14	50 82
Sodium "	1 70	85 05	50 03
Lithium "	1 60	69 00	42 86

These numbers show that the affinity coefficients are directly proportional to the formula weights of the nitrates, and that (with one exception) α and Σ increase and diminish in regular order. The quotients, q , therefore, represent the masses of nitrates which correspond with what Mill calls a 'unit of elective attraction'.

Chemical Systems of limited action

When a chemical reaction is expressed symbolically either as $\text{AB} + \text{CD} = \text{AC} + \text{BD}$ or $\text{A}' + \text{B}' = \text{C}'$, it is usually understood that for the complete decomposition of the mass AB all that is necessary is to bring it into suitable contact with the definite mass of the second body CD , or that the

mass A' if presented to B' under proper conditions will unite with it to form C' . In many chemical changes this is true, at least within the limits of experimental error, and if sufficient time be given, and it may be said that many processes of quantitative chemical analyses are based on this assumption. There are, however, many instances known in which the statement does not hold good. For example, if mol weights of ethylic alcohol and acetic acid are mixed and heated for some time, say at 100° , only about 60 p.c. of the total action possible takes place, no matter how long the operation is allowed to continue, or again, if mol weights of iodine and hydrogen are heated at 440° in a closed vessel, even after an indefinitely long period of time there will still exist a certain fraction of these elements uncombined. The limitation of these and many other similar changes appears to be due to the fact that the products of the first action tend, under the conditions of the experiment, to re-form the original substances, and the two reactions proceed simultaneously with different degrees of intensity, depending upon the masses of material, until a stage is reached at which a state of equilibrium is attained, the first action at this stage being balanced by the second. The mutual action of alcohol and acetic acid would thus be represented by the equations,

The theory of such limited actions was formulated by Guldberg and Waage, in 1867 (*Etudes sur les Affinités chimiques*) and applied by them to the determination of the 'coefficients of affinity' for several reactions. These chemists concluded from the results of their experiments that in a system undergoing change the amount of action in a unit of time between two or more active bodies—in other words, the rate of the change—is proportional to the product of the active masses. This same assumption was made by Berthelot in 1862, based on the results of his etherification experiments, and in 1866 Harcourt and Esson showed that for certain chemical systems the rate of change is proportional to the product of the active masses of the changing bodies. In the above statements the 'active masses' of the various bodies means the number of equivalents of each present in the reacting system. There are instances, however, in which bodies introduced into a chemical system either accelerate or retard the reaction without themselves undergoing change (*vide post*, p. 714). Guldberg and Waage assume that, in the reaction $A + B = A' + B'$, if the masses of A and B be p and q , then the force tending to produce the change varies as the product pq , whatever may be the kinds of matter, for two particular substances this force is equal to κpq , where κ is the 'coefficient of affinity' depending upon the kinds of matter, and probably upon the conditions of the experiment (*vide ante* and also AFFINITY, pp. 70-75). This, however, is not the only force acting, there are others of a secondary character tending to retard or accelerate the formation of A' and B' . Neglecting these secondary forces for the present, let the masses of A' and B' be p' and q' and the coefficient of affinity for the reverse

action $A' + B' = A + B$ be κ' , then the force tending to re-form A and B equals $\kappa'p'q'$. When equilibrium is attained these two forces are equal, or $\kappa pq = \kappa'p'q'$, so that if the four quantities p, q, p', q' , are determined experimentally, the ratio $\frac{\kappa}{\kappa'}$ of the coefficients of affinity may be found.

Expressed in another way, if p, q, p', q' , be the number of equivalents of the four substances in the system at the beginning of the reaction, and if x be the number of equivalents of p and q transformed into p' and q' when equilibrium is reached, or no further change takes place in the system, all expressed in terms of unit volume, then $p = p - x$, $q = q - x$, $p' = p' + x$, and $q' = q' + x$, inserting these values, the equation becomes $\kappa(p - x)(q - x) = \kappa'(p' + x)(q' + x)$.

Such is the simplest representation of the theory of limited actions. The presence, however, of extraneous salts, or even the secondary actions among the four bodies themselves, doubtless materially influence the ultimate limit when a state of equilibrium is reached. For instance, if a body x be introduced into the system, Guldberg and Waage assume that the force produced by the action between x and A , and influencing the change between A and B , is proportional to the product of x and A , or is equal to αAx , and they term α the 'coefficient of action'. Assuming that there are coefficients of action between all the four bodies—these coefficients being α, b, c , and d , for A and A' , A and B , B and A' , and B and B' , respectively, and α', b', c', d' , for A' and A , B and A' and B , and B' and B , respectively—then the total force for the reaction between A and B will be equal to

$$\kappa pq + \alpha pp' + bpq' + cqp' + dqg',$$

and that between A' and B' will be equal to

$$\kappa'p'q' + \alpha'p'p + b'p'q' + c'p'q' + d'q'q'$$

But that there may be equilibrium these forces must be equal. Writing $\alpha - \alpha' = \alpha$, $b - b' = \beta$, &c., the equation of equilibrium becomes

$$\kappa pq + \alpha pp' + bpq' + cqp' + dqg' = \kappa'p'q' + \alpha'p'p + b'p'q' + c'p'q' + d'q'q'$$

If it is desired to study the rate at which the reaction progresses, then this rate is assumed to be measured by the difference between the two forces or

$$\frac{dy}{dt} = \kappa pq - \kappa'p'q' - \alpha pp' - \beta pq' - \gamma p'q - \delta q'q'$$

Owing to their complicated character, these equations for the limit or the rate of a chemical change are of little value from an experimental point of view, it would seem scarcely possible to determine the numerous secondary forces Guldberg and Waage introduce into their formulae. In such a case as the action between barium sulphate and potassium carbonate the secondary actions to be taken into account are between BaSO_4 and BaCO_3 , BaSO_4 and K_2SO_4 , K_2CO_3 and BaCO_3 , K_2CO_3 and K_2SO_4 , and between the water and each of the four salts. For a full discussion of this theory in its simpler form applied to experimental results see Guldberg and Waage, *J. pr.* [2] 19, 69 (*vide ante* AFFINITY, p. 75).

Berthelot and Saint-Gilles (*A. Ch.* [3] 65, 385, 66, 1, 68, 225) were the first to make a complete study of the reactions between carbon acids and alcohols, as regards the influence exerted by variations of temperature, pressure

amounts of material, and time They found that these reactions are characterised by three important features (1) the combination proceeds slowly, with a velocity depending upon the influences to which the system is submitted, (2) the combination is never complete, however long the duration of contact, (3) the proportion of ethereal salt formed under different conditions always tends towards a limit

The inverse action limiting the formation of the ethereal salt, viz its decomposition by the water formed during the reaction, was found to be much less rapid than the combination In other words, if two systems are employed—one consisting of ethylic alcohol and acetic acid, the other of ethylic acetate and water—all in equivalent proportions, the first of these will attain the limit of equilibrium more quickly than the second under like conditions Berthelot (*A Ch* [3] 66, 118) concluded that in the formation of the ethereal salts 'the quantities of acid and alcohol that combine at each instant are proportional to the product of the reacting masses.' He gave the formula for expressing the rate of formation as $\frac{dy}{dt} = m \nu \left(1 - \frac{y}{l}\right)^2$, for

equivalent quantities of alcohol and acid, where l is the limit, which for acetic acid is = 66.5

According to the theory of mass action, the rates of formation of ethereal salts, as well as the magnitude of the limits, ought to be increased by an increase in either the amount of alcohol or of acid As regards the ultimate limits, this was found to be true by Berthelot and Saint Gilles, but for the speed of etherification they found that with n equivalents of alcohol and one of acid there was (at least for part of the course) little or no increase over that for equivalent quantities, in fact, a diminution in the rate was observed On the other hand, with n equivalents of acid and one of alcohol the rate of etherification was greatly accelerated The following two tables illustrate these points (*A Ch* [3] 66, 90, 98) —

1 eq acetic acid + n eq alcohol Temp 100°

	$n=1$, acid=100, limit=100		$n=2$, acid=100, limit=100		$n=5$, acid=100, limit=100

The variation produced in the limit, or maximum amount of ethereal salt formed, by employing excess of one or other of the constituents is illustrated by the following tables (*A. Ch.* [3] 63, 274, 286).—

1 eq acid + n eqs. alcohol	limit	n eqs. acid + 1 eq alcohol	limit
1.0	66.5 p.c.	1.0	66.5 p.c.
1.5	77.9	67	51.9
2.0	82.8	50	41.4
2.8	85.6	36	30.6
3.0	88.2	33	29.3
4.0	90.2	25	22.6
5.4	92.0	18	17.1
12.0	93.2	08	7.8
19.0	95.0	06	5.0
500.0	neutral to litmus		

The action of inorganic acids on alcohols has been investigated by Villiers (*A Ch* [5] 21, 72), but in these processes secondary reactions that are liable to occur complicate matters somewhat With a given alcohol, the speeds of etherification of the acids HI, HBr, HCl , and H_2SO_4 , were found to be widely different HI etherifies more quickly than HBr, and each more quickly than acetic acid, whereas HCl acts with extreme slowness, even much more slowly than acetic acid H_2SO_4 etherifies almost immediately under ordinary conditions, but the speed is diminished by dilution, as well as by lowering the temperature The etherification limits at 100° are different for the three hydric acids, and are greater than the corresponding limits at lower temperatures The limits also depend upon the proportion of water which exists in the initial mixture, but while the limit diminishes in the case of organic acids in a continuous manner as the water increases, without actually becoming $n/1$, the etherification by hydric acids ceases completely with a certain dilution, and this limit of dilution is not fixed but rises rapidly as the temperature rises With H_2SO_4 , the etherification is completely stopped with a certain proportion of water, but, contrary to what occurs with the hydric acids, increasing the temperature to 100° does not cause the reaction to take place From a consideration of the work of Berthelot and Saint-Gilles on the rate and conditions limiting the etherification of alcohols by organic acids, it would seem natural to conclude that the application of the methods employed by these chemists to the various cases of isomerism among alcohols and acids would yield important results relating to the structure of such bodies For the purpose of discovering whether any relation exists between the rate and limit of etherification and the isomeric structure of either of the two active bodies taking part in the reaction, Menschutkin (*A Ch* [5] 20, 289, 23, 14, *J pr* [2] 24, 49, 25, 193) has made an elaborate study of the action of organic acids on alcohols In order to render all the results comparable with each other it was necessary to assume two standards for reference, one for the alcohols and another for the acids Methyllic alcohol was chosen as the standard alcohol, and formic acid as the standard acid The two characteristics chosen for measurement were (1) the initial speed of etherification, or the amount of action that takes place in the first hour, and (2) the final limit of the process, these Menschutkin terms the 'etherification data' For the 'methyllic-acetic' system Menschutkin took the limit as equal to 100, that is to say, out of equal numbers of molecules of methyllic

alcohol and acetic acid (in this case 144) only 100 molecules were converted into methyl acetate when the system reached a state of equilibrium, of these 100 molecules, 80 were formed during the first hour of action.

The following table contains the 'etherification-data' for the primary alcohols employed —

Alcohol	Speed	Limit
Methylc, HCH_2OH	80	100
Ethylc, $\text{CH}_3\text{CH}_2\text{OH}$	67.3	95.6
Propylc, $\text{C}_2\text{H}_5\text{CH}_2\text{OH}$	66.9	96
Butylc, $\text{C}_3\text{H}_7\text{CH}_2\text{OH}$	67.4	96.6
Octylc, $\text{C}_7\text{H}_{15}\text{CH}_2\text{OH}$	67.0	?

The influence of isomerism on etherification among the primary alcohols was investigated for the case of isobutyl alcohol, the data obtained were

Isobutylc, $\text{C}_3\text{H}_7\text{CH}_2\text{OH}$, speed = 64.6 limit = 96.6

These numbers show that the limit is unaffected, but that there is a small decrease in the speed. The unsaturated primary alcohols showed less facility for forming ethers, the reaction in their case progressing much less rapidly, as the following numbers show —

	speed	limit
Allylc alcohol, $\text{C}_3\text{H}_5\text{CH}_2\text{OH}$	51.9	85.3
Propargyl alcohol, $\text{C}_3\text{H}_3\text{CH}_2\text{OH}$	29.5	?
Benzyl alcohol, $\text{C}_6\text{H}_5\text{CH}_2\text{OH}$	54.6	87.3

For the secondary alcohols, the phenols, and some other alcohols, the following etherification-data were obtained —

	Speed	Limit
Dimethyl carbinol $(\text{CH}_3)_2\text{CHOH}$	38.2	86.9
Methylethyl " $(\text{CH}_3)(\text{C}_2\text{H}_5)\text{CHOH}$	32.5	85.2
Diethyl " $(\text{C}_2\text{H}_5)_2\text{CHOH}$	24.3	84.2
Isopropylmethyl " $(\text{CH}_3)(\text{C}_2\text{H}_5)_2\text{CHOH}$	27.2	86.2
Isobutylmethyl " $(\text{C}_2\text{H}_5)(\text{C}_3\text{H}_7)\text{CHOH}$	26.2	?
Hexylmethyl " $(\text{CH}_3)(\text{C}_5\text{H}_{11})\text{CHOH}$	34.1	?
Ethylvinyl " $(\text{C}_2\text{H}_5)(\text{C}_2\text{H}_5)\text{CHOH}$	21.3	75.1
Diallyl " $(\text{C}_2\text{H}_5)_2\text{CHOH}$	15.3	72
Ethylphenyl " $(\text{C}_2\text{H}_5)(\text{C}_6\text{H}_5)\text{CHOH}$	27.2	?
Diphenyl " $(\text{C}_6\text{H}_5)_2\text{CHOH}$	81.6	?
Phenol " $\text{C}_6\text{H}_5\text{OH}$	2.0	12.4
Para-cresol " $\text{C}_6\text{H}_4\text{CH}_3\text{OH}$	3.7	13.7
Thymol " $\text{C}_9\text{H}_7\text{CH}_2\text{CH}_3\text{OH}$	1.4	13.6
α -Naphthol " $\text{C}_{10}\text{H}_7\text{OH}$?	8.8
Glycol " $\text{CH}_2\text{OHCH}_2\text{OH}$	61.7	77.4
Glycerin " $(\text{CH}_2\text{OH})_2\text{CHOH}$	52.2	66.2
Erythrit " $\text{C}_4\text{H}_8(\text{OH})_2$	34	57.6
Mannite " $\text{C}_6\text{H}_{14}(\text{OH})_6$	29.6	88

Menschutkin (*J pr* 25, 193) has also determined the initial speeds and limits for different organic acids, employing one alcohol (isobutylc), and taking formic acid as the standard of reference. The following results were obtained —

Acid	Speed	Limit
Formic $\text{CH}_3\text{CO}_2\text{H}$	100	100
Acetic $\text{C}_2\text{H}_3\text{O}_2$	71.9	104.8
Propionic $\text{C}_3\text{H}_5\text{O}_2$	66.7	106.9
Butyric $\text{C}_4\text{H}_7\text{O}_2$	53.9	108.2
Caproic $\text{C}_6\text{H}_{11}\text{O}_2$	53.6	108.7
Caprylic $\text{C}_8\text{H}_{15}\text{O}_2$	50.0	110.3
Hydrostibic $\text{C}_{10}\text{H}_{19}\text{O}_2$	69.7	100.4
Phenylacetic $\text{C}_8\text{H}_9\text{O}_2$	79.1	116
Phenylpropionic $\text{C}_9\text{H}_{11}\text{O}_2$	65.2	112.1
Dimethacetic $\text{CH}_3(\text{CH}_2)_2\text{CO}_2\text{H}$	48.4	108.2
Methacetic $\text{CH}_3(\text{CH}_2)\text{CO}_2\text{H}$	30.3	114.8
Crotonic $\text{C}_4\text{H}_7\text{CO}_2\text{H}$	19.6	112.3
Cinnamic $\text{C}_9\text{H}_7\text{CO}_2\text{H}$	18.7	116.8
Trimethacetic $\text{C}_6\text{H}_9\text{O}_2$	11.8	113.1
Dimethacetic $\text{C}_5\text{H}_9\text{O}_2$	4.8	115.4
Sorbic $\text{C}_6\text{H}_9\text{O}_2$	12.9	116.3

Acid	Speed	Limit
Benzofc $\text{C}_6\text{H}_5\text{O}_2$	13.9	113.9
Nitrobenzofc $\text{C}_6\text{H}_4(\text{NO}_2)\text{O}_2$	40.1	114.3
Paratolylfc $\text{C}_6\text{H}_4\text{O}_2$	10.7	118.1
Cumilic $\text{C}_{10}\text{H}_{11}\text{O}_2$	10.1	118.1

From the foregoing numbers it is seen that the rates of etherification of the secondary acids are much less than those of the primary acids, but that the limits show only slight variations. The speeds of etherification of the tertiary acids are less than those of either the primary or secondary acids, but on the other hand the limits are greater. For a full discussion of the value of etherification data as a means of determining isomerism among alcohols and acids see Menschutkin (*J pr* [2] 26, 103, also *Z P C* 1, 611).

The theory of limited chemical reactions has been formulated in a simple manner by Van 't Hoff (*B* 10, 669) for the particular case of etherification, but essentially in the same manner as Guldberg and Waage have done in their general treatment of this chemical problem. If the system initially consists of one equivalent of acetic acid, κ of alcohol, and q of water, then when the quantity ϵ of ether has been formed, there will still remain of acid $1 - \epsilon$, of alcohol $\kappa - \epsilon$, and of water $q + \epsilon$, consequently the rate at which ether is still being formed is expressed by $C_1(1 - \epsilon)(\kappa - \epsilon)$, and the rate of decomposition of the already formed ether by the water by $C_2\epsilon(q + \epsilon)$. When equilibrium is attained these two expressions must be equal, or $C_1(1 - \epsilon)(\kappa - \epsilon) = C_2\epsilon(q + \epsilon)$. For equivalent quantities of acetic acid and ethylic alcohol, or $\kappa = 1$ and $q = 0$, Berthelot and St Gilles found the limit to be about 66.6 p.c., or $\epsilon = \frac{2}{3}$. Inserting

these values in the equation, the ratio of the two constant C_1 and C_2 is found, or $C_1 = 4C_2$. The equation now becomes $4(1 - \epsilon)(\kappa - \epsilon) = \epsilon(q + \epsilon)$ from which the maximum quantity of ether capable of being formed when various amounts of alcohol or water are employed can be calculated. For instance, if $\kappa = \infty$, i.e. if the alcohol is unlimited in amount, $\epsilon = 1$, that is, all the acid is changed into ethereal salt, if $q = \infty$, i.e. if the water is unlimited in amount, $\epsilon = 0$, or no ether is formed. These results are merely the extreme cases of what experiments have proved to be true between those limits of κ and q which have been tried.

Formation of Acetanilide—In a study of the formation of acetanilide, according to the equation $\text{C}_6\text{H}_5\text{NH}_2 + \text{C}_2\text{H}_3\text{O}_2 = \text{C}_6\text{H}_5(\text{C}_2\text{H}_3\text{O})\text{HN} + \text{H}_2\text{O}$, Menschutkin (*J pr* 26, 208) found that, although in the processes of etherification the final limit of the reaction attained after an indefinitely long interval of time is practically uninfluenced by change of temperature, in this example the limit is materially decreased as the temperature increases. The following results show this decrease —

Temp	Limit
100°	85.05 p.c.
125°	83.11
135°	82.89
145°	81.22
155°	79.68

Another remarkable fact was noticed in this

reaction, and one which is apparently at variance with most experiments relating to the action of mass (see Berthelot's etherification experiments, *ante*) In any chemical system undergoing change, comprising two or more active bodies, the rate of change is generally accelerated (*v* p 744) by an increase in the amount of any of the active bodies, and this increase in the rate is more or less proportional to the quantity of active substance added. But in the formation of acetanilide, with a constant amount of acetic acid, an increase in the quantity of aniline retards the action, according to Menschutkin, although the final limit is increased as the theory of mass action requires. The numbers under 'speed' showing this fact represent the amount of action after 15 mins

Molecules aniline with one mol acid	Speed	Limit
1	34.71	79.68
2	28.71	91.65
3	23.45	94.61
4	—	96.17
8	17.13	97.22

However, when the aniline remains constant and the acetic acid is increased, the law of mass action appears in the normal way (*v* also *AF FINITY*, p 85)

Molecules acid with one mol aniline	Speed	Limit
1	34.71	79.68
2	57.30	96.88
4	78.08	99.80

Division of a base between two acids

When a mixture of two acids acts on a base, or two bases act on one acid, the two acids in the first case being more than sufficient to combine with the base, or the two bases in the second case with the single acid, it is usually granted that the base divides itself between the two acids or the acid between the two bases in definite ratios. Or if an acid acts upon a salt in solution, as nitric acid on potassic sulphate, a definite amount of change takes place resulting in this instance in the formation of potassic nitrate and sulphuric acid. If the ratios in which such divisions occur were known they might afford measures of the relative affinities of the acting bodies for the particular conditions of the experiments. Such ratios have been determined for a great many acids by Ostwald, with most important results (For an account of this work *v* *AFFINITY*).

Pattison Muir (*C J* 33, 27, 35, 311, 36, 60) has studied the conditions affecting the equilibrium of certain chemical systems wherein pps are formed, with the view of determining the relationship between the concentrations of the solutions, the ratios between the active bodies, and the influence of heat on the equilibrium ratios. An investigation somewhat similar to this was conducted by Morris (*A* 218, 233)

Fractional Precipitation

It has been shown (*ante*, and *v* *AFFINITY*) that if a mixture of two acids is allowed to

act upon a single base, or of two bases on a single acid, the ratio in which the base divides itself between the two acids, or the acid between the two bases, depends upon the relative quantities or masses of the materials in the system, as well as upon the strength of the affinities acting between the several bodies. In like manner, if a pptant is added to a solution, containing two or more salts of different metals, the mass of the pptant being less than is required for complete ppn of all the salts in the solution (being,

say, $\frac{1}{\mu}$ th of the total necessary) then the ratios

of the quantities of the salts decomposed—of the hydrates, carbonates, &c formed—depends on (i) the relative masses of the substances in solution, (ii) the relative affinities of the salts or the basic powers of the oxides with reference to the pptant, and also (iii) on the fraction of the total material that is ppd

This highly interesting subject of fractional ppn has been as yet investigated but to a very slight extent, it would, however, seem to promise in the future a fertile field for the determination of what might be called the relative basic powers of different oxides or hydrates. If, for example, a solution contains two salts of different metals, the basic powers of whose oxides are different, and if a small fraction is ppd (say as hydrate), there will be a tendency on the part of the less basic material to accumulate in the pp in preference to the more basic, and this tendency will be greater as the difference between the basic powers is greater. If the basic powers differ but slightly, then the increase in the ratio of the less to the more basic material will progress very slowly by repeated application of the process of fractional ppn. If in the extreme case no such difference exists under the conditions of the experiment as regards temperature and quality of the pptant (the ratio of the basic powers may and probably does vary with the temperature), then the ratio of the two materials in the small pp will be the same as that in the original solution, and consequently, however frequently the process may be repeated on each fraction formed, no separation will be effected.

At the present time there are a number of elements known belonging to the earths, for the separation of which the only method that has yet been discovered is that of fractional ppn, or fractional fusion, in both cases the separation depends on the differences of the basic powers of the various bodies. Such, for instance, is the separation of the three elements, samarium, didymium, and lanthanum, from each other, or holmium, thulium, and erbium, or again terbium from yttrium. These separations are so extremely tedious, requiring the application of fractional ppn to be repeated a very great number of times with but relatively infinitesimal yields of finally pure material, that it is evident that the differences in basic powers must be extremely small, more particularly in the cases of samarium, didymium, yttrium, terbium, and holmium, thulium. This process for effecting the separation of these earths is rendered all the more uncertain and difficult owing to the want of facts drawn from the study of fractional ppn of other bodies bearing upon

the best conditions under which the process should be conducted (*v* EARTS)

Chłzyński (*A Suppl* 4, 226, J 1866 12) has investigated the subject of fractional ppn for the case of magnesium and calcium chlorides by phosphoric acid. This chemist employed solutions containing the two salts in varied proportions, to these solutions he added a constant quantity of phosphoric acid insufficient for complete ppn, then ammonia was added, and he determined the amounts of calcic and magnesian oxides in the pps. The composition of the pps was found to vary with the ratio of the amounts of calcic and magnesian chlorides in the solutions, but to be nearly independent of the quantity of water used for dilution. By increasing the amount of calcic chloride in the solution, the magnesian chloride remaining constant, it was found that the lime passed into the pp in greater quantity, while the amount of magnesia decreased, with the calcium salt constant, the magnesian chloride being increased, the reverse occurred, but to a less marked degree. These variations took place in a regular manner as the composition of the solutions varied.

Mills, in conjunction with others (*P M* [5] 13, 169, 177, and *Pr* 29, 181), has studied the fractional ppn, by means of sodium hydrate or carbonate, of several sulphates, taken in pairs under varying conditions of mass, with the view of determining the relative facility with which one sulphate is decomposed in presence of another when an insufficiency of a pptant is added to the solution.

In one set of experiments in which nickel and manganese sulphates were employed, the following numbers were obtained, each solution contained 1 gram of material made up to 100 cc, and 10 cc of a solution of Na_2CO_3 (5715 gram Na CO_3) were added —

NISO ₄	MnSO ₄	rtISO ₄ ppd	MnSO ₄ ppd	Temp C°
1 grm	9 grm	0953	5850	12 9
2	8	1852	4616	13 6
3	7	2799	3766	12 5
4	6	3588	2976	13
5	5	4305	2450	13 6
6	4	4788	1536	12 8
7	3	4991	1089	17
8	2	5584	0722	17
9	1	5841	0363	15 2

From these numbers it is seen that the ratio of the quantities of material ppd varies continuously, and in the same manner as the ratio of the amounts of salts employed, with equal masses of the two sulphates in solution the pp contains much more nickel than manganese, hence it is at once inferred that the basic power of manganous hydrate or oxide is greater than that of nickel, since the less basic a material the greater its tendency to be affected by the pptant.

Extending these experiments performed in a similar manner to mixtures of nickel and cobalt sulphates, but employing sodic hydrate instead of carbonate, it was found that these two salts

have almost equal degrees of precipitability, that is to say, if the two salts exist in the solution in equal amounts they will accumulate in the pp in about equal quantities, or, with varying quantities of material, the ratio of the amounts of the two salts ppd will be approximately equal to the ratio initially in the solution, in other words, the basic powers of the two salts are about equal. (For the theory of fractional ppn see Hood, *P M* 1886.)

Reduction of Oxides

The conditions that affect the reduction of metallic oxides by hydrogen, carbon monoxide, and carbon, have been examined by Wright and Luff (*C J* 33, 1, 509, 35, 475, 37, 757), the type of the reactions being represented by the equation $A + B \rightarrow AB + C$. The results have important practical bearings on metallurgical operations. The temperature at which reduction commences is a function of (1) the physical conditions of the bodies experimented with, (2) and the chemical nature of the substances. With CO as the reducing agent, the temperature at which action begins in the case of cupric oxide varies from 60° to 146° according to the state of aggregation of the copper oxide, for ferric oxide the temperature ranges between 90° and 220°. The reduction by CO of copper oxide, prepared by ppn, is well marked at temperatures below 100°, but at 100° it becomes very energetic. The initial action of H on copper oxide was found to take place at temperatures ranging between 85° and 172°, and on ferric oxide between 195° and 265°. When carbon was employed as the reducing agent, the temperature of initial action varied not only with the physical nature of the metallic oxide, but also with the quality of the carbon, the temperature limits for copper oxide were 350° and 440°, and for ferric oxide 430° to 450°. By comparing the temperatures of initial action for a given kind of metallic oxide, it was invariably found that that reducing agent begins to act at the lowest temperature which has the greatest heat of combustion, so that the heat disturbance during its action has (algebraically) the greatest value. Thus H always begins to act at a lower temperature than carbon, and CO at a lower temperature than H, as the following table shows for different specimens of metallic oxides —

	CO	H	Sugar C	O from CO
Cupric oxide A	60°	85°	390°	350°
" B	125	175	430	350
" C	146	172	440	430
Cuprous oxide	110	155	390	345
Ferric oxide A	202	260	450	430
" B	90	195	450	—
" C	220	245	450	430

Comparing cupric and ferric oxides prepared by analogous processes, and therefore presumably in much the same physical state, it was uniformly found that the temperature of initial action of a given reducing agent is lower on oxide of copper than on oxide of iron, as the following numbers show —

		CO	H	Sugar C	O from CO
Oxides prepared by precipitation	Copper	60°	85°	890°	350°
	Iron	90	195	450	430
Oxides prepared by heating salts	Copper	125	175	430	890
	Iron {	202	260	450	430
		220	245	450	430

The extension of these experiments to the oxides of nickel, cobalt, lead, manganese, ferrous and ferrous ferric oxides, resulted in the following conclusions, among others. Differences in physical state are attended with correlative differences in the temperatures at which the actions of the reducing agents CO, H, and C, are first manifested. For the several oxides of the same metal the temperature of the initial action of a given reducing agent is sensibly the same unless the differences in physical structure are very marked. In no case was any exception found to the rule that the temperature of initial action of CO is lower than that of H, and that of H lower than that of C, on the same sample of metallic oxide. For a large number of cases the rule holds that the greater (algebraically) the heat production during the occurrence of a reaction the lower is the temperature at which this action is first manifested.

During the investigation of the rates of action of CO and H, it was noticed that in many instances 'chemical induction' manifested itself, i. e. the reducing action of the gas on the metallic oxide at a given temperature was at first slight or nil ('period of incubation'), but after a longer or shorter time the reduction commenced and proceeded at an increasing rate, until the retarding influences of the products of the action caused the rate of reduction to cease increasing, and subsequently to diminish. The 'period of incubation,' when measurable, was found to be shorter the higher the temperature.

A similar phenomenon has been observed by Bunsen and Roscoe in their investigation of the action of light on a mixture of chlorine and hydrogen (*v* INFLUENCE OF LIGHT, *post*), and it is interesting to note that in a heterogeneous system consisting of a solid oxide and a gas chemical induction should also manifest itself. The question naturally arises whether or not it is a general phenomenon accompanying all chemical changes.

Homogeneous Unlimited Systems—Considering the simplest chemical system undergoing change, that of a single body either decomposing, like ammonium nitrate when heated, or suffering molecular rearrangement, as ammonium cyanate into urea, it is evident that unless the products interfere as retarding agents the amount of change in unit of time, that is to say the rate of change, will be proportional at any time to the amount of active substance then existing. When, however, a system comprises two or more active members reacting on each other, such as an alcohol on an acid, or hydric peroxide on a acidulated solution of a soluble iodide, the circumstances are much more complicated. The general experiments on the rate of chemical

change, when not limited by inverse action, prove that in such complex systems the rate of change of any one of the members is increased or diminished by an increase or decrease in the quantity of any of the other constituents, and is more or less proportional to such variation. For example, if the system comprises $A_1, A_2, A_3, \dots A_n$ (different bodies reacting one with the other), the rate at which A_1 changes is increased or diminished by a similar variation in any other member, as A_r . The statement of this law of mass by Mills (*P M* [5] 1) in the words 'no matter what may be the masses of the substances reacting the entire mass of each takes part in the process,' requires to be limited by the further statement that the law applies only to homogeneous systems in the sense in which these have been before defined. It could not be asserted for instance that the entire mass of the marble in Bojurski and Kajander's experiments affects the rate of action of the acid, or that a hollow sphere of zinc dissolves less rapidly in acid than a solid sphere of similar external dimensions.

Berthelot in 1862 (*A Ch*) showed that the rate of reaction of alcohol with acetic acid is proportional to the product of the two active substances. Harcourt and Esson in 1866 (*Pr* 14, 470) established several formulae representing various experimental conditions based on the same hypothesis, but the reaction they employed for verification of the theory (permanganate on oxalic acid) proved to be of so complex a character as to give but imperfect results. These chemists, however, were more successful subsequently (*Pr* 15, 262) with the reaction

The theory of Guldberg and Waage relates more particularly to cases of limited action, but in its application to the study of the rate of change the introduction of so many 'coefficients of action' (*v ante*, p 737) renders the equation of little practical use for such investigations. (But *v* article AFFINITY, p 70). Except in the theory of Guldberg and Waage, the influence of the products of the change either as accelerating or retarding agents is generally overlooked in attempts to formulate chemical action, but it is easy to introduce these effects in an equation to represent the rate of change of a complex system, on the hypothesis that the rate is directly proportional to the product of all the active members and is inversely proportional to the amount of chemically inactive bodies formed (*v* RETARDATION OF CHEMICAL CHANGE, p 744).

In a complex system, consisting of n members, undergoing change, let the masses of the initial active bodies be represented by $A_1, A_2, A_3, \dots A_n$, and let the masses of these bodies that have become changed or rendered chemically inactive up to a time t , be represented by $a_1, a_2, a_3, \dots a_n$, then, according to this hypothesis, the rate of change of any member of the system, say A_x , is

$$\frac{da_x}{dt} = \mu \frac{(A_1 - a_1)(A_2 - a_2) \dots (A_n - a_n)}{B \pm (\lambda' a_1 + \lambda'' a_2 \dots \lambda^n a_n)} \quad (1)$$

Where μ , and n , are constants, and $\lambda', \lambda'', \dots \lambda^n$ are the retardation or accelerating coefficients of the products of the action, the + or - sign being taken according as these products all act as retarding or as accelerating agents. Which of these actions was performed by any specified

product of the primary action could be determined experimentally, by introducing a known mass of the body into the system, and comparing the rate of the change with that observed when no more of the specified body was present than was formed during the primary reaction. Since Λ_0 is the member of the system whose rate of change is the object of measurement, let the amount that remains unchanged at time t , that is $\Lambda_0 - \alpha_t$, be taken as y , then—if the initial quantities of the other members be $\nu_1, \nu_2, \dots, \nu_n$ (equivalents of Λ_0), $\Lambda_1 - \Lambda_1 = \epsilon_1 \nu_1 \Lambda_0$, $\Lambda_2 = \epsilon_2 \nu_2 \Lambda_0$, $\Lambda_n = \epsilon_n \nu_n \Lambda_0$, and $\alpha_t = \epsilon_1 \alpha_1, \alpha_2 = \epsilon_2 \alpha_2, \dots, \alpha_n = \epsilon_n \alpha_n$. In setting these values in the above equation it becomes

$$-\frac{dy}{dt} = \mu' y \left\{ (\nu_1 - 1) \Lambda + y \right\} \left\{ (\nu_2 - 1) \Lambda + y \right\} \dots \text{etc.} \quad (2)$$

In this equation μ' and ν' are constants to be determined experimentally, Λ being the initial value of y , μ' is proportional to the rate and is dependent on the temperature (v INFLUENCE OF HEAT ON CHEMICAL CHANGE, p 744).

Numerical examples of this equation for a system comprising the three bodies, ferrous chloride, hydric chloride, and potassic chlorate, have been given by Hood (*P. M.* [5] 20, 444), but the solutions he employed were so dilute that the products of the action appeared to influence the rate inappreciably, consequently the term in the equation relating to these effects was neglected, and the equation was taken as

$$-\frac{dy}{dt} = \mu' y (\nu_1 - 1) \Lambda + y \left\{ (\nu_2 - 1) \Lambda + y \right\} \quad (3)$$

for the system of three bodies

It is possible to arrange the experimental conditions in such a way that, neglecting the action of the products, the course of the change may be much simpler than is represented by equation (2). This may be done, (1) by having all the active substances present in very large excess over that one which is made the object of measurement, so that they undergo but slight diminution between the beginning and the finish of the change taking place in the body measured, or (2) by arranging the constituents so that one or more of them, although taking part in the reaction, remains constant in amount, one constituent only diminishing in value. The equation for the rate of change of one member in either case would be by (2)

$$\frac{dy}{dt} = -\mu y \Lambda_1 \Lambda_2 \quad \Lambda_n$$

Where $\Lambda_1, \Lambda_2, \dots, \Lambda_n$ are the masses of the chemically active constituents which remain constant or nearly so, or integrating, $y = B e^{-at}$, a being equal to $\mu \Lambda_1 \Lambda_2 \dots \Lambda_n$.

Harcourt and Esson (*T.* 157, 117) proved the truth of this exponential formula for the action between a soluble iodide and hydric peroxide. The fundamental change in this case is represented by $\text{H}_2\text{O}_2 + 2\text{HI} = 2\text{H}_2\text{O} + \text{I}_2$. By the simple device of adding a known constant amount of sodic thiosulphate to the active solution each time the liberated iodine made its appearance, the amount of hydric iodide was kept constant, while the H_2O_2 alone diminished. The successive additions of thiosulphate measured the amount of change of the hydric peroxide (or y), and the intervals between each addition, or rather the appearances of free

iodine, measured the times of action. From their experiments relating to the influence of variations of temperature, and variations of the masses of the acting substances, Harcourt and Esson concluded that 'whether the solution contains in loc 746 millionths of a gram of hydric sulphate or 150 times that quantity, 604 millionths of a gram of KI or 9 times that quantity, or whether HCl or hydric sodic carbonate be substituted for H_2SO_4 , whether the temperature be 0° or 50° , and whether the portions of change require for their accomplishment intervals of one or two minutes, or intervals of half an hour or an hour, this reaction still conforms to the law that the amount of change is at any moment proportional to the amount of changing substance'.

Harcourt and Esson (*T.* 156, 193) had previously employed the reaction between potassic permanganate and oxalic acid for investigating the laws according to which a chemical change progresses. Although this investigation was not quite successful in its primary object, it serves well to illustrate the anomalous results that may be obtained by the interfering action of the products formed in a reaction, or by extraneous salts. The reaction under examination may be represented at its beginning and its conclusion by the two sides of the equation

The reaction progresses with moderate rapidity at temperatures easily kept under control. By varying the mass of any one of the constituents a corresponding variation occurs in the rate of oxidation. The influence of H_2SO_4 is shown in the following table, the reaction was allowed to go on in each case for four minutes, and was then suddenly stopped by the addition of KI, the amount of change that had taken place being obtained by estimating the iodine liberated —

Mole- cules H_2SO_4	Per cent change in 4 min.	Molecules H_2SO_4	Per cent change in 4 min.
2	21.8	10	71.6
4	36	12	77.4
6	51.1	14	82.4
8	63.5	16	85.7
		22	92.8

The principal secondary reaction in the oxidation of $\text{C}_2\text{H}_2\text{O}_4$ by $\text{K}_2\text{Mn}_2\text{O}_8$ arises from the decomposition of $\text{K}_2\text{Mn}_2\text{O}_8$ by the MnSO_4 ,

$(\text{K}_2\text{Mn}_2\text{O}_8 + 3\text{MnSO}_4 + 2\text{H}_2\text{O} = \text{K}_2\text{SO}_4 + 2\text{H}_2\text{SO}_4 + 5\text{MnO}_2)$, this reaction influences the rate of oxidation in a remarkable manner. With the materials in the proportions of $\text{K}_2\text{Mn}_2\text{O}_8, 10\text{H}_2\text{SO}_4, 5\text{H}_2\text{C}_2\text{O}_4$, it was found that when no manganous sulphate was added only eight p.c. of chemical change took place in 4 mins., but by gradually increasing the mass of MnSO_4 the amount of change taking place in this interval of time increased, until it reached 85 p.c. when 3MnSO_4 was present. Further increase of the MnSO_4 only slightly altered the rate of oxidation. Harcourt and Esson likewise found that by varying the masses of H_2SO_4 and $\text{C}_2\text{H}_2\text{O}_4$, the $\text{K}_2\text{Mn}_2\text{O}_8$ and MnSO_4 remaining constant, the percentage of chemical change in a definite time (3 mins.) gradually increased till it reached

a maximum, then diminished to a minimum, and again increased on addition of more $\text{H}_2\text{C}_2\text{O}_4$. Experiments on the relation between the time of continuance of the action and its amount showed that after a certain interval the course of the change was represented by an hyperbola. The reason of this regularity only occurring after the action had proceeded some time was traced to the double changes that take place, first between the MnSO_4 and $\text{K}_2\text{Mn}_2\text{O}_8$, and then between the MnO_2 produced and the $\text{C}_2\text{H}_2\text{O}_4$. Both changes are, however, comparatively slow, but if either of them occurred very rapidly compared with the other, in presence of equivalent quantities of materials, the whole course of the change would doubtless be represented by an hyperbola.

Hood (*P M* [5] 6, 371, 8, 121) has studied the rate of oxidation of ferrous sulphate by potassic chlorate, and the influence exerted on the process by variations (1) in the amounts of acid used and (2) in the temperature. The equation for equivalents being

$6\text{FeSO}_4 + \text{KClO}_3 + 3\text{H}_2\text{SO}_4 = 3\text{Fe}_2(\text{SO}_4)_3 + \text{KCl} + 3\text{H}_2\text{O}$, it is evident that the rate of change will be the product of three factors. The acid being in large excess and $\text{KClO}_3/6\text{FeSO}_4 = v/1$, the rate of change by equation (3) is

$\frac{dy}{dt} = -\mu y(v-1)A + y$ where B equals

the amount of acid, or $\log \frac{y}{(n-1)A+y} =$

$\mu B(n-1)A(c-t)$, if, however, $\text{KClO}_3/6\text{FeSO}_4 = 1/1$,

then $\frac{dy}{dt} = -\mu y^2$, or $y(a+t) = \frac{1}{\mu B}$. By a series

of determinations of y (e.g. of permanganate) at indefinite intervals of time, the constants in either of these equations (μB and c , and μB and a) were found for different conditions of temperature, amount of acid (B), &c., and consequently a measure was obtained of the changes produced in the rate of oxidation by such variations. Hood found that for this reaction both these formulae hold good, and, as theory indicates, the rate of oxidation, within certain limits, is proportional to the amount of free acid, as the amount of acid, however, becomes comparatively very great the oxidation progresses much more rapidly than the acid increases. When HCl replaces H_2SO_4 , in order to produce the same rate of oxidation the amounts must be as 36.5 : 80.

Ostwald (*J pr* 27, 1) has studied the interesting reaction $\text{R CONH}_2 + \text{H}_2\text{O} = \text{R CO ONH}_2$ with reference to the accelerating influence acids have upon the rate of the change. This reaction is a striking instance of so called 'pre-disposing' affinity, the reaction being a very slow one when water alone is employed. (For details of this investigation, *v* the article AFFINITY, p. 79.)

The decomposition of the ethereal salts, e.g. methylic acetate, by water, affords an example of chemical change somewhat analogous to that of the acetamides. The difference between the two cases is that in the former the water resolves the compound into two others, alcohol and acid, whereas in the latter the water is assimilated to form a more complex compound. The presence of acids greatly accelerates the decomposition of the ethereal salts, as is the case with the acetamides, the relations between speed of action and

quality of acid have been investigated by Ostwald (*J pr* 28, 449), *v* AFFINITY.

RETARDATION AND ACCELERATION OF CHEMICAL CHANGES—In the reaction that takes place when an alcohol and an organic acid are mixed, the amount of change is limited by the inverse action that arises between the products of the change, ethereal salt and water, which inverse action tends to the re-formation of the original alcohol and acid, it is consequently evident that the rate at which the etherification progresses is retarded by this inverse action. In like manner if BaSO_4 is acted on by K_2CO_3 , the rate of the decomposition is retarded by the inverse action that occurs between the BaCO_3 and K_2SO_4 , which results in the formation of the original bodies.

The same may be said as regards the rate of all those reactions which are limited in extent by inverse chemical changes.

There is, however, another kind of retardation possible, not arising from any secondary chemical changes taking place in the system, but of a purely physical origin. If in a homogeneous system undergoing change, such for instance as is represented by the equation $A + B = AB$, the chemically active bodies be considered to be in a state of continual motion, the rate of formation of AB will be proportional to the number of impacts between the A 's and B 's in a unit of time. It is conceivable then that if the molecules AB are not removed from the sphere of action their mere presence will hamper the movements of the remaining A 's and B 's, and by so doing will diminish the number of impacts between them in a unit of time, that is to say, will retard their rate of combination. That retardation of a chemical change does arise by the addition of a quantity of one of the products has been shown to be true in several instances, but whether the effects are to be interpreted on a physical basis, as is done here, or on a chemical basis, cannot be decided with certainty. Much more experimental evidence has been obtained. The study of the influence of chemically inactive bodies on systems undergoing change, that is to say of bodies which probably do not take part chemically in the reactions, forms a wide field for research, and there is no doubt that the results obtained will have an important bearing on chemical science considered in its dynamical aspect.

An acceleration in the rate of a chemical change may be brought about by an increase in the amount of any one of the active constituents of the system, such an acceleration, as has been already shown, is easily explained by the law of mass action, viz. that the total mass of each constituent takes part in the reaction.

There are instances, however, somewhat more difficult of explanation, such as the inversion of cane sugar, or the decomposition of methylic acetate, by acids, wherein the addition of an acid merely accelerates the change, the mass of the acid remaining the same at the finish as at the beginning of the reaction. The tendency to undergo change in these instances is merely increased by the presence of the acid, and this tendency, measured by the speed of the change, is dependent on the character of the acid employed (*v* Ostwald's experiments detailed in AFFINITY, p. 79). The difficulties that are here

encountered would seem to be similar to those that arise in the consideration of so-called 'contact actions' or catalysis

Guldberg and Waage (*Études*), in their investigation of the rate of production of hydrogen by the mutual action of metals and acids, found that the presence of salts in the acid solution exercised a remarkable influence on the speed, some salts accelerating, others retarding, the reaction, the salts themselves remaining unaltered. Mills and Walton (*Pr* 28, 268) observed an acceleration in the rate of formation of ammonia from potassic nitrate and zinc amalgam by the addition of either K_2SO_4 or Na_2SO_4 , the increase of speed being practically the same for equal masses of the two sulphates. If a dilute acidulated solution of ferrous sulphate is oxidised by potassic chlorate at the ordinary temperature, these two bodies being present in equivalent quantities, and the free acid (H_2SO_4) being much in excess, the rate of the oxidation (*vide ante*)

is expressed by the equation $\frac{dy}{dt} = -\frac{y^2}{b}$, or

$y(a+t) = b$, where t is time in minutes, and y is c.c. permanganate equivalent to ferrous iron remaining at time t . Since in these equations

$\frac{dy}{dt} \propto b^{-1}$ (or the rate of change is inversely proportional to b), by performing two experiments under like conditions of temperature, dilution, amount of acid, of iron, and of chlorate, except that to one of the solutions a known mass of a sulphate is added, it is easy to calculate the equations, $y(a+t) = b$, for each of the systems, and, by comparing the two values for b , to get a measure of the retarding action of the particular sulphate employed. In other words, the time required to oxidise the iron from y' to y'' is proportional to b , and if this time for the blank experiment be taken as 100 minutes, the value of $\frac{100b'}{b}$ (where b' corresponds to the blank

and b' to the retarded experiment) gives the number of minutes required to perform the same amount of oxidation in the presence of the added sulphate. The annexed table contains the results obtained by Hood (*P. M.* [5] 13, 419) in studying the retardation of various sulphates in the above manner, the temperature being 21°C in each experiment.

The numbers show that the retardation occasioned by the presence of a chemically inactive salt in the system employed is proportional to the mass of the salt added, and that some salts of analogous character produce for equal masses the same retarding effect. Thus the potassium, sodium, and ammonium sulphates each produce a retardation of about 10 p.c. per gram, and the two alums about 6 p.c. per gram. The differences in the effects of magnesium and zinc sulphates are, however, too great to allow of their being classed together as analogous salts from a dynamical point of view with reference to this particular case of retardation.

Considering the alkali sulphates and the alums, it is clear that, since equal masses of the several members of each group produce the same effect, the retardation produced by a mole of one of the salts is proportional to its

Weight of salt	K_2SO_4		Na_2SO_4		$(NH_4)_2SO_4$

mass, in other words, the greater the mass of a molecule the more it retards the rate of the chemical change.

Judging by these facts, it would seem not improbable that chemical bodies might be classified on a dynamical basis as regards their retardation effects. With this aim, Hood (*P. M.* [5] 20, 444) has continued these experiments in relation to soluble chlorides, but the anomalous results obtained do not justify the assumption started with. The results show that the sulphates of the alkali metals in the oxidation of ferrous chloride by $KClO_4$ produce an equal retarding effect, about 17 p.c. per gram, but that $MgSO_4$, $ZnSO_4$, and $CdSO_4$ (although usually classed together from a statical point of view) differ greatly in their retardation effects, the results for the first two sulphates are in about the same ratio as in previous experiments with ferrous sulphate instead of ferrous chloride. Experiments with $MgSO_4$ showed that these 'retardation coefficients' vary slightly with increase of temperature.

An examination of the effects of chlorides on this reaction showed strikingly anomalous results, no two chlorides gave the same retardation effect. Sodium chloride practically produced no effect on the speed of the oxidation, while zinc, magnesium, and cadmium chlorides produced an acceleration. It seems difficult to reconcile these results with a theory that should account for the action of a chemically inactive

salt in a system undergoing change on the basis of molecular interference with the movements of the changing constituents of the system. It may be, however, that the presence of such extraneous bodies induces secondary reactions in the system which occasion either an acceleration or a retardation of the principal change.

INFLUENCE OF HEAT—The study of the influence exerted by heat on chemical changes, as illustrated by the phenomena of dissociation, and by such phenomena as occur when phosphorus or sulphur are heated, forms an important factor in the vast problem of chemical action. Starting with the fundamental notions, that heat is a form of energy, and that all external material phenomena comprise two factors, matter and motion, which it is the aim of chemistry to investigate, with the molecular theory of the constitution of matter for a basis, it is evident that the relations between the action of heat and chemical change will be most advantageously studied by examining in what way the rates and the limits of chemical changes, occurring in homogeneous systems, are affected by heat, and by determining the influence exerted on such changes by extraneous bodies.

What is already known regarding the influence of heat in bringing about chemical combinations and decompositions would seem to indicate that such action is of a twofold character, more particularly in systems possessing free mobility either in the gaseous or liquid states, for, besides accelerating the motions of translation of the molecules of the system, and so multiplying the chances of collision in a given time, and consequently increasing the rate at which the change takes place, the action of heat also accelerates the rate of change by diminishing the stabilities of the reacting molecules, and thus increasing their tendency to undergo change. Thus, representing the molecules of gaseous iodine and hydrogen respectively as I_2 and H_2 , the amount of HI produced in unit time at a given temperature, by the mutual action of H_2 and I_2 , will depend upon the number of molecular collisions, the velocities of translation of the molecules (or the temperature of the gas), as well as upon the facility with which the molecules become separated into $2HI$ and $2I$. It is easy to understand in this way why there are definite limits of temperature within which chemical changes take place, and how some reactions which occur very rapidly at one temperature may be prevented by sufficiently cooling the reacting bodies.

Although as a general rule the action of heat is such as to induce chemical combination at moderately low temperatures and decomposition at higher temperatures, instances are known of bodies being more stable, under certain conditions, at high, than at low temperatures. Troost and Hautefeuille (*C R* 73, 443, 84, 946) have shown that by passing $SiCl_4$ over strongly heated silicon the latter is volatilised and is again condensed on the cooler parts of the tube. This apparent volatilisation of silicon was found to be brought about by the formation of Si_4Cl_6 at the higher temperature, and decomposition of this compound into the original bodies at a lower temperature ($2Si_4Cl_6 = 8SiCl_4 + Si$). The comparatively complex body Si_4Cl_6 is thus resolved

by diminishing the temperature into the comparatively simpler bodies $SiCl_4$ and Si .

A somewhat analogous reaction is asserted to occur by Ditté with SeH_2 (*C R* 74, 980). This chemist says that if selenium is heated with hydrogen in a closed vessel, the amount of SeH_2 formed increases with increase of temperature up to 520° , but that any further increase in the temperature is accompanied by a decrease in the amount of SeH_2 formed. If two tubes are heated under like circumstances until the amount of SeH_2 formed is constant, and one of them is then cooled rapidly while the other is allowed to return gradually to the lower temperature, Ditté says that the second tube contains less SeH_2 than the first, and so much less as the cooling has been slower. On the other hand, SeH_2 submitted to the action of heat suffers sensible decomposition even at 150° , above 270° the amount of decomposition gradually decreases until it reaches a minimum at 520° , after which the decomposition continuously increases as temperature rises.

Chemical systems which are limited by reason of inverse actions may be represented in terms of their rates by the equations $\frac{dv_1}{dt} = f(\theta)\psi(AB)$, and

$\frac{dv_2}{dt} = f(\theta)\psi(CD)$, in which the accelerating influence of temperature is expressed by the functions $f(\theta)$ and $f'(\theta)$, and the absolute rate by the difference, or $\frac{dv}{dt} = f(\theta)\psi(AB) - f'(\theta)\psi(CD)$. When equilibrium is attained, or no further change takes place, $f(\theta)\psi(AB) - f'(\theta)\psi(CD) = 0$, A', B', C', D' , being the quantities of active substances that can exist together in stable equilibrium at temperature θ .

If the temperature functions be the same in both cases, then $f(\theta)\{\psi(A'B') - \psi(C'D')\} = 0$, or $\psi(A'B') = \psi(C'D')$, or the limits are independent of temperature. This would seem to be true between certain limits for the simpler etherification processes, as Berthelot and Saint Gilles' experiments have shown. Menschutkin, however, has examined certain limited reactions which show a marked variation in the limits with temperature, and seem to indicate that the ratio of $f(\theta)$ to $f'(\theta)$ is not constant.

From a study of certain reactions which are not affected by limiting conditions, and of other reactions which are so limited, attempts have been made to determine the accelerating action of heat, that is to say, to determine the form of the temperature function $f(\theta)$ in the equation $\frac{dy}{dt} = f(\theta)\psi(Tabc)$.

Hood (*P M* [5] 6, 371), from experiments on the rate of oxidation of ferrous sulphate solution by $KClO_3$, considered that $f(\theta) \propto \theta^2$, or that the rate of oxidation varied as the second power of the temperature, but the experiments were not sufficiently numerous to place this conclusion beyond doubt.

Warder (*Am* [3] 203) studied the influence of heat on the rate of the action

$C_2H_2O, C_2H_2O + NaHO = NaC_2H_3O_2 + C_2H_2HO$, in dilute aqueous solutions, the temperature limits being 36° and 87.7° . The results obtained agreed well with the formula $(7.5 + a)(62.5^\circ - t) = 521.4$, t being temperature, and a the number of gram equivalents per litre which would (accord

ing to the theory of mass) react upon each other per minute in a solution kept of normal strength. The formula could be written as $a = A + Bt^2$, indicating the rate to vary nearly as the square of the temperature. Menshutkin (*J pr* [2] 29, 437) employed three somewhat analogous reactions for the study of this subject, (1) formation of ethylic acetate from acetic acid and ethylic alcohol, (2) formation of acetanilide from acetic acid and aniline, (3) formation of acetamide from acetic acid and ammonia. Molecular quantities of the materials were heated for one hour at different temperatures, and the amounts of ether, anilide, and acetamide formed were determined, and taken as measures of the speeds. The following are his results —

Temp	Ether formed	Temp	Anilide formed	Temp	Acetamide formed
90	7 50	82°	6 08	100°	0
102	13 50	90	8 50	110	1 27
112	19 02	102	14 59	121	4 41
122	24 78	112	21 51	130	9 02
132	32 60	122	30 71	140	21 36
142	40 65	132	39 91	150	36 96
152	46 82	142	47 65	152	40 66
162	52 99	152	55 49	155	50 90
172	57 45	162	61 57	160	58 67
182 5	60 99	172	66 39	172	72 33
212 5	63 98	182 5	68 87	182 5	78 31
		212 5	72 19	212 5	82 83

These numbers all agree in this respect, that the differences in the amounts of action during one hour, for equal differences of temperature, gradually increase, pass through a maximum at a definite temperature, and then decrease. As regards the general inferences that might be drawn from these experiments relative to the connection between action of heat and rate of change, it must be remembered that the reactions labour under the disadvantage of being cases of only limited action, and that the products of the change no doubt retard the principal reaction, and tend to complicate matters. Besides this, the method of allowing the change to proceed in each case for the same interval of time is objectionable, for at the higher temperatures the amounts of the products formed before the expiration of one hour are so very much greater than the amounts formed at the lower temperature that their presence must exercise a considerable retarding influence on the further progress of the reaction up to the time limit.

Unlike some of the etherification processes the limits of formation of acetanilide and acetamide are influenced very considerably by heat, as the following numbers show —

Acetanilide		Acetamide	
Temp	Limit	Temp	Limit
100°	80.05	125°	75 10
125	83 11	140	78 18
135	82 89	155	81 46
145	81 22	182 5	82 82
155	79 68	212 5	84 04
182 5	78 85		
212 5	77 75		

In order to determine the temperature-function influencing the rate of a chemical change, Hood (*P M* [5] 20, 323) has again studied the oxidation of ferrous sulphate solution by potassic chlorate. This reaction is well adapted for work of the kind, as it is completely under control, and can be rendered as quick or as slow as may be desired by altering such conditions as dilution, temperature, amount of free acid, &c. The progress of the oxidation can also be followed with the greatest precision by means of permanganate.

Each experimental solution consisted of 5637 gram of iron as ferrous sulphate, and 3 099 grams of free H_2SO_4 , made up to a volume of 250 c.c. To this solution 10 c.c. of a solution of $KClO_3$ were added, equal to 2057 gram, being the oxidising equivalent of the iron. From such a solution, maintained at a constant temperature, 10 c.c. were withdrawn at indefinite intervals of time, and titrated by permanganate, and from several such observations the constants in the equation $y(a+t) = b$ were calculated, y being c.c. of permanganate, and t being time in minutes.

Since b is inversely proportional to the rate of change, or $\frac{dy}{dt} = -\frac{y^2}{b} = -kf(\theta)y^2$, by compar-

ing the values of b obtained from a series of experiments in which everything remains the same except the temperature, a measure is obtained of the influence of heat on the rate of the oxidation, and consequently a means of finding the probable nature of the temperature function $f(\theta)$.

The following table contains the results of Hood's experiments, the values for a and b for the equation $y(a+t) = b$ being the means of several experiments —

Temp C	a	b	Ratio $\frac{b_n}{b_{n+1}}$
10°	330.8	3327.8	
11	301.6	3025	1.100
12	274.7	2752.9	1.098
13	250	2503	1.099
14	227.5	2282.7	1.096
15	206.6	2055.7	1.110
16	194.3	1920.8	1.070
17	174.2	1733	1.109
18	159	1577.4	1.098
19	147.1	1452.6	1.086
20	134.4	1325.4	1.096
21	124	1216.8	1.089
22	114.9	1123	1.083
23	102.6	1002.3	1.120
24	94.8	924.5	1.084
25	89.9	869	1.064
28	68.5	654.8	1.099
30	58.7	551.2	1.090
32	50.3	465.3	1.088
		Mean	1.098

From the numbers under $\frac{b_n}{b_{n+1}}$ it appears that this ratio has as nearly as possible a constant value, the mean of all the experiments being 1.098. It would seem, therefore, that for this reaction at least the temperature function has an exponential form, and that the rate of

change may be written $\frac{dy}{dt} = -\mu a^{\theta} y^{\rho}$, θ being the temperature. Calculating the rates of oxidation on this assumption, or $\rho = \mu(1.093)^{\theta}$, where ρ is rate and θ temperature, and comparing them with the rates found by experiment from the values of b , or $\frac{b_{10}}{b_{\theta}}$ the rate at 10°C being taken as unity, the following numbers are obtained —

Temp C.	Rate of oxidation	Calculated rate of oxidation
10°	1 00	
11	1 10	1 09
12	1 21	1 19
13	1 33	1 31
14	1 46	1 43
15	1 62	1 56
16	1 73	1 70
17	1 93	1 86
18	2 11	2 04
19	2 29	2 23
20	2 51	2 43
21	2 73	2 66
22	2 96	2 91
23	3 32	3 18
24	3 59	3 47
25	3 83	3 80
28	5 08	4 96
30	6 04	5 92
32	7 15	7 07

Investigations of many reactions must be made before it can be determined how far it may be true in general that the rate of a chemical change increases in geometrical progression as the temperature varies arithmetically. Lemoine (*Études sur les Équilibres chimiques*, 178) has expressed the opinion that the temperature function is of an exponential form, and thus he considers to be correlative with the nature of the internal movements which constitute the temperature of a body.

INFLUENCE OF LIGHT — A survey of the principal facts that are known relating to the influence of light on chemical changes, or in producing such changes, would seem to indicate the possibility of classifying these chemical changes into (1) such as are only induced by the action of light, or light and heat combined, and (2) reactions which, taking place under ordinary conditions in darkness, are accelerated by the action of light. To the first class of actions belong *par excellence* the photographic processes (of which unfortunately so little is known), and such reactions as the combination of H with Cl, the dissociation of HI, or the reduction of ferric oxalate solution. From the experiments of Amato it would seem that some of these typical changes produced by light can only take place above a certain limit of temperature, indicating that heat as well as light is necessary. To the second class probably a great many, if not all, of the chemical changes that have been studied with reference to their rates, limits, &c., will be found to belong when they have been examined in this respect, but as yet little or nothing has been done. As an instance of the latter class of reactions may be cited the oxidation of oxalic

acid by potassic permanganate. Harcourt and Esson (*T* 156, 194) observed that the rate of this oxidation (which under ordinary conditions is moderately quick) is greatly accelerated in direct sunlight, the amount of this acceleration was not, however, determined.

Hydroic acid exposed to sunlight for one month at ordinary temperatures is decomposed to the extent of 80 p.c., but when this gas is heated night and day for the same length of time at 265° in a dark chamber, scarcely 2 p.c. of the hydrogen is liberated.

The analogy between the chemical effects of light and heat is very striking both agencies act in such a way as to break down or simplify chemical structures, as well as to build up complex molecules from simpler constituents. Many instances might be cited to exemplify these statements, such as the disruption of HI into free iodine and hydrogen, the formation of HCl and of COCl₂ by light, and the formation, and at a higher temperature the dissociation, of HI, H₂Se, H₂O, and numberless other bodies, by heat.

There seems, however, to be one marked difference in the modes of action of heat and light. Whereas, in those chemical changes produced by heat which are termed dissociations or disruptions of molecular structures, a limit is reached depending upon the pressure and temperature to which the system is subjected, in similar changes produced by light there seems to be no limit, but the process goes on until complete decomposition is attained. This is easily understood when it is remembered that in such reactions, under suitable conditions, heat tends to destroy as well as to re-form the molecular structures, but that when light acts in such a way as to break down complex molecules the inverse action has not yet been observed to occur under any conditions. For example free H and I exposed for one month to sunlight suffer no measurable change, but HI in the same interval of time is decomposed to the extent of 80 p.c. Reactions of a limited, and perhaps reversible, character, induced by light, analogous with the dissociation phenomena produced by heat, may yet be discovered. Light rays of different refrangibilities induce chemical changes with greatly different intensities, and probably with different effects. Lemoine (*C R* 93, 514) has shown that HI is decomposed with facility in vessels made of blue glass, but is very slowly changed in red glass vessels. For those bodies which heat alone decomposes at low temperatures, the extreme red of the spectrum appears much less efficacious than the extreme violet. In the cases of bodies which are stable at high temperatures, if the time of action be long enough, the red rays ultimately produce the same result as the violet. Chastaing (*A Ch* [5] 11, 145) concludes that it is not necessary that white light should act more energetically in a given way than any particular part of the solar spectrum, for it is possible that some rays produce the inverse action of others. The chemical action of the solar spectrum on binary metalloid and metallic compounds ought, he thinks, to be represented by two curves, one reducing on the side of the violet, the other of an oxidising character on the red side of the spectrum, and,

he says, there probably exists a point where photochemical action is nil or equal to that which takes place in darkness

An elaborate study of the influence of light in producing chemical changes was made by Bunsen and Roscoe in 1857, some of the facts which their investigations brought out are of a highly important character. Draper in 1843 had observed that the action of light on a mixture of H and Cl does not begin to show itself instantaneously, and he concluded that the first action of light was to bring about a change in the Cl, probably producing an allotropic modification, before combination could take place between it and hydrogen. Bunsen and Roscoe made this observation by Draper the subject of many experiments and measurements. They considered that whatever may be the cause of the resistance to combination which the gaseous mixture shows for some little time after submitting it to the action of a constant source of light, Draper's assumption is not borne out by facts.

The following measurements exemplify this resistance effect as obtained by these chemists with a constant source of light (*T* 147, 363) —

Time in mins	Observation	Action during 1 min
0	100	
1	100.5	5
2	102.1	16
3	102.6	5
4	103.2	6
5	105.3	21
6	119.9	14.6
7	139.1	19.2
8	170.2	31.1
9	200.6	30.4

These numbers show that about 8 mins exposure is required before the rate of combination reaches a constant maximum. It was found that the time that elapses, from the first insolation until the first trace of photochemical induction becomes visible, and until the maximum action is attained, varies much according to the experimental conditions. It was also found that the resistance to combination, once overcome by the influence of light, is soon restored when the gaseous mixture is allowed to stand in darkness, but that the increase of the induction from exposure to light takes place much more rapidly than the diminution of the same on darkening. The presence of a foreign gas, or of excess of Cl or H, influences the induction effect in a remarkable manner. Thus the maximum of the induction of a normal mixture was reduced from 100 to 37.8 by the presence of $\frac{1}{1000}$ of hydrogen, and in the presence of $\frac{1}{1000}$ and $\frac{1}{1000}$ of oxygen it diminished from 100 to 9.7 and 2.7 respectively, and for $\frac{10}{1000}$ of Cl from 100 to 60.2. By insulating the gases separately no appreciable effect was produced on the induction effect when the gases were afterwards mixed.

It is interesting to note that if this preliminary resistance to undergo change is a universal law in such actions as are brought about by light in bodies in the liquid or solid state, it

would evidently place a limit to so called instantaneous photography.

Marchand (*A Ch* [4] 30, 303) has studied the influence of light on a mixture of oxalic acid and ferric chloride in aqueous solution. Such a solution placed in darkness suffers no change, but when exposed to light it evolves CO₂ with the reduction of the ferric chloride. Heat alone has no visible effect on the mixture even at a boiling temperature, but if the solution is exposed to solar radiations and is then heated, decomposition takes place with explosive violence. Of the different parts of the spectrum, the blue rays exercise the most energetic action, even more so than the violet rays. Some highly interesting facts have been noticed by Lemoine (*C R* 97, 1208), bearing on the chemical changes produced by light with the above mixture. He employed a number of thin vertical glass tubes, 15 mm diameter, each containing 20 cc of a mixture of ferric chloride and oxalic acid, the solutions were saturated with CO₂, and contained equivalent quantities of the reacting bodies. The evolved gas was collected over glycerine. The speed of the reaction increased in proportion to the intensity of the light, but for equal intensities of light the speed was at first approximately constant, and only began to slacken when the liquid had disengaged half the possible quantity of gas. If the two reagents are exposed separately to strong sunlight and are then mixed, the decomposition goes on much more rapidly than if the mixture is exposed to light before separate insolation. The following numbers illustrate this fact, the measurements, which were made after the same intervals of exposure, show an acceleration of about ten per cent in the latter case —

	Gas disengaged.									
Liquids not insulated for nine hours	0	24	52	84	83	93	100	107		
Liquids insulated for nine hours	0	24	58	70	91	103	110	117		
Ratios	1	1.11	1.09	1.10	1.11	1.10	1.11	1.09		

A remarkable point noticed in these experiments was that the addition of water increased the rate of action of the light. This anomalous effect may have been due to the partial decomposition of the ferric salt, as well as to the fact that the upper layers of the ferric chloride absorb much of the light and prevent it penetrating far into the liquid.

According to Amato (*G* 14, 57), many reactions which are produced by sunlight are not really due to this agency. Amato considers that light only acts under certain determinate conditions of temperature, and that consequently there are limits of temperature within which light does not act in a chemical way. He found that a mixture of Cl and H if cooled to -12° could be exposed to the direct rays of the sun for hours without combination taking place. In this experiment care must be taken that the Cl is not exposed to the sun's rays before cooling, as insolation renders chlorine capable of combining with hydrogen even in the dark.

INFLUENCE OF PRESSURE.—Many substances when subjected to the influence of heat in a closed vessel, such for instance as calcic carbonate, ammonic carbonate, or paracyanogen, are decomposed or changed to an extent which is found to be limited, for a constant temperature, by the pressure of the resulting gaseous

products When the pressure of the evolved gases has reached a definite value no further alteration takes place If, however, the pressure is maintained below this limit, by allowing the gases to escape, complete decomposition results The consideration of the influence of gaseous pressure in such instances belongs to dissociation (*q v*) There are, however, a few chemical changes known, other than those of dissociation, which occur only under considerable pressures, and others again which are prevented, or at least greatly retarded, by pressure

Cailletet (*C R* 68, 395) found that, representing the amount of action between zinc and HClAq of a definite strength under ordinary atmospheric pressure by 10, the action was reduced to 4.7 under a pressure of 60 atmospheres, and under 120 atmospheres the amount of action in the same time was only 1 The amount of action between HNO_3 and CaCO_3 under pressures of 1 and 150 atmospheres he found to be as 11.09 1

Beketoff (*C R* 48, 442) reduced solutions of silver nitrate and sulphate, and ammoniacal silver chloride, by hydrogen, under pressure—reactions which do not take place at atmospheric pressure

By mere mechanical pressure Spring (*B* 17, 1218) caused several of the metals, such as copper and lead, to combine with sulphur, and also brought about the formation of many alloys

CONTACT ACTIONS—*Catalysis Cyclical Actions*—Catalysis, or contact action, is the name given to a numerous class of chemical changes that are induced in certain chemical systems by a substance which does not itself undergo any permanent alteration, but which by its mere presence under suitable conditions brings about a re-arrangement among the molecules of the bodies with which it is placed in contact The material which acts in this manner, without apparently being affected itself by the changes it induces, has been termed a catalytic or contact agent

According to the theory of Berzelius, who was the first to study this class of reactions, such bodies are possessed of a peculiar property* or power which he termed 'catalytic force,' or the power to bring about chemical changes Berzelius assumed this catalytic force to be of the character of an electrical force It seems simpler, however, to regard such actions as being merely manifestations of the same property or power that is exhibited by all forms of matter undergoing chemical change, or the manifestation of the affinities of one kind of matter for another It is reasonable to suppose that in every chemical system there is a tendency to undergo change of some definite character, such for instance as hydrogen and oxygen to unite, cane sugar and water to form glucose, potassic chlorate to give off oxygen, &c The conditions under which the system exists may be such that the affinities are in a state of stable equilibrium among themselves Every system may be regarded as having a weak point, or point of least resistance, at which an alteration will most easily take place For instance, in the reduction of certain metallic oxides, the oxides are first reduced to lower oxides and then to the metal,

or, certain salts are decomposed when heated, but one phase of the change takes place at a lower temperature, or more easily, than another phase It would seem probable, therefore, that if a suitable material were introduced into a chemical system, it might so react with certain constituents of the system as to upset the previous equilibrium to such an extent that what was before merely a tendency to undergo change would become an actual change, beginning at the point which before the introduction of the catalytic agent was the weakest point of the system The catalytic agent may be regarded as tending to form, with one of the constituents of the system, a compound too unstable to exist under the conditions, which compound immediately breaks up, leaving the so called catalytic agent in its original condition, free to react with a fresh portion of the system

Contact action would seem to be rather an ill chosen term for this class of reactions, since all chemical combinations imply contact It is also well known that many soluble salts if placed in contact with insoluble salts or pps adhere tenaciously to these A striking instance of this kind of contact action is exhibited by metastannic acid If a small quantity of this powder be shaken up with a highly ferruginous solution of aluminium sulphate, the ferric oxide in solution is seized upon by the insoluble metastannic acid, leaving a solution of aluminium sulphate in which scarcely a trace of iron can be detected

From the evidence that exists relating to what is strictly known as catalytic action, if a word were necessary to distinguish this kind of change from ordinary chemical reactions, *cyclical action* or *cyclical change* would seem to be near the mark

The instances that are known among gases in which the presence of a body brings about chemical action in an otherwise stable gaseous mixture seem to be explained by assuming that contact action merely causes a condensation of the gases upon the surface of the material that brings about their union Faraday (*T* 1834 55) found that if a plate of perfectly clean platinum is brought into a mixture of hydrogen and oxygen, combination of the gases begins to take place, at first slowly, but at a gradually increasing rate, until combination occurs with explosive violence This combination was considered by Faraday to be due to the condensation of the gases upon the metallic surface, whereby the molecules of oxygen and hydrogen were brought into such close contact that chemical union took place The presence of small quantities of CO or CS_2 prevents the combination of the oxygen and hydrogen by aid of a platinum surface, although the metal is not found to lose its power if afterwards plunged into a pure mixture of the gases Small quantities of such gases as H_2S or HCl , however, so alter the platinum surface that the metal is now incapable of effecting the combination of H with O Other substances, such as charcoal, pumice, rock crystal, &c, act in a similar manner to, but less rapidly than, platinum Platinum also brings about the combination of SO_2 and O to form SO_3 , of NH_3 and O to form HNO_3 , and H_2O , &c

Konowalow (*B* 17, 1860, 18, 2808), when determining the vapour density of tertiary amyliacetate, found that the dissociation-phenomena exhibited by the vapour of this body are influenced in a striking manner by the presence of many finely divided substances such as silica, magnesia, calcium sulphate, &c. The effects varied with the chemical, as well as with the physical, characters of the substances placed in contact with the vapour. To such a slight extent have these contact actions been studied that it seems as yet impossible to interpret them in the same way as those chemical actions which are here termed cyclical. Faraday's theory for the action of platinum in bringing about the union of oxygen and hydrogen by a mere condensation of the gases would seem to be the most reasonable explanation in the face of the facts at present known.

Examples of catalytic actions are known among liquids, which may be explained on the theory of cyclical change, such are the evolution of oxygen from a solution of a hypochlorite when warmed with cobaltous or manganic oxide, and the decomposition of hydrogen peroxide by manganese dioxide, finely divided platinum or silver, or by oxide of silver. The last case is remarkable, for here oxygen is evolved both from the silver oxide and from the hydrogen peroxide, to explain this, and a number of analogous reactions, Brodie (*T* 140, 759) assumed that atoms of the same body may have an attraction for each other or be in a state of polarisation. Brodie expressed the reaction of Ag_2O with H_2O , thus, $\text{H}_2\text{OO} + \text{Ag}_2\text{O} = \text{H}_2\text{O} + \text{OO} + \text{Ag}_2$.

The change of cane sugar and water into glucose, and of ethereal salts and water into acids and alcohols, in the presence of acids which themselves remain unchanged, are other instances of catalytic action probably of a cyclical character (see AFFINITY, pp 71 *et seq*).

If potassic chlorate is heated alone it melts at about 345°C and on increasing the temperature to about 370°C oxygen begins to be produced. Many substances in a fine state of division when mixed with this salt cause an evolution of oxygen much below the temperature at which the chlorate decomposes when heated alone, and without the salt entering into a state of fusion. The substances which facilitate this decomposition do not themselves appear to undergo any chemical change. It is probable that the theory propounded by Mercer (*B* A 1842 32) to explain analogous chemical changes is the true one, viz that the material which facilitates the decomposition has a tendency to pass into a higher state of oxidation, and that an unstable compound is formed, but is decomposed at the temperature of the experiment. On this hypothesis the potassium chlorate is regarded as being decomposed at the lower temperature by the double effect of heat and the affinity of the contact substance—as MnO_2 —for the oxygen of the chlorate. Heated by itself, potassium chlorate passes through an intermediate stage in its decomposition with the formation of perchlorate, this intermediate stage is represented according to some chemists by the equation $2\text{KClO}_3 = \text{KClO}_4 + \text{KCl} + \text{O}_2$, but it appears to be more correctly expressed by the

equation $10\text{KClO}_3 + 6\text{KClO}_4 + 4\text{KCl} + 8\text{O}_2$ (Teed, *C* N 52, 248). If, however, manganese dioxide is heated with the chlorate, no perchlorate is formed, this fact may be explained and used as an argument in favour of Mercer's view, by supposing that KClO_3 when decomposed by itself forms KCl and O_2 , and that the nascent ozone oxidises a second molecule of chlorate to perchlorate, whereas in the presence of MnO_2 , a higher but very unstable oxide of manganese is formed, and is almost simultaneously decomposed. The oxides which most markedly facilitate the decomposition of potassium chlorate are as a rule those the metals of which form several oxides. It is a well known fact that the oxygen prepared from KClO_3 , either by heating the salt alone or mixed with MnO_2 , liberates iodine from an alkaline iodide, this is usually considered to be due to a trace of free chlorine, it may, however, be occasioned by a little ozone that escapes decomposition by the MnO_2 or the KClO_3 .

Contact chemical action, whatever be its true cause, plays a highly important part in several industrial operations, as the inversion of cane sugar, the conversion of starchy matters into glucose, the decolorisation of sugar solutions by charcoal, and probably in the purification of waters by filtration through porous media. Formerly the great industrial processes of fermentation in the formation of alcoholic liquors were referred to this cause, but it seems now certain that such changes are phenomena connected with organic life and not with those of unorganised matter.

(For a theoretical consideration of catalysis see Mendeléeff, *B* 19, 456.)

A consideration of the facts that are known relating to chemical change shows that in the study of the subject not only must the kind or quality, and the mass, of the reacting matter, be taken into account, but attention must also be given to the intrinsic forces that come into play, as well as to the notion of molecular or atomic motions. It is not at present so much the relative values of these forces that one desires to know, in whatever way they may be measured, as the circumstances under which the forces act, or are modified in their action. It has been seen that all atomic structures are possessed of relative degrees of stability, as is shown when submitted to the action of physical agencies, or when they play an active part in chemical systems, this stability being due to the interaction of the affinities holding the structure together. These forces or affinities offer different degrees of resistance to the action of different agencies, and it would seem to be only by the study of such influences that a rational conception of the nature of chemical action will be arrived at.

That the ultimate constituents of matter—the atoms or molecules—are in continual motion, the interdiffusion of gases, and of salts in solution, seems to prove, and the fact that, in a chemical system undergoing change, such change is more or less gradual, taking fractions of seconds or whole years to be accomplished, seems to offer conclusive proof that the atomic constituents are in a continual motion of interdiffusion. But whether or not the change going on in a chemical system is brought about by simple

collisions among the moving molecules cannot be asserted. For instance, anhydrous alcohol and acetic acid, when mixed in equivalent proportions react upon each other at ordinary temperatures with extreme slowness, in fact, it takes months to accomplish what at 100° requires only minutes, and yet it is highly probable that very many more collisions occur between the alcohol and the acid molecules than the rate of change would lead us to conclude. It may be that in these and similar cases the molecules of the two constituents of the system must be moving with a definite velocity if chemical action is to occur. But the kinetic theory of gases teaches that in a space of uniform temperature some molecules have high and others low velocities, and that the ratio between the numbers of molecules having high and those having low velocities varies with the temperature, consequently the chemical change which occurs may be but a process of selection among the molecules according to the velocities they possess, those with velocities below a certain limit colliding, but not reacting chemically with, each other.

As chemical reactions are generally formulated, the phenomena of change are for the most part at present viewed only in the light of the distribution of certain masses of matter of various kinds, and no cognisance is taken of the changes in the energies of the systems as these pass from the initial to the final states. In the blank that is at present occupied by the sign '=' lie all the real phenomena of the science of matter. Attempts have been made to fill up this blank by the investigation and measurement of the heat disturbances that arise when a chemical system passes from the state represented by one side of the equation to that represented by the other side. By virtue of the inherent forces or affinities, as well as by the particular motions of the ultimate particles or atoms of matter, all substances may be looked upon as possessing a certain definite amount of energy, potential as well as kinetical, and consequently as capable of performing a definite amount of work. The tendency of the constituents of a system is invariably towards a state the attainment of which involves a degradation of energy, in other words the total energy of the system tends to fall from a higher to a lower level. (For the general inferences that have been drawn from the study of thermal phenomena bearing on the applications of the laws of energy to chemical change reference must be made to the section on THERMAL PHENOMENA of the article PHYSICAL METHODS USED IN CHEMISTRY.)

It is much to be desired that a classification of the elements, or, what seems more possible, of their compounds, should be attempted, based

upon some particular dynamical properties which should include not only the conception of mass but also the conceptions of time and work, it is evident, however, that the difficulty lies in the kind of phenomena to be observed and measured. Mills (*P M* [5] 1) has propounded certain ideas relating to chemical phenomena, making motion the basis of the science, and he considers that chemical substances should be valued not for what they are conceived as being, but for what they are capable of doing. Doubtless, however, the being as well as the doing must be considered together. The masses of various bodies necessary for the performance of unit of work Mills terms the dynamic equivalents, or the 'bergmannics,' of the respective bodies, these may vary according to the sort of doing, or work, the several substances are employed to effect, such as the power of various acids to invert sugar, or to decompose ethereal salts, the precipitability of salts, the coefficients of diffusion, &c., &c. For many valuable determinations of dynamical effects of substances in inducing or accelerating chemical changes, see the work of Ostwald. For a full account of this work see the article AFFINITY. (In connexion with this article, see the articles AFFINITY, ALLOTROPY, CHEMICAL AND PHYSICAL PROPERTIES OF BODIES, CONNEXIONS BETWEEN, COMBINATION, CHEMICAL, DISSOCIATION, EQUILIBRIUM, CHEMICAL, ISOMERISM.)
